and inſtantly the air reſounds with his name, with cries of *vivat*, and the noiſe of piſtols. If all the palatines agree in their nominations, the primate gets on horſeback; and then the profoundeſt ſilence ſucceeding to the greateſt noiſe, he aſks three times if all are ſatisfied? and after a general approbation, three times proclaims the king; and the grand-marſhal of the crown repeats the proclamation three times at the three gates of the camp. How glorious a king this, if endued with royal qualities! and how inconteſtible his title in the ſuffrages of a whole people! But this ſketch of a free and peaceable election is by no means a repreſentation of what uſually happens. The corruption of the great, the fury of the people, intrigues and factions, the gold and the arms of foreign powers, frequently fill the ſcene with violence and blood."

118 The pacta conventa.

Before the king is proclaimed, the *pacta conventa* is read aloud to him, which on his knees at the altar he ſwears to obſerve. As this contract, which is drawn up, methodized, and approved, by the ſenate and nobility, may be deemed the great charter of Poland, we ſhall enumerate the principal articles of which it conſiſts. Theſe are, that the king ſhall not attempt to encroach on the liberty of the people, by rendering the crown hereditary in his family; but that he ſhall preſerve all the cuſtoms, laws, and ordinances, reſpecting the freedom of election: that he ſhall ratify all treaties ſubſiſting with foreign powers which are approved by the diet: that it ſhall be his chief ſtudy to cultivate peace, preſerve the public tranquillity, and promote the intereſt of the realm: that he ſhall not coin money except in the name of the republic, nor appropriate to himſelf the advantages ariſing from coinage: that in declaring war, concluding peace, making levies, hiring auxiliaries, or admitting foreign troops upon any pretext within the Poliſh dominions, the conſent of the diet and ſenate ſhall be neceſſary: that all offices and preferments ſhall be given to the natives of Poland and Lithuania; and that no pretence ſhall excuſe or palliate the crime of introducing foreigners into the king's council or the departments of the republic: that the officers of his majeſty's guards ſhall be Poles or Lithuanians; and that the colonel ſhall abſolutely be a native of Poland, and of the order of nobility: that all the officers ſhall be ſubordinate to the authority of the mareſchal: that no individual ſhall be veſted with more employments than the law allows: that the king ſhall not marry without the approbation of the ſenate; and that the houſehold of the queen ſhall be determined and regulated by the republic: that the ſovereign ſhall never apply his private ſignet to acts and papers of a public nature: that the king ſhall diſpoſe of the offices both of the court and of the republic; and regulate with the ſenate the number of forces neceſſary for the defence of the kingdom: that he ſhall adminiſter juſtice by the advice of the ſenate and his council: that the expences of his civil liſt ſhall be the ſame with thoſe of his predeceſſors: that he ſhall fill up all vacancies in the ſpace of ſix weeks: that this ſhall be his firſt buſineſs in the diet, obliging the chancellor to publiſh his appointments in due form: that the king ſhall not diminiſh the treaſure kept at Cracow; but, on the contrary, endeavour to augment that and the number of the crown-jewels: that he ſhall borrow no money without the conſent of the diet: that he ſhall not equip a naval force without the conſent and full approbation of the republic: that he ſhall profeſs the Roman Catholic faith, promote, maintain, and defend it, through all the Poliſh dominions: and finally, that all their ſeveral liberties, rights, and privileges, ſhall be preſerved to the Polanders and Lithuanians in general, and to all the diſtricts and provinces contained within each of theſe great diviſions, without change, alteration, or the ſmalleſt violation, except by the conſent of the republic. To theſe articles a variety of others are added, according to circumſtances and the humour of the diet; but what we have recited form the ſtanding conditions, which are ſcarce ever altered or omitted.

119 The diet of Poland, and

The diet of Poland is compoſed of the king, the ſenate, biſhops, and the deputies of the nobility or gentry of every palatinate, called, in the collective capacity, *comitia togata*; that is, when the ſtates aſſemble in the city without arms and horſes; or *comitia paludata*, when they meet in the fields armed, as during an interregnum, at the diet of election. It is a prerogative of the crown to aſſemble the diet at any particular place, except on occaſion of a coronation, which the cuſtom of the country requires ſhould be celebrated at the capital. For a number of years, indeed, the diet regularly aſſembled at Warſaw; but, on complaint made by the Lithuanians, it was agreed, that every third diet ſhould be held at Grodno. "When it is propoſed to hold a general diet, the king, or, in caſe of an interregnum, the primate, iſſues writs to the palatines of the ſeveral provinces, ſpecifying the time and place of the meeting. A ſketch likewiſe is ſent of the buſineſs to be deliberated on by the aſſembly; the ſenate is conſulted in this particular, and ſix weeks are allowed the members to prepare themſelves for the intended ſeſſion. It is remarkable, that the diet never ſits more than ſix weeks in the moſt critical conjunctures and preſſing emergencies: they have been known to break up in the middle of an important debate, and to leave the buſineſs to a future meeting. This cuſtom hath been juſtly eſteemed one of the greateſt defects of the Poliſh conſtitution, which probably owes its origin to convenience, but is now ſuperſtitiouſly obſerved from whim and caprice. On receipt of the king's writ, the palatine communicates the meeting of the diet to all the caſtellans, ſtaroſtas, and other inferior officers and gentry within his juriſdiction, requiring them to aſſemble on a certain day to elect deputies, and take into conſideration the buſineſs ſpecified in the royal ſummons. 120 Dietines. Theſe meetings are called *petty diets*, *dietines*, or *lantage*, in the language of the country; every gentleman poſſeſſing three acres of land having a vote, and matters being determined by a majority; whereas in the general diet decrees are only valid when the whole body is unanimous. Every palatinate has three repreſentatives, though the buſineſs devolves on one called a *nuncio*, who is elected for his ability and experience; and the other two are added only to give weight to this leading member, and do honour by their magnificent appearance to the palatinate they repreſent. As theſe deputies, ſince the reign of Caſimir III. have ſeats in the diet, it naturally divides the general aſſembly into two bodies, the upper and lower; the one being compoſed of the ſenate, the ſuperior clergy, and the great officers; the other of the repreſentatives of the palatinates, who prepare all buſineſs for the ſuperior body.

"The firſt buſineſs of the aſſembly is to chooſe a mareſchal; upon which occaſion the debates and tumults run ſo high, that the whole time for the ſeſſion of the diet is often conſumed in altercation and wrangling about the election of a ſpeaker, who has now nothing farther to do than return quietly to his own home. After his election, he kiſſes the king's hand; and the chancellor, as the royal repreſentative, reports the matters to be deliberated by the diet. Then the mareſchal acquaints the king with the inſtructions of the deputies from their conſtituents, the grievances which they would have redreſſed, and the abuſes they require to be remedied. He likewiſe requeſts of his majeſty to fill up the vacant offices and benefices, according to law; and he is anſwered by a ſet ſpeech from the chancellor, who reports the king's inclination to ſatisfy his people, as ſoon as he hath conſulted his faithful ſenate.

121 Abſurd cuſtoms obſerved in the diet.

There is ſomething very peculiarly abſurd in ſome of the cuſtoms obſerved by the Poliſh diet: one in particular merits attention. Not only an unanimity of voices is neceſſary to paſs any bill, and conſtitute a decree of the diet, but every bill muſt likewiſe be aſſented to unanimouſly, or none can take effect.

122 The liberum veto.

Thus, if out of twenty bills one ſhould happen to be oppoſed by a ſingle voice, called *liberum veto*, all the reſt are thrown out, and the diet meets, deliberates, and debates, for ſix weeks to no purpoſe.

"To add to the other inconveniences attending the conſtitution of the diet of Poland, a ſpirit of venality in the deputies, and a general corruption, hath ſeized all ranks and degrees in that aſſembly. Here, as in ſome other countries, the cry of liberty is kept up for the ſake of private intereſt. Deputies come with a full reſolution of profiting by their patriotiſm, and not lowering their voice without a gratification. Determined to oppoſe the moſt ſalutary meaſures of the court, they either withdraw from the aſſembly, proteſt againſt all that ſhall be tranſacted in their abſence, or elſe excite ſuch a clamour as renders it neceſſary for the court to ſilence them by ſome lucrative penſion, donation, or employment. Thus not only the buſineſs of the aſſembly is obſtructed by its own members, but frequently by largeſſes from neighbouring powers, and ſometimes by the liberality of an open enemy, who has the art of diſtributing his money with deſcretion.

123 The ſenate of Poland.

"Perhaps the moſt reſpectable department of the Poliſh government is the ſenate, compoſed of the biſhops, palatines, caſtellans, and ten officers of ſtate, who derive a right from their dignities of ſitting in that aſſembly; in all amounting to 144 members, who are ſtyled *ſenators of the kingdom* or *counſellors of the ſtate*, and have the title of *excellency*, a dignity ſupported by no penſion or emoluments neceſſarily annexed. The ſenate preſides over the laws, is the guardian of liberty, the judge of right, and the protector of juſtice and equity. All the members, except the biſhops, who are ſenators *ex officio*, are nominated by the king, and they take an oath to the republic before they are permitted to enter upon their functions. Their honours continue for life: at the general diet they ſit on the right and left of the ſovereign, according to their dignity, without regard to ſeniority. They are the mediators between the monarch and the ſubject, and, in conjunction with the king, ratify all the laws paſſed by the nobility. As a ſenator is bound by oath to maintain the liberties of the republic, it is thought no diſreſpect to majeſty that they remind the prince of his duty. They are his counſellors, and this freedom of ſpeech is an inſeparable prerogative of their office."

Such was the conſtitution of Poland before it was new-modelled by the partitioning powers. That it was a very bad conſtitution needs no proof; but thoſe foreign reformers did not improve it. For two centuries at leaſt, the Poles have with great propriety denominated their government a republic, becauſe the king is ſo exceedingly limited in his prerogative, that he reſembles more the chief of a commonwealth than the ſovereign of a powerful monarchy.

124 The permanent council.

That prerogative, already too confined to afford protection to the peaſants, groaning under the ariſtocratic tyranny of the nobles, was, after the partition treaty, ſtill further reſtrained by the eſtabliſhment of the *permanent council*, which was veſted with the whole executive authority, leaving to the ſovereign nothing but the name. The permanent council conſiſts of 36 perſons, elected by the diet out of the different orders of nobility; and though the king, when preſent, preſides in it, he cannot exert a ſingle act of power but with the conſent of the majority of perſons, who may well be called his *colleagues*.

That the virtuous and accompliſhed Staniſlaus ſhould labour to extricate himſelf and the great body of the people from ſuch unparalleled oppreſſion, and that the more reſpectable part of the nation ſhould wiſh to give to themſelves and their poſterity a better form of government, was ſurely very natural and very meritorious. The influence of the partitioning powers was indeed exerted to make the king contented with his ſituation. His revenues, which before did not exceed L. 100,000, were now increaſed to three times that ſum. The republic likewiſe agreed to pay his debts, amounting to upwards of L. 400,000. It beſtowed on him alſo, in hereditary poſſeſſion, four ſtaroſties, or governments of caſtles, with the diſtricts belonging to them; and reimburſed him of the money he had laid out for the ſtate. It was alſo agreed, that the revenues of the republic ſhould be enhanced to 33 millions of florins (near two millions Sterling), and the army ſhould conſiſt of 30,000 men. Soon after the concluſion of the peace with Turky, the empreſs of Ruſſia alſo made the king a preſent of 250,000 rubles, as a compenſation for that part of his dominions which fell into her hands.

125 A new conſtitution eſtabliſhed in 1791.

Theſe bribes, however, were not ſufficient to blind the eyes of Staniſlaus, or to cool the ardour of his patriotiſm. He laboured for poſterity, and with ſuch apparent ſucceſs, that on the 3d of May 1791, a new conſtitution of the government of Poland was eſtabliſhed by the king, together with the confederate ſtates aſſembled in double number to repreſent the Poliſh nation. That this was a perfect conſtitution, we are far from thinking; but it was probably as perfect as the inveterate prejudices of the nobles would admit of. It deviated as little as poſſible from the old forms, and was drawn up in 11 articles, reſpecting the government of the republic; to which were added 21 ſections, regulating the dietines or primary aſſemblies of Poland.

126 Subſtances of the firſt five articles of it.

Of this conſtitution, the firſt article eſtabliſhed the Roman Catholic faith, with all its privileges and immunities, as the dominant national religion; granting to all other people, of whatever perſuaſion, peace in matters of faith, and the protection of government. The ſecond article guaranteed to the nobility or the equeſtrian order, all the privileges which it enjoyed under the kings of the houſe of Jagellan. The third and fourth articles granted to the free royal towns internal juriſdictions of their own; and exempted the peaſants from ſlavery, declaring every man free as ſoon as he ſets his foot on the territory of the republic. The fifth article, after declaring, that in civil ſociety all power ſhould be derived from the will of the people, enacted that the government of the Poliſh nation ſhould be compoſed of three diſtinct powers, the *legiſlative*, in the ſtates aſſembled; the *executive*, in the king and the council of inſpection; and the *judicial* power, in the juriſdictions exiſting, or to be eſtabliſhed. The ſixth and ſeventh articles, as being of more importance, we ſhall give in the words of the conſtitution itſelf.

127 The diet to conſiſt of two houſes, viz. the houſe of nuncios,

VI. *The Diet*, or *the legiſlative power*, ſhall be divided into two houſes, viz. the houſe of nuncios, or deputies, and the houſe of ſenate, where the king is to preſide. The former being the repreſentative and central point of ſupreme national authority, ſhall poſſeſs the preeminence in the legiſlature; therefore all bills are to be decided firſt in this houſe.

1. *All General Laws*, viz. conſtitutional, civil, criminal, and perpetual taxes; concerning which matters, the king is to iſſue his propoſitions by the circular letters ſent before the dietines to every palatinate and to every diſtrict for deliberation, which coming before the houſe with the opinion expreſſed in the inſtructions given to their repreſentatives, ſhall be taken the firſt for deciſion.

2. *Particular Laws*, viz. temporal taxes; regulations of the mint; contracting public debts; creating nobles, and other caſual recompenſes; reparation of public expences, both ordinary and extraordinary; concerning war; peace; ratification of treaties, both political and commercial; all diplomatic acts and conventions relative to the laws of nations; examining and acquitting different executive departments, and ſimilar ſubjects ariſing from the accidental exigencies and circumſtances of the ſtate; in which the propoſitions, coming directly from the throne into the houſe of nuncios, are to have preference in diſcuſſion before the private bills.

128 And the houſe of ſenate.

In regard to the houſe of ſenate, it is to conſiſt of biſhops, palatines, caſtellans, and miniſters, under the preſidency of the king; who ſhall have but one vote, and the caſting voice in caſe of parity, which he may give either perſonally, or by a meſſage to the houſe. Its power and duty ſhall be,

1. Every general law that paſſes formally through the houſe of nuncios, is to be ſent immediately to this, which is either accepted, or ſuſpended till farther national deliberation, by a majority of votes, as preſcribed by law. If accepted, it becomes a law in all its force; if ſuſpended, it ſhall be reſumed at the next diet; and if it is then agreed to again by the houſe of nuncios, the ſenate muſt ſubmit to it.

3. Every particular law or ſtatute of the diet in matters above ſpecified, as ſoon as it has been determined by the houſe of nuncios, and ſent up to the ſenate, the votes of both houſes ſhall be jointly computed, and the majority, as deſcribed by law, ſhall be conſidered as a decree and the will of the nation. Thoſe ſenators and miniſters who, from their ſhare in executive power, are accountable to the republic, cannot have an active voice in the diet, but may be preſent, in order to give neceſſary explanations to the ſtates.

Theſe ordinary legiſlative diets ſhall have their uninterrupted exiſtence, and be always ready to meet; renewable every two years. The length of ſeſſions ſhall be determined by the law concerning diets. If convened out of ordinary ſeſſion upon ſome urgent occaſion, they ſhall only deliberate on the ſubject which occaſioned ſuch a call, or on circumſtances which may ariſe out of it.

No law or ſtatute enacted by ſuch ordinary diet can be altered or annulled by the ſame. The complement of the diet ſhall be compoſed of the number of perſons in both houſes to be determined hereafter.

The law concerning the dietines or primary elections, as eſtabliſhed by the preſent diet, ſhall be regarded as a moſt eſſential foundation of civil liberty.

129 The liberum veto aboliſhed.

The majority of votes ſhall decide every thing, and every where; therefore we aboliſh, and utterly annihilate, *liberum veto*, all ſorts of confederacies and confederate diets, as contrary to the ſpirit of the preſent conſtitution, as undermining the government, and as being ruinous to ſociety.

130 Extraordinary diet for reviſing the conſtitution.

Willing to prevent, on one hand, violent and frequent changes in the national conſtitution, yet, conſidering on the other, the neceſſity of perfecting it, after experiencing its effects on public proſperity, we determine the period of every 25 years for an extraordinary conſtitutional diet, to be held purpoſely for the reviſion and ſuch alterations of the conſtitution as may be found requiſite: which diet ſhall be circumſcribed by a ſeparate law hereafter.

VII. The moſt perfect government cannot exiſt or laſt without an effectual executive power. The happineſs of the nation depends on juſt laws, but the good effects of laws flow only from their execution. Experience has taught us, that the neglecting this eſſential part of government has overwhelmed Poland with diſaſters.

131 Powers of the king and council of inſpection.

Having, therefore, ſecured to the free Poliſh nation the right of enacting laws for themſelves, the ſupreme inſpection over the executive power, and the choice of their magiſtrates, we entruſt to the king and his council the higheſt power of executing the laws. This council ſhall be called *ſtraz*, or the council of inſpection.

The duty of ſuch executive power ſhall be to watch over the laws, and to ſee them ſtrictly executed according to their import, even by the means of public force ſhould it be neceſſary. All departments and magiſtracies are bound to obey its directions. To this power we leave the right of controuling ſuch as are refractory, or of puniſhing ſuch as are negligent in the execution of their reſpective offices.

This executive power cannot aſſume the right of making laws, or of their interpretation. It is expreſsly forbidden to contract public debts; to alter the repartition of the national income, as fixed by the diet; to declare war; to conclude definitively any treaty, or any diplomatic act; it is only allowed to carry on negociations with foreign courts, and facilitate temporary occurrences, always with reference to the diet.

132 Crown elective in regard to families;

The crown of Poland we declare to be elective in regard to families, and it is ſettled ſo for ever.

Having experienced the fatal effects of interregna, 133 But hereditary in each family till its extinction.

periodically ſubverting government, and being deſirous of preventing for ever all foreign influence, as well as of inſuring to every citizen a perfect tranquillity, we have, from prudent motives, reſolved to adopt hereditary ſucceſſion to our throne: therefore we enact and declare, that, after the expiration of our life, according to the gracious will of the Almighty, the preſent elector of Saxony ſhall reign over Poland, and in his perſon ſhall the dynaſty of future kings of Poland begin. We reſerve to the nation, however, the right of electing to the throne any other houſe or family, after the extinction of the firſt.

134 Coronation oath.

Every king, on his acceſſion to the throne, ſhall take a ſolemn oath to God and the nation, to ſupport the preſent conſtitution, to fulfil the *pacta conventa*, which will be ſettled with the preſent elector of Saxony, as appointed to the crown, and which ſhall bind him in the ſame manner as former ones.

135 King's perſon ſacred:

The king's perſon is ſacred and inviolable; as no act can proceed immediately from him, he cannot be in any manner reſponſible to the nation; he is not an abſolute monarch, but the father and the head of the people; his revenues, as fixed by the *pacta conventa*, ſhall be ſacredly preſerved. All public acts, the acts of magiſtracies, and the coin of the kingdom, ſhall bear his name.

136 His particular powers.

The king, who ought to poſſeſs every power of doing good, ſhall have the right of pardoning thoſe that are condemned to death, except the crimes be againſt the ſtate. In time of war, he ſhall have the ſupreme command of the national forces: he may appoint the commanders of the army, however, by the will of the ſtates. It ſhall be his province to patentee officers in the army, and other dignitaries, conſonant to the regulations hereafter to be expreſſed, to appoint biſhops, ſenators, and miniſters, as members of the executive power.

137 Members of the council of inſpection,

The king's council of inſpection is to conſiſt, 1. Of the primate, as the head of the clergy, and the preſident of the commiſſion of education, or the firſt biſhop *in ordine*. 2. Of five miniſters, viz. the miniſter of police, miniſter of juſtice, miniſter of war, miniſter of finances, and miniſter for the foreign affairs. 3. Of two ſecretaries to keep the protocols, one for the council, another for the foreign department; both, however, without deciſive vote. The hereditary prince coming of age and having taken the oath to preſerve the conſtitution, many aſſiſt at all ſeſſions of the council, but ſhall have no vote therein. The marſhal of the diet, being choſen for two years, has alſo a right to ſit in this council, without taking any ſhare in its reſolves; for the end only to call together the diet, always exiſting, in the following caſe: ſhould he deem, from the emergencies hereunder ſpecified, the convocation of the diet abſolutely neceſſary, and the king refuſing to do it, the marſhal is bound to iſſue his circular letters to all nuncios and ſenators, adducing real motives for ſuch meeting.

138 Powers of the marſhal.

The caſes demanding ſuch convocation of the diet are the following: 1. In a preſſing neceſſity concerning the law of nations, and particularly in caſe of a neighbouring war. 2. In caſe of an internal commotion, menacing with the revolution of the country, or of a colliſion between magiſtratures. 3. In an evident danger of general famine. 4. In the orphan ſtate of the country, by demiſe of the king, or in caſe of the king's dangerous illneſs. All the reſolutions of the council of inſpection are to be examined by the rules abovementioned. The king's opinion, after that of every member in the council has been heard, ſhall deciſively prevail. Every reſolution of this council ſhall be iſſued under the king's ſignature, counterſigned by one of the miniſters ſitting therein; and thus ſigned, ſhall be obeyed by all executive departments, except in caſes expreſsly exempted by the preſent conſtitution.

Should all the members refuſe their counterſign to any reſolution, the king is obliged to forego his opinion; but if he ſhould perſiſt in it, the marſhal of the diet may demand the convocation of the diet; and if the king will not, the marſhal himſelf ſhall ſend his circular letters as above. Miniſters compoſing this council cannot be employed at the ſame time in any other commiſſion or department.

If it ſhould happen that two thirds of ſecret votes in both houſes demand the changing of any perſon either in the council, or any executive department, the king is bound to nominate another. Willing that the council of inſpection ſhould be reſponſible to the nation for their actions, we decree, that when theſe miniſters are denounced and accuſed before the diet (by the ſpecial committee appointed for examining their proceedings) of any tranſgreſſion of poſitive law, they are anſwerable with their perſons and fortunes. Such impeachments being determined by a ſimple majority of votes, collected jointly from both houſes, ſhall be tried immediately by the comitial tribunal, where the accuſed are to receive their final judgment and puniſhment, if found guilty; or to be honourably acquitted on ſufficient proof of innocence.

139 Commiſſions of education, police, &c.

In order to form a neceſſary organization of the executive power, we eſtabliſh hereby ſeparate commiſſions, connected with the above council, and ſubjected to obey its ordinations. Theſe commiſſions are, 1. of education; 2. of police; 3. of war; 4. of treaſury. It is through the medium of theſe four departments that all the particular orderly commiſſions (D), as eſtabliſhed by the preſent diet, in every palatinate and diſtrict, ſhall depend on, and receive all orders from, the council of inſpection, in their reſpective duties and occurrences.

140 Adminiſtration of juſtice.

The eighth article regulates the adminiſtration of juſtice, beginning with a very ſenſible declaration, that the judicial power is incompatible with the legiſlative, and that it cannot be adminiſtered by the king. It therefore conſtitutes primary courts of juſtice for each palatinate or diſtrict, compoſed of judges choſen at the dietine; and appoints higher tribunals, erected one in each of the three provinces into which the kingdom is divided, with which appeals may be lodged from the primary

---

(D) Orderly commiſſions are newly inſtituted; each palatinate and diſtrict chooſes a certain number of commiſſaries; their office laſts two years; their principal duty is to maintain police and good order in their diſtrict; to put into execution decrees and regulations of ſupreme departments; to collect taxes; to keep caſh; to make ſuch payments as aſſigned by the commiſſion of finances; to protect citizens from the military oppreſſion; to furniſh recruits, beſides many other duties of internal management.

mary courts. It appoints likewiſe for the trial of perſons accuſed of crimes againſt the ſtate, one ſupreme general tribunal for all claſſes, called a *comitial tribunal* or court, compoſed of perſons choſen at the opening of every diet. The ninth article provides a regency during the king's minority, in caſe of his ſettled alienation of reaſon, or upon the emergency of his being made a priſoner of war. This regency was to be compoſed of the council of inſpection, with the queen at their head, or, in her abſence, the primate of the kingdom. The tenth article enjoins, that the education of the king's ſons ſhall be entruſted to the king with the council, and a tutor appointed by the ſtates; and the eleventh regulates the army in ſuch a manner, as to prevent it from being employed to overturn the conſtitution.

141
Regency on certain occaſions.

142
The election and duties of nuncios.

The regulation of the dietines contains nothing that can be intereſting to our readers, except what relates to the election and duties of nuncios or repreſentatives to the general diet. And here it is enacted, that perſons having a right to vote are all nobles of the equeſtrian order; *i. e.* 1. All hereditary proprietors of landed property, or poſſeſſed of eſtates by adjudication for a debt, paying territorial tax to government: ſons alſo of ſuch proprietors during the life of their parents, before the ex-diviſion of patrimony. 2. Brothers inheriting eſtates before they have ſhared their ſucceſſion. 3. All mortgages who pay 100 florins (50 ſhillings) of territorial tax per year from their poſſeſſions. 4. All life-holders of lands paying territorial tax to the ſame amount. 5. All nobles in the army poſſeſſed of ſuch qualifying eſtates have a vote in their reſpective diſtricts in time of peace, and properly furloughed by their commanders. 6. Legal poſſeſſion is underſtood to be qualifying when it has been formerly acquired and actually enjoyed for twelve calender months previouſly.

Perſons who have no right to vote are, 1. Thoſe of the equeſtrian order that are not actually poſſeſſed of a property, as deſcribed in the foregoing article. 2. Such as hold royal, eccleſiaſtical, or noble lands, even with right of inheritance, but on condition of ſome duty or payment to their principals, conſequently dependent thereon. 3. Gentry poſſeſſing eſtates on feudal tenure, called *ordynackie*, as being bound to certain perſonal ſervice thereby. 4. All renters of eſtates that have no other qualifying property. 5. Thoſe that have not accompliſhed 18 years of age. 6. *Crimine notati*, and thoſe that are under a decree paſſed in default, even in the firſt inſtance, for having diſobeyed any judicial court.

143
Perſons eligible and not eligible.

Every perſon of the equeſtrian order that pays territorial tax to government for his freehold, let it be ever ſo ſmall, is eligible to all elective offices in his reſpective diſtrict.

Gentlemen actually ſerving in the army, even poſſeſſed of landed hereditary eſtate, muſt have ſerved ſix complete years before they are eligible to the office of a nuncio only. But this condition is diſpenſed with in favour of thoſe that have filled before ſome public function.

Whoever is not perſonally preſent at the dietine; whoever has not completed 23 years of age; whoever has not been in any public function, nor paſſed the biennial office of a commiſſary in the orderly commiſſion; thoſe that are not exempted by law from obligations of *ſcarta bellatus*, which ſubjects all newly nobilitated perſons to certain civil reſtrictions until the next generation; and, laſtly, all thoſe againſt whom may be objected a decree *in contumaciam* in a civil cauſe; are not eligible.

144
Inſtructions to the nuncios,

During the buſineſs of election, the preſident who opened the meeting, with the reſt of the committee, except thoſe who are aſſeſſors, ſhall prepare inſtructions for procedure; and in regard to the propoſitions ſent by the king and the council of inſpection, theſe inſtructions ſhall be worded thus: "Our nuncios ſhall vote *affirmative* to the article *N*;" or, "Our nuncios ſhall vote *negative* to the article *N*," in caſe it is found contrary to the opinion of the dietine: and ſhould any amendment or addition be deemed neceſſary and agreed on, it may be inſerted in the inſtructions at the end of the relative propoſition.

145
Who are accountable to their conſtituents,

At the meeting of the dietines, after the diet has ſat, the nuncios are bound to appear before their conſtituents, and to bring their report of the whole proceedings of that aſſembly; firſt, reſpecting the acts of legiſlature; next, with reſpect to the particular projects of their palatinate or diſtrict recommended to them by the inſtructions.

It is at theſe dietines that nuncios, after they have rendered to their conſtituents a clear account of their proceedings and of the diet, may be either confirmed or changed, and new ones elected in their ſtead till the general election for the following ordinary diet.

New nuncios are choſen, 1. In the room of the deceaſed. 2. In the room of thoſe that are become ſenators or miniſters of ſtate. 3. In caſe of reſignation. 4. In the room of ſuch as are diſqualified by the diet. 5. When any of the aſſembly deſires a new election, to ſubſtitute another nuncio in the room of one expreſsly pointed out; which requeſt muſt be made in writing, ſigned by 12 members beſides, and be delivered to the marſhal of the dietine. In this laſt caſe, the marſhal is to read the name of the nuncio objected to, and to make the following propoſition: "Shall the nuncio *N* be confirmed in his function? or, Shall there be a new election made in his ſtead?" The opinion of the meeting being taken by a diviſion, the majority ſhall decide the queſtion, and be declared by the marſhal. If the majority approves the conduct of the nuncio, the marſhal and the aſſeſſors ſhall certify this confirmation on the diploma; and in caſe of diſapprobation, the marſhal ſhall declare the vacancy, and begin the form of a new election.

146
This conſtitution, though ſuperior to the former, proteſted againſt by ſome corrupt nobles,

Such are the outlines of the Poliſh conſtitution eſtabliſhed by the king and the confederates in 1791. It will not bear a compariſon with that under which we have the happineſs to live; but it is ſurely infinitely ſuperior to that motly form of government which for a century paſt, has rendered Poland a perpetual ſcene of war, tumult, tyranny, and rebellion. Many of the corrupt nobles, however, perceiving that it would curb their ambition, deprive them of the baſe means which they had long enjoyed of gratifying their avarice by ſetting the crown to ſale, and render it impoſſible for them to continue with impunity their tyrannical oppreſſion of the peaſants, proteſted againſt it, and withdrew from the confederates. This was nothing more than what might have been expected, or than what the king and his friends undoubtedly did expect. But the malcontents were not ſatisfied with a ſimple proteſt; they preferred their complaints to the empreſs of Ruſſia, 147 And oppoſed by the Ruſſians.

ſia, who, ready on all occaſions, and on the ſlighteſt pretence, to invade Poland, poured her armies into the republic, and ſurrounding the king and the diet with ferocious ſoldiers, compelled them, by the moſt furious and indecent menaces, to undo their glorious labour of love, and to reſtore the conſtitution as ſettled after the partition treaty.

Of the progreſs of the Ruſſians in this work of darkneſs, our readers will be pleaſed with the following manly and indignant narrative, taken from a periodical work * of acknowledged merit.

“It was on the 21ſt of April 1792, that the diet received the firſt notification from the king, of the inimical and unjuſt intentions of Ruſſia. He informed them that, without the ſhadow of pretence, this avowed enemy of the rights of mankind had determined to invade the territory of the republic with an army of 60,000 men. This formidable banditti, commanded by generals Soltikow, Michelſon, and Koſakowſki, was afterwards to be ſupported by a corps of 20,000 and by the troops then acting in Moldavia, amounting to 70,000. The king, however, profeſſed that he was not diſcouraged, and declared his readineſs to put himſelf at the head of the national troops, and to terminate his exiſtence in a glorious conteſt for the liberties of his country. Then, and not before, the diet decreed the organization of the army, and its augmentation to 100,000. The king and the council of inſpection were inveſted with unlimited authority in every thing that regarded the defence of the kingdom. Magazines were ordered to be conſtructed when it was too late, and quarters to be provided for the army.

148 The nation riſes to maintain its independence.

“The diet and the nation roſe as one man to maintain their independence. All private animoſities were obliterated, all private intereſts were ſacrificed; the greateſt encouragements were held forth to volunteers to enroll themſelves under the national ſtandard, and it was unanimouſly decreed by the diet, that all private loſſes ſhould be compenſated out of the public treaſury.

“On the 18th of May, the Ruſſian ambaſſador delivered a declaration, which was worthy of ſuch a cauſe. It was a tiſſue of falſehood and hypocriſy. It aſſerted, that this wanton invaſion, which was evidently againſt the ſenſe of almoſt every individual Polander, was meant entirely for the *good* of the republic. It cenſured the precipitancy with which the new conſtitution was adopted, and aſcribed the ready conſent of the diet to the influence of the Warſaw mob. It repreſented the conſtitution as a violation of the principles on which the Poliſh republic was founded—complained of the licentiouſneſs with which the *ſacred name of the empreſs* was treated in ſome ſpeeches of the members; and concluded by profeſſing, that on theſe accounts, and in behalf of the emigrant Poles, her imperial majeſty had ordered her troops to enter the territories of the republic.

149 Spirit of the nobility.

“At the moment this declaration was delivered to the diet, the Ruſſian troops, accompanied by counts Potocki, Rzewuſki, Branicki, and a few Poliſh apoſtates, appeared upon the frontiers, and entered the territories of the republic in ſeveral columns, before the cloſe of the month. The ſpirit manifeſted by the nobility was truly honourable. Some of them delivered in their plate to the mint. Prince Radzvil engaged voluntarily to furniſh 10,000 ſtand of arms, and another a train of artillery. The courage of the new and haſtily embodied ſoldiers correſponded with the patriotiſm of their nobles. Prince Poniatowſki, nephew to the king, was appointed commander in chief; and though his force was greatly inferior to the enemy, it muſt be confeſſed that he made a noble ſtand. On the 24th of May, the enemy's Coſſacks were repulſed, and purſued by the patroles of the republic to the very entrenchments. On the 26th, about one o'clock, the piquets of the republic diſcovered a large body of Don Coſſacks approaching the outpoſts; and a ſquadron of cavalry, commanded by Lieutenant Kwaſniewſki, ſupported by Lieutenant Golejowſki with two ſquadrons more, in all about 300, marched out to meet them. They attacked the Coſſacks with ſucceſs, but purſued them with more valour than prudence to the ſide of a wood, where they found themſelves drawn into an ambuſcade, and ſurrounded by 2000 horſe, two battalions of chaſſeurs, and ſix pieces of cannon. The intrepid Poles bravely fought their way through the Ruſſian line, and killed upwards of 200 of the enemy. The Poles in this engagement loſt 100 men and two officers; one of whom, Lieutenant Kwaſniewſki, was wounded and made priſoner. The remainder of the detachment reached their quarters in ſafety.

150 Conduct of the court of Berlin.

“Perhaps the hiſtory of man can ſcarcely furniſh an inſtance of perfidy, meanneſs, and duplicity, equal to that which was manifeſted by Pruſſia on this occaſion. By the treaty of defenſive alliance, ſolemnly contracted between the republic of Poland and the king of Pruſſia, and ratified on the 23d of April 1790, it is expreſsly ſtipulated, ‘That the contracting parties ſhall do all in their power to gurantee and preſerve to each other reciprocally the whole of the territories which they reſpectively poſſeſs: That, in caſe of menace or invaſion from any foreign power, they ſhall aſſiſt each other with *their whole force*, if neceſſary:’—and by the ſixth article, it is further ſtipulated, ‘that if any foreign power whatever ſhall preſume to interfere in the internal affairs of Poland, his Pruſſian majeſty ſhall conſider this as a caſe falling within the meaning of the alliance, and ſhall aſſiſt the republic according to the tenor of the fourth article,” that is, with his *whole force*. What then is the pretext for abandoning this treaty? It is, that the *empreſs of Ruſſia has ſhown a decided oppoſition to the order of things eſtabliſhed in Poland on the third of May* 1791, *and is provoked by Poland preſuming to put herſelf into a poſture to defend it.*—It is known, however, by the moſt authentic documents, that nothing, was effected on the third of May 1791, to which Pruſſia had not previouſly aſſented, and which ſhe did not afterwards ſanction; and that Pruſſia, according to the aſſertion of her own king, did not intimate a ſingle doubt reſpecting the revolution till one month (and according to the Pruſſian miniſter till ſix months) after it had taken place; in ſhort, to uſe the monarch's own words as fully explanatory of his double politics, “not till the *general tranquillity of Europe* permitted him to explain himſelf.”——Inſtead, therefore, of aſſiſting Poland, Pruſſia inſultingly recommended to Poland to retrace her ſteps; in which caſe, ſhe ſaid that ſhe would be ready to *attempt an accommodation* in her favour. This attempt was never made, and probably never intended; for the empreſs purſued her meaſures.

The duchy of Lithuania was the great ſcene of action in the beginning of the war; but the Ruſſians had made little

---

* New Annual Regiſter, 1792.

151 War with Ruſſia.

little progreſs before the middle of the month of June. On the 10th of that month, General Judycki, who commanded a detachment of the Poliſh troops, between Mire and Swierzna, was attacked by the Ruſſians; but, after a combat of ſome hours, he obliged them to retire with the loſs of 500 men dead on the field.—The general was deſirous of profiting by this advantage, by purſuing the enemy, but was prevented by a moſt violent fall of rain. On the ſucceeding day, the Ruſſians rallied again to the attack; and it then too fatally appeared, that the Poles were too young and undiſciplined to contend with an inferior force againſt experienced troops and able generals. By a maſterly manœuvre, the Ruſſians contrived to ſurround their antagoniſts, at a moment when the Poliſh general ſuppoſed that he had obliged the enemy to retreat; and though the field was conteſted with the utmoſt valour by the troops of the republic, they were at length compelled to give way, and to retire towards Nieſwieſz.

On the 14th another engagement took place near Lubar on the banks of the river Sluez, between a detachment of the Ruſſian grand army and a party of Poliſh cavalry, diſpatched by Prince Joſeph Poniatowſki, to intercept the enemy. The patriotic bravery of the Poles was victorious in this conteſt; but upon reconnoitering the force of the enemy, the prince found himſelf incapable of making a ſucceſsful ſtand againſt ſuch ſuperior numbers. He therefore gave orders to ſtrike the camp at Lubar, and commenced a precipitate retreat. During their march, the Poliſh rear was harraſſed by a body of 4000 Ruſſians, till arriving at Boruſkowee, the wooden bridge unfortunately gave way, under the weight of the cavalry. The enemy, in the mean time, brought their artillery to play upon the rear of the fugitives, who loſt upwards of 250 men. The Poliſh army next directed its courſe toward Zielime, where meeting, on the 17th, with a reinforcement from Zaſlow, it halted to give battle to the enemy. The Ruſſians were upwards of 17,000 ſtrong, with 24 pieces of cannon, and the force of the republic much inferior. After a furious conteſt from ſeven in the morning till five in the afternoon, the Ruſſians were at length obliged to retreat, and leave the field of battle in poſſeſſion of the patriots. The Ruſſians were computed to have loſt 4000 men in this engagement, and the Poles about 1100.

Notwithſtanding theſe exertions, the Poles were obliged gradually to retire before their numerous and diſciplined enemies. Nieſwez, Wilna, Minſk, and ſeveral other places of leſs conſequence, fell into their hands one after another. On a truce being propoſed to the Ruſſian general Kochowſki, the propoſal was haughtily rejected; while the deſertion of vice brigadier Rudnicki and ſome others, who preferred diſhonour to perſonal danger, proclaimed a tottering cauſe. The progreſs of the armies of Catharine was marked with devaſtation and cruelty, while, ſuch was the averſion of the people both to the cauſe and the manner of conducting it, that, as they approached, the country all around became a wilderneſs, and ſcarcely a human being was to be ſeen.

In the mean time, a ſeries of little defeats, to which the inexperience of the commanders, and the intemperate valour of new raiſed troops, appear to have greatly contributed, ſerved at once to diſtreſs and to diſpirit theſe defenders of their country. Prince Poniatowſki continued to retreat, and on the 17th of July, his rear being attacked by a very ſuperior force, it ſuffered a conſiderable loſs, though the ſkill and courage of General Koſciuſko enabled him to make a moſt reſpectable defence. On the 18th, a general engagement took place between the two armies. The Ruſſian line extended oppoſite Dubienka, along the river Bog, as far as Opalin. The principal column, conſiſting of 14,000 men, was chiefly directed againſt the diviſion of General Koſciuſko, which conſiſted of 5000 men only. After a moſt vigorous reſiſtance, in which the Ruſſians loſt upwards of 4000 men, and the troops of the republic only ſome hundreds, the latter was compelled to give way before the ſuperior numbers of the enemy, and to retire further into the country.

152 The king propoſes ſubmiſſion.

This unequal conteſt was at laſt prematurely terminated. The king, whoſe benevolent intentions were, perhaps, overpowered by his mental imbecillity, and whoſe age and infirmities, probably, rendered him unequal to the difficulties and dangers which muſt attend a protracted war, inſtead of putting himſelf, according to his firſt reſolve, at the head of his army, determined, at once, to ſurrender at diſcretion. On the 23d of July, he ſummoned a council of all the deputies at that moment in Warſaw. He laid before them the laſt diſpatches from the empreſs, which inſiſted upon total and unreſerved ſubmiſſion. He pointed out the danger of a diſmemberment of the republic, ſhould they delay to throw themſelves upon the clemency of the empreſs, and to intreat her protection. He mentioned the fatal union of Auſtria and Pruſſia with Ruſſia; and the diſgraceful ſupineneſs maniſeſted by every other court in Europe.

Four citizens, the intrepid and patriotic Malachowſki, the princes Sapieha, Radzvil, and Soltan, vehemently proteſted againſt theſe daſtardly proceedings; and the following evening a company of gentlemen from the different provinces aſſembled for the ſame purpoſe. The aſſembly waited immediately on theſe four diſtinguiſhed patriots, and returned them their acknowledgements for the ſpirit and firmneſs with which they had reſiſted the uſurpations of deſpotiſm. The ſubmiſſion of the king to the deſigns of Ruſſia was no ſooner made known, than Poland was bereft of all her beſt and moſt reſpectable citizens. Malachowſki as marſhal of the diet, and Prince Sapieha grand marſhal of Lithuania, entered ſtrong proteſts on the journals of the diet againſt theſe hoſtile proceedings, and declared ſolemnly that the diet legally aſſembled in 1788 was not diſſolved.

153 Confederation at Warſaw overawed by Ruſſia, reſtores the former conſtitution.

On the ſecond of Auguſt a confederation was formed at Warſaw, of which the grand apoſtate, Potocki, was choſen Marſhall. The acts of this confederation were evidently the deſpotic dictates of Ruſſia, and were calculated only to reſtore the ancient abuſes, and to place the country under the aggravated oppreſſion of a foreign yoke.

It is remarkable, that at the very moment when Poland was ſurrendering its liberties to its deſpotic invaders, the generous ſympathy of Great Britain was evinced, by a liberal ſubſcription, ſupported by all the moſt reſpectable characters in the nation, of every party and of every ſect, for the purpoſe of aſſiſting the king and the republic to maintain their independence. Though the benevolent deſign was fruſtrated, the fact remains on record as a noble teſtimony of the ſpirit of Britons in the cauſe of freedom, of the indignation which fills every liberal heart at the commiſſion of injuſtice, and of the liberality with which they are diſpoſed to aſſiſt thoſe who ſuffer from the oppreſſion of tyrants.

154 The empreſs ſeizes upon part of the Poliſh territory,

Not ſatisfied with reſtoring the old wretched conſtitution, the empreſs of Ruſſia ſeized upon part of the territory which, at the laſt partition, ſhe and her coadjutors had left to the republic; and her ambaſſador entering into the diet with a crowd of armed ruffians, compelled the king and that aſſembly to grant the form of legality to her uſurpations. The nation, however, did not ſubmit. General Koſciuſko kept together a few retainers, whom he was ſoon enabled to augment to the number of an army; and ſeizing on the perſon of the king, he has ever ſince waged againſt Ruſſia a war, of which, it muſt be confeſſed, the object is doubtful. His enemies accuſe him of cheriſhing in the republic the principles of the French Jacobins; and ſome late occurrences give a countenance to the accuſation. Yet it is known he proteſted at firſt that his aim reached no farther than to reſtore the conſtitution of 1791; and if public report may be credited, an inſurrection has lately taken place in Great Poland, or ſouth Pruſſia, in favour of that conſtitution. If other Poles have been driven to democracy, they have only, with the common weakneſs of human nature, run from one extreme to another; and in flying from the tyranny of their invaders, have fallen into the horrors of anarchy. That Koſciuſko will ſucceed againſt the powerful empire of Ruſſia, there is not the ſmalleſt probability: and if there were, the court of Berlin, to complete its character, has withdrawn from the moſt honourable alliance in which it was ever engaged, and ſeems to have employed the ſubſidy which it received from Great Britain for the maintenance of that alliance, to co-operate with the empreſs in annihilating the kingdom and republic of Poland. What will be the ultimate fate of that unhappy country, and its amiable ſovereign, it is impoſſible to ſay; but appearances at preſent indicate a diviſion of the whole territory among the three hoſtile powers who formerly robbed it of ſome of its moſt valuable provinces; and when that diviſion is made, the virtuous Staniſlaus may be removed to a better world by the dagger, by the bowl, by the gripe of a giant, or by a red-hot ſpit!

155 Deplorable ſtate of the country.

156 Air, climate, &c. of Poland.

The air of this kingdom is cold in the north, but temperate in the other parts both in ſummer and winter, and the weather in both more ſettled than in many other countries. The face of the country is for the moſt part level, and the hills are but few. The Crapack or Carpathian mountains ſeparate it from Hungary on the ſouth. The ſoil is very fruitful both in corn and paſturage, hemp and flax. Such is the luxuriance of the paſtures in Podolia, that it is ſaid one can hardly ſee the cattle that are grazing in the meadows. Vaſt quantities of corn are yearly ſent down the Viſtula to Dantzic from all parts of Poland, and bought up chiefly by the Dutch. The eaſtern part of the country is full of woods, foreſts, lakes, marſhes, and rivers; of the laſt of which, the moſt conſiderable in Poland are, the Viſtula, Nieper, Nieſter, Duna, Bog, Warta, and Memel. The metals found in this country are iron and lead, with ſome tin, gold, and ſilver; but there are no mines of the two laſt wrought at preſent. The other products of Poland are moſt ſorts of precious ſtones, ochre of all kinds, fine rock-cryſtal; Muſcovy glaſs, talc, alum, ſaltpetre, amber, pitcoal, quickſilver, ſpar, ſal gem, lapis calaminaris, and vitriol. In Leſſer Poland are ſalt-mines, which are the chief riches of the country, and bring moſt money into the exchequer. In the woods, which conſiſt moſtly of oak, beech, pine, and fir-trees, beſides the more common wild beaſts, are elks, wild aſſes, wild oxen or uri, lynxes, wild horſes, wild ſheep with one horn, biſons, hyænas, wild goats, and buffaloes. In the meadows and fenny ground is gathered a kind of manna; and the kermes-berries produced in Britain are uſed both in dying and medicine.

157 Different claſſes of inhabitants.

The inhabitants conſiſt of nobles, citizens, and peaſants. The firſt poſſeſs great privileges, which they enjoy partly by the indulgence of their kings, and partly by ancient cuſtom and preſcription. Some of them have the title of *prince*, *count*, or *baron*; but no ſuperiority or pre-eminence on that account over the reſt, which is only to be obtained by ſome public poſt or dignity. They have the power of life and death over their vaſſals; pay no taxes; are ſubject to none but the king; have a right to all mines and ſalt-works on their eſtates; to all offices and employments, civil, military, and eccleſiaſtic; cannot be cited or tried out of the kingdom; may chooſe whom they will for their king, and lay him under what reſtraints they pleaſe by the Pacta Conventa; and none but they and the burghers of ſome particular towns can purchaſe lands. In ſhort, they are almoſt entirely independent, enjoying many other privileges and prerogatives beſides thoſe we have ſpecified; but if they engage in trade, they forfeit their nobility.

158 Language.

The Poliſh tongue is a dialect of the Sclavonic: (ſee PHILOLOGY, n° 222.). It is neither copious nor harmonious. Many of the words, as they are written, have not a ſingle vowel in them; but the High Dutch and Latin are underſtood and ſpoken pretty commonly, though incorrectly. The language in Lithuania differs much from that of the other provinces. True learning, and the ſtudy of the arts and ſciences, have been little attended to in Poland, till of late they began to be regarded with a more favourable eye, and to be not only patronized, but cultivated by ſeveral of the nobles and others, both laymen and eccleſiaſtics.

159 Archbiſhoprics, &c.

There are two archbiſhops in the kingdom, viz. thoſe of Gneſna and Laopol, and about a dozen biſhops. The archbiſhop of Gneſna is always a cardinal, and primate of the kingdom. The prevailing religion is Popery, but there are great numbers of Lutherans, Calviniſts, and Greeks, who are called *Diſſidents*, and by the laws of the kingdom were intitled to toleration; but were much oppreſſed till very lately. The Jews are indulged with great privileges, and are very numerous in Poland; and in Lithuania, it is ſaid there are a multitude of Mahometan Tartars. We may judge of the numbers of Jews in this country by the produce of their annual poll-tax, which amounts to near 57,000 rixdollars.

160 Manufactures.

There are few or no manufactures in the kingdom; if we except ſome linen and woollen clothes and hardwares; and the whole trade is confined to the city of Dantzic, and other towns on the Viſtula or Baltic.

161 Revenue.

Before the preſent troubles the king's revenue was all clear to himſelf; for he paid no troops, not even his own guards; but all the forces, as well as the officers of ſtate, were paid by the republic. The public revenues aroſe chiefly from the crown-lands, the ſalt-mines in the palatinate of Cracow, from the rents of Marienburg, Dirſhau, and Regenhus, from the government of Cracow, and diſtrict of Niepolomiez, and from ancient tolls and cuſtoms, particularly thoſe of Elbing and Dantzic. From what ſources thoſe revenues now ariſe, it is difficult to ſay; but Pruſſia has got poſſeſſion of the moſt lucrative cuſtoms.

162 Order of knighthood. The order of the White Eagle was inſtituted by Auguſtus II. in the year 1705. Its enſign is a croſs of gold enamelled with red, and appendant to a blue ribbon. The motto, *Pro fide, rege, et lege*.

163 Forces. The ſtanding forces of Poland are divided into the crown-army, and that of Lithuania, conſiſting of horſe and foot, and amounting to between 20,000 and 30,000 men. Theſe troops are moſtly cantoned on the crown-lands, and in Poland are paid by a capitation or poll-tax; but in Lithuania other taxes are levied for this purpoſe. Moſt of the foot are Germans. On any ſudden and imminent danger, the whole body of the nobility, with their vaſſals, are obliged to appear in the field on horſeback; and the cities and towns furniſh a certain number of foot-ſoldiers, with carriages, and military ſtores: but for want of proper arms, proviſions, ſubordination, and diſcipline, and by being at liberty after a few weeks to return home, this body has proved but of little advantage to the republic. Dantzic is the only place in the Poliſh dominions that deſerves the name of a fortreſs, and it is now in the poſſeſſion of Pruſſia. Foreign auxiliaries are not to be brought into the kingdom, nor the national troops to march out of it, without the conſent of the ſtates.

Such was the military eſtabliſhment of Poland before the partition treaty. What it has been ſince, and is at preſent, we cannot poſitively ſay.

164 Character of the people. The Poles are perſonable men, and have good complexions. They are eſteemed a brave, honeſt people, without diſſimulation, and exceedingly hoſpitable. They clothe themſelves in furs in winter, and over all they throw a ſhort cloak. No people keep grander equipages than the gentry. They look upon themſelves as ſo many ſovereign princes; and have their guards, bands of muſic, and keep open houſes: but the lower ſort of people are poor abject wretches, in the loweſt ſtate of ſlavery. The exerciſes of the gentry are hunting, riding, dancing, vaulting, &c. They reſide moſtly upon their eſtates in the country; and maintain themſelves and families by agriculture, breeding of bees, and grazing.

POLAR, in general, ſomething relating to the poles of the world, or poles of the artificial globes.

Polar Regions, thoſe parts of the world which lie near the north and ſouth poles. See the article POLE.

POLARITY, the quality of a thing conſidered as having poles, or a tendency to turn itſelf into one certain poſture; but chiefly uſed in ſpeaking of the magnet.

POLE (Reginald), cardinal, and archbiſhop of Canterbury, a younger ſon of Sir Rich. Pole, Lord Montague, was born at Stoverton caſtle, in Staffordſhire, in the year 1500. At ſeven years of age he was ſent to a Carthuſian monaſtery at Shene, near Richmond in Surry; and thence, when he was about 12 years old, removed to Magdalen college in Oxford, where, by the inſtructions of the celebrated Lineacre and Latimer, he made conſiderable progreſs in learning. In 1515 he took the degree of bachelor of arts, and was admitted to deacon's orders ſome time after: in 1517, he was made prebendary of Saliſbury, and in 1519 dean of Wimborne and dean of Exeter. We are not ſurprized at this young nobleman's early preferments, when we conſider him as the kinſman of Henry VIII. and that he was bred to the church by the king's ſpecial command.

Being now about the age of 19, he was ſent, according to the faſhion of the times, to finiſh his ſtudies at Padua in Italy, where he reſided ſome time in great ſplendor, having a handſome penſion from the king. He returned to England in 1525, where he was moſt graciouſly received at court, and univerſally admired for his talents and addreſs; but preferring ſtudy and ſequeſtration to the pleaſures of a court, he retired to the Carthuſian convent at Shene, where he had continued about two years, when the pious king began to divulge his ſcruples of conſcience concerning his marriage with Catharine of Spain. Pole foreſaw that this affair would neceſſarily involve him in difficulties; he therefore determined to quit the kingdom, and accordingly obtained leave to viſit Paris. Having thus avoided the ſtorm for the preſent, he returned once more to his convent at Shene; but his tranquillity was again interrupted by the king's reſolution to ſhake off the pope's ſupremacy, of which Pole's approbation was thought indiſpenſably neceſſary. How he managed in this affair, is not very clear. However, he obtained leave to reviſit Italy, and his penſion was continued for ſome time.

The king, having now divorced Queen Catharine, married Anne Boylen, and being reſolved to throw off the papal yoke, ordered Dr Richard Sampſon to write a book in juſtification of his proceedings, which he ſent to Pole for his opinion. To this Pole, ſecure in the pope's protection, wrote a ſcurrilous anſwer, entitled *Pro Unitate Eccleſiaſtica*, and ſent it to the king; who was ſo offended with the contents, that he withdrew his penſion, ſtripped him of all his preferments, and procured an act of attainder to be paſſed againſt him. In the mean time, Pole was created a cardinal, and ſent nuncio to different parts of Europe. King Henry made ſeveral attempts to have him ſecured and brought to England, but without effect. At lengh the pope fixed him as legate at Viterbo, where he continued till the year 1543, when he was appointed legate at the council of Trent, and was afterwards employed by the pope as his chief counſellor.

Pope Paul III. dying in 1549, Pole was twice elected his ſucceſſor, and we are told, twice refuſed the papal dignity: firſt, becauſe the election was made in too great haſte; and the ſecond time, becauſe it was done in the night. This delicacy in a cardinal is truly wonderful: but the intrigues of the French party ſeem to have been the real cauſe of his miſcarriage; they ſtarted many objections to Pole, and by that means gained time to procure a majority againſt him. Cardinal Maria de Monte obtained the triple crown; and Pole, having kiſſed his ſlipper, retired to the convent of Magazune near Verona, where he continued till the death of Edward VI. in the year 1553. On the acceſſion of queen Mary, Pole was ſent legate to England, where he was received by her majeſty with great veneration, and conducted to the archbiſhop's palace at Lambeth, poor Cranmer being at that time priſoner in the tower. He immediately appeared in the Houſe of Lords, where he made a long ſpeech; which being reported to the commons by their ſpeaker, both theſe obſequious houſes concurred in an humble ſupplication to be reconciled to the ſee of Rome. They preſented it on their knees to her majeſty, who interceded with the cardinal, and he graciouſly condeſcended to give them abſolution. This buſineſs being over, the legate made his public entry into London, and immediately ſet about the extirpation of hereſy. The day after the execution of Cranmer, which he is ſaid, though we believe falſely, to have adviſed, he was conſecrated archbiſhop of Canterbury. In the ſame year, 1556, he was elected chancellor of the univerſity of Oxford, and ſoon after of Cambridge; both which he viſited, by his commiſſioners. He died of a double quartan ague in the year 1558, about 16 hours after the death of the queen; and was buried in the cathedral of Canterbury.

As to his character, the Romiſh writers aſcribe to him every virtue under heaven: even Biſhop Burnet is extremely laviſh in his praiſe, and attributes the cruelties of Mary's reign to the advice of Gardiner. In this Mr Hume agrees with the biſhop, and, repreſents Pole as the advocate of toleration. By every impartial account, he ſeems to have been a man of mild manners, and of real worth, though undoubtedly a zealous member of the church of Rome.—He wrote, *Pro unitate eccleſiaſtica, De ejuſdem poteſtate*; A Treatiſe on Juſtification, and various other tracts.

Mr Philips publiſhed a very well written, though a very partial account, of Pole's life, to which Glouceſter Ridley replied. This laſt work, which is intitled a *Review of Mr Philips's Life of Reginald Pole*, was publiſhed in 1766. It is a complete confutation of the former, and is a very learned and temperate vindication of the doctrines of the Reformation.

Pole, in aſtronomy, that point in the heavens round which the whole ſphere ſeems to turn. It is alſo uſed for a point directly perpendicular to the centre of any circle's plane, and diſtant from it by the length of a radius.

Pole, in geography, one of the points on which the terraqueous globe turns; each of them being 90 degrees diſtant from the equator, and, in conſequence of their ſituation, the inclination of the earth's axis, and its paralleliſm during the annual motion of our globe round the ſun, having only one day and one night throughout the year.

1
The poles enjoy much light;

It is remarkable that though the *north* in Hebrew, Greek, Latin, and French, derives its name from gloom, obſcurity, and darkneſs, the poles enjoy more light than any other part of the world. The ancients believed the north to be covered with thick darkneſs; Strabo, tells us, that Homer, by the word σεφος, which properly ſignifies *obſcurity* or *darkneſs*, meant the *north*; and thus Tibullus, ſpeaking of the north, ſays,

> *Illic et denſa tellus abſconditur umbra.*
>
> Paneg. ad Miſſel.

The Arabians call the northern ocean the *dark ſea*; the Latins gave the name of *Aquilo* to the north wind, becauſe *aquilus* ſignifies *black*; and the French call it *la biſe*, from *bis* "black." According to the ancients, the Cimmerians lived in darkneſs, becauſe they were placed near the north. But all this is mere prejudice; for there are no places in the world that enjoy light longer than the arctic and antarctic poles; and this is accounted for by conſidering the nature of twilight. In the torrid zone, and under the line, night immediately follows the ſetting of the ſun, without any ſenſible twilight; whereas the twilight begins and continues increaſing in proportion as places are diſtant from the equator or approach the pole. To this long twilight we muſt add the *aurora borealis*, which appears in the northern regions, Greenland, &c. in clear nights, at the beginning of the new moon, caſting a light equal to that of full moon. See Gaſſendi *in the life of Peyreſc*, book iii. and La Perere in his *Account of Greenland*. There is alſo long moonlight at the poles during winter. See Astronomy, 373. But though there is really more light in the polar regions than elſewhere, yet owing to the obliquity with which the rays of the ſun fall upon them, and the great length of winter night, the cold is ſo intenſe, that thoſe parts of the globe which lie near the poles have never been fully explored, though the attempt has been repeatedly made by the moſt celebrated navigators. Indeed their attemps have chiefly been confined to the northern regions; for with regard to the ſouth pole, there is not the ſame incitement to attempt it. The great object for which navigators have ventured themſelves in theſe frozen ſeas, was to find out a more quick and more ready paſſage to the Eaſt Indies *; and this hath been attempted three ſeveral ways: one by coaſting along the northern parts of Europe and Aſia, called the *north-eaſt paſſage*; another, by ſailing round the northern part of the American continent, called the *north-weſt paſſage*; and the third, by ſailing directly over the pole itſelf.

2
And why.

We have already given a ſhort account of ſeveral unſucceſsful attempts which have been made from England to diſcover the firſt two of theſe. See *North-Weſt Paſſage*, and *North-Eaſt Paſſage*. But before we proceed to the third, we ſhall make a few further obſervations on them, and mention the attempts of ſome other nations.

3
Attempts to find out the north-eaſt paſſage.

During the laſt century, various navigators, Dutchmen particularly attempted to find out the *north-eaſt paſſage*, with great fortitude and perſeverance. They always found it impoſſible, however, to ſurmount the obſtacles which nature had thrown in the way. Subſequent attempts are thought by many to have demonſtrated the impoſſibility of ever ſailing eaſtward along the northern coaſt of Aſia; and this impoſſibility is accounted for by the increaſe of cold in proportion to the extent of land. See America, n° 3—5. This is indeed the caſe in temperate climates; but much more ſo in thoſe frozen regions where the influence of the ſun, even in ſummer, is but ſmall. Hence, as the continent of Aſia extends a vaſt way from weſt to eaſt, and has beſides the continent of Europe joined to it on the weſt, it follows, that about the middle part of that tract of land the cold ſhould be greater than anywhere elſe. Experience has determined this to be fact; and it now appears, that about the middle part of the northern coaſt of Aſia the ice never thaws; neither have even the hardy Ruſſians and Siberians themſelves been able to overcome the difficulties they met with in that part of their voyage. In order to make this the more plain and

4
Why it is impoſſible to ſail along the north-eaſt coaſt of Aſia.

[*] See Cook, p. 395. col. 2.

and the following accounts more intelligible, we ſhall obſerve, that from the north-weſtern extremity of Europe, called the *North Cape*, to the north-eaſtern extremity of Aſia, called the *Promontory of the Tſchutſki**, is a ſpace including about 160 degrees of longitude, *viz.* from 40 to 200 eaſt from Ferro: the port of Archangel lies in about 57 degrees eaſt longitude, Nova Zembla between 70 and 95; which laſt is alſo the ſituation of the mouth of the great river Oby. Still farther eaſtward are the mouths of the rivers Jeniſey in 100°; Piaſida in 105°; Chatanga in 124°; Lena, which has many mouths, between 134° and 142°; Indigirka in 162°; and the Kovyma in 175°. The coldeſt place in all this tract, therefore, ought to be that between the mouths of the Jeniſey and the Chatanga; and indeed here the unſurmountable difficulty has always been, as will appear from the following accounts of the voyages made by the Ruſſians with a view to diſcover the north-eaſt paſſage.

5 Voyage of Morzovieff, &c.

In 1734, lieutenant Morzovieff ſailed from Archangel towards the river Oby, but could ſcarce advance 20 degrees of longitude during that ſeaſon. The next ſummer he paſſed through the ſtraits of Weygatz into the ſea of Kara; but did not double the promontory which ſeparates the ſea of Kara from the bay or mouth of Oby. In 1738, the lieutenants Malgyin and Shurakoff doubled that promontory with great difficulty, and entered the bay of Oby. Several unſucceſsful attempts were made to paſs from the bay of Oby to the Jeniſey; which was at laſt effected, in 1738, by two veſſels commanded by lieutenants Offzin and Koſkeleff. The ſame year the pilot Feodor Menin ſailed eaſtward from the Jeniſey to the mouth of the Piaſida: but here he was ſtopped by the ice; and finding it impoſſible to force a paſſage, he returned to the Jeniſey.

6 Of Prontſhiſtcheff.

In July 1735, lieutenant Prontſhiſtcheff ſailed down the river Lena, in order to paſs by ſea to the mouth of the Jeniſey. The weſtern mouths of the Lena were ſo choaked up with ice, that he was obliged to paſs thro' the moſt eaſterly one; and was prevented by contrary winds from getting out till the 13th of Auguſt. Having ſteered north-weſt along the iſlands which lie ſcattered before the mouths of the Lena, he found himſelf in lat. 70. 4.; yet even here he ſaw pieces of ice from 24 to 60 feet in height, and in no place was there a free channel left of greater breadth than 100 or 200 yards. His veſſel being much damaged, he entered the mouth of the Olenek, a ſmall river near the weſtern mouth of the Lena; and here he continued till the enſuing ſeaſon, when he got out in the beginning of Auguſt. But before he could reach the mouth of the Chatanga, he was ſo entirely ſurrounded and hemmed in with ice, that it was with the utmoſt difficulty he could get looſe. Obſerving then a large field of ice ſtretched into the ſea, he was obliged to ſail up the Chatanga. Getting free once more, he proceeded northward, doubled the cape called *Taimura*, and reached the bay of that name, lying in about 115° eaſt from Ferro; from thence he attempted to proceed weſtward along the coaſt. Near the ſhore were ſeveral ſmall iſlands, between which and the ſhore the ice was immoveably fixed. He then directed his courſe towards the ſea, in order to paſs round the chain of iſlands. At firſt he found the ſea more free to the north of theſe iſlands, but obſerved much ice lying between them. At laſt he arrived at what he took to be the laſt of the iſlands, lying in lat. 77. 25. Between this iſland and the ſhore, as well as on the other ſide of the iſland which lay moſt to the north, the ice was firm and immoveable. He attempted, however, to ſteer ſtill more to the north; and having advanced about ſix miles, he was prevented by a thick fog from proceeding: this fog being diſperſed, he ſaw nothing everywhere but ice, which at laſt drove him eaſtward, and with much danger and difficulty he got to the mouth of the Olenek on the 29th of Auguſt.

7 Of Chariton Laptieff.

Another attempt to paſs by ſea from the Lena to the Jeniſey was made in 1739 by Chariton Laptieff, but with no better ſucceſs than that juſt mentioned. This voyager relates, that between the rivers Piaſida and Taimura, a promontory ſtretches into the ſea, which he could not double, the ſea being entirely frozen up before he could paſs round.

8 Mr Coxe's obſervations.

Beſides the Ruſſians, it is certain that ſome Engliſh and Dutch veſſels have paſſed the iſland of Nova Zembla into the ſea of Kara: "But (ſays Mr Coxe in his Account of the Ruſſian voyages) no veſſel of any nation has ever paſſed round that cape which extends to the north of the Piaſida, and is laid down in the Ruſſian charts in about 78° lat. We have already ſeen that no Ruſſian veſſel has ever got from the Piaſida to the Chatanga, or from the Chatanga to the Piaſida; and yet ſome authors have poſitively aſſerted that this promontory has been ſailed round. In order therefore to elude the Ruſſian accounts, which clearly aſſert the contrary, it is pretended that Gmelin and Muller have purpoſely concealed ſome parts of the Ruſſian journals, and have impoſed on the world by a miſrepreſentation of facts. But without entering into any diſpute upon this head, I can venture to affirm, that no ſufficient proof has been as yet advanced in ſupport of this aſſertion; and therefore, until ſome poſitive information ſhall be produced, we cannot deny plain facts, or give the preference to hearſay evidence over circumſtantial and well atteſted accounts."

9 Of the navigation from the Lena to Kamſchatka.

The other part of this north-eaſt paſſage, *viz.* from the Lena, to Kamſchatka, though ſufficiently difficult and dangerous, is yet practicable; as having been once performed, if we may believe the accounts of the Ruſſians. According to ſome authors indeed, ſays Mr Coxe, this navigation has been open a century and an half; and ſeveral veſſels at different times have paſſed round the north-eaſtern extremity of Aſia. But if we conſult the Ruſſian accounts, we ſhall find that frequent expeditions have been unqueſtionably made from the Lena to the Kovyma, but that the voyage from the Kovyma round Tſchutſkoi Noſs into the Eaſtern Ocean has been performed but once. According to Mr Muller, this formidable cape was doubled in the year 1648. The material incidents of this remarkable voyage are as follow.

10 Voyage of Deſhneff, Ankudinoff, &c.

"In 1648 ſeven kotches, or veſſels ſailed from the mouth of the river Kovyma, in order to penetrate into the Eaſtern Ocean. Of theſe, four were never more heard of: the remaining three were commanded by Simon Deſhneff, Geraſim Ankudinoff, and Fedot Alexeeff. Deſhneff and Ankudinoff quarrelled before their departure concerning the diviſion of profits and honours to be acquired by their voyage; which, however, was not ſo eaſily accompliſhed as they had imagined. Yet

---

* See Cook's Diſcoveries n°109, and 118.

Deſhneff in his memorials makes no mention of obſtructions from the ice, nor probably did he meet with any; for he takes notice that the ſea is not every year ſo free from ice as it was at that time. The veſſels ſailed from the Kovyma on the 20th of June, and in September they reached the promontory of the Tſchutſki, where Ankudinoff's veſſel was wrecked, and the crew diſtributed among the other two. Soon after this the two veſſels loſt ſight of each other, and never joined again. Deſhneff was driven about by tempeſtuous winds till October, when he was ſhipwrecked conſiderably to the ſouth of the Anadyr. Having at laſt reached that river, he formed a ſcheme of returning by the ſame way that he had come; but never made the attempt. As for Alexeeff, after being alſo ſhipwrecked, he had died of the ſcurvy, together with Ankudinoff; part of the crew were killed by the ſavages, and a few eſcaped to Kamſchatka, where they ſettled."

* See Cook's Diſcoveries, n° 95—100.

From Captain * Cook's voyage towards the north-eaſtern parts of Aſia, it appears, that it is poſſible to double the promontory of Tſchutſki without any great difficulty: and it now appears, that the continents of Aſia and America are ſeparated from one another but by a narrow ſtrait, which is free from ice; but, to the northwards, that experienced navigator was everywhere ſtopped by ice in the month of Auguſt, ſo that he could neither trace the American continent farther than to the latitude of 70°, nor reach the mouth of the river Kovyma on the Aſiatic continent; though it is probable that this might have been done at another time when the ſituation of the ice was altered either by winds or currents.

11 Inſurmountable obſtacles in the north-eaſt paſſage.

On the whole, therefore, it appears that the inſurmountable obſtacle in the north-eaſt paſſage lies between the rivers Piaſida and Chatanga; and unleſs there be in that ſpace a connection between the Aſiatic and American continents, there is not in any other part. Ice, however, is as effectual an obſtruction as land: and though the voyage were to be made by accident for once, it never could be eſteemed a paſſage calculated for the purpoſes of trade, or any other beneficial purpoſe whatever.

12 Of the north weſt paſſage.

With regard to the north-weſt paſſage, the ſame difficulties occur as in the other. Captain Cook's voyage has now aſſured us, that if there is any ſtrait which divides the continent of America into two, it muſt lie in a higher latitude than 70°, and conſequently be perpetually frozen up. If a north-weſt paſſage can be found then, it muſt be by ſailing round the whole American continent, inſtead of ſeeking a paſſage through it, which ſome have ſuppoſed to exiſt in the bottom of Baffin's Bay. But the extent of the American continent to the northward is yet unknown; and there is a poſſibility of its being joined to that part of Aſia between the Piaſida and Chatanga, which has never yet been circumnavigated*. It remains therefore to conſider, whether there is any poſſibility of attaining the wiſhed for paſſage by ſailing directly north, between the eaſtern and weſtern continents.

* See Cook's Diſcoveries, n° 11.

13 Barrington's arguments in favour of a poſſibility of reaching the pole.

Of the practicability of this method, the Honourable Daines Barrington is very confident, as appears by ſeveral tracts which he publiſhed in the years 1775 and 1776, in conſequence of the unſucceſsful attempts made by Captain Phipps, now Lord Mulgrave. See *North-Eaſt Paſſage*, p. 108. col. 1. top of the page.—In theſe tracts he inſtances a great number of navigators who have reached very high northern latitudes; nay, ſome who have been at the pole itſelf, or gone beyond it.—Theſe inſtances are, 1. One Captain Thomas Robertſon aſſured our author, that he had been in latitude 82½, that the ſea was open, and he was certain that he could have reached the latitude of 83°.—2. From the teſtimony of Captain Cheyne, who gave anſwers to certain queries drawn up by Mr Dalrymple concerning the polar ſeas, it appears that he had been in the latitude of 82°.—3. One Mr Watt informed our author, that when he was 17 years of age, at that time making his firſt voyage with Captain M'Callam, a bold and ſkilful navigator, who commanded a Scotch whale-fiſhing ſhip, as during the time that the whales are ſuppoſed to copulate no fiſhing can be carried on, the captain reſolved to employ that interval in attempting to reach the north pole. He accordingly proceeded without the leaſt obſtruction to 83½, when the ſea was not only open to the northward, but they had ſeen no ice for the laſt three degrees; but while he ſtill advanced, the mate complained that the compaſs was not ſteady, and the captain was obliged with reluctance to give over his attempt.—4. Dr Campbell, the continuator of Harris's voyages, informed Mr Barrington, that Dr Dallie, a native of Holland, being in his youth aboard a Dutch ſhip of war which at that time was uſually ſent to ſuperintend the Greenland fiſhery, the captain determined, like the Scotchman abovementioned, to make an attempt to reach the pole during the interval between the firſt and ſecond fiſheries. He penetrated, according to the beſt of Dr Campbell's recollection, as far as 88°; when the weather was warm, the ſea free from ice, and rolling like the bay of Biſcay. Dallie now preſſed the captain to proceed: but he anſwered, that he had already gone too far, and ſhould be blamed in Holland for neglecting his ſtation; upon which account he would ſuffer no journal to be kept, but returned as ſoon as poſſible to Spitſbergen.—5. In the year 1662-3, Mr Oldenburg, then ſecretary of the Royal Society, was ordered to regiſter a paper, entitled "Several inquiries concerning Greenland, anſwered by Mr Gray, who had viſited theſe parts." The 19th of theſe queries is the following: How near hath any one been known to approach the pole?—The anſwer is, "I once met upon the coaſt of Greenland a Hollander that ſwore he had been half a degree from the pole, ſhowing me his journal, which was alſo atteſted by his mate; where they had ſeen no ice or land, but all water."—6. In Captain Wood's account of a voyage in queſt of the north-eaſt paſſage, we have the following account of a Dutch ſhip which reached the latitude of 89°. "Captain Goulden, who had made above 30 voyages to Greenland, did relate to his majeſty, that being at Greenland ſome 20 years before, he was in company with two Hollanders to the eaſtward of Edge's iſland; and that the whales not appearing on the ſhore, the Hollanders were determined to go farther north[illegible]rd; and in a fortnight's time returned, and gave it out that they had ſailed into the latitude 89°, and that they did not meet with any ice, but a free and open ſea, and that there run a very hollow *grown* ſea like that of the Bay of Biſcay. Mr Goulden being not ſatisfied with the bare relation, they produced him four journals out of the two ſhips, which teſtified the ſame, and that they all agreed within four minutes."

minutes."—7. In the Philoſophical Tranſactions for 1675 we have the following paſſage: "For it is well known to all that ſail northward, that moſt of the northern coaſts are frozen up for many leagues, though in the open ſea it is not ſo, *no nor under the pole itſelf*, unleſs by accident." In which paſſage the having reached the pole is alluded to as a known fact, and as ſuch ſtated to the Royal Society.—8. Mr Miller, in his Gardener's Dictionary, mentions the voyage of one Captain Johnſon, who reached 88 degrees of latitude. Mr Barrington was at pains to find a full account of this voyage; but met only with the following paſſage in Buffon's Natural Hiſtory, which he takes to be a confirmation of it. "I have been aſſured by perſons of credit, that an Engliſh captain, whoſe name was Monſon, inſtead of ſeeking a paſſage to China between the northern countries, had directed his courſe to the pole, and had approached it within two degrees, where there was an open ſea, without any ice." Here he thinks that Mr Buffon has miſtaken Johnſon for Monſon.—9. A map of the northern hemiſphere, publiſhed at Berlin (under the direction of the Academy of Sciences and Belles Lettres), places a ſhip at the pole, as having arrived there according to the Dutch accounts.—10. Moxon, hydrographer to Charles II. gives an account of a Dutch ſhip having been two degrees beyond the pole, which was much relied on by Wood. This veſſel found the weather as warm there as at Amſterdam.

Beſides theſe, there are a great number of other teſtimonies of ſhips which have reached the lat. of 81, 82, 83, 84 (A), &c.; from all which our author concludes, that if the voyage is attempted at a proper time of the year, there would not be any great difficulty of reaching the pole. Thoſe vaſt pieces of ice which commonly obſtruct the navigators, he thinks, proceed from the mouths of the great Aſiatic rivers which run northward into the frozen ocean, and are driven eaſtward and weſtward by the currents. But though we ſhould ſuppoſe them to come directly from the pole, ſtill our author thinks that this affords an undeniable proof that the pole itſelf is free from ice; becauſe, when the pieces leave it, and come to the ſouthward, it is impoſſible that they can at the ſame time accumulate at the pole.

14 Why we cannot ſuppoſe the ſea all round the pole to be frozen.

The extreme cold of the winter air on the continents of Aſia and America has afforded room for ſuſpicion, that the pole itſelf, and for ſeveral degrees to the ſouthward of it, the ſea muſt be frozen to a vaſt depth in one ſolid cake of ice; but this Mr Barrington refutes from ſeveral conſiderations. In the firſt place, he ſays, that on ſuch a ſuppoſition, by the continual intenſity of the cold, and the accumulation of ſnow and frozen vapour, this cake of ice muſt have been increaſing in thickneſs ſince the creation, or at leaſt ſince the deluge; ſo that now it muſt be equal in height to the higheſt mountains in the world, and be viſible at a great diſtance. Beſides, the pieces broken off from the ſides of ſuch an immenſe mountain muſt be much thicker than any ice that is met with in the northern ocean; none of which is above two yards in height above the ſurface of the water, thoſe immenſe pieces called *ice-mountains* being always formed on land.

Again, the ſyſtem of nature is ſo formed, that all parts of the earth are expoſed for the ſame length of time, or nearly ſo, throughout the year to the rays of the ſun. But, by reaſon of the ſpheroidal figure of the terraqueous globe, the poles and polar regions enjoy the ſun ſomewhat longer than others; and hence the Dutch who wintered in Nova Zembla in 1672 ſaw the ſun a fortnight ſooner than they ought to have done by aſtronomical calculations. By reaſon of this flatneſs about the poles, too, the ſun not only ſhines for a greater ſpace of time on theſe inhoſpitable regions, but with leſs obliquity in the ſummer-time, and hence the effect of his rays muſt be the greater. Now Mr Barrington conſiders it is an abſurd ſuppoſition, that this glorious luminary ſhould ſhine for ſix months on a cake of barren ice where there is neither animal nor vegetable. He ſays that the polar ſeas are aſſigned by nature as the habitation of the whales, the largeſt animals in the creation; but if the greateſt part of the polar ſeas are for ever covered with an impenetrable cake of ice, theſe huge animals will be confined within very narrow bounds; for they cannot ſubſiſt without frequently coming to the top of the water to breathe.

15 Quantity of ice formed is not always in proportion to the degree of cold.

Laſtly, the quantity of water frozen by different degrees of cold is by no means directly in proportion to the

---

(A) See *M. Bauche's Obſervations on the North or Ice Sea*, where he gives an account of various attempts made to reach the pole, from which he is convinced that the ſea is there open, and that the thing is practicable. M. de Pages, in his *Travels*, Vol. III. informs us, that he wiſhed to take a voyage to the north ſeas, for the purpoſe of bringing under one view the various obſtacles from the ice, which have impeded the reſearches of navigators in thoſe ſeas; and for this purpoſe he was prepared to continue his voyage to as high a latitude as poſſible, and that he might be able to ſay whether any land actually exiſts north from the coaſt of Greenland. He ſailed without any encouragement from his court (France) on the 16th of April 1776 from the Texel, in a Dutch veſſel bound to Spitſbergen. On the 16th of May ſhe was a little way north of 81°, the higheſt latitude ſhe reached.

"Being now (ſays the author) leſs than 180 leagues from the pole, the idea of ſo ſmall a diſtance ſerved effectually to awaken my curioſity. Had I been able to inſpire my fellow-voyagers with ſentiments ſimilar to my own, the winds and currents which at this moment carried us faſt towards the pole, a region hitherto deemed innacceſſible to the eye of mortals, would have been ſaluted with acclamations of joy. This quarter, however, is not the moſt eligible for ſuch an enterprize: here the ſea lying in the vicinity of thoſe banks of ice, ſo frequent a little farther to the weſt, is much too confined. Neverthele ſs, when I conſider the very changeable nature of the ſhoals under whatever form, even in their moſt crowded and compact ſtate; their conſtant changes and concuſſions which break and detach them from one another, and the various expedients that may be employed for freeing the ſhip from confinement, as well as for obviating impending danger—I am far from viewing a voyage to the pole as a chimerical idea."

the intenſity of the cold, but likewiſe to the duration of it. Thus, large bodies of water are never frozen in any temperature of ſhort duration, though ſhallow bodies often are. Our author obſerves, that as much of a given maſs of water was frozen in five hours of a temperature 12° below the freezing point, as was frozen in one hour of the temperature 50° below it; and that long duration of the temperature between 20 and 32 is, with regard to the congelation of water, equivalent to intenſity of cold ſuch as is marked 0 and below 0 in Fahrenheit, but of ſhort duration. See COLD and CONGELATION.

16
Mr Forſter's arguments againſt the poſſibility of reaching the pole,

On the other hand, Mr Forſter, in his Obſervations, takes the contrary ſide of the queſtion with no little vehemence. "I know (ſays he) that M. de Buffon, Lomonoſof, and Crantz, were of opinion, that the ice found in the ocean is formed near the lands only from the freſh water and ice carried down into the ſea by the many rivers in Siberia, Hudſon's Bay, &c.; and therefore, when we fell in with ſuch quantities of ice in December 1772, I expected we ſhould ſoon meet with the land from whence theſe ice maſſes had been detached. But being diſappointed in the diſcovery of this land, though we penetrated beyond the 67° twice, and once beyond 71°, ſouth latitude, and having beſides ſome other doubts concerning the exiſtence of the pretended ſouthern continent, I thought it neceſſary to inquire what reaſons chiefly induced the above authors to form the opinion that the ice floating in the ocean muſt be formed near land, or that an auſtral land is abſolutely requiſite for that purpoſe; and having looked for their arguments, I find they amount chiefly to this: 'That the ice floating in the ocean is all freſh: that ſalt water does not freeze at all; or if it does, it contains briny particles. They infer from thence, that the ice in the ocean cannot be formed in the ſea far from any land, there muſt therefore exiſt auſtral lands; becauſe, in order to form an idea of the original of the great ice-maſſes agreeably to what is obſerved in the northern hemiſphere, they find that the firſt point for fixing the high ice-iſlands is the land; and, ſecondly, that the great quantity of flat ice is brought down the rivers.' I have impartially and carefully conſidered and examined theſe arguments, and compared every circumſtance with what we ſaw in the high ſouthern latitude, and with other known facts; and will here inſert the reſult of all my inquiries on this ſubject.

"Firſt, they obſerve the ice floating in the ocean to yield, by melting, freſh water: which I believe to be true. However, hitherto it has by no means been generally allowed to be freſh: for Crantz ſays expreſsly, that 'the flat pieces (forming what they call the *ice-fields*) are ſalt, becauſe they were congealed from ſea-water.' The ice taken up by us for watering the ſhip was of all kinds, and nevertheleſs we found it conſtantly freſh: Which proves, either that the principle of analogy cannot be applied indiſcriminately in both hemiſpheres; and that one thing may be true in the northern hemiſphere which is quite otherwiſe in the ſouthern, from reaſons not yet known or diſcovered by us; or we muſt think that Crantz and others are miſtaken, who ſuppoſe the ice floating in the ocean to be ſalt.

"The next remark is, That ſalt water does not freeze at all; or if it does, it contains briny particles. M. de Buffon tells us, 'that the ſea between Nova Zembla and Spitzbergen, under the 79° north latitude, does not freeze, as it is there conſiderably broad; and that it is not to be apprehended to find the ſea frozen not even under the pole itſelf; for inded there is no example of having ever found a ſea wholly frozen over, and at a conſiderable diſtance from the ſhores; that the only inſtance of a ſea entirely frozen is that of the Black Sea, which is narrow and not very ſalt, and receives a great many rivers coming from northern regions, and bringing down ice that this ſea therefore ſometimes freezes to ſuch a degree, that its whole ſurface is congealed to a conſiderable thickneſs; and, if the hiſtorians are to be credited, was frozen, in the reign of the emperor Conſtantine Copronymus, 30 ells thick, not including 20 ells of ſnow which was lying on the ice. This fact, continues M. de Buffon, ſeems to be exaggerated: but it is true, however, that it freezes almoſt every winter; whilſt the high ſeas which are 1000 leagues nearer towards the pole do not freeze; which can have no other cauſe than the difference in ſaltneſs, and the little quantity of ice carried out by rivers, if compared to the enormous quantity of ice which the rivers convey into the Black Sea.' M. de Buffon is not miſtaken when he mentions that the Black Sea frequently freezes. Strabo informs us, that the people near the Boſphorus Cimmerius paſs this ſea in carts from Panticapæum to Phanagorea; and that Neoptolemus, a general of Mithridates Eupator, won a battle with his cavalry on the ice on the very ſpot where he gained a naval victory in the ſummer. Marcellinus Comes relates, that under the conſulſhip of Vincentius and Fravita, in the year 401 after Chriſt, the whole ſurface of the Pontus was covered with ice, and that the ice in ſpring was carried through the Propontis, during 30 days, like mountains. Zonaras mentions the ſea between Conſtantinople and Scutari frozen to ſuch a degree in the reign of Conſtantine Copronymus, that even loaded carts paſſed over it. The prince Demetrius Cantemir obſerves, that in the year 1620-1 there happened ſo intenſe a froſt, that the people walked over the ice from Conſtantinople to Iſkodar. All theſe inſtances confirm M. de Buffon's aſſertion. But as this great natural hiſtorian ſays that the Black Sea is the only inſtance of a ſea being entirely frozen (B), I muſt beg leave to diſſent from him; for it is equally well atteſted that the Baltic is ſometimes entirely frozen, according to Caſpar Schutz's account. In the year 1426, the winter was ſo ſevere, that people travelled over the ice acroſs the Baltic from Dantzic to Lubeck; and the ſea was likewiſe paſſable from Denmark to Mecklenburgh: and in the year 1459 the whole Baltic was entirely frozen, ſo that perſons travelled, both on foot and on horſeback, over

---

(B) In the year 860 the Mediterranean was covered with ice, ſo that people travelled in carts and horſes acroſs the Ionian Sea to Venice; (*Hermannus Contractus ap. Piſtor. Script.* t. ii. p. 236.) And in 1234 the Mediterranean was again thus frozen, that the Venetian merchants travelled over the ice with their merchandiſe to what place they choſe; *Matth. Paris*, p. 78.

over ice from Denmark to the Vendick Hans-towns, called *Lubeck*, *Wiſmar*, *Roſtock*, and *Stralſund*, which had never happened before; people likewiſe travelled acroſs the Baltic over ice from Reval in Eſtland to Denmark and to Sweden, and back again, without the leaſt danger (c). But according to Sæmund Frode, even the great German Ocean between Denmark and Norway was frozen in the year 1048, ſo that the wolves frequently ran over the ice from one country to the other. The great northern ocean is likewiſe moſt certainly ſometimes frozen to a great diſtance from any land: for Muller relates, that in the year 1715 a Coſſack called *Markoff*, with ſome other perſons, was ſent by the Ruſſian government to explore the north ſea; but finding it next to impoſſible to make any progreſs during ſummer on account of the vaſt quantities of ice commonly filling this ocean, he at laſt determined to try the experiment during winter. He therefore took ſeveral ſledges drawn according to the cuſtom of the country by dogs, which commonly go about 80 or 100 verſts per day, 105 of which make a degree; and on March the 15th, old ſtyle, with this caravan of nine perſons, he left the ſhores of Siberia at the mouth of the river Yana, under the 71° of north latitude, and proceeded for ſeven days together northward, ſo that he had reached at leaſt the 77° or 78° north latitude, when he was ſtopped by the ice, which there began to appear in the ſhape of prodigious mountains. He climbed up to the top of ſome of theſe ice-mountains: but ſeeing from thence no land, nor any thing except ice as far as the eye could reach, and having beſides no more food for his dogs left, he thought it very neceſſary to return; which he with great difficulty performed, on April the 3d, as ſeveral of the dogs, which had periſhed for want, were employed to ſupport thoſe that remained alive. Theſe facts, I believe, will convince the unprejudiced reader, that there are other ſeas beſides the Black Sea which really do freeze in winter, and that the ice carried down the rivers could not at leaſt freeze the German Ocean between Norway and Denmark, becauſe the rivers there are ſo ſmall, and bear a very inconſiderable proportion to the immenſe ocean, which, according to experiments made by Mr Wilke, is very ſalt, though near the land, in the Swediſh harbour of Landſcrona.

"Now, if ſix or ſeven degrees of latitude, containing from 360 to 420 ſea-miles, are not to be reckoned a great diſtance from the land, I do not know in what manner to argue, becauſe no diſtance whatſoever will be reckoned far from any land. Nay, if the Coſſack Markoff, being mounted on one of the higheſt ice-mountains, may be allowed to ſee at leaſt to the diſtance of 20 leagues, the extent alluded to above muſt then be increaſed to 480 Engliſh ſea-miles; which certainly is very conſiderable, and makes it more than probable that the ocean is frozen in winter, in high northern latitudes, even as far as the pole. Beſides, it invalidates the argument which theſe gentlemen wiſh to infer from thence *that the ocean does not freeze in high latitudes, eſpecially where there is a conſiderable broad ſea*; for we have ſhown inſtances to the contrary.

"But M. de Buffon ſpeaks of ice carried down the rivers into the northern ocean, and forming there theſe immenſe quantities of ice. 'And in caſe, ſaye he, we would ſuppoſe, againſt all probability, that at the pole it could be ſo cold as to congeal the ſurface of the ſea, it would remain equally incomprehenſible how theſe enormous floating ice-maſſes could be formed if they had not land for a point to fix on, and from whence they are ſevered by the heat of the ſun. The two ſhips which the India Company ſent in 1739 upon the diſcovery of the auſtral lands, found ice in 47° or 48° ſouth latitude, but at no great diſtance from land; which they diſcovered, without being able to approach it. This ice, therefore, muſt have come from the interior parts of the lands near the ſouth pole; and we muſt conjecture, that it follows the courſe of ſeveral large rivers, waſhing theſe unknown lands, in the ſame manner as the rivers Oby, the Yeniſea, and the other great rivers which fall into the northern ſea, carry the ice-maſſes, which ſtop up the ſtraits of Waigats for the greater part of the year, and render the Tartarian ſea inacceſſible upon this courſe.' Before we can allow the analogy between the rivers Oby, Yeniſea, and the reſt which fall into the northern ocean, and thoſe coming from the interior parts of the auſtral lands, let us compare the ſituation of both countries, ſuppoſing the auſtral lands really to exiſt. The Oby, Yeniſea, and the reſt of the Siberian rivers, falling down into the northern ocean, have their ſources in 48° and 50° north latitude, where the climate is mild and capable of producing corn of all kinds. All the rivers of this great continent increaſing, theſe great rivers have likewiſe their ſources in mild and temperate climates, and the main direction of their courſe is from ſouth to north; and the coaſt of the northern ocean, not reckoning its ſinuoſities, runs in general weſt and eaſt. The ſmall rivers which are formed in high latitudes have, properly ſpeaking, no ſources, no ſprings, but carry off only the waters generated by the melting of ſnow in ſpring, and by the fall of rain in the ſhort ſummer, and are for the greateſt part dry in autumn. And the reaſon of this phenomenon is obvious, after conſidering the conſtitution of the earth in thoſe high northern climates. At Yakutſk, in about 62° north latitude, the ſoil is eternally frozen, even in the height of ſummer, at the depth of three feet from the furnace. In the years 1685 and 1686, an attempt was made to dig a well; and a man, by great and indefatigable labour, continued during two ſummer-ſeaſons, and ſucceeded ſo far in this laborious taſk, that he at laſt reached the depth of 91 feet; but the whole earth at this depth was frozen, and he met with no water; which forced him to deſiſt from ſo fruitleſs an attempt. And it is eaſy to infer from hence how impoſſible it is that ſprings ſhould be formed in the womb of an eternally frozen ſoil.

(c) In 1296 the Baltic was frozen from Gothland to Sweden. (*Incerti auctoris Annales Denor. in Weſtphalii monument. Cimbr.* t. i. p. 1392.

In 1306 the Baltic was, during fourteen weeks, covered with ice between all the Daniſh and Swediſh iſlands. (*Ludwig. reliquiæ, MSS.* t. ix. p. 170.)

In 1323 there was a road for foot-paſſengers and horſemen over the ice on the Baltic during ſix weeks. (*id. ibid.*)

In 1349, people walking over the ice from Stralſund to Denmark. (*Incerti auct. cit. ap. Ludwig.* t. ix. p. 181.)

In 1408 the whole ſea between Gothland and Oeland, and likewiſe between Roſtock and Gezoer, was frozen. (*id. ibid.*)

In 1423 the ice bore riding from Pruſſia to Lubec. (*Crantzii Vandal.* l. x. c. 40.) The whole ſea was covered with ice from Mecklenburg to Denmark. (*Incert. auct. ap. Ludwig.* t. ix. p. 125.)

In 1461 (ſays *Nichol. Marſchallus in Annal. Herul. ap. Weſtphal.* t. i. p. 261.) Tanta erat hyems, ut concreto gelu oceano plauſtris millia paſſuum ſupra CCC merces ad ultimam Thylen (*Iceland*) et Orcades veherentur *e Germania* tota pene bruma.

In 1545 the ſea between Roſtock and Denmark, and likewiſe between Fionia and Sealand, was thus frozen, that the people travelled over the ice on foot, with ſledges to which horſes and oxen were put. (*Anonym. ap. Ludwig.* t. ix. p. 176.)

In 1294 the Cattegat or ſea between Norway and Denmark was frozen; that from Oxſlo in Norway, they could travel on it to Jutland, (*Strelow Chron. Jutbiland*, p. 148.)

17 Of the freezing of ſalt-water.

“The argument, therefore, is now reduced to this, *That ſalt water does not freeze at all; or, if it does, the ice contains briny particles.* But we have already produced numberleſs inſtances, that the ſea does freeze; nay, Crantz allows, *that the flat pieces of ice are ſalt, becauſe they were congealed from ſea-water.* We beg leave to add a few deciſive facts relative to the freezing of the ſea. Barentz obſerves in the year 1596, September the 16th, the ſea froze two fingers thick, and next night the ice was as thick again. This happened in the midſt of September; what effect then muſt the intenſe froſt of a night in January not produce? When Captain James wintered in Carleton's Iſle, the ſea froze in the middle of December 1631. It remains, therefore, only to examine, whether the ice formed in the ſea muſt neceſſarily contain briny particles. And here I find myſelf in a very diſagreeable dilemma; for during the intenſe froſt of the winter in 1776, two ſets of experiments were made on the freezing of ſea-water, and publiſhed, contradicting one another almoſt in every material point. The one by Mr Edward Nairne F. R. S. an ingenious and accurate obſerver; the other by Dr Higgins, who reads lectures on chemiſtry and natural philoſophy, and conſequently muſt be ſuppoſed to be well acquainted with the ſubject. I will therefore ſtill venture to conſider the queſtion as undecided by theſe experiments, and content myſelf with making a few obſervations on them: but previouſly I beg leave to make this general remark, that thoſe who are well acquainted with mechanics, chemiſtry, natural philoſophy, and the various arts which require a nice obſervation of minute circumſtances, need not be informed, that an experiment or machine ſucceeds often very well when made upon a ſmaller ſcale, but will not anſwer if undertaken at large; and *vice verſa*, machines and experiments executed upon a ſmall ſcale will not produce the effect which they certainly have when made in a more enlarged manner. A few years ago an experiment made on the dyeing of ſcarlet, did not ſucceed when undertaken on a ſmall ſcale, whereas it produced the deſired effect when tried at a dyer's houſe with the large apparatus; and it evidently confirms the above aſſertion, which I think I have a right to apply to the freezing of ſalt-water. It is therefore probable, that the ice formed in the ocean at large, in a higher latitude, and in a more intenſe degree of cold, whereof we have no idea here, may become ſolid, and free from any briny particles, though a few experiments made by Dr Higgins, in his houſe, on the freezing of ſalt-water, produced only a looſe ſpongy ice filled with briny particles.

18 Reſult of Mr Nairn's experiments on this ſubject.

“The ice formed of ſea-water by Mr Nairne was very hard, 3½ inches long, and 2 inches in diameter: it follows from thence, that the waſhing the outſide of this ice in freſh water, could not affect the inſide of a hard piece of ice. This ice when melted yielded freſh water, which was ſpecifically lighter than water which was a mixture of rain and ſnow-water, and next in lightneſs to diſtilled water. Had the ice thus obtained not been freſh, the reſiduum of the ſea-water, after this ice had been taken out, could not have been ſpecifically heavier than ſea-water, which, however, was the caſe in Mr Nairne's experiment. It ſeems, therefore, in my opinion, evident from hence, that ſalt-water does freeze, and has no other briny particles than what adhere to its outſide. All this perfectly agrees with the curious fact related by Mr Adanſon (D), who had brought to France two bottles of ſea-water, taken up in different parts of the ocean, in order to examine it, and to compare its ſaltneſs, when more at leiſure; but both the bottles containing the ſalt-water were burſt by being frozen, and the water produced from melting the ice proved perfectly freſh. This fact is ſo fairly ſtated, and ſo very natural, that I cannot conceive it is neceſſary to ſuppoſe, without the leaſt foundation for it, *that the bottles were changed, or that Mr Adanſon does not mention the circumſtance by which the ſea-water was thus altered upon its being diſſolved:* for as he expreſsly obſerves the bottles to have been burſt, it is obvious that the concentrated briny parts ran out, and were entirely drained from the ice, which was formed of the freſh water only.

“The ice formed by Dr Higgins from ſea-water, *conſiſted of thin laminæ, adhering to each other weakly.* Dr Higgins took out the frozen ice from the veſſels wherein he expoſed the ſea-water, and continued to do ſo till the remaining concentrated ſea-water began to form cryſtals of ſea-ſalt. Both theſe experiments, therefore, by no means prove what the Doctor intended to infer from thence; for it was wrong to take out ſuch ice, which only *conſiſted of thin laminæ, adhering to each other weakly.* Had he waited with patience, he would have obtained a hard ice as well as Mr Nairne, which by a more perfect congelation, would have excluded the

---

(D) Second Supplement to the Probability of reaching the North Pole, p. 119.

the briny particles intercepted between the *thin laminæ, adhering to each other weakly;* and would have connected the laminæ, by others formed by freſh water. The Doctor found afterwards, it is true, thicker and ſomewhat more ſolid ice: but the ſea-water had already been ſo much concentrated by repeated congelations, that it is no wonder the ice formed in it became at laſt brackiſh: it ſhould ſeem, then, that no concluſive arguments can be drawn from theſe experiments.

“There are two other objections againſt the formation of the ice in the great ocean. The *firſt* is taken from the immenſe bulk and ſize of the ice maſſes formed in the ocean, which is *the deepeſt maſs of water we know of*. But it has been experimentally proved, that in the midſt of ſummer, in the latitudes of 55°, 55° 26′, and 64° ſouth, at 100 fathoms depth, the thermometer ſtood at 34°, 34°½ and 32°; and that in all inſtances, the difference between the temperature at top and 100 fathoms depth never exceeded four degrees of Fahrenheit's thermometer, or that the temperature of the air did not differ five degrees from that of the ocean at 100 fathom deep. If we now add to this, that beyond the 71° ſouth the temperature of the air and ocean muſt be ſtill colder, and that the rigours of an antarctic winter are certainly more than ſufficient to cool the ocean to 28°½, which is requiſite for congealing the aqueous particles in it; if we moreover conſider, that theſe ſevere froſts are continued during ſix or eight months of the year, we may eaſily conceive that there is time enough to congeal large and extenſive maſſes of ice. But it is likewiſe certain, that there is more than one way by which thoſe immenſe ice maſſes are formed. We ſuppoſe very juſtly, that the ocean does freeze, having produced ſo many inſtances of it; we allow likewiſe, that the ice thus formed in a calm, perhaps does not exceed three or four yards in thickneſs; a ſtorm probably often breaks ſuch an ice-field, which Crantz allows to be 200 leagues one way and 80 the other; the preſſure of the broken fragments againſt one another frequently ſets one upon the other piece, and they freeze in that manner together; ſeveral ſuch double pieces, thrown by another preſſure upon one another, form at laſt large maſſes of miles extent, and of 20, 40, 60, and more fathoms thickneſs, or of a great bulk or height. Martens, in his deſcription of Spitzbergen, remarks, that the pieces of ice cauſe ſo great a noiſe by their ſhock, that the navigators in thoſe regions can only with difficulty hear the words of thoſe that ſpeak; and as the ice-pieces are thrown one upon another, ice-mountains are formed by it. And I obſerved very frequently, in the years 1772 and 1773, when we were among the ice, maſſes which had the moſt evident marks of ſuch a formation, being compoſed of ſtrata of ſome feet in thickneſs. This is in ſome meaſure confirmed by the ſtate in which the Coſſack Markoff found the ice at the diſtance of 420 miles north from the Siberian coaſts. The high maſſes were not found formed, as is ſuſpected in the *Second ſupplement to the probability of reaching the north pole*, p. 143-145, near the land, under the high cliffs, but far out at ſea; and when theſe ice mountains were climbed by Markoff, nothing but ice, and no veſtiges of land, appeared as far as the eye could reach. The high climates near the poles are likewiſe ſubject to heavy falls of ſnow, of ſeveral yards in thickneſs, which grow more and more compact, and by thaws and rain are formed into ſolid ice, which increaſe the ſtupendous ſize of the floating ice mountains.

“The *ſecond* objection againſt the freezing of the ocean into ſuch ice as is found floating in it, is taken from the *opacity* of ice formed in ſalt water; becauſe the largeſt maſſes are commonly tranſparent like cryſtal, with a fine blue tint, cauſed by the reflection of the ſea. This argument is very ſpecious, and might be deemed unanſwerable by thoſe who are not uſed to cold winters and their effects. But whoſoever has ſpent ſeveral winters in countries which are ſubject to intenſe froſts, will find nothing extraordinary or difficult in this argument: for it is a well-known fact in cold countries, that the ice which covers their lakes and rivers is often opaque, eſpecially when the froſt ſets in, accompanied by a fall of ſnow; for, in thoſe inſtances, the ice looks, before it hardens, like a dough or paſte, and when congealed it is opaque and white; however, in ſpring, a rain and the thaw, followed by froſty nights, change the opacity and colour of the ice, and make it quite tranſparent and colourleſs like a cryſtal: but, in caſe the thaw continues, and it ceaſes entirely to freeze, the ſame tranſparent ice becomes ſoft and porous, and turns again entirely opaque. This I believe may be applicable to the ice ſeen by us in the ocean. The field-ice was commonly opaque; ſome of the large maſſes, probably drenched by rain, and frozen again, were tranſparent and pellucid; but the ſmall fragments of looſe ice, formed by the decay of the large maſſes, and ſoaked by long-continued rains, we found to be porous, ſoft, and opaque.

“It is likewiſe urged as an argument againſt the formation of ice in the ocean, that it always requires land, in order to have a point upon which it may be fixed. Firſt, I obſerve, that in Mr Nairne's experiments, the ice was generated on the ſurface, and was ſeen ſhooting cryſtals downwards: which evidently evinces, in my opinion, that ice is there formed or generated where the intenſeſt cold is; as the air ſooner cools the ſurface than the depth of the ocean, the ice ſhoots naturally downwards, and cools the ocean more and more, by which it is prepared for further congelation. I ſuppoſe, however, that this happens always during calms, which are not uncommon in high latitudes, as we experienced in the late expedition. Nor does land ſeem abſolutely neceſſary in order to fix the ice; for this may be done with as much eaſe and propriety to the large ice mountains which remain undiſſolved floating in the ocean in high latitudes; or it may, perhaps, not be improper to ſuppoſe, that the whole polar region, from 80° and upwards, in the ſouthern hemiſphere, remains a ſolid ice for ſeveral years together, to which yearly a new circle of ice is added, and of which, however, part is broken off by the winds and the return of the mild ſeaſon. Wherever the ice floats in large maſſes, and ſometimes in compact bodies formed of an infinite number of ſmall pieces, there it is by no means difficult to freeze the whole into one piece; for amongſt the ice the wind has not a power of raiſing high and great waves. This circumſtance was not entirely unknown to the ancients; and it is probable they acquired this information from the natives of ancient Gaul, and from the Britons and other northern nations, who ſometimes undertook long voyages. The northern ocean was called by the ancients the *frozen*, the *dead*, the *lazy*, and *immoveable ſea:* ſometimes they gave it the name *mare cronium*, the concrete ſea, and *morimaruſa*, the dead ſea. And, what is very remarkable, in all the northern cold countries the froſt ſometimes is ſo intenſe, that all the waters become ſuddenly coagulated into a kind of paſte or dough, and thus at once congeal."

19 Obſervations on Mr Forſter's reaſoning.

On this reaſoning of Mr Forſter's, however, we muſt obſerve, that it cannot poſſibly invalidate any fact which Mr Barrington has advanced. The beſt concerted and moſt plauſible theory in the world muſt yield to experience; for this is in fact what muſt judge all theories. Now, from what we have already related, it is demonſtrated, that in the ſpace between the mouths or the rivers Piaſida and Chatanga more ice muſt be formed, and more intenſe colds generated, than in any other part of the world; conſequently, for a conſiderable ſpace, both on the eaſt and weſt ſide of that, the ſea muſt be more full of ice than any where elſe. Now, between theſe two rivers there is the promontory of Taimura, which runs out to the latitude of 78°, or near it, and which of neceſſity muſt obſtruct the diſperſion of the ice; and that it actually does ſo is in ſome degree probable; becauſe in one of the Ruſſian voyages abovementioned the eaſtern mouth of the Lena was quite free, when the weſtern ones were entirely choaked up with ice. Now the mouth of the Yana lies ſeveral degrees to the eaſtward of the Lena: conſequently, when the ice comes eaſtward from the cape of Taimura, it muſt neceſſarily fill all that ſea to the latitude of 78° and upwards; but the Coſſack Markoff, if he proceeded directly north, could not be farther than the promontory of Taimura, and conſequently ſtill enveloped among the ice. Beſides, we are certain, that the ſea in 78° is not at all frozen into a ſolid cake in ſome places, ſince Lord Mulgrave, in 1773, reached 81°. Mr Forſter's argument, therefore, either proves nothing, or it proves too much. If it proves, that about the middle of the eaſtern continent the cold is ſo intenſe that a ſufficient quantity of ice is formed to obſtruct the navigation for ſeveral hundred miles round, this proves nothing; becauſe we knew before that this muſt be the caſe: But if it proves, that the ſea muſt be unnavigable by reaſon of ice all round the globe at 78° N. L. this is too much; becauſe we certainly know, that in 1773 Lord Mulgrave reached the latitude of 81°. However, though it ſhould be allowed that the ſea is quite clear all the way to the pole, it muſt be a very great uncertainty whether any ſhip could by that way reach the Eaſt Indies; becauſe we know that it muſt ſail down between the continents of Aſia and America, through that ſtrait whoſe mouth muſt often be blocked up with ice driving eaſtward along the continent of Aſia.

The ſouth pole is ſtill more inacceſſible than the north pole; for the ice is found in much lower ſouthern than northern latitudes. Upon this ſubject M. Pages ſpeaks thus: "Having in former voyages (ſays he) viſited many parts of the terraqueous globe in different latitudes, I had opportunities of acquiring a conſiderable knowledge of climate in the torrid as well as in the temperate diviſions of the earth. In a ſubſequent voyage I made it my buſineſs to be equally well informed reſpecting the reputed inhoſpitable genius of the South Seas; and upon my return from that expedition I entertained not the ſmalleſt doubt that there exiſts a peculiar and perpetual rigour in the ſouthern hemiſphere.' (See his *Travels round the World*, v. iii. tranſlated from the French, and printed at London, 1792, for Murray.) This ſuperior degree of cold has by many been ſuppoſed to proceed from a greater quantity of land about the ſouth than the north pole *; and the notion of a vaſt continent in theſe regions prevailed almoſt univerſally, inſomuch that many have ſought for it, but hitherto in vain. See the articles *Cook's Diſcoveries*, n° 38—49. and n° 68. and 69. *South-Sea*, and *Terra Auſtralis*.

* See America, n° 3—5, and Cook's Diſcoveries, n° 38, &c.

Magnetic Pole. See Magnet, Magnetism, § 4. p. 432. and p. 441. and Variation.

North Pole. See Pole.

Pole-Axe, a ſort of hatchet nearly reſembling a battle-axe, having an handle about 15 inches in length, and being furniſhed with a ſharp point or claw, bending downwards from the back of its head; the blade whereof is formed like that of any other hatchet. It is principally employed in ſea-fights to cut away and deſtroy the rigging of any adverſary who endeavours to board.

Pole-axes are alſo ſaid to have been ſucceſsfully uſed on ſome occaſions in boarding an enemy, whoſe ſides were above thoſe of the boarder. This is executed by detaching ſeveral gangs to enter at different parts of the ſhip's length, at which time the pole-axes are forcibly driven into her ſide, one above another, ſo as to form a ſort of ſcaling-ladders.

Pole Cat. See Mustela.

Pole Star. See Astronomy, n° 3. 17. and 39.

POLEIN, in Engliſh antiquity, is a ſort of ſhoe, ſharp or picked at the point. This faſhion took its riſe in the time of king William Rufus; and the picks were ſo long, that they were tied up to the knees with ſilver or golden chains. They were forbidden by ſtat. an. 4 Edw. IV. cap. *Tunc fluxus crinium, tunc luxus veſtium, tunc uſus calceorum cum arcuatis aculeis inventus eſt.* Malmeſb. in Will. ii.

POLEMARCHUS was a magiſtrate at Athens, who had under his care all the ſtrangers and ſojourners in the city, over whom he had the ſame authority that the archon had over the citizens. It was his duty to offer a ſolemn ſacrifice to Enyalus (ſaid to be the ſame with Mars, though others will have it that he was only one of his attendants), and another to Diana, ſurnamed Αγροτερα, in honour of the famous patriot Harmodius. It was alſo his buſineſs to take care that the children of thoſe that had loſt their lives in the ſervice of their country ſhould be provided for out of the public treaſury.

Potter's Grecian Antiquities.

POLEMICAL, in matters of literature, an appellation given to books of controverſy, eſpecially thoſe in divinity.

POLEMO, who ſucceeded Zenocrates in the direction of the academy, was an Athenian of diſtinguiſhed birth, and in the earlier part of his life a man of looſe morals. The manner in which he was reclaimed from the purſuit of infamous pleaſures, and brought under the diſcipline of philoſophy, affords a memorable example of the power of eloquence employed in the cauſe of virtue. His hiſtory is thus related by Dr Enfield: "As he was, one morning about the riſing of the ſun, returning home from the revels of the night,

night clad in a looſe robe, crowned with garlands, ſtrongly perfumed, and intoxicated with wine, he paſſed by the ſchool of Xenocrates, and ſaw him ſurrounded with his diſciples. Unable to reſiſt ſo fortunate an opportunity of indulging his ſportive humour, he ruſhed without ceremony into the ſchool, and took his place among the philoſophers. The whole aſſembly was aſtoniſhed at this rude and indecent intruſion, and all but Xenocrates diſcovered ſigns of reſentment. Xenocrates, however, preſerved the perfect command of his countenance; and with great preſence of mind turned his diſcourſe from the ſubject on which he was treating to the topics of temperance and modeſty, which he recommended with ſuch ſtrength of argument, and energy of language, that Polemo was conſtrained to yield to the force of conviction. Inſtead of turning the philoſopher and his doctrine to ridicule, as he at firſt intended, he became ſenſible of the folly of his former conduct; was heartily aſhamed of the contemptible figure which he had made in ſo reſpectable an aſſembly; took his garland from his head; concealed his naked arm under his cloak; aſſumed a ſedate and thoughtful aſpect; and, in ſhort, reſolved from that hour to relinquiſh his licentious pleaſures, and devote himſelf to the purſuit of wiſdom. Thus was this young man, by the powerful energy of truth and eloquence, in an inſtant converted from an infamous libertine to a reſpectable philoſopher. In ſuch a ſudden change of character it is difficult to avoid paſſing from one extreme to another. Polemo, after his reformation, in order to brace up his mind to the tone of rigid virtue, conſtantly practiſed the ſevereſt auſterity and moſt hardy fortitude. From the thirtieth year of his age to his death he drank nothing but water. When he ſuffered violent pain, he ſhowed no external ſign of anguiſh. In order to preſerve his mind undiſturbed by paſſion, he habituated himſelf to ſpeak in an uniform tone of voice, without elevation or depreſſion. The auſterity of his manners was, however, tempered with urbanity and generoſity. He was fond of ſolitude, and paſſed much of his time in a garden near his ſchool. He died, at an advanced age, of a conſumption. Of his tenets little is ſaid by the ancients, becauſe he ſtrictly adhered to the doctrine of Plato."

POLEMONIUM, Greek Valerian, or *Jacob's Ladder*: A genus of the monogynia order, belonging to the pentandria claſs of plants; and in the natural method ranking under the 29th order, *Campanaceæ*. The corolla is quinquepartite; the ſtamina inſerted into ſcales which cloſe the bottom of the corolla; the ſtigma is trifid: the capſule bilocular ſuperior. There are two ſpecies, of which the moſt remarkable is the cœruleum, with an empalement longer than the flower. It grows naturally in ſome places of England: however, its beauty has obtained it a place in the gardens. There are three varieties; one with a white, another with a blue, and another with a variegated flower; alſo a kind with variegated leaves. They are eaſily propagated by ſeeds; but that kind with variegated leaves is preſerved by parting its roots, becauſe the plants raiſed from ſeeds would be apt to degenerate and become plain.

POLEMOSCOPE, in optics, the ſame with Opera-glass. See Dioptrics, p. 37. col. 1. par. 3.

POLENBURG (Cornelius), an excellent painter of little landſcapes and figures, was born at Utrecht in 1586, and educated under Blomaert, whom he ſoon quitted to travel into Italy; and ſtudied for a long time in Rome and Florence, where he formed a ſtyle entirely new, which, though preferable to the Flemiſh, is unlike any Italian, except in his having adorned his landſcapes with ruins. There is a varniſhed ſmoothneſs and finiſhing in his pictures, that render them always pleaſing, though ſimple and too nearly reſembling one another. The Roman cardinals were charmed with the neatneſs of his works, as was alſo the great duke; but could not retain him. He returned to Utrecht, and pleaſed Rubens, who had ſeveral of his performances. King Charles I. invited him to London, where he generally painted the figures in Steenwyck's perſpectives: but the king could not prevail on him to fix there; for after ſtaying only four years, and being handſomely rewarded by his majeſty for ſeveral pieces which he performed for him, he returned to Utrecht, and died there at the age of 74. His works are very ſcarce and valuable.

POLERON, one of the Banda or nutmeg iſlands in the Eaſt Indies. This was one of thoſe ſpice iſlands which put themſelves under the protection of the Engliſh, and voluntarily acknowledged James I. king of England for their ſovereign; for which reaſon the natives of this and the reſt of the iſlands were murdered or driven thence by the Dutch, together with the Engliſh.

POLESIA, a province of Poland, bounded by Polachio and Proper Lithuania on the north, and by Volhinia on the ſouth. It is one of the palatinates of Lithuania, and is commonly called *Breſcia*, and its capital is of this name. It is full of foreſts and lakes.

POLESINO-de-Rovigo, a province of Italy, in the republic of Venice, lying to the north of the river Po; and bounded on that ſide by the Paduan, on the ſouth by the Ferrareſe, on the Eaſt by Degado, and on the weſt by the Veroneſe. It is 45 miles in length, and 17 in breadth, and is a fertile country. Rovigo is the capital.

POLETÆ were ten magiſtrates of Athens, who, with three that had the management of money allowed for public ſhows, were empowered to let out the tribute-money and other public revenues, and to ſell confiſcated eſtates; all which bargains were ratified by their preſident, or in his name. They were by their office alſo bound to convict ſuch as had not paid the tribute called Μετοικιον, and ſell them in the market by auction. The market where theſe wretches were ſold was called πωλητηριον τȣ μετοικιȣ.

POLIANTHES, the Tuberose: A genus of the monogynia order, belonging to the hexandria claſs of plants; and in the natural method ranking under the 10th order, *Coronariæ*. The corolla is funnel-ſhaped, incurvated, and equal; the filaments are inſerted into the throat of the corolla; in the bottom of which the germen is ſituated. There is but one ſpecies, conſiſting of ſome varieties; all of which being exotics of tender quality, require aid of artificial heat, under ſhelter of frames and glaſſes, &c. to bring them to flower in perfection in cold countries. The polianthes, or tuberoſe, hath an oblong, bulb-like, tuberous, white root; crowned with a few long very narrow leaves; amidſt them an upright, ſtraight, firm ſtem, three or four feet high, terminated by a long ſpike of large white flowers arranged alternately. The varieties are the common tuberoſe, with ſingle flowers,—double-flowered,—dwarf-ſtalked,—variegated-leaved. They all flower here in June, July, and Auguſt: the flowers are funnel or bell ſhaped; garniſh the upper part of the ſtem in a long ſpike, conſiſting of from 10 to 20 or more ſeparate in alternate arrangements, the lower flowers opening firſt, which are ſucceeded by thoſe above, in regular order, making in the whole a moſt beautiful appearance, highly enriched with a moſt fragrant odour. The common ſingle-flowered tuberoſe is the ſort the moſt commonly cultivated, as it generally blows the moſt freely, and poſſeſſes the fineſt fragrance. The double-flowered kind alſo highly merits culture, as when it blows fair it makes a ſingularly fine apppearance. The dwarf and the variegated kinds are inferior to the other two, but may be cultivated for variety.

All the varieties being exotics from warm countries, although they are made to flower in great perfection in Britiſh gardens by aſſiſtance of hot-beds, they will not proſper in the open ground, and do not increaſe freely in England; ſo that a ſupply of the roots is imported thither annually from Genoa, and other parts of Italy, by moſt of the eminent nurſery and ſeedſmen, and the Italian warehouſe-keepers; generally arriving in February or March, time enough for the enſuing ſummer's bloom; and are ſold commonly at the rate of twelve or fifteen ſhillings per hundred, being careful always to procure as large roots as poſſible, for on this depends the ſucceſs of having a complete blow. They, requiring artificial heat to blow them in cold countries, are planted in pots, and plunged in a hot-bed, under a deep frame furniſhed with glaſs lights; or placed in a hot-houſe, where they may be blowed to great perfection with little trouble. The principal ſeaſon for planting them is March and April: obſerving, however, that in order to continue a long ſucceſſion of the bloom, it is proper to make two or three different plantings, at about a month interval; one in March, another in April, and a third the beginning of May, whereby the blow may be continued from June until September; obſerving, as above-mentioned, they may be flowered either by aid of a common dung or bark hot-bed, or in a hot-houſe.

With reſpect to the propagation of theſe plants, it is principally by offſets of the roots. The blowing roots that are brought annually from abroad for ſale are often furniſhed with offſets, which ought to be ſeparated previous to planting. Thoſe alſo that are planted in the gardens frequently furniſh offſets fit for ſeparation in autumn when the leaves decay; they muſt then be preſerved in ſand all winter in a dry ſheltered place; and in the beginning of March, plant them either in a bed of light dry earth in the full ground; or, to forward them as much as poſſible, allow them a moderate hot-bed; and in either method indulge them with a ſhelter in cold weather, either of a frame and lights, or arched with hoops and occaſionally matted; but let them enjoy the full air in all mild weather, giving alſo plenty of water in dry weather during the ſeaſon of their growth in ſpring and ſummer. Thus let them grow till their leaves again decay in autumn: then take them up, clean them from earth, and lay them in ſand till ſpring; at which time ſuch roots as are large enough to blow may be planted and managed as already directed, and the ſmaller roots planted again in a nurſery-bed, to have another year's growth; afterwards plant them for flowering. The Egyptians put the flowers of tuberoſe into ſweet oil; and by this means give it a moſt excellent flavour, ſcarce inferior to oil of jaſmine.

POLICANDRO, a ſmall iſland in the Archipelago, ſeated between Milo and Morgo. It has no harbour, but has a town about three miles from the ſhore near a huge rock. It is a ragged ſtony iſland, but yields as much corn as is ſufficient for the inhabitants, who conſiſt of about 120 Greek families, all Chriſtians. The only commodity is cotton; of which they make napkins, a dozen of which are ſold for a crown. E. Long. 35. 25. N. Lat. 36. 36.

POLICASTRO, an epiſcopal town of Italy, in the kingdom of Naples, and in the Hither Principato; but now almoſt in ruins, for which reaſon the biſhop reſides in another town. E. Long. 15. 46. N. Lat. 40. 26.

POLICY, or POLITY, in matters of government. See POLITY.

POLICY of Inſurance, or *Aſſurance*, of ſhips, is a contract or convention, whereby a perſon takes upon himſelf the riſks of a ſea-voyage; obliging himſelf to make good the loſſes and damages that may befal the veſſel, its equipage, tackle, victualling, lading, &c. either from tempeſts, ſhipwrecks, pirates, fire, war, repriſals, in part or in whole; in conſideration of a certain ſum of ſeven, eight, or ten *per cent.* more or leſs according to the riſk run; which ſum is paid down to the aſſurer by the aſſuree upon his ſigning the policy. See INSURANCE.

POLIDORO DA CARAVAGGIO, an eminent painter, born at Caravaggio in the Milaneſe in 1492. He went young to Rome, where he worked as a labourer in preparing ſtucco for the painters; and was ſo animated by ſeeing them at work in the Vatican, that he ſolicited ſome of them to teach him the rules of deſigning. He attached himſelf particularly to Maturino, a young Florentine; and a ſimilarity in talents and taſte producing a diſintereſted affection, they aſſociated like brothers, laboured together, and lived on one common purſe, until the death of Maturino. He underſtood and practiſed the chiaro-ſcuro in a degree ſuperior to any in the Roman ſchool; and finiſhed an incredible number of pictures both in freſco and in oil, few of the public buildings at Rome being without ſome of his paintings. Being obliged to fly from Rome when it was ſtormed and pillaged, he retired to Meſſina, where he obtained a large ſum of money with great reputation, by painting the triumphal arches for the reception of Charles V. after his victory at Tunis: and when he was preparing to return to Rome, he was murdered, for the ſake of his riches, by his Sicilian valet with other aſſaſſins, in the year 1543.

POLIFOLIA. See ANDROMEDA.

POLIGNAC (Melchier de), an excellent French genius and a cardinal, was born of an ancient and noble family at Puy, the capital of Velay, in 1662. He was ſent by Louis XIV. ambaſſador extraordinary to Poland, where, on the death of Sobieſki, he formed a project of procuring the election of the prince of Conti. But failing, he returned home under ſome diſgrace; but when reſtored to favour, he was ſent to Rome as auditor of the Rota. He was plenipotentiary during the congreſs at Utrecht, at which time Clement I. created him a cardinal; and upon the acceſſion of Louis XV. he was appointed to reſide at Rome as miniſter of

France. He remained there till the year 1732, and died in the year 1741. He left behind him a MS. poem entitled *Anti-Lucretius, ſeu De Deo et Natura;* the plan of which he is ſaid to have formed in Holland in a converſation with Mr Bayle. This celebrated poem was firſt publiſhed in the year 1749, and has ſince been ſeveral times printed in other countries beſides France. He had been received into the French Academy in 1704, into the Academy of Sciences in 1715, into that of the Belles Lettres in 1717: and he would have been an ornament to any ſociety, having all the accompliſhments of a man of parts and learning.

POLISHER, or Burnisher, among mechanics, an inſtrument for poliſhing and burniſhing things proper to take a poliſh. The gilders uſe an iron-poliſher to prepare their metals before gilding, and the bloodſtone to give them the bright poliſh after gilding.

The poliſhers, among cutlers, are a kind of wooden wheels made of walnut-tree, about an inch thick, and of a diameter at pleaſure, which are turned round by a great wheel; upon theſe they ſmooth and poliſh their work with emery and putty.

The poliſhers for glaſs conſiſt of two pieces of wood; the one flat, covered with old hat; the other long and half-round, faſtened on the former, whoſe edge it exceeds on both ſides by ſome inches, which ſerves the workmen to take hold of, and to work backwards and forwards by.

The poliſhers uſed by ſpectacle-makers are pieces of wood a foot long, ſeven or eight inches broad, and an inch and a half thick, covered with old beaver hat, whereon they poliſh the ſhell and horn frames their ſpectacle-glaſſes are to be ſet in.

POLISHING, in general, the operation of giving a gloſs or luſtre to certain ſubſtances, as metals, glaſs, marble, &c.

The operation of poliſhing optic-glaſſes, after being properly ground, is one of the moſt difficult points of the whole proceſs. See Telescope.

POLITENESS means elegance of manners or good breeding: Lord Cheſterfield calls it the art of pleaſing. It has alſo been called an artificial good nature; and indeed good nature is the foundation of true politeneſs; without which art will make but a very indifferent figure, and will generally defeat its own ends. "Where compliance and aſſent, caution and candour, ſays an elegant eſſayiſt*, ariſe from a natural tenderneſs of diſpoſition and ſoftneſs of nature, as they ſometimes do, they are almoſt amiable and certainly excuſable; but as the effects of artifice, they muſt be deſpiſed. The perſons who poſſeſs them are, indeed, often themſelves dupes of their own deceit, when they imagine others are deluded by it. For exceſſive art always betrays itſelf; and many, who do not openly take notice of the deceiver, from motives of delicacy and tenderneſs for his character, ſecretly deride and warmly reſent his ineffectual ſubtilty."

"True politeneſs (ſays another author†) is that continual attention which humanity inſpires us with, both to pleaſe others, and to avoid giving them offence. The ſurly plain-dealer exclaims loudly againſt this virtue, and prefers his own ſhocking bluntneſs and Gothic freedom. The courtier and fawning flatterer, on the contrary, ſubſtitute in its place inſipid compliments, cringings, and a jargon of unmeaning ſentences. The one blames politeneſs, becauſe he takes it for a vice; and the other is the occaſion of this, becauſe that which he practiſes is really ſo."

Both theſe characters act from motives equally abſurd, though not equally criminal. The conduct of the artful flatterer is guided by ſelf-love, while that of the plain-dealer is the effect of ignorance; for nothing is more certain, than that the deſire of pleaſing is founded on the mutual wants and the mutual wiſhes of mankind; on the pleaſure which we wiſh to derive from ſociety, and the character which we wiſh to acquire. Men having diſcovered that it was neceſſary and agreeable to unite for their common intereſts, they have made laws to repreſs the wicked, they have ſettled the duties of ſocial life, and connected the idea of reſpectability with the practice of thoſe duties; and after having preſcribed the regulations neceſſary to their common ſafety, they have endeavoured to render their commerce with one another agreeable, by eſtabliſhing the rules of politeneſs and good breeding. Indeed, as an elegant author already quoted remarks, the philoſopher who, in the auſterity of his virtue, ſhould condemn the art of pleaſing as unworthy cultivation, would deſerve little attention from mankind, and might be diſmiſſed to his ſolitary tub, like his brother Diogenes. It is the dictate of humanity, that we ſhould endeavour to render ourſelves agreeable to thoſe in whoſe company we are deſtined to travel in the journey of life. It is our intereſt, it is the ſource of perpetual ſatisfaction; it is one of our moſt important duties as men, and particularly required in the profeſſor of Chriſtianity."

It is needleſs to particularize the motives which have induced men to practiſe the agreeable virtues; for, from whatever ſource the deſire of pleaſing proceeds, it has always increaſed in proportion to the general civilization of mankind. In a rude ſtate of ſociety, pleaſure is limited in its ſources and in its operation. When the wants of mankind, and the means of attaining them, are few, perſonal application is neceſſary to gratify them, and it is generally ſufficient; by which means an individual becomes more independent than can poſſibly be the caſe in civilized life, and of courſe leſs diſpoſed to give or receive aſſiſtance. Confined to the ſolitary wiſh of furniſhing means for his own happineſs, he is little intent on the pleaſures of converſation and ſociety. His deſire of communication is equal to the extent of his knowledge. But as ſoon as the natural wants of life are filled up, we find unoccupied time, and we labour hard to make it paſs in an agreeable manner. It is then we perceive the advantage of poſſeſſing a rational nature, and the delights of mutual intercourſe. When we conſider ſociety in that ſtate of perfection which enables a great part of the members of it to purſue at leiſure the pleaſures of converſation, we ſhould expect, both from the eaſe of acquitting ourſelves to the ſatisfaction of our aſſociates, and from the advantages ariſing from this conduct, that the art of pleaſing might be reduced to a few plain and ſimple rules, and that theſe might be derived from a ſlight attention to general manners.

The art of pleaſing, in our intercourſe with mankind, is indeed ſo ſimple, that it requires nothing more than the conſtant deſire to pleaſe in all our words and actions; and the practice of it can neither wound a man's ſelf love, nor be prejudicial to his intereſt in any poſſible ſituation.

* Dr Knox.

† Beauties of Hiſtory.

But though this be certain, it is doubtleſs leſs attended to than in reaſon it ought to be. Each particular man is ſo zealous to promote his own ends or his own pleaſure, as to forget that his neighbour has claims equal to his own; that every man that enters into company gives up for the time a great many of his peculiar rights; and that he then forms part of an aſſociation, met together not for the particular gratification of any one, but for the purpoſe of general ſatisfaction. See BREEDING, CONVERSATION, and *Good MANNERS*.

The qualities eſſential in the art of pleaſing, are *virtue*, *knowledge*, and *manners*. All the virtues which form a good and reſpectable character in a moral ſenſe are eſſential to the art of pleaſing. This muſt be an eſtabliſhed principle, becauſe it depends on the wants and mutual relations of ſociety. In all affairs of common buſineſs, we delight in tranſacting with men in whom we can place confidence, and in whom we find integrity; but truth is ſo naturally pleaſing, and the common affairs of life are ſo interwoven with ſocial intercourſe, that we derive abundantly more ſatisfaction from an honeſt character than from ſpecious manners. "Should you be ſuſpected (ſays Cheſterfield) of injuſtice, malignity, perfidy, lying, &c. all the parts and knowledge of the world will never procure you eſteem, friendſhip, and reſpect."

The firſt of virtues in our commerce with the world, and the chief in giving pleaſure to thoſe with whom we aſſociate, is inviolable ſincerity of heart. We can never be too punctual in the moſt ſcrupulous tenderneſs to our moral character in this reſpect, nor too nicely affected in preſerving our integrity.

The peculiar modes, even of the faſhionable world, which are founded in diſſimulation, and which on this account have induced ſeveral to recommend the practice, would not prevent a man of the higheſt integrity from being acceptable in the very beſt company. Acknowledged ſincerity gives the ſame ornament to character that modeſty does to manners. It would abundantly atone for the want of ridiculous ceremony, or falſe and unmeaning profeſſions; and it would in no reſpect diminiſh the luſtre of a noble air, or the perfection of an elegant addreſs.

If integrity be the foundation of that character which is moſt generally acceptable, or which, in other words, poſſeſſes the power of pleaſing in the higheſt degree, humanity and modeſty are its higheſt ornaments.

The whole art of pleaſing, as far as the virtues are concerned, may be derived from the one or other of theſe ſources. Humanity comprehends the diſplay of every thing amiable to others; modeſty removes or ſuppreſſes every thing offenſive in ourſelves.

This modeſty, however, is not inconſiſtent with firmneſs and dignity of character: it ariſes rather from the knowledge of our imperfection compared with a certain ſtandard, than from conſcious ignorance of what we ought to know. We muſt therefore diſtinguiſh between this modeſty and what the French call *mauvaiſe honte*. The one is the auaffected and unaſſuming principle which leads us to give preference to the merit of others, the other is the aukward ſtruggling of nature over her own infimities. The firſt gives an additional luſtre to every good quality; while ſome people, from feeling the pain and inconveniency of the *mauvaiſe honte*, have ruſhed into the other extreme, and turned impudent, as cowards ſometimes grow deſperate from exceſs of danger. The medium between theſe two extremes marks out the well-bred man; he feels himſelf firm and eaſy in all companies, is modeſt without being baſhful, and ſteady without being impudent.

A man poſſeſſing the amiable virtues is ſtill farther prepared to pleaſe, by having in his own mind a perpetual fund of ſatisfaction and entertainment. He is put to no trouble in concealing thoughts which it would be diſgraceful to avow, and he is not anxious to diſplay virtues which his daily converſation and his conſtant looks render viſible.

The next ingredient in the art of pleaſing, is to poſſeſs a correct and enlightened underſtanding, and a fund of rational knowledge. With virtue and modeſty we muſt be able to entertain and inſtruct thoſe with whom we aſſociate.

The faculty of communicating ideas is peculiar to man, and the pleaſure which he derives from the interchange alone is one of the moſt important of his bleſſings. Mankind are formed with numberleſs wants, and with a mutual power of aſſiſting each other. It is a beautiful and happy part of the ſame perfect plan, that they are likewiſe formed to delight in each other's company, and in the mutual interchange of their thoughts. The different ſpecies of communication, in a highly poliſhed age, are as numerous as the different ranks, employments, and occupations of men; and indeed the knowledge which men wiſh to communicate, takes its tinge from their peculiar profeſſion or occupation.

Thus commercial men delight to talk of their trade, and of the nature of public buſineſs; men of pleaſures, who wiſh merely to vary or quicken their amuſements, are in converſation light, trifling, and inſincere; and the literati delight to dwell on new books, learned men, and important diſcoveries in ſcience or in arts. But as the different claſſes of men will frequently meet together, all parties muſt ſo contrive matters, as to combine the uſeful and agreeable together, ſo as to give the greateſt delight at the time, and the greateſt pleaſure on reflection. An attention to theſe principles would make the man of pleaſure and the man of learning meet together on equal terms, and derive mutual advantage from their different qualifications. With due attention to ſuch ideas, we proceed to mention the kinds of knowledge which are moſt fitted for converſation. Thoſe who wiſh to pleaſe ſhould particularly endeavour to be informed in thoſe points which moſt generally occur. An accurate or extenſive knowledge on learned ſubjects is by no means ſufficient: we muſt alſo have an accurate and extenſive knowledge of the common occurrences of life.

It is the knowledge of mankind, of governments, of hiſtory, of public characters, and of the ſprings which put the great and the little actions of the world in motion, which give real pleaſure and rational inſtruction. The knowledge which we communicate muſt in ſome ſhape be intereſting to thoſe to whom we communicate it; of that nature, that the deſire of receiving it may overbalance every kind of diſguſt, excited too often on the ſcore of envy and ſelf-love, againſt thoſe who happen to poſſeſs ſuperior endowments, and at the ſame time of that importance, as to elevate the thoughts ſomewhat above the actions and the faults of the narrow circle formed in our own immediate neighbourhood.

Politeneſs.

bourhood. On this account it is recommended by an author who fully knew mankind, as a maxim of great importance in the art of pleaſing, to be acquainted with the private character of thoſe men who, from their ſtation or their actions, are making a figure in the world. We naturally wiſh to ſee ſuch men in their retired and undiſguiſed moments; and he who can gratify us is highly acceptable. Hiſtory of all kinds, fitly introduced, and occaſionally embelliſhed with pleaſing anecdotes, is a chief part of our entertainment in the intercouſe of life. This is receiving inſtruction, without exciting much envy; it depends on memory, and memory is one of thoſe talents the poſſeſſion of which we leaſt grudge to our neighbour. Our knowledge of hiſtory, at the ſame time, muſt not appear in long and tedious details; but in apt and well choſen alluſions, calculated to illuſtrate the particular ſubject of converſation. But the knowledge moſt neceſſary is that of the human heart. This is acquired by conſtant obſervation on the manners and maxims of the world, connected with that which paſſes in our own minds. This leads us from the common details of conduct, from ſlander and defamation, to the ſources and principles of action, and enables us to enter into what may be called the philoſophy of converſation. We may ſee both the practicability of this kind of diſcourſe, and the nature of it, in the following lines of Horace:

> Sermo oritur, non de villis domibuſve alienis;
> Nec male necne Lepos ſaltet: ſed quod magis ad nos
> Pertinet, & neſcire malum eſt, agitamus: utrumne
> Divitiis homines, an ſint virtute beati?
> Quidve ad amicitias, uſus rectumne, trahat nos?
> Et quæ ſit natura boni, ſummumque quid ejus? &c.

By this means conſtant materials are ſupplied for free, eaſy, and ſpirited communication. The reſtraints which are impoſed on mankind, either from what their own character may ſuffer, or from the apprehenſion of giving offence to others, are entirely taken off, and they have a ſufficient quantity of current coin for all the common purpoſes of life.

In addition to virtue and knowledge, which are the chief ingredients in the art of pleaſing, we have to conſider graceful and eaſy manners. Lord Cheſterfield indeed conſiders theſe as the moſt eſſential and important part; as if the diamond received its whole value from the poliſh. But though he is unqueſtionably miſtaken, there is yet a certain ſweetneſs of manners which is particularly engaging in our commerce with the world. It is that which conſtitutes the character which the French, under the appellation of *l'aimable*, ſo much talk of, and ſo juſtly value. This is not ſo eaſily deſcribed as felt. It is the compound reſult of different things; as complaiſance, a flexibility, but not a ſervility of manners, an air of ſoftneſs in the countenance, geſture, and expreſſion, equally whether you concur or differ with the perſon you converſe with. This is particularly to be ſtudied when we are obliged to refuſe a favour aſked of us, or to ſay what in itſelf cannot be very agreeable to the perſon to whom we ſay it. It is then the neceſſary gilding of a diſagreeable pill. But this, which may be called the *ſuaviter in modo*, would degenerate and ſink into a mean and timid complaiſance and paſſiveneſs, if not ſupported by firmneſs and dignity of character. Hence the Latin ſentence, *ſuaviter in modo, fortiter in re*, becomes an uſeful and important maxim in life.

Politeneſs.

Genuine eaſy manners reſult from a conſtant attention to the relations of perſons, things, time, and places. Were we to converſe with one greatly our ſuperior, we are to be as eaſy and unembarraſſed as with our equals; but yet every look, word, and action, ſhould imply, without any kind of ſervile flattery, the greateſt reſpect. In mixed companies, with our equals, greater eaſe and liberty are allowed; but they too have their proper limits. There is a ſocial reſpect neceſſary. Our words, geſtures, and attitudes, have a greater degree of latitude though not an unbounded one. That eaſineſs of carriage and behaviour which is exceedingly engaging, widely differs from negligence and inattention, and by no means implies that one may do whatever he pleaſes; it only means, that one is not to be ſtiff, formal, and embarraſſed, diſconcerted and aſhamed; but it requires great attention to, and a ſcrupulous obſervation of, what the French call *les bienſeances;* a word which implies "decorum, good-breeding, and propriety." Whatever we ought to do, is to be done with eaſe and unconcern; whatever is improper, muſt not be done at all. In mixed companies, alſo, different ages and ſexes are to be differently addreſſed. Although we are to be equally eaſy with all, old age particularly requires to be treated with a degree of deference and regard. It is a good general rule, to accuſtom ourſelves to have a kind feeling to every thing connected with man; and when this is the caſe, we ſhall ſeldom err in the application. Another important point in the *bienſeances* is, not to run our own preſent humour and diſpoſition indiſcriminately againſt every body, but to obſerve and adopt theirs. And if we cannot command one preſent humour and diſpoſition, it is neceſſary to ſingle out thoſe to converſe with who happen to be in the humour the neareſt to our own. Peremptorineſs and deciſion, eſpecially in young people, is contrary to the *bienſeances:* they ſhould ſeldom ſeem to diſſent, and always uſe ſome ſoftening mitigating expreſſion.

There is a *bienſeance* alſo with regard to people of the loweſt degree; a gentleman obſerves it with his footman, and even indeed with the beggar in the ſtreet. He conſiders them as objects of compaſſion, not of inſult; he ſpeaks to neither in a harſh tone, but corrects the one coolly, and refuſes the other with humanity.

The following obſervations perhaps contain the ſum of the art of pleaſing:

1. A fixed and habitual reſolution of endeavouring to pleaſe, is a circumſtance which will ſeldom fail of effect, and its effect will every day become more viſible as this habit increaſes in ſtrength.

2. This reſolution muſt be regulated by a very conſiderable degree of good ſenſe.

3. It is a maxim of almoſt general application, that what pleaſes us in another will alſo pleaſe others in us.

4. A conſtant and habitual attention to the different diſpoſitions of mankind, to their ruling paſſions, and to their peculiar or occaſional humours, is abſolutely neceſſary.

5. A man who would pleaſe, muſt poſſeſs a firm, equal, and ſteady temper. And,

6. An eaſy and graceful manner, as diſtant from baſhfulneſs on the one hand as from impudence on the other,

Politeneſs, Politian.

Political, Political Arithmetic

other. "He who thinks himſelf ſure of pleaſing (ſays Lord Cheſterfield), and he who deſpairs of it, are equally ſure to fail." And he is undoubtedly in the right. The one, by his aſſuming vanity, is inattentive to the means of pleaſing; and the other, from fear, is rendered incapable of employing them.

A variety of excellent rules for acquiring politeneſs, with ſtrictures on particular kinds of impoliteneſs, may be found in the *Spectator*, *Rambler*, *Idler*, *Lounger*, *Mirror*, and other periodical works of that kind; in *Knox's Eſſays*, and among *Swift's Work's*; ſee *Good Manners*. *Cheſterfield's Art of Pleaſing*, and his *Letters*, are alſo worthy of peruſal, provided the reader be on his guard againſt the inſincerity and other vices which thoſe books are calculated to infuſe, and provided he always bears in mind what we have endeavoured to ſhow in this article, that true politeneſs does not conſiſt in ſpecious manners and a diſſimulating addreſs, but that it muſt always be founded on real worth and intrinſic virtue.

POLITIAN (Angelo), was born at Monte Pulciano in Tuſcany in 1454. He learned the Greek tongue, of which he became a complete maſter, under Andronicus of Theſſalonica. He is ſaid to have written verſes both in Greek and Latin when he was not more than 12 years of age. He ſtudied alſo the Platonic philoſophy under Marſilius Finicus, and that of Ariſtotle under Argyropylus. He was one of the moſt learned and polite writers of his time. The firſt work which gained him a reputation was a poem on the tournament of Julian de Medicis. The account he wrote ſome time after of the conſpiracy of the Pazzi's was very much eſteemed. He wrote many other pieces which have merited approbation; and had he lived longer, he would have enriched the republic of letters with many excellent works; but he died at the age of 40 years. His morals anſwered the homelineſs of his face rather than the beauty of his genius; for Paul Jovius informs us, that "he was a man of aukward and perverſe manners, of a countenance by no means open and liberal, a noſe remarkably large, and ſquinting eyes. He was crafty, ſatirical, and full of inward malice; for his conſtant way was, to ſneer and ridicule the productions of other men, and never to allow any criticiſm, however juſt, upon his own."

He was, nevertheleſs, as all acknowledge, a man of moſt conſummate erudition; and not only ſo, but a very polite and elegant writer. Eraſmus, in his *Ciceronianus*, calls him a rare miracle of nature, on account of his excelling in every kind of writing: his words are remarkable: "*Fateor Angelum prorſus angelica fuiſſe mente, rarum naturæ miraculum, ad quodcunque ſcripti genus applicaret animum.*" Some of his poems were ſo much admired, that ſeveral learned men have made it their buſineſs to comment on them. It has been often reported that he ſpoke of the Bible with great contempt; and that, having read it but once, he complained he had never ſpent his time ſo ill. But this is not probable, for it muſt be remembered that he was a prieſt and canon of Florence; and we learn from one of his Epiſtles that he preached a whole Lent. It does not indeed follow hence, that he did not think contemptuouſly of the Bible, becauſe many of his church, eſpecially among the better ſort, have not been very good believers, and he might be one of them: but it is not likely he would ſpeak out ſo freely. "I could (as Bayle ſays) much more eaſily believe the judgment he is ſaid to have made on the Pſalms of David and the Odes of Pindar: he did not deny that there are many good and fine things in the Pſalms; but he pretended that the ſame things appear in Pindar with more brightneſs and ſweetneſs." The two Scaligers have ſpoken highly of Politian: the elder has preferred a conſolatory elegy of his to that which Ovid ſent to Livia upon the death of Druſus, and ſays, he had rather have been the author of it: the younger calls him an excellent poet, but thinks the ſtyle of his epiſtles too elated and declamatory.

His works have been printed at various times, and in various places: his epiſtles have probably been moſt read, becauſe theſe are things which the generality of people are beſt pleaſed with.

POLITICAL, from πολις "a city," ſignifies any thing that relates to policy or civil government.

Political Arithmetic, is the art of reaſoning by figures upon matters relating to government, ſuch as the revenues, number of people, extent and value of land, taxes, trade, &c. in any nation.

Theſe calculations are generally made with a view to aſcertain the comparative ſtrength, proſperity, &c. of any two or more nations. With this view, Sir William Petty, in his *Political Arithmetic*, p. 74, &c. computes the land of Holland and Zealand to be about 1,000,000 acres, and that of France to be 8,000,000; and yet the former is one-third part as rich and ſtrong as the latter. The ſhipping of Europe he computes to be about 2,000,000, of which Britain has 500,000; Holland 900,000; France 100,000; Hamburgh, Denmark, Sweden, and Dantzic 250,000; and Spain, Portugal, Italy, &c. the reſt. The exports of France he computes at L. 5,000,000, of which one fourth came to Britain; of Holland L. 18,000,000, of which L. 300,000, came to Britain. The money raiſed yearly by the king of France was about L. 6,500,000 Sterling; that of all the Dutch provinces L. 3,000,000, of which 2,100,000 was raiſed in Holland and Zealand. The number of people in England he computed to be ſix millions, and their expences, at L. 7 *per annum* a head, L. 42,000,000; the rent of land L. 8,000,000; and the intereſts, &c. of perſonal eſtates as much, the rents of houſes L.4,000,000, and the profits of labour L. 26,000,000. The people of Ireland he reckoned 1,200,000. The corn ſpent in England, at 5*s*. a buſhel for wheat, and 2*s*. 6*d*. for barley, amounts to L.10,000,000 a-year. The navy of England then required 36,000 men to man it, and other trade and ſhipping 48,000. In France, to manage the whole ſhipping trade, there were then required only 1500 men. The whole people of France were 13,500,000; and thoſe of England, Scotland, and Ireland, about 9,500,000. In the three kingdoms are about 20,000 churchmen, and in France more than 270,000. In the dominions of England were above 40,000 ſeamen, and in France not more than 10,000. In England, Scotland, and Ireland, and all their dependencies, there was then about 60,000 ton of ſhipping, worth about 4,500,000 in money. The ſea-line round England, Scotland, and Ireland, and the adjacent iſles, is about 3800 miles. In the whole world he reckoned about 350,000,000 of people; and thoſe with whom the Engliſh and Dutch have any commerce, not more than eighty millions; and the value of

Political Arithmetic

commodities annually traded for in the whole not above L. 45,000,000. That the manufactures exported from England amounted to about L. 5,000,000 *per annum*; lead, tin, and coals, to L. 500,000 *per annum*. The value of the French commodities then brought into England did not exceed L. 1,200,000 *per annum*; and the whole caſh of England in current money was then about L. 6,000,000 Sterling.

With theſe calculations Dr Davenant was diſſatisfied; and therefore, from the obſervations of Mr Greg. King, he advanced others of his own. He reckons the land of England 39 millions of acres; the number of people 5 millions and a half, increaſing 9000 a year, making allowance for wars, plagues, and other accidents. He reckons the inhabitants of London 530,000; of other cities and market-towns in England 870,000; and thoſe of villages, &c. 4,100,000. The yearly rent of land he reckons L. 10,000,000; of houſes, &c. 2,000,000; the produce of all kinds of grain in a tolerable year L. 9,075,000; the annual rent of corn lands L. 2,200,000, and their net produce L. 9,000,000; the rent of paſture, meadows, woods, foreſts, commons, heaths, &c. L. 7,000,000; the annual produce by cattle in butter, cheeſe, and milk, about L. 2,500,000; the value of the wool yearly ſhorn about L. 2,000,000; of horſes yearly bred about L. 250,000; of the fleſh yearly ſpent as food about L. 3,350,000; of the tallow and hides about L. 600,000; of the hay yearly conſumed by horſes about L. 1,300,000; of the hay conſumed by other cattle L. 1,000,000; of the timber yearly felled for building L. 500,000; and of the wood yearly ſpent in firing, &c. about L. 500,000. The proportion of the land of England to its inhabitants is now about 7¼ acres per head; the value of the wheat, rye, and barley, neceſſary for the ſuſtenance of England, amounts to at leaſt L. 6,000,000 Sterling *per annum*; of the woollen manufacture about L. 8,000,000 *per annum*, and exports of all kinds of the woollen manufacture amount to above L. 2,000,000 *per annum*; the annual income of England, on which the whole people ſubſiſt, and out of which all taxes are paid, is reckoned to be about L. 43,000,000, that of France L. 81,000,000, and of Holland L. 18,250,000. See Davenant's *Eſſay on Trade*, in vol. vi. of his works. For calculations reſpecting mortality, ſee Major Grant's *Obſervations on the Bills of Mortality*, and our article *Bills of Mortality*.

In Vol. XLIX. of the Philoſophical Tranſactions we have an eſtimate of the number of people in England by Dr Brakenridge, from conſidering the number of houſes and quantity of bread conſumed. On the former principle he computes the number of people to be 6,257,418 of all ages, counting in England and Wales 911,310 houſes, and allowing ſix perſons to a houſe. From a ſurvey of the window-lights after the year 1750, the number of houſes charged in England and Wales were 690,000, beſides 200,000 cottages that pay nothing; the whole number therefore was 890,000, and the number of people, allowing ſix to a houſe, 5,340,000. On the latter principle, he eſtimates the number of quarters of wheat conſumed at home to be 2,026,100; and allowing a quarter for three perſons in a year, or ſeven ounces a day for each perſon, he concludes the number of people to be 6,078,300. Of this number, according to Dr Halley's rule, he ſuppoſes about 1,500,000 men able to carry arms. The country he ſuppoſes capable of ſupporting one-half more inhabitants, or 9,000,000; for, according to Mr Templeman's ſurvey, England contains 49,450 ſquare miles, that is, 31,648,000 acres, of which 25,300,000 acres are proper to be cultivated; and allowing three acres, well manured, for the maintenance of one perſon, there will be maintenance in England for 8,430,000 people; to which add the produce of fiſhing, and it will enable the country to ſupport 9,000,000. In Ireland, Mr Templeman reckons 17,536,000 acres, of which Dr Brakenridge thinks 12,000,000 are capable of cultivation; and allowing four acres to each perſon, and the number of inhabitants to be only 1,000,000, Ireland could maintain 2,000,000 more people than it has now. In Scotland, containing 1,500,000 people, and 17,728,000 acres of land, of which there are 11,000,000 good acres, allowing five for each perſon, he ſuppoſes there may be proviſion for 2,200,000 people, or for 700,000 more than there are at preſent. Hence he infers, that were both the Britiſh iſles properly cultivated, there is a proviſion for 6,000,000 inhabitants beyond the preſent number. Extending his ſurvey to the whole globe, he ſuppoſes the whole ſurface to be to the quantity of land as 8 to 3, *i. e.* as 197,819,550 to 74,182,331 ſquare miles; out of which, deducting one-third for waſte-ground, there will be 49,454,887 ſquare miles, or 31,651,127,680 good acres. And ſtating the whole number of inhabitants on the globe to be 400,000,000, there will be 79 good acres to each perſon. See Dr Halley's *Calculations* on the ſame ſubject, and *Dr Price's* (for a liſt of whoſe works ſee his life at the Word Price), and King *on the National Debt*

Political Arithmetic ‖ Polity.

POLITICS, the firſt part of economy or ethics, conſiſting in the well governing and regulating the affairs of a ſtate for the maintenance of the public ſafety, order, tranquillity, and morals.

Lord Bacon divides politics into three parts, viz. the *preſervation* of the ſtate, its *happineſs* and *flouriſhing*, and its *enlargement*. Of the firſt two, he informs us, various authors have treated, but the laſt has never been handled; and he has given a ſpecimen of an eſſay to ſupply the want.

POLITY, or Policy, denotes the peculiar form and conſtitution of the government of any ſtate or nation; or the laws, orders, and regulations, relating thereto *.——Polity differs only from politics, as the theory from the practice of any art.

Of the nature of our ſocial duties, both private and political, we have already ſpoken at ſome length (ſee *Moral Philoſophy*, Part II. chap. iii. and particularly ſect. vii.); and we ſhall have occaſion to take a view of the origin and nature of the ſeveral political eſtabliſhments of Europe, &c. hereafter. (See *Civil Society*.) We ſhall only further remark in this place upon the neceſſity of always joining politics and morality together. This view of the ſubject is indeed antiquated and neglected; but the connection has always been externally reſpected even by thoſe who have ſeparated them the moſt widely. Politics and morality, far from ſtanding in oppoſition to each other, have the moſt intimate connection, and exhibit the relation which the *part* bears to the *whole*; that is to ſay, that politics are only a part or a branch of morality. No truth can be more evident than this;

---

* See Government.

for as morality is the guide of human life, the principle of order, and the univerſal ſource of real improvement and genuine happineſs to all mankind, every thing relative to the direction of individuals, or the government of nations, muſt be comprehended within its ſphere, and be ſubſervient to its laws. All the ſchemes and projects of pretended political wiſdom, that deviate from or violate the rules of this maſter-ſcience, turn out in the iſſue often to the detriment of their contrivers, always to that of the nation; and it is a palpable and abſurd error to think of advancing the happineſs of one country at the expence of the general good of mankind. The experience of ages, and the hiſtory of the world, confirm theſe aſſertions; from which, and from daily obſervation, we obtain a convincing proof of the wiſdom of the good old maxim, both in its application to individuals and to nations, that "honeſty is the beſt policy." See Baron Dahlberg's *Conſiderations on the Connection between Morality and Politics*, read by himſelf to the Academy of Sciences at Erfurt.

POLL, a word uſed in ancient writings for the head: hence to poll, is either to vote, or to enter down the names of thoſe perſons who give their votes at an election.

Poll-Evil. See FARRIERY, § xxxii.

Poll-Money, or *Capitation*, a tax impoſed by authority of the Britiſh parliament on the perſon or head; either on all indifferently, or according to ſome known mark or diſtinction, as quality, calling, &c.

Thus, by the ſtatute 18 Car. II. every ſubject in the kingdom was aſſeſſed by the head, or poll, according to his degree; every duke L.100, marquis L.80, baronet L.30, knight L.20, eſquire L.10, &c. and every ſingle private perſon 12d.

This was no new tax, as appears by former acts of parliament.

POLLACHIUS, or POLLACK. See GADUS.

POLLARD, or CROCARD, the name of a ſort of baſe money current in Ireland in the time of Edward I. See *Simon's Hiſtory of Iriſh Coins*, p. 15.

POLLEN, the fecundating or fertilizing duſt contained within the antheræ or tops of the ſtamina, and diſperſed upon the female organ when ripe for the purpoſes of impregnation. See BOTANY.

This duſt, correſponding to the ſeminal fluid in animals is commonly of a yellow colour; and is very conſpicuous in the ſummits of ſome flowers, as the tulip and lily. Its particles are very minute, and of extreme hardneſs. Examined by the microſcope, they are generally found to aſſume ſome determinate form, which often predominates, not only through all the ſpecies of a particular genus, but alſo through the genera of a natural family or order. The powder in queſtion being triturated, and otherwiſe prepared in the ſtomach of bees, by whom great quantities are collected in the hairy bruſhes with which their legs are covered, is ſuppoſed by ſome authors to produce the ſubſtance known by the name of *wax;* a ſpecies of vegetable oil, rendered concrete by the preſence of an acid, which muſt be removed before the ſubſtance can be rendered fluid.

POLLENTIA, a town or colony of Roman citizens in the Balearis Major. It is now ſaid to be Alcudia, ſituated on the north-eaſt ſide of the iſland Majorca. There was another *Pollentia* of the Picenum, likewiſe a colony. It is thought to be either the ſame with or near to the Urbs Salvia, but is now extinct. There was a third of Liguria, ſituated at the confluence of the Stura and Tanarus. Suetonius calls it a municipium, and the people *Pollentina Plebs*. It was famous for its abundance of black fleeces; but was afterwards, under Arcadius and Honorius, ſtained with a defeat rather of the Romans under Stilico than of the Goths under Alaricus, though palliated by Claudian the poet; after which Rome was taken and ſet on fire. It is now called *Solenza*, a ſmall town of Piedmont, not far from Aſti.

POLLEX, in anatomy, denotes either the thumb or great toe, according as *manus* or *pedis* is added to it.

POLLICHIA, in botany: A genus of the monogynia order, belonging to the monandria claſs of plants; and in the natural method ranking with thoſe that are doubtful. Of this there is only one ſpecies, *viz.* the *campeſtris*, or whorl-leaved pollichia, a native of the Cape of Good Hope, and flowers in September.

POLLICIPES, the TOE-SHELL, in natural hiſtory, is the name of a genus of ſhells, the characters of which are theſe: they are multivalve flat ſhells, of a triangular figure, each being compoſed of ſeveral laminæ, which end in a ſharp point. They ſtand upon pedicles, and are furniſhed with a great number of hairs. We have only one known ſpecies of this genus, which is always found in large cluſters.

POLLICIS PRESSIO, and POLLICIS VERSIO, were uſed at the combats of gladiators as ſignals of life or death to the vanquiſhed combatant; or to the victor to ſpare or take the life of his antagoniſt. The *pollicis preſſio*, by which the people granted life to the proſtrate gladiator, was no more than a clenching of the fingers of both hands together, and ſo holding the two thumbs upright cloſe together. The *pollicis verſio*, which authoriſed the victor to kill the other as a coward, was the bending back of the thumbs. Such is Dacier's opinion; but others ſay the *pollicis preſſio* was when the people held up one hand with the thumb bent, and the *pollicis verſio* when they ſhowed the hand with the thumb raiſed. Authors, however, are not perfectly agreed, though the phraſes *pollicem premere*, and *pollicem vertere*, frequently occur in the Latin claſſics as indications of the people's will that a gladiator ſhould live or die.

POLLIO (Caius Aſinius), a celebrated Latin poet and orator, was of conſular dignity, and compoſed ſome tragedies which were eſteemed, but are now loſt. He was the firſt who opened at Rome a library for the uſe of the public. He was the friend of Mark Antony; which prevented his complying with the ſolicitations of Auguſtus, who preſſed him to embrace his party. At length Auguſtus having wrote ſome verſes againſt Pollio, he was urged to anſwer them: on which he ſaid, "I ſhall take care of writing againſt a man who has the power of proſcribing us." He is praiſed by Virgil and Horace, whoſe patron he was.

There was another *Pollio*, a friend of Auguſtus, who uſed to feed his fiſhes with human fleſh. This cruelty was diſcovered when one of his ſervants broke a glaſs in the preſence of Auguſtus, who had been invited to a feaſt. The maſter ordered the ſervant to be ſeized, but he threw himſelf at the feet of the emperor, and begged him to interfere, and not to ſuffer him to be devoured by fiſhes. Upon this the cauſes of his apprehenſion were examined; and Auguſtus, aſtoniſhed at the barbarity of his favourite, cauſed the ſervant to be diſmiſſed, all the fiſh ponds to be filled up, and the cryſtal glaſſes of Pollio to be broken to pieces.

POLLUTION, in general, ſignifies defilement, or the rendering a perſon or place unclean or unholy. For the Jewiſh pollutions, ſee the article Impurity.

The Romaniſts hold a church to be polluted by the effuſion of blood or of ſeed therein: and that it muſt be conſecrated anew. And the Indians are ſo ſuperſtitious on this head, that they break all the veſſels which thoſe of another religion have drank out of, or even only touched; and drain all the water out of a pond in which a ſtranger has bathed.

Pollution, in medicine, a diſeaſe which conſiſts in an involuntary emiſſion of the ſeed in time of ſleep. This, in different perſons, is very different in degree; ſome being affected with it only once in a week, a fortnight, three weeks, or a month, and others being ſubject to it almoſt every night. The perſons moſt ſubject to it, are young men of a ſanguineous temperament, who feed high and lead a ſedentary life. When this happens to a perſon but once in a fortnight or a month, it is of no great conſequence; but when it happens almoſt every night, it greatly injures the health; the patient looks pale and ſickly; in ſome the eyes become weak and inflamed, are ſometimes affected with violent defluctions, and are uſually at laſt encircled with a livid appearance of the ſkin. This diſtemper is to be cured rather by a change of life than by medicines. When it has taken its riſe from a high diet and a ſedentary life, a coarſer food and the uſe of exerciſe will generally cure it. ' Perſons ſubject to this diſeaſe ſhould never take any ſtimulating purges, and muſt avoid as much as poſſible all violent paſſions of the mind: and though exerciſe is recommended in moderation, yet if this be too violent, it will rather increaſe the diſorder than contribute to its cure.

Self-Pollution. See Onanism.

POLLUX (Julius), a Greek writer of antiquity, flouriſhed in the reign of the emperor Commodus, and was born at Naucrates, a town in Egypt. He was educated under the ſophiſts, and made great progreſs in grammatical and critical learning. He taught rhetoric at Athens, and became ſo famous that he was made preceptor of the emperor Commodus. He drew up for his uſe, and inſcribed to him, while his father Marcus Antoninus was living, an *Onomaſticon* or Greek Vocabulary, divided into ten books. It is extant, and contains a vaſt variety of ſynonymous words and phraſes, agreeably to the copiouſneſs of the Greek tongue, ranged under the general claſſes of things. It was intended to facilitate the knowledge of the Greek language to the young prince; and it is ſtill very uſeful to all who have a mind to be perfect in it. The firſt edition of it was printed at Venice by Aldus in 1502, and a Latin verſion was afterwards made and publiſhed with it: but there was no correct and handſome edition of it till that of Amſterdam, 1706, in folio, by Lederlinus and Hemſterhuſius. Lederlinus went through the firſt ſeven books, correcting the text and verſion, and ſubjoining his own, with the notes of Salmaſius, Iſ. Voſſius, Valeſius, and of Kuhnius, whoſe ſcholar he had been, and whom he ſucceeded in the profeſſorſhip of the oriental languages in the univerſity of Straſburg. Hemſterhuſius continued the ſame method through the three laſt books: this learned man has ſince diſtinguiſhed himſelf by an excellent edition of Lucian, and other monuments of ſolid and profound literature.

Pollux wrote many other things, none of which remain. He lived to the age of 58. Philoſtratus and Lucian have treated him with much contempt and ridicule. *Philoſtrat. de vit. Sophiſt.* lib. ii. and *Lucian in Rhetorum præceptorem.*

Pollux. See Castor and Pollux.

Pollux, in aſtronomy, a fixed ſtar of the ſecond magnitude in the conſtellation Gemini, or the Twins. See Castor.

Pollux and Caſtor, a fiery meteor. See *Castor and Pollux.*

POLOCSKI, a palatinate in the duchy of Lithuania, bounded on the north by the palatinate of Weytepſki, on the ſouth by the Dwina, on the north by Muſcovy, and on the weſt by Livonia. It is a deſert country full of wood, and had formerly its own dukes.

Polocski, a town of Lithuania, and capital of a palatinate of the ſame name, with two caſtles to defend it. It was taken by the Muſcovites in 1563, and retaken the ſame year. It is ſeated on the river Dwina, 50 miles ſouth-weſt of Weytepſki, and 80 eaſt of Braſlaw. E. Long. 29. 0. N. Lat. 56. 4.

POLTROON, or Poltron, a coward or daſtard, wanting courage to perform any thing great or noble. The word is borrowed from the French, who according to Salmaſius, derive it *a pollice truncato*; becauſe anciently thoſe who would avoid going to the wars cut off their thumb. But Menage, with more probability, derives it from the Italian *poltrone*, and that from *poltro* a "bed;" becauſe timorous, puſillanimous people take pleaſure in lying a-bed. Others chooſe to derive the word from the Italian *poltro* a "colt;" becauſe of that creature's readineſs to run away.

POLVERINE, the calcined aſhes of a plant; of a ſimilar nature with our pot-aſhes or pearl-aſhes. It is brought from the Levant and Syria; and in the glaſs-trade it is always to be preferred to any other aſhes. The barilla, or pot-aſhes of Spain, yield more pure ſalt than the polverine of the Levant, but the glaſs made with it has always ſome blue tinge: that made with the polverine is perfectly white, which ought always to be uſed for the fineſt cryſtal.

POLYADELPHIA (from πολυς *many*, and αδελφια *brotherhood)*, many brotherhoods. The name of the 18th claſs of Linnæus's ſexual ſyſtem, conſiſting of plants with hermaphrodite flowers, in which ſeveral ſtamina or male organs are united by their filaments into three or more diſtinct bundles.

POLYÆNUS, the name of many famous men recorded in ancient writers. Among them was Julius Polyænus, of whom we have ſome Greek epigrams extant in the firſt book of the *Anthologia*. The Polyænus whom it moſt concerns us to know about, is the author of the eight books of the Stratagems of illuſtrious Commanders in War. He was probably a Macedonian, and perhaps a ſoldier in the early part of his life; but of this there is no certainty. He was undoubtedly a rhetorician and a pleader of cauſes; and appears, from the dedication of his work to the emperors Antoninus and Verus, to have lived towards the latter part of the ſecond century. The *Stratagemata* were publiſhed in Greek by Iſaac Caſaubon, with notes, in 1589, 12mo; but no good edition of them appeared till that of Leyden, 1690, in 8vo. The title-page runs thus: *Polyæni Stratagematum libri octo, Juſto Vulteio interprete, Pancratius Maaſvicius recenſuit, Iſaaci Caſauboni nec non ſuas notas adjecit.*

We have in this work the various ſtratagems of above 300 captains and generals of armies, chiefly Greeks and barbarians: for the Romans ſeldom uſed ſuch fineſſes; and Polyænus has ſhown further, that he was not well verſed in Roman affairs. A great number of theſe ſtratagems appear to us to be ridiculous or impracticable; and neither the generals, nor even common ſoldiers of our days, would be found ſimple enough to be caught by them. Few of this order are capable of reading *Polyænus's Stratagems*; and if they were, they would reap little benefit from it. The book is uſeful to ſuch as ſtudy the Greek language and antiquity; for many things will be found in it, illuſtrating the cuſtoms and opinions of ancient times. The ſixth and ſeventh books are imperfect.

Polyænus compoſed other works beſides the *Stratagemata.* Stobœus has produced ſome paſſages out of a book *De Republica Macedonum*; and Suidas mentions a piece concerning the Thebans and three books of Tacitus. If death had not prevented, he would have written *Memorabilia of the Emperors Antoninus and Verus*: for he makes a promiſe of this in the preface to his ſixth book of *Stratagems*. Caſaubon, in the dedication of Polyænus to Mornæus, calls him *an elegant, acute, and learned writer*.

POLYANDRIA (from πολυς *many*, and ανηρ a *man* or *huſband)*, many huſbands. The name of the 13th claſs in Linnæus's ſexual method, conſiſting of plants with hermaphrodite flowers, which are furniſhed with ſeveral ſtamina, that are inſerted into the common receptacle of the flower.

POLYANTHEA, a collection of common-places in alphabetical order, for the uſe of orators, preachers, &c. The word is formed from the Greek πολυς *much*, and ανθος *flower*; and has much the ſame meaning with *anthology* or *florilege*. The firſt author of the polyanthea was Dominic Nanni de Mirabellio, whoſe labour has been improved on by Barth. Amantius, and Franc. Torſius; and ſince theſe, by Joſ. Langius, under the title of *Polyanthea nova*, 1613.

POLYANTHUS, in botany. See PRIMULA.

POLYBIUS, a famous Greek hiſtorian, was born at Megalopolis, a city of Arcadia, 205 years before Chriſt; and was the ſon of Lycortas, chief of the republic of the Achæans. He was trained to arms under the celebrated Philopœmen, and is deſcribed by Plutarch carrying the urn of that great but unfortunate general in his funeral proceſſion. He aroſe to conſiderable honours in his own country, but was compelled to viſit Rome with other principal Achæans, who were detained there as pledges for the ſubmiſſion of their ſtate. From hence he became intimate with the ſecond Scipio Africanus, and was preſent with him at the demolition of Carthage. He ſaw Corinth alſo plundered by Mummius, and thence paſſing through the cities of Achaia, reconciled them to Rome. He extended his travels into Egypt, France, and Spain, that he might avoid ſuch geographical errors as he has cenſured in others.

It was in Rome that he compoſed his excellent hiſtory, for the ſake of which his travels were undertaken. This hiſtory was divided into 40 books; but there only remains the five firſt, with extracts of ſome parts of the others. It has had ſeveral editions in Greek and Latin; and there is an Engliſh tranſlation by Mr Hampton. He died at the age of 82.

POLYCARP, one of the moſt ancient fathers of the Chriſtian church, was born towards the end of the reign of Nero, probably at Smyrna; where he was educated at the expence of Caliſta, a noble matron diſtinguiſhed by her piety and charity. He was unqueſtionably a diſciple of St John the Evangeliſt, and converſed familiarly with other of the apoſtles. When of a proper age, Bucolus ordained him a deacon and catechiſt of his church; and upon his death he ſucceeded him in the biſhopric, to which he is ſaid to have been conſecrated by St John, who alſo directed his Apocalypſe, among others, to him, under the title of *the angel of the church of Smyrna*. At length the controverſy about the obſervation of Eaſter beginning to grow high between the eaſtern and weſtern churches, he went to Rome to diſcourſe with thoſe who were of the oppoſite party. The ſee was then poſſeſſed by Anicetus, with whom he had many conferences, that were carried on in the moſt peaceable and amicable manner; and though neither of them could bring the other to embrace his opinion, they both retained their own ſentiments without violating that charity which is the great law of their religion.

Whilſt at Rome he particularly oppoſed the hereſies of Marcian and Valentinus. His conduct on this occaſion is related by Irenæus; who informs us, that when Polycarp paſſed Marcian in the ſtreet without ſpeaking, Marcian ſaid, "Polycarp, own us!" To which he replied with indignation, "I own thee to be the firſt-born of Satan." Irenæus adds, that when any heretical doctrines were ſpoken in his preſence, he would ſtop his ears and ſay, "Good God! to what times haſt thou reſerved me, that I ſhould hear ſuch things!" and immediately left the place. He was wont to tell, that St John, going into a bath at Epheſus, and finding Cerinthus the heretic in it, immediately ſtarted back without bathing, crying out, "Let us run away, leſt the bath ſhould fall upon us while Cerinthus the enemy of truth is in it." Polycarp governed the church of Smyrna with apoſtolic purity, till he ſuffered martyrdom in the 7th year of Marcus Aurelius; the manner of which is thus related.

The perſecution waxing hot at Smyrna, and many having ſealed their faith with their blood, the general cry was, "Away with the impious; let Polycarp be ſought for." Upon which he privately withdrew into a neighbouring village, where he continued for ſome time praying night and day for the peace of the church. He was thus employed, when one night he fell into a trance, and dreamed that his pillow took fire, and was burnt to aſhes; which, when he awoke, he told his friends was a preſage that he ſhould be burnt alive for the cauſe of Chriſt. Three days afterwards, in order to eſcape the inceſſant ſearch for him, he retired into another village: his enemies, however, were at hand, who ſeized upon two youths (one of whom they forced by ſtripes to a confeſſion), by whom they were conducted to his lodging. He might have ſaved himſelf by getting into another houſe; but he ſubmitted, ſaying, "The will of the Lord be done." He therefore came down from his bed-chamber, and ſaluting his perſecutors with a ſerene and cheerful countenance, he ordered a table to be ſet with proviſions, invited them to partake of them, and only requeſted for himſelf one hour for prayer; after which he was ſet upon an aſs, and conducted towards Smyrna. On the road he met Herod an irenarch or juſtice of the province, and his father, who were the principal inſtigators of the perſecution. Herod took him up into his chariot, and ſtrenuouſly endeavoured to undermine his conſtancy; but having failed in the attempt, he thruſt him out of the chariot with ſo much violence and indignation, that he bruiſed his thigh with the fall. When at the place of execution, there came, as is ſaid, a voice from heaven, ſaying, "Polycarp, be ſtrong, and quit thyſelf like a man." Before the tribunal he was urged to ſwear by the genius of Cæſar. "Repent (ſays the proconſul), and ſay with us, take away the impious." Whereupon the martyr looking round at the crowd with a ſevere and angry countenance, beckoned with his hand, and looking up to heaven, ſaid with a ſigh, in a very different tone from what they meant, "Take away the impious." At laſt, confeſſing himſelf to be a Chriſtian, the crier thrice proclaimed his confeſſion, and the people ſhouted, "This is the great doctor of Aſia, and the father of the Chriſtians; this is the deſtroyer of our gods, that teaches men not to do ſacrifice, or worſhip the deities." When the fire was prepared, Polycarp requeſted not to be nailed, as uſual, but only tied to the ſtake; and after a ſhort prayer, which he pronounced with a clear and audible voice, the executioner blew up the fire, which increaſing to a mighty flame, "Behold a wonder ſeen (ſays my author) by us who were purpoſely reſerved, that we might declare it to others; the flames diſpoſing themſelves, into the reſemblance of an arch, like the ſails of a ſhip ſwelled with the wind, gently encircled the body of the martyr, who ſtood all the while in the midſt, not like roaſted fleſh, but like the gold or ſilver purified in the furnace, his body ſending forth a delightful fragrancy, which, like frankincenſe or ſome other coſtly ſpices, preſented itſelf to our ſenſes. The infidels, exaſperated by the miracle, commanded a ſpearman to run him through with a ſword: which he had no ſooner done, but ſuch a vaſt quantity of blood flowed from the wound as extinguiſhed the fire; when a dove was ſeen to fly from the wound, which ſome ſuppoſe to have been his ſoul, clothed in a viſible ſhape at the time of its departure (A)." The Chriſtians endeavoured to carry off his body entire, but were not allowed by the irenarch, who commanded it to be burnt to aſhes. The bones, however, were gathered up, and decently interred by the Chriſtians.

Thus died St Polycarp, the 7th of the kalends of May, A. C. 167. The amphitheatre on which he ſuffered was moſtly remaining not many years ago; and his tomb, which is in a little chapel in the ſide of a mountain, on the ſouth-eaſt of the city, was ſolemnly viſited by the Greeks on his feſtival day; and for the maintenance and repairing of it, travellers were wont to throw a few aſpers into an earthen pot that ſtands there for the purpoſe. He wrote ſome homilies and epiſtles, which are now loſt, except that to the Philippians, which is a truly pious and Chriſtian piece, containing ſhort and uſeful precepts and rules of life, which St Jerome informs us was even in his time read in the public aſſemblies of the Aſiatic churches. It is ſingularly uſeful in proving the authenticity of the books of the New Teſtament; for he has ſeveral paſſages and expreſſions from Matthew, Luke, the Acts, St Paul's Epiſtles to the Philippians, Epheſians, Galatians, Corinthians, Romans, Theſſalonians, Coloſſians, 1ſt Timothy, 1ſt Epiſtle of St John, and 1ſt of Peter; and makes particular mention of St Paul's Epiſtle to the Epheſians. Indeed his whole Epiſtle conſiſts of phraſes and ſentiments taken from the New Teſtament (B).

POLYCARPON, in botany: A genus of the trigynia order, belonging to the triandria claſs of plants; and in the natural method ranking under the 22d order, *Caryophyllei*. The calyx is pentaphyllous; there are five very ſmall ovate petals; the capſule is unilocular and trivalved.

POLYCHREST, in pharmacy, ſignifies a medicine that ſerves for many uſes, or that cures many diſeaſes.

Sal Polychrest, a compound ſalt made of equal parts of ſaltpetre and ſulphur, deflagrated in a red-hot crucible.

POLYCNEMUM, in botany: A genus of the monogynia order, belonging to the triandria claſs of plants; and in the natural method ranking under the 12th order, *Holoraceæ*. The calyx is triphyllous; and there are five calciform petals, with one ſeed almoſt naked.

POLYCRATES, was a tyrant of Samos, famous for the good fortune which always attended him. He became very powerful; and got poſſeſſion not only of the neighbouring iſlands, but alſo of ſome cities on the coaſt of Aſia. He had a fleet of 100 ſhips of war and was ſo univerſally eſteemed, that Amaſis the king of Egypt made a treaty of alliance with him. The Egyptian king was, however, afraid of his continued proſperity, and adviſed him to chequer his enjoyments, by relinquiſhing ſome of his moſt favourite objects. Polycrates, in compliance, threw into the ſea a beautiful ſeal, the moſt valuable of his jewels. The loſs of ſo precious a ſeal afflicted him for ſome time; but ſoon after he received as a preſent a large fiſh, in whoſe belly it was found. Amaſis no ſooner heard this, than he gave up all alliance with the tyrant of Samos, and obſerved, that ſooner or later his good fortune would vaniſh. Some time after Polycrates viſited Magneſia on the Mæander, where he had been invited by Orontes the governor. Here he was ſhamefully put to death, merely becauſe the governor wiſhed to terminate his proſperity. The

(A) The miraculous part of this account is ridiculed by Dr Middleton in his Free Enquiry and Defence of it; but ſomething is offered in its favour by Mr Jortin, who obſerves, "the circumſtances are ſufficient only to create a pauſe and a doubt." *Remarks on Eccl. Hiſt.* vol. i.

(B) Jortin, vol. i. p. 68. who to the particulars made out by Cotelerius, has added one from Galat. iv. 26. and another from Hebr. iv. 12, 13.

daughter of Polycrates had diſſuaded her father from going to the houſe of Orontes, on account of the bad dreams which ſhe had, but in vain.

POLYCROTA, in the naval architecture of the ancients, is a word uſed to expreſs ſuch of their galleys as had three, four, five, or more tiers of rowers, ſeated at different heights; they were diſtinguiſhed by this term from the *monocrota*, or thoſe which had only ſingle rows of oars. The number of rows of rowers in the polycrote galleys has given occaſion to ſome to ſuppoſe thoſe veſſels of ſuch a height from the water as is ſcarce credible. Commentators are not at all agreed upon the conſtruction of theſe veſſels.

POLYDAMAS, was a famous athlete, who imitated Hercules in whatever he did. He killed a lion with his fiſt, and it is reported he could ſtop a chariot with his hand in its moſt rapid courſe. He was one day with ſome of his friends in a cave, when on a ſudden a large piece of rock came tumbling down, and while all fled away he attempted to receive the falling fragment in his arms. His prodigious ſtrength, however, was inſufficient, and he was inſtantly cruſhed to pieces under the rock.

POLYDECTES, a ſon of Magnes, was king of the iſland of Seriphos. He received with great kindneſs Danae and her ſon Perſeus, who had been expoſed on the ſea by Acriſius. He took great care of the education of Perſeus; but becoming enamoured of Danae, he removed her from his kingdom, apprehenſive of his reſentment. He afterwards paid his addreſſes to Danae; and being rejected, he prepared to offer her violence. Danae fled to the altar of Minerva for protection; and Dictys, the brother of Polydectes, who had himſelf ſaved her from the ſea-waters, oppoſed her raviſher, and armed himſelf in her defence. At this critical moment Perſeus arrived; and with Meduſa's head he turned into ſtones Polydectes, with the aſſociates of his guilt. The crown of Seriphos was given to Dictys, who had ſhown himſelf ſo active in the cauſe of innocence.

POLYDORE virgil. See Virgil.

POLYDORUS, a ſon of Priam by Hecuba, or, according to others, by Laothoe, the daughter of Altes, king of Pedaſus. Being young and inexperienced when Troy was beſieged by the Greeks, his father removed him to the court of Polymneſtor, king of Thrace, to whoſe care he entruſted the greateſt part of his treaſures, till his country ſhould be freed from foreign invaſion. On the death of Priam, Polymneſtor made himſelf maſter of the riches which were in his poſſeſſion; and to enſure them the better, he murdered the young prince, and threw his body into the ſea, where it was found by Hecuba. According to Virgil, his body was buried near the ſhore by his aſſaſſin; and there grew on his grave a myrtle, whoſe boughs dropped blood, when Æneas going to Italy, attempted to tear them from the tree.

POLYGALA, milkwort: A genus of the octandria order, belonging to the diadelphia claſs of plants; and in the natural method ranking under the 33d order, *Lomentaceæ*. The calyx is pentaphyllous, with two of its leaflets wing-ſhaped and coloured; the legumen is obcordate and bilocular. There are 24 ſpecies; of which the moſt remarkable are,

1. The vulgaris, or common milkwort, is a native of the Britiſh heaths and dry paſtures. The ſtalks are about five or ſix inches long, ſeveral ariſing from the ſame root: the leaves are firm, ſmooth, entire, and grow alternate upon the ſtalks, which are terminated with ſpikes of flowers, moſt commonly blue, but often red or white: the calyx conſiſts of five leaves, three of which are ſmall and green, two below, and one above the corolla; the other two intermediate ones are large, oval, flat-coloured, veined, and reſemble petals, which at length turn greeniſh, and remain a defence to the ſeed-veſſel; the corolla conſiſts of three petals folded together, and forming a tube: the carina is terminated by a kind of heart-ſhaped, concave appendage, fringed at the extremity. The root of this plant has a bitter taſte, and has been found to poſſeſs the virtues of the American rattleſnake-root. It purges without danger, and is alſo emetic and diuretic; ſometimes operating all the three ways at once. A ſpoonful of the decoction made by boiling an ounce of the herb in a pint of water till one half has exhaled, has been found ſerviceable in pleuriſies and fevers, by promoting a diaphoreſis and expectoration; and three ſpoonfuls of the ſame, taken once an hour, has proved beneficial in the dropſy and anaſarca. It has alſo been found ſerviceable in conſumptive complaints.

2. The ſenega, or ſeneka, rattleſnake-wort, grows naturally in moſt parts of North America. This hath a perennial root compoſed of ſeveral fleſhy fibres, from which ariſe three or four branching ſtalks which grow erect, garniſhed with ſpear-ſhaped leaves placed alternately. The flowers are produced in looſe ſpikes at the end of the branches: they are ſmall, white, and ſhaped like thoſe of the common ſort. It flowers in July, but the plants do not produce ſeeds. The root of this ſpecies operates more powerfully than the laſt; but beſides the virtues of a purgative, emetic, and diuretic, it has been recommended as an antidote againſt the poiſon of a rattleſnake; but this opinion is now exploded. It ſtill, however, maintains its character in ſeveral diſorders. Its efficacy, particularly in pleuriſies, is moſt fully eſtabliſhed in Virginia: formerly near 50 out of 100 died of that diſtemper, but by the happy uſe of this root hardly three out of the ſame number have been loſt.

As the ſeeds of the rattleſnake-wort ſeldom ſucceed even in the countries where the plant is a native, the beſt method of propagating it in Europe is to procure the roots from America, and plant them in a bed of light earth in a ſheltered ſituation, where they will thrive without any other culture than keeping them free from weeds. But though the plant will ſtand out ordinary winters, it will be proper to cover it during that ſeaſon with old tanner's bark, or other mulch, to keep out the froſt.

POLYGAMIA (πολυς *many*, and γαμος *marriage*). This term, expreſſing an intercommunication of ſexes, is applied, by Linnæus, both to plants and flowers. A polygamous plant is that which bears both hermaphrodite flowers and male or female, or both.

POLYGAMY, a plurality of wives or huſbands, in the poſſeſſion of one man or woman at the ſame time.

Polygamy is ſo univerſally eſteemed unlawful, and even unnatural, through Europe, and in all Chriſtian countries, that we have generally reaſoned upon this conviction. Both religion and reaſon appear at firſt ſight at leaſt to condemn it; and with this view of the ſubject mankind in general reſt ſatisfied: but ſome bolder geniuſes have taken the oppoſite ſide of the queſtion; have caſt off the prejudices of education, and attempted to ſhow that polygamy is not unlawful, but that it is juſt and neceſſary, and would be a public benefit. Such writers, to uſe the words of an intelligent critic[*], "recur to the common ſubterfuge, of which every *ſetter up of ſtrange gods*, and every CONSCIENTIOUS troubler of the public peace, have artfully availed themſelves to ſilence the clamour of expoſtulation. 'TRUTH! TRUTH!' is their general cry: and with this hopeful pretence, prudence and humility, and every amiable and uſeful virtue; are left behind; while CONSCIENCE (*conſcience!*) blindly ruſhes forward to oppoſe order, inſult authority, and overturn the cuſtoms of ages."

But notwithſtanding theſe fair pretences, it will, we doubt not, be eaſy to ſhow that truth is not upon their ſide; prudence and delicacy are certainly at open war with them: for Dr Percival, Phil. Tranſ. vol. lxvi. part i. p. 163. has very juſtly obſerved, that the practice is brutal, deſtructive to friendſhip and moral ſentiment, inconſiſtent with one great end of marriage, the education of children, and ſubverſive of the natural rights of more than half of the ſpecies. Beſides, it is injurious to population, and therefore can never be countenanced or allowed in a well-regulated ſtate; for though the number of females in the world may conſiderably exceed the number of males, yet there are more men capable of propagating their ſpecies than women capable of bearing children; and it is a well-known fact, that Armenia, in which a plurality of wives is not allowed, abounds more with inhabitants than any other province of the Turkiſh empire.

Indeed it appears, that in ſome countries where it is allowed, the inhabitants do not take advantage of it. "The Europeans (ſays M. Niebuhr[†]) are miſtaken in thinking the ſtate of marriage ſo different among the Muſſulmans from what it is with Chriſtian nations. I could not diſcern any ſuch difference in Arabia. The women of that country ſeem to be as free and as happy as thoſe of Europe can poſſibly be. Polygamy is permitted, indeed, among Mahometans, and the delicacy of our ladies is ſhocked at this idea; but the Arabians rarely avail[‡] themſelves of the privilege of marrying four lawful wives, and entertaining at the ſame time any number of female ſlaves. None but rich voluptuaries marry ſo many wives, and their conduct is blamed by all ſober men. Men of ſenſe, indeed, think this privilege rather troubleſome than convenient. A huſband is by law obliged to treat his wives ſuitably to their condition, and to diſpenſe his favours among them with perfect equality: but theſe are duties not a little diſagreeable to moſt Muſſulmans; and ſuch modes of luxury are too expenſive to the Arabians, who are ſeldom in eaſy circumſtances. I muſt, however, except one caſe; for it ſometimes happens that a man marries a number of wives in the way of commercial ſpeculation. I know a Mullah, in a town near the Euphrates, who had married four wives, and was ſupported by the profits of their labour."

See a curious kind of polygamy under the article NAYRES. The ancient Britons, too, had a kind of polygamy among them, 12 women being common to 12 men.

Selden has proved, in his *Uxor Hebraica*, that plurality of wives was allowed of, not only among the Hebrews, but alſo among all other nations, and in all ages. It is true, the ancient Romans were more ſevere in their morals, and never practiſed it, though it was not forbid among them: and Mark Antony is mentioned as the firſt who took the liberty of having two wives.

From that time it became pretty frequent in the empire till the reigns of Theodoſius, Honorius, and Arcadius, who firſt prohibited it by expreſs law in 393. After this the emperor Valentinian, by an edict, permitted all the ſubjects of the empire if they pleaſed, to marry ſeveral wives; nor does it appear, from the eccleſiaſtical hiſtory of thoſe times, that the biſhops made any oppoſition to this introduction of polygamy. In effect, there are ſome even among the Chriſtian caſuiſts who do not look on polygamy as in itſelf criminal. Jurieu obſerves, that the prohibition of polygamy is a poſitive law; but from which a man may be exempted by ſovereign neceſſity. Baillet adds, that the example of the patriarchs is a very powerful argument in favour of polygamy: of theſe arguments we ſhall ſpeak hereafter.

It has been much diſputed among the doctors of the civil law whether polygamy be adultery. In the Roman law it is called *ſtuprum*, and puniſhed as ſuch, that is, in ſome caſes, capitally. But a ſmaller puniſhment is more conſiſtent with the Jewiſh law, wherein the prohibition of adultery is perpetual, but that of polygamy temporary only.

In Germany, Holland, and Spain, this offence is differently puniſhed. By a conſtitution of Charles V. it was a capital crime. By the laws of ancient and modern Sweden it is puniſhed with death. In Scotland it is puniſhed as perjury.

In England it is enacted by ſtatute 1 Jac. I. cap. 11. that if any perſon, being married, do afterwards marry again, the former huſband or wife being alive, it is felony, but within the benefit of clergy. The firſt wife in this caſe ſhall not be admitted as an evidence againſt her huſband, becauſe ſhe is the true wife; but the ſecond may, for ſhe is indeed no wife at all; and ſo *vice verſa* of a ſecond huſband. This act makes an exception to five caſes, in which ſuch ſecond marriage, tho' in the three firſt it is void, is, however, no felony. 1. Where either party hath been continually abroad for ſeven years, whether the party in England had notice of the other's being living or not. 2. Where either of the parties hath been abſent from the other ſeven years within the kingdom, and the remaining party hath had no notice of the other's being alive within that time. 3. Where there is a divorce or ſeparation *a menſa et thora* by ſentence in the eccleſiaſtical court. 4. Where the firſt marriage is declared abſolutely void by any ſuch ſentence, and the parties looſed *a vinculo*. Or, 5. Where either of the parties was under the age of conſent at the time of the firſt marriage; for in ſuch caſe the firſt marriage was voidable by the diſagreement of either party, which this ſecond marriage very clearly amounts to. But if at the age of conſent the parties had agreed to the marriage which completes the contract, and is indeed the real marriage, and afterwards one of them ſhould marry again, judge Blackſtone apprehends that ſuch ſecond marriage would be within the reaſon and penalties of the act.

Bernardus Ochinus, general of the order of Capuchins, and afterwards a Proteſtant, publiſhed, about the middle of the 16th century, Dialogues in favour of Polygamy, which where anſwered by Theodore Beza. And about the concluſion of the laſt century we had at London an artful treatiſe publiſhed in behalf of a plurality of wives, under the title of *Polygamia Triumphatrix:* the author whereof aſſumes the name of *Theophilus Aletheus;* but his true name was *Lyſerus.* He was a native of Saxony. It has been anſwered by ſeveral.

[†] Heron's Tranſlation of Niebuhr's Travels.

[‡] See Hindoos, nº 9.

A new argument in favour of polygamy has been adduced by Mr Bruce, on this principle, that in ſome parts of the world the proportion of female children is much greater than that of males. "From a diligent inquiry (ſays he) into the ſouth and ſcripture-part of Meſopotamia, Armenia, and Syria, from Mouſul or Nineveh to Aleppo and Antioch, I find the proportion to be fully two women to one man. There is indeed a fraction over, but it is not a conſiderable one. From Latikea, Laodicea *ad mare*, down the coaſt of Syria to Sidon, the number is nearly three, or two and three fourths, to one man. Through the Holy Land, the country called *Horan*, in the Iſthmus of Suez, and the parts of the Delta unfrequented by ſtrangers, it is ſomething leſs than three. But from Suez to the Straits of Babelmandel, which contains the three Arabias, the proportion is fully four women to one man; which I have reaſon to believe holds as far as the line, and 30° beyond it. The Imam of Sama was not an old man when I was in Arabia Felix in 1769; but he had 88 children then alive, of whom 14 only were ſons. The prieſt of the Nile had 70 and odd children; of whom, as I remember, above 50 were daughters.

"It may be objected, that Dr Arburthnot, in quoting the bills of mortality for 20 years, gave the moſt unexceptionable grounds for his opinion; and that my ſingle aſſertion of what happens in a foreign country, without further foundation, cannot be admitted as equivalent teſtimony: and I am ready to admit this objection, as there are no bills of mortality in any of theſe countries. I ſhall therefore ſay in what manner I attained the knowledge which I have juſt mentioned. Whenever I went into a town, village, or inhabited place, dwelt long in a mountain, or travelled journeys with any ſet of people, I always made it my buſineſs to inquire how many children they had, or their fathers, their next neighbours or acquaintance. I then aſked my landlord at Sidon, ſuppoſe him a weaver, how many children he has had? He tells me how many ſons and how many daughters. The next I aſk is a tailor, a ſmith, &c. in ſhort every man who is not a ſtranger, from whom I can get the proper information. I ſay, therefore, that a medium of both ſexes, ariſing from three or four hundred families, indiſcriminately taken, ſhall be the proportion in which one differs from the other; and this, I am confident, will give the reſult to be three women in 50° of the 90° under every meridian of the globe."

Our author corroborates this argument by ſuppoſing that Mahomet perceived this diſproportion, and that upon it he founded his inſtitution allowing one man to have four wives. "With this view he enacted, or rather revived, the law which gave liberty to every individual to marrry four wives, each of whom was to be equal in rank and honour, without any preference but what the predilection of the huſband gave her."

Having thus eſtabliſhed, as he ſuppoſes, the neceſſity of polygamy in the Eaſt, Mr Bruce proceeds to conſider whether there is not ſome other reaſons why it ſhould not be practiſed in Britain farther than the mere equality in numbers of the ſexes to one another. This reaſon he finds in the difference between the conſtitutions of the Europeans and eaſtern nations. "Women in England (ſays he) are capable of child-bearing at 14; let the other term be 48, when they bear no more; 34 years therefore an Engliſh woman bears children. At the age of 14 or 15 they are objects of our love; they are endeared by bearing us children after that time; and none, I hope, will pretend, that at 48 and 50 an Engliſhwoman is not an agreeable companion. The Arab, on the other hand, if ſhe begins to bear children at 11, ſeldom or never has a child after 20. The time, then, of her child-bearing is nine years; and four women, taken altogether, have then the term of 36. So that the Engliſh woman that bears children for 34 years has only two years leſs than the term enjoyed by the four wives whom Mahomet has allowed; and if it be granted that an Engliſh wife may bear at 50, the terms are equal. But there are other grievous differences. An Arabian girl, at 11 years old, by her youth and beauty, is the object of man's deſire: being an infant, however, in underſtanding, ſhe is not a rational companion for him. A man marries there, ſay at 20; and before he is 30, his wife, improved as a companion, ceaſes to be an object of his deſires and a mother of children: ſo that all the beſt and moſt vigorous of his days are ſpent with a woman he cannot love; with her he would be deſtined to live 40, or 45 years, without comfort to himſelf by increaſe of family, or utility to the public. The reaſons, then, againſt polygamy, which ſubſiſt in England, do not by any means ſubſiſt in Arabia; and that being the caſe, it would be unworthy of the wiſdom of God, and an unevenneſs in his ways, which we ſhall never ſee, to ſubject two nations under ſuch different circumſtances abſolutely to the ſame obſervances."

To all this argumentation, however, it may be replied, that whatever we may now ſuppoſe to be the conſtitution of nature in the warmer parts of the globe, it certainly was different at the beginning. We cannot indeed aſcertain the exact poſition of the Garden of Eden; but it is with reaſon ſuppoſed not to have been far from the ancient ſeat of Babylon. In that country, therefore, where Mr Bruce contends that *four* women are neceſſary to the comfort of one man, it pleaſed God to grant only *one* to the firſt man; and that, too, when there was more occaſion for population than ever there has been ſince, becauſe the whole earth was to be peopled from a ſingle pair. Matters were not altered at the flood; for Noah had but one wife. And this is the very argument uſed by our Saviour himſelf when ſpeaking of divorce without any ſufficient cauſe, and then marrying another woman, which is a ſpecies of polygamy.—Again, with reſpect to the alleged multiplicity of females in the eaſtern part of the world, it is by no means probable that the calculations of Mr Bruce or any other perſon can be admitted in this caſe. Hiſtory mentions no ſuch thing in any nation; and conſidering the vaſt deſtruction among the male part of the human ſpecies more than of the females by war and other accidents, we may ſafely ſay, that if *four* women children were born for every ſingle male, there would in ſuch countries be five or ſix grown up women for every man; a proportion which we may venture to affirm does not, nor ever did, exiſt anywhere in the world. That it was not ſo in former times we can only judge from the particular examples recorded in hiſtory, and theſe are but few. We read in the Greek hiſtory, indeed, of the *fifty* daughters of Danaus; but theſe were matched by as many *ſons* of another man. Job had only one wife, yet had *ſeven* ſons and but *three* daughters. Jacob had two wives, who bore *twelve* ſons, and only one daughter. Abraham had only one child by his firſt wife, and that was a ſon. By his ſecond wife Keturah he had ſix ſons; and conſidering his advanced age at the time he married her, it is by no means probable that he could have 24 daughters; nay, if, as Mr Bruce tells us, the women in the eaſtern countries bear children only for nine years, it was impoſſible ſhe could have ſo many. Gideon, who had many wives, had no fewer than ſeventy ſons by theſe wives, and even his concubine had a ſon; ſo that if all theſe women had produced according to Mr Bruce's proportion, of nearly three females to one male, he muſt have had almoſt 284 children; a better family than any of Mr Bruce's eaſtern acquaintances can probably boaſt of.

With regard to this ſubject, however, it muſt be obſerved, that the procreation of male or female children depends in ſome degree on the health and vigour of the parents. It is by no means improbable, therefore, that the eaſtern voluptuaries, whoſe conſtitutions are debilitated by their exceſſes, may have many more female than male children born to them. The women themſelves, by premature enjoyment, will alſo be inclined to produce females inſtead of males; but neither of theſe circumſtances can prove this to be an original law of nature. Something like this may be gathered from ſacred hiſtory. Gideon abovementioned, who was a hardy and active warrior, had many ſons. The ſame was the caſe with David, who led an active and laborious life; while Solomon, who was a voluptuary, had only one ſon, notwithſtanding his multitude of wives.

The moſt barefaced defence of polygamy that has appeared in modern times is by the Rev. Mr Madan, who publiſhed a treatiſe, artfully vindicating, and ſtrongly recommending it, under the title of *Thelyphthora*; or, *A treatiſe on Female Ruin, in its Cauſes, Effects, Conſequences, Prevention, and Remedy*, &c. Marriage, according to this writer, ſimply and wholly conſiſts in the act of perſonal union, or *actus coitus*. Adultery, he ſays, is never uſed in the ſacred writings but to denote the defilement of a betrothed or married woman, and to this ſenſe he reſtricts the uſe of the term; ſo that a married man, in his opinion, is no adulterer, if his commerce with the ſex be confined to ſingle women, who are under no obligations by eſpouſals or marriage to other men: but, on the other hand, the woman who ſhould dare to have even but once an intrigue with any other man beſides her huſband, (let him have as many wives as Solomon), would, *ipſo facto*, be an adultereſs, and ought, together with her gallant, to be puniſhed with immediate death. This, he boldly ſays, is the law of God: and on this foundation he limits the privilege of polygamy to the man; in ſupport of which he refers to the polygamous connections of the patriarchs and ſaints of the Old Teſtament, and infers the lawfulneſs of their practice from the bleſſings which attended it, and the laws which were inſtituted to regulate and ſuperintend it. He contends for the lawfulneſs of Chriſtians having, like the ancient Jews, more wives than one; and labours much to reconcile the genius of the evangelical diſpenſation to an arrangement of this ſort. With this view he aſſerts, that there is not one text in the New Teſtament that even hints at the criminality of a polygamous connection; and he would infer from St Paul's direction, that biſhops and deacons ſhould have but one wife, that it was lawful for laymen to have more. Chriſt, he ſays, was not the giver of a new law; but the buſineſs of marriage, polygamy, &c. had been ſettled before his appearance in the world, by an authority which could not be revoked. Beſides, this writer not only thinks polygamy lawful in a religious, but advantageous in a civil, light, and highly politic in a domeſtic view.

In defence of his notion of marriage, which, he ſays, conſiſts in the union of man and woman as one body, the effects of which in the ſight of God no outward forms or ceremonies of man's invention can add to or detract from, he grounds his principal argument on the Hebrew words made uſe of in Gen. ii. 24. to expreſs the primitive inſtitution of marriage. viz. דבק באשתו, rendered by the LXX. προσκολληθησεται προς την γυναικα αυτου, which tranſlation is adopted by the evangeliſt (Mat. xix. 5.) with the omiſſion only of the ſuperfluous prepoſition (προς) after the verb. Our tranſlation, "ſhall cleave to his wife," doth not, he ſays, convey the idea of the Hebrew, which is literally, as Montanus renders the words, "ſhall be joined or cemented *in* his woman, and they ſhall become (*i. e.* by this union) one fleſh." But on this criticiſm it is well remarked, that both the Hebrew and Greek terms mean ſimply and literally attachment or adherence; and are evidently made uſe of in the ſacred writings to expreſs the whole ſcope of conjugal fidelity and duty though he would reſtrain them to the groſſer part of it.

With reſpect to the Moſaic law, for which Mr Madan is a warm advocate, it was certainly a local and temporary inſtitution, adapted to the ends for which it was appointed, and admirably calculated, in its relation to marriage, to maintain and perpetuate the ſeparation of the Jewiſh people from the Gentiles. In attempting to depreciate the outward forms of marriage, this writer would make his readers believe, that becauſe none are explicitly deſcribed, therefore none exiſted; and conſequently that they are the ſuperfluous ordinances of human policy. But it is evident, from comparing Ruth iv. 10. 13. with Tobit vii. 13. 14. and from the caſe of Dinah, related Gen. xxxiv. that ſome forms were deemed eſſential to an honourable alliance by the patriarchs and ſaints under the Old Teſtament, excluſive of the carnal knowledge of each other's perſons. It is alſo evident in the caſe of the woman of Samaria, whoſe connection with a man not her huſband is mentioned in John iv. that ſomething beſides cohabitation is neceſſary to conſtitute marriage in the ſight of God.

Having ſtated his notion of marriage, he urges, in defence of polygamy, that, notwithſtanding the ſeventh commandment, it was allowed by God himſelf, who made laws for the regulation of it, wrought miracles in ſupport of it by making the barren women fruitful, and declared the iſſue legitimate to all intents and purpoſes. God's allowance of polygamy is argued from Exod. xxi. 10. and particularly from Deut. xxi. 15, which, he ſays, amounts to a demonſtration. This paſſage, however, at the utmoſt, only preſuppoſes that the practice might have exiſtence among ſo hard-hearted and fickle a people as the Jews; and therefore wiſely provides againſt ſome of its more unjuſt and pernicious conſequences, ſuch as tended to affect the rights and privileges of heirſhip. Laws enacted to regulate it cannot be fairly urged in proof of its lawfulneſs on the author's own hypotheſis; becauſe laws were alſo made to regulate divorce, which Mr Madan condemns as abſolutely unlawful, except in caſes of adultery. Beſides, it is more probable that the "hated wife" had been diſmiſſed by a bill of divorcement, than that ſhe was retained by her huſband: and moreover, it is not certain but that the two wives, ſo far from living with the ſame huſband at the ſame time, might be dead; for the words may be rendered thus, "if there *ſhould have been* to a man two wives, &c." The words expreſſing the original inſtitution of marriage, Gen. ii. 24. compared with Mat. xix. 4, 5, 8. afford inſuperable objections againſt Mr Madan's doctrine of polygamy.

If we appeal on this ſubject, from the authority of Scripture to the writings of the earlieſt fathers in the Chriſtian church, there is not to be found the fainteſt trace of any thing reſembling a teſtimony to the lawfulneſs of polygamy; on the contrary, many paſſages occur, in which the practice of it is ſtrongly and explicitly condemned.

Monthly Review, vol. 63. p. 338. See alſo vol. 69.

We ſhall cloſe this article with the words of an excellent anonymous writer already quoted, and to whoſe critique on Mr Madan's work we are indebted for the above remarks: "In a word, when we reflect that the primitive inſtitution of marriage limited it to one man and one woman; that this inſtitution was adhered to by Noah and his ſons, amidſt the degeneracy of the age in which they lived, and in ſpite of the examples of polygamy which the accurſed race of Cain had introduced; when we conſider how very few (comparatively ſpeaking) the examples of this practice were among the faithful; how much it brought its own puniſhment with it; and how dubious and equivocal thoſe paſſages are in which it appears to have the ſanction of divine approbation; when to theſe reflections we add another, reſpecting the limited views and temporary nature of the more ancient diſpenſations and inſtitutions of religion—how often the imperfections and even vices of the patriarchs and people of God, in old time, are recorded, without any expreſs notification of their criminality—how much is ſaid to be commanded, which our reverence for the holineſs of God and his law will only ſuffer us to ſuppoſe, were, for wiſe ends, permitted—how frequently the meſſengers of God adapted themſelves to the genius of the people to whom they were ſent, and the circumſtances of the times in which they lived:—above all, when we conſider the purity, equity, and benevolence of the Chriſtian law; the explicit declaration of our Lord, and his apoſtle St Paul, reſpecting the inſtitution of marriage its deſign and limitation;—when we reflect, too, on the teſtimony of the moſt ancient fathers, who could not poſſibly be ignorant of the general and common practice of the apoſtolic church; and, finally, when to theſe conſiderations we add thoſe which are founded on juſtice to the female ſex, and all the regulations of domeſtic economy and national policy—we muſt wholly condemn the revival of polygamy; and thus bear our honeſt teſtimony againſt the leading deſign of this dangerous and ill-adviſed publication."

We would adviſe our readers to read the whole criticiſms on Madan's book in the Monthly Review, together with their account of the ſeveral anſwers to it. The reverend author of the Thelyphthora has there met with a moſt able antagoniſt, who traces him through all his deceitful windings, and expoſes the futility and falſehood of his arguments with ſingular ability. See *Monthly Review*, vol. lxiii. p. 273, &c.; ſee alſo *Paley's Moral Philoſophy*, 4to. p. 262.

POLYGARS, are natives of Hindoſtan. They inhabit almoſt impenetrable woods, and are under the abſolute direction of their own chieſtains. In time of peace they are profeſſionally robbers, but in times of war are the guardians of the country. The general name of theſe people is *Polygar*. Their original inſtitution, for they live in diſtinct clans, is not very well underſtood. It probably took its riſe from the municipal regulations relative to the deſtruction of tygers and other ferocious beaſts. Certain tracts of woodland were indiſputedly allotted as rewards to thoſe who ſhould ſlay a certain number of thoſe animals; and thoſe lands approximating, probably laid the foundation of the ſeveral confederacies of Polygars.

"The Pollams, or woods, from which is derived the word *Polygar*, lying in profuſion through all the ſouthern parts of Hindoſtan, the ravages committed in the open countries by theſe adventurous clans, are both frequent and deſtructive. Cattle and grain are the conſtant booty of the Polygars. They not unfrequently even deſpoil travellers of their property, and ſometimes murder, if they meet with oppoſition: yet theſe very Polygars are the hands into which the aged and infirm, the wives, children, and treaſure, of both Hindoos and others are entruſted, when the circumjacent country unfortunately happens to be the ſeat of war. The protection they afford is paid for; but the price is inconſiderable, when the helpleſs ſituation of thoſe who fly to them for ſhelter is conſidered, and eſpecially when their own very peculiar character is properly attended to. The native governments of Hindoſtan are under the neceſſity of tolerating this honourable banditti. Many of them are ſo formidable as to be able to bring 15,000 and 20,000 men into the field.

"The Hindoo code of laws, in ſpeaking of robberies, hath this remarkable clauſe, 'The mode of ſhares amongſt robbers ſhall be this:—If any thief or thieves, by the command of the magiſtrate, and with his aſſiſtance, have committed depredations upon, and brought away any booty from, another province, the magiſtrate ſhall receive a ſhare of one ſixth part of the whole. If they received no command or aſſiſtance from the magiſtrate, they ſhall give the magiſtrate in that caſe one tenth part for his ſhare, and of the remainder their chief ſhall receive four ſhares; and whoſoever among them is perfect maſter of his occupation, ſhall receive three ſhares: alſo, which ever of them is remarkably ſtrong and ſtout, ſhall receive two ſhares, and the reſt ſhall receive each one ſhare.' Here, then, we ſee not only a ſanction, but even an inducement, to fraudulent practices.—Another ſingular inconſiſtency among a people who, in many periods of their hiſtory, have been proverbial for innocency of manners, and for uncommon honeſty in their conduct towards travellers and ſtrangers.

"At the firſt ſight, it would appear that the toleration of the Polygars, owing to their great numbers, and to the ſecurity of their fortreſſes, which are in general impenetrable but to Polygars; that the government licence, in this manner given to them, to live on the ſpoils of the induſtrious—might have originally occaſioned the formal diviſion, and encouragement to perſeverance, which we have juſt quoted: but the cauſe I ſhould rather ſuppoſe to lie in the nature of certain governments, than to have ariſen from any accidental circumſtance afterwards; and I am the more inclined to this opinion, from the ſituation of the northern parts of Hindoſtan, which are, and always have been, uninfeſted by theſe freebooters.

"The dominion of the Eaſt was, in former days, moſt probably divided and ſubdivided into all the various branches of the feodal ſyſtem. The veſtiges of it remain to this hour: rajahs and zemindars are nothing more than chieftains of a certain degree of conſequence in the empire. If, then, experience has ſhown, in other parts of the world, that clans have always been obſerved to commit the moſt pernicious acts of depredation and hoſtility on each other, and that the paramount lord has ſeldom been able effectually to cruſh ſo general and ſo complicated a ſcene of miſchief—may we not reaſonably venture to ſuppoſe, that the Hindoo legiſlature paſſed this ordinance for the ſuppreſſion of ſuch provincial warfare, and for the wholeſome purpoſe of drawing the people, by unalarming degrees, more immediately under the controul of the one ſovereign authority? The concluſion, I own, appears to me ſatisfactory. Moreover, Polygars cannot but be of modern growth; for the law relative to thefts is antecedent to the mention of Polygars in hiſtory." Sullivan's *Philoſophical Rhapſodies*.

POLYGLOTT, among divines and critics, chiefly denotes a Bible printed in ſeveral languages. See BIBLE and PRINTING.

POLYGLOTTUS, in ornithology. See TURDUS.

POLYGNOTUS, a famous painter of Thaſos, flouriſhed about 422 years before the Chriſtian era, and was the ſon and ſcholar of Aglaophon. He adorned one of the public porticoes of Athens with his paintings, in which he had repreſented the moſt ſtriking events of the Trojan war. The Athenians were ſo pleaſed with him, that they offered to reward his labours with whatever he pleaſed to accept; but he declined the offer; and the Amphictyonic council, which was compoſed of the repreſentatives of the principal cities of Greece, ordered that Polygnotus ſhould be maintained at the public expence wherever he went.

Of the talents of Polygnotus much honourable mention is made by many of the beſt authors of antiquity, as Ariſtotle and Plutarch, Dionyſius Halicarnaſſenſis, &c. Pauſanias ſpeaks of his pictures of the events of the Trojan war, and, in his Tenth Book, introduces a very long deſcription of other pictures by the ſame artiſt, painted alſo from Homer in the temple at Delphos. The paſſage, however, gives but a confuſed and imperfect idea of the painter's performance. How much the art is indebted to this ancient maſter, what grace and ſoftneſs he gave to the human countenance, what embelliſhments he added to the female figure and dreſs, are much more happily deſcribed by Pliny. "Primus mulieres lucida veſte pinxit, capita earum mitris verſicoloribus operuit, plurimumque picturæ primus contulit: ſiquidem inſtituit os adaperire, dentes oſtendere, vultum ab antiquo rigore variare."—The ſame author likewiſe bears honourable teſtimony to the liberal ſpirit of this great artiſt, who refuſed any reward for his ingenious labours in the portico.——"Porticum gratuito, cum partem ejus Mycon mercede pingeret." Plin. *lib*. 35. *cap*. 8.

POLYGON, in geometry, a figure with many ſides, or whoſe perimeter conſiſts of more than four ſides at leaſt; ſuch are the pentagon, hexagon, heptagon, &c.

POLYGONUM, KNOT-GRASS: A genus of the trigynia order, belonging to the octandria claſs of plants; and in the natural method ranking under the 12th order, *Holoraceæ*. There is no calyx; the corolla is quinquepartite, and calycine, or ſerving inſtead of a calyx; there is one angulated ſeed. There are 27 ſpecies; but the moſt remarkable are, 1. The biſtorta, biſtort, or greater ſnakeweed, hath a thick oblique intorted root, blackiſh without, and red within; a ſimple, round, ſlender ſtem, near two feet high; oval leaves, having decurrent foot-ſtalks, and the ſtalk terminated by thick ſhort ſpikes of whitiſh-red flowers. 2. The viviparum, or ſmaller biſtort, hath a thickiſh root, a ſimple ſlender ſtem half a foot high, ſpear-ſhaped leaves, and the ſtalks and branches terminated by long ſpikes of whitiſh-red flowers. Both theſe perennials flower in May and June, ſucceeded by ripe ſeeds in Auguſt. They grow wild in England, &c. the firſt in moiſt, the other in mountainous, ſituations. 3. Oriental polygonum, commonly called *perſicaria*, hath fibrous roots; an upright, robuſt, ſtrong, jointed ſtem, riſing eight or ten feet high, dividing at top into ſeveral branches; very large oval-lanceolate alternate leaves, on broad footſtalks half ſurrounding the ſtem; and all the branches terminated by long, ſlender, hanging ſpikes of reddiſh-purple heptandrous and digynious flowers, from July till October. 4. Fagopyrum, buckwheat, or brank, riſes with an upright, ſmooth, branchy ſtem, from about a foot and a half to a yard high, heart-ſhaped ſagittated leaves, and the branches terminated by cluſters of whitiſh flowers, ſucceeded by large angular ſeeds; excellent for feeding pigeons and moſt ſorts of poultry.

All theſe plants are hardy, and ſucceed in almoſt any ſoil and ſituation; the two firſt are perennial in root; and the third and fourth are annual, wholly decay at the end of ſummer, or early in winter. The firſt two ſorts are retained in ſome curious gardens for variety; but their chief merit is for medical purpoſes; they are powerful aſtringents, and are uſed both internally and externally; eſteemed very efficacious in hæmorrhagies and other fluxes; and good to heal ſore mouths. The third ſort, Oriental polygonum, or perſicaria, is a moſt elegant annual for the embelliſhment of pleaſure-ground; aſſuming a majeſtic tree-like growth by its erect luxuriant ſtem, and branchy head; which being garniſhed with noble large foliage, and numerous pendulous ſpikes of flowers, in conſtant ſucceſſion three or four months, exhibits a very ornamental appearance from June or July until October, and is ſo eaſy of culture, that from its ſcattered ſeeds in autumn, young plants riſe ſpontaneouſly in abundance the enſuing ſpring, and ſhoot up ſo rapidly as to attain ſix or eight feet in height by July, when they generally begin flowering, and continue till attacked by the froſt, when they totally periſh; ſo that a freſh ſupply muſt be raiſed from ſeed annually. The fourth ſort (buck-wheat) is a ſort of corn, and is frequently cultivated both by way of fodder, cutting its ſtalks while young and green to feed cattle, and for its grain to feed pigeons, poultry, hogs, &c. It flouriſhes in any ſoil and ſituation, but generally thrives beſt in a light dry earth; and the drieſt ſeaſons ſeldom retard its growth. The firſt and ſecond ſorts are eaſily propagated in plenty, by parting the roots in autumn. The third ſort, Oriental polygonum, being annual is always propagated from ſeed annually, either in the full ground, or by means of hot-beds.

Uſes. The root of a kind of biſtort, according to Gmelin, is uſed in Siberia for ordinary food. This ſpecies is by Haller called *biſtorta foliis ad oram nervoſis*, and by ſome other botaniſts *biſtorta montana minor*. The natives call it *mouka;* and ſo indolent are they, that, to ſave themſelves the trouble of digging it out of the earth, they go in ſpring and pillage the holes of the mountain rats, which they find filled with theſe roots. In Britain, biſtort is uſed as a medicine. All the parts of biſtort, have a rough auſtere taſte, particularly the root, which is one of the ſtrongeſt of the vegetable aſtringents. It is employed in all kinds of immoderate hæmorrhagies and other fluxes, both internally and externally, where aſtringency is the only indication. It is certainly a very powerful ſtyptic, and is to be looked on ſimply as ſuch; the ſudorific, antipeſtilential, and other like virtues aſcribed to it, it has no other claim to than in conſequence of its aſtringency, and of the antiſeptic power which it has in common with other vegetable ſtyptics. The largeſt doſe of the root in powder is a ſingle dram.

POLYGRAPHY, Polygraphia, or *Polygraphice*, the art of writing in various unuſual manners or ciphers; as alſo of deciphering the ſame. The word is formed from the Greek, *πολυ multum*, and *γραφη ſcriptura*, "writing."

The ancients ſeem to have been very little acquainted with this art; nor is there any mark of their having gone beyond the Lacedemonian ſcytala. Trithemius, Porta, Vigenere, and father Niceron, have written on the ſubject of polygraphy or ciphers. See Cipher.

POLYHYMNIA, in the pagan mythology, one of the nine muſes, thus named from the Greek words Πολυς "much," and ὑμνος "ſong." She preſided over hiſtory, or rather rhetoric; and is repreſented with a crown of pearls and a white robe; her right hand in action as if haranguing, and holding in her left a caduceus or ſceptre to ſhow her power.

POLYHEDRON, in geometry, denotes a body or ſolid comprehended under many ſides or planes.

Polyhedron, in optics, is a multiplying glaſs or lens, conſiſting of ſeveral plane ſurfaces diſpoſed into a convex form. See Optics, n° 256.

POLYMATHY, denotes the knowledge of many arts and ſciences. The word is derived from the Greek, Πολυ *multum*, and *μαθανω*, *diſco*.

POLYMNESTOR, was a king of the Thracian Cherſoneſus. He married Ilione, Priam's eldeſt daughter; and for the ſake of the treaſure with which he was entruſted by Priam during the ſiege of Troy, he murdered Polydorus, (ſee Polydorus). The fleet in which the victorious Greeks returned, together with their Trojan captives, among whom was Hecuba, ſtopped on the coaſts of Thrace, where one of the female captives diſcovered on the ſhore the body of Polydorus, whom Polymneſtor had thrown into the ſea. The dreadful intelligence was immediately communicated to Hecuba his mother, who recollecting the frightful dreams ſhe had the preceding night, did not doubt but Polymneſtor was the cruel aſſaſſin. Reſolved to revenge her ſon's death, ſhe immediately called out Polymneſtor, as if to impart to him ſomething of importance. He was drawn into the ſnare; and no ſooner was he introduced into the apartment of the Trojan princeſs, than the female captives ruſhing upon him, put out his eyes with their pins, while Hecuba murdered his two children, who had accompanied him. Euripides informs us, that the Greeks condemned Polymneſtor to be baniſhed into a diſtant iſland for his perfidy. Hyginus, however, relates the whole differently, and tells us, that when Polydorus was ſent to Thrace, Ilione his ſiſter took him inſtead of her ſon Deiphilus, who was of the ſame age, being fearful of her huſband's cruelty. The monarch, unacquainted with the impoſition, looked upon Polydorus as his own ſon, and treated Deiphilus as her brother. After the deſtruction of Troy, the conquerors wiſhed the houſe and family of Priam to be extirpated, and therefore offered Electra the daughter of Agamemnon to Polymneſtor, if he would deſtroy Ilione and Polydorus. He accepted the offer, and immediately diſpatched his own ſon Deiphilus, whom he took for Polydorus. Polydorus, who paſſed as the ſon of Polymneſtor, conſulted the oracle after the murder of Deiphilus, and being informed that his father was dead, his mother a captive in the hands of the Greeks, and his country in ruins, he communicated the anſwer to Ilione, whom he had always regarded as his mother. She told him the meaſures ſhe had purſued to ſave his life, upon which he avenged the perfidy of Polymneſtor by putting out his eyes.

POLYMNIA, in botany: A genus of the polygamia neceſſaria order, belonging to the ſyngeneſia claſs of plants; and in the natural method ranking under the 49th order, *Compoſitæ*. The receptacle is paleaceous; there is no pappus; the exterior calyx is tetraphyllous, or pentaphyllous; the interior decaphyllous, and compoſed of concave leafets.

POLYNICES, the ſon of Œdipus by his mother Jocaſta. See Jocasta, Œdipus, and Eteocles.

POLYPE. See Polypus.

POLYPETALOUS, among botaniſts, an epithet applied to ſuch flowers as conſiſt of ſeveral petals or flower-leaves.

POLYPHEMUS (fab hiſt.), a celebrated Cyclops, and king of all the Cyclops in Sicily, was the ſon of Neptune and Thooſa the daughter of Phorcys. He is ſaid to have been a monſter of great ſtrength, very tall, and with one eye in the middle of the forehead. He eat human fleſh, and kept his flocks on the coaſt of Sicily, when Ulyſſes, at his return from the Trojan war, was driven there. Ulyſſes, together with 12 of his companions, viſited the coaſt, and with them was ſeized by the Cyclops, who confined them in his cave, and daily devoured two of them. Ulyſſes would have ſhared the fate of the reſt, had he not intoxicated the Cyclops, and put out his eye with a firebrand when he was aſleep. Polyphemus was awakened by the ſudden pain, and ſtopped the entrance of his cave; but Ulyſſes eſcaped, by creeping between the legs of the rams of the Cyclops, as they were led out to feed on the mountains. Polyphemus became enamoured of Galatæa; but his addreſſes were diſregarded, and the nymph ſhunned his preſence. The Cyclops was ſtill more earneſt; and when he ſaw Galatæa ſurrender herſelf to the pleaſures of Acis, he cruſhed his rival with a piece of a broken rock.

POLYPODIUM, in botany; a genus of the order of filices, belonging to the cryptogamia claſs of plants. The fructifications are in roundiſh points, ſcattered over the inferior diſc of the frons or leaf.—There are 65 ſpecies, of which the moſt remarkable is the filix mas, or common male fern. This grows in great plenty throughout Britain in woods and ſtony uncultivated ſoils. The greateſt part of the root lies horizontally, and has a great number of appendages placed cloſe to each other in a vertical direction, while a number of ſmall fibres ſtrike downwards. The leaves are a cubit high, and grow in circular tufts. They are at firſt alternately pinnate, the pinnæ increaſing in ſize from the baſe towards the middle, and afterwards gradually decreaſing upwards to the ſummit of the leaf. Theſe pinnæ are again pinnatifid, or ſubdivided almoſt to the nerve into obtuſe parallel lobes, crenated on the edges. The ſtalks are covered with brown filmy ſcales. The fructifications are kidney-ſhaped, and covered with a permanent ſcaly ſhield or involucrum. The capſules are of a pale brown, ſurrounded with a ſaffron-coloured elaſtic ring.

This fern has nearly the ſame qualities, and is uſed for moſt of the ſame intentions, as the pteris aquilina. They are both burnt together for the ſake of their aſhes, which are purchaſed by the ſoap and glaſs-makers. In the iſland of Jura are exported annually 150 l. worth of theſe aſhes.

Gunner relates, in his *Flor. Noveg.* that the young curled leaves, at their firſt appearance out of the ground, are by ſome boiled and eaten like aſparagus; and that the poorer Norwegians cut off thoſe ſucculent laminæ, like the nails of the finger at the crown of the root, which are the baſes of the future ſtalks, and brew them into beer, adding thereto a third portion of malt, and in times of great ſcarcity mix the ſame in their bread. The ſame author adds, that this fern cut green, and dried in the open air, affords not only an excellent litter for cattle, but, if infuſed in hot water, becomes no contemptible fodder to goats, ſheep, and other cattle, which will readily eat and ſometimes grow fat upon it: a circumſtance well worth the attention of the inhabitants of the Highlands and Hebrides, as great numbers of their cattle, in hard winters, frequently periſh for want of food.

But the anthelmintic quality of the root of the male fern is that for which it is chiefly to be valued, and of which an account is given under the article MEDICINE, p. 343. col. 2.

The polypodium oreopteris is only remarkable becauſe it has been confounded by moſt of the Engliſh botaniſts with the ſpecies which we have now deſcribed, and the polypodium thelypteris. It has a large ſcaly root, wrapped and tied together with ſmall ſtrong fibres, not to be ſeparated without difficulty.—The fructifications are on the margins both when young and old, and never run into one another: the lobes are oval and plain. It is four times as large as the thelypteris, and grows in dry woods, moors or hills, and very ſeldom near water; all which characters are widely different from thoſe of the ſpecies with which it has been confounded. It is to be found both in England and Scotland, in the latter place very plentifully. See *Linnæan Tranſactions*, vol. 1. p. 181.

POLYPREMUM, in botany: A genus of the monogynia order, belonging to the tetrandria claſs of plants; and in the natural method ranking under the 22d order, *Caryophillei*. The calyx is tetraphyllous; the corolla quadrifid and rotaceous, with its lobes obcordate; the capſule compreſſed, emarginated, and bilocular.

POLYPUS, a ſpecies of freſh-water inſects, belonging to the genus of hydra, of the order of zoophytes, and claſs of vermes. (See ANIMALCULE, nº 24, &c.) The name of *hydra* was given them by Linnæus on account of the property they have of reproducing themſelves when cut in pieces, every part ſoon becoming a perfect animal. Dr Hill called them *biota*, on account of the ſtrong principle of life with which every part of them is endowed.

Theſe animals were firſt diſcovered by Leeuwenhoek, who gave ſome account of them in the Philoſophical Tranſactions for 1703, but their wonderful properties were not thoroughly known till the year 1740, when Mr Trembley began to inveſtigate them. Previous to his diſcoveries, indeed, Leibnitz and Boerhaave, by reaſonings *à priori*, had concluded that animals might be found which would propagate by ſlips like plants; and their conjectures were ſoon verified by the obſervations of the gentlemen above-mentioned. At firſt, however, Mr Trembley was uncertain whether he ſhould reckon theſe creatures animals or plants; and while thus uncertain, he wrote a letter on the ſubject to Mr Bonnet in January 1741; but in March the ſame year he had ſatisfied himſelf that they were real animals. The ſurpriſe of Mr Trembley, and of others, on diſcovering the true nature of theſe animals, was very great. When Mr Reaumur ſaw for the firſt time two polypes formed from one which he had divided into two parts, he could hardly believe his own eyes; and even after having repeated the operation an hundred times, he ſaid that the ſight was by no means familiar to him. On the 18th of July 1741, M. Buffon wrote to Martin Folkes, Eſq; preſident of the Royal Society, acquainting him with "the diſcovery of a ſmall inſect called a *polypus*, which is found about the common duck-weed; and which, being cut in two, puts forth from the upper part a tail, and from the lower end a head, ſo as to become two animals inſtead of one. If it be cut into three parts, the middlemoſt alſo puts out from one end a head, and from the other a tail, ſo as to become three diſtinct animals, all living like the firſt, and performing the various offices of their ſpecies."

ſpecies."—In September the ſame year, a letter was communicated from C. Bentink, Eſq; at the Hague, deſcribing the inſects diſcovered by Mr Trembley, adding, that he himſelf had ſeen them; and in November that year, a letter was read before the Society from Gronovius, at Leyden, giving an account of a water-inſect, which, ſays he, if cut into five or ſix pieces, in a few hours there will be as many animals exactly ſimilar to their parent. Theſe accounts, however, were all deemed ſo extraordinary, that they were not credited, until profeſſors Albinus and Muſchenbroeck provided themſelves with them, and found every thing related concerning them to be exactly true. In March 1742, Mr Folkes gave an account of them to the Royal Society, from ſome obſervations made on ſeveral polypes which Mr Trembley had ſent from Holland. They were ſoon after found in England, and the obſervations made upon them were publiſhed by ſeveral perſons; ſo that no doubt remained concerning the reality of what had been related concerning them.

The general character of the polype is, that it fixes itſelf by its baſe; is gelatinous, linear, naked, contractile; and can change its place. The mouth, which is placed at one end, is ſurrounded by hair-like feelers. The young ones grow out from its ſides; but in autumn it produces eggs from its ſides. There are ſix varietes.

1. The *viridis*, or green polype, has commonly ten ſhort arms.
2. The *fuſca* has frequently eight arms ſeveral times longer than the body.
3. The *griſea* is of a yellowiſh colour, ſmall towards the bottom, and has long arms, generally about ſeven in number.
4. The *pallens* has generally about ſix arms of a moderate length.
5. The *hydatula* has a veſicular body, and four obſolete arms. It is found in the abdomen of ſheep, ſwine, &c.
6. The *ſtentorea* has been called the *tunnel-ſhaped*, and has a mouth ſurrounded with a row of hairs.
7. The *ſocialis* is bearded, thick, and wrinkled.

The three firſt ſpecies are thoſe on which the greateſt number of experiments have been made; and their ſhapes are ſo various, that it is by no means eaſy to deſcribe them. They are generally found in ditches. Whoever has carefully examined theſe when the ſun is very powerful, will find many little tranſparent lumps of the appearance of a jelly, and ſize of a pea, and flatted upon one ſide. The ſame kind of ſubſtances are likewiſe to be met with on the under ſide of the leaves of plants which grow in ſuch places. Theſe are the polypes in a quieſcent ſtate, and apparently inanimate. They are generally fixed by one end to ſome ſolid ſubſtance, with a large opening, which is the mouth, at the other; having ſeveral arms fixed round it, projecting as rays from the centre. They are ſlender, pellucid, and formed of a tender ſubſtance like the horns of a ſnail, and capable of contracting themſelves into a very ſmall compaſs, or of extending to a conſiderable length. The arms are capable of the ſame contraction and expanſion as the body; and with theſe they lay hold of minute worms and other inſects, bringing them to the mouth and ſwallowing them; the indigeſtible parts are again thrown out by the mouth.

The green polype was that firſt diſcovered by Mr Trembley; and the firſt appearances of ſpontaneous motion were perceived in its arms, which it can contract, extend, and twiſt about in various directions. On the firſt appearance of danger they contract to ſuch a degree that they appear little bigger than a grain of ſand, of a fine green colour, the arms diſappearing entirely. Soon after he found the griſea, and afterwards the fuſca.

The bodies of the viridis and griſea diminiſh almoſt inſenſibly from the anterior to the poſterior extremity; but the fuſca is for the moſt part of an equal ſize for two-thirds of its length from the anterior to the poſterior extremity, from which it becomes abruptly ſmaller, and then continues of a regular ſize to the end. Theſe three kinds have at leaſt ſix, and at moſt 12 or 13 arms, though ſometimes the griſea is met with having 18 arms. They can contract themſelves till their bodies do not exceed one-tenth of an inch in length, and they can ſtop at any intermediate degree of contraction or extenſion. They are of various ſizes, from half an inch to an inch and an half long; their arms are ſeldom longer than their bodies, though ſome have them an inch, and ſome even eight inches, long. The thickneſs of their bodies decreaſes as they extend themſelves, and *vice verſa;* and they may be made to contract themſelves either by agitating the water in which they are contained, or by touching the animals themſelves. When taken out of the water, they all contract ſo much that they appear only like a little lump of jelly. The arms have the ſame power of contraction or expanſion that the body has; and they can contract or expand one arm, or any number of arms, independent of the reſt; and they can likewiſe bend their bodies or arms in all poſſible directions. They can alſo dilate or contract their bodies in various places, and ſometimes appear thick ſet with folds, which, when careleſsly viewed, appear like rings. Their progreſſive motion is performed by that power which they have of contracting and dilating their bodies. When about to move, they bend down their head and arms, lay hold by means of them on ſome other ſubſtance to which they deſign to faſten themſelves; then they looſen their tail, and draw it towards the head; then either fix it in that place, or ſtretching forward their head as before, repeat the ſame operation. They aſcend or deſcend at pleaſure in this manner upon aquatic plants, or upon the ſides of the veſſel in which they are kept; they ſometimes hang by the tail from the ſurface of the water, or ſometimes by one of the arms; and they can walk with eaſe upon the ſurface of the water. On examining the tail with a microſcope, a ſmall part of it will be found to be dry above the ſurface of the water, and as it were in a little concave ſpace, of which the tail forms the bottom; ſo that it ſeems to be ſuſpended on the ſurface of the water on the ſame principle that a ſmall pin or needle is made to ſwim. When a polype, therefore, means to paſs from the ſides of the glaſs to the ſurface of the water, it has only to put that part out of the water by which it is to be ſupported, and to give it time to dry, which it always does upon theſe occaſions; and they attach themſelves ſo firmly by the tail to aquatic plants, ſtones, &c. that they cannot be eaſily diſengaged: they often further ſtrengthen theſe attachments by means of one or two of their arms, which ſerve as a kind of anchors for fixing them to the adjacent ſubſtances.

The ſtomach of the polype is a kind of bag or gut into which the mouth opens, and goes from the head to the tail. This, in a ſtrong light, is viſible to the naked eye, eſpecially if the animal be placed between the eye and a candle; for theſe animals are quite tranſparent whatever their colour may be. The ſtomach, however, appears to more advantage through a powerful magnifier. Mr Trembley, by cutting one of theſe animals tranſverſely into three parts, ſatiſfied himſelf that they were perforated throughout. Each piece immediately contracted itſelf, and the perforation was very viſible through a microſcope. The ſkin which incloſes the ſtomach is that of the polype itſelf; ſo that the whole animal, properly ſpeaking, conſiſts only of one ſkin, in the form of a tube, and open at both ends. No veſſels of any kind are to be diſtinguiſhed.

The mouth is ſituated at the anterior end in the middle between the ſhooting forth of the arms, and aſſumes different appearances according to circumſtances; being ſometimes lengthened out in the form of a nipple, at others appearing truncated; ſometimes the aperture is quite cloſed, at others there is a hollow; though at all times a ſmall aperture may be diſcovered by a powerful magnifier.

The ſkin of a polype, when examined with a microſcope, appears like ſhagreen, or as if covered with little grains, more or leſs ſeparated from each other, according to the degree of contraction of the body. If the lips of a polype be cut tranſverſely, and placed ſo that the cut part of the ſkin may lie directly before the microſcope, the ſkin throughout its whole thickneſs will be found to conſiſt of an infinite number of grains, and the interior part is found to be more ſhagreened than the exterior one; but they are not ſtrongly united to each other, and may be ſeparated without much trouble. They even ſeparate of themſelves, though in no great numbers, in the moſt healthy animals of this kind; for where they are obſerved to ſeparate in large quantities, it is a ſymptom of a very dangerous diſorder. In the progreſs of this diſorder, the ſurface of the polype becomes gradually more and more rough and unequal, and no longer well defined or terminated as before. The grains fall off on all ſides; the body and arms contract and dilate, and aſſume a white ſhining colour; and at laſt the whole diſſolves into an heap of grains, which is more particularly obſerved in the green polype. By a careful examination we find, that the ſkin of the polype is entirely compoſed of grains, cemented by means of a kind of gummy ſubſtance; but it is to the grains entirely that the polype owes its colour. The ſtructure of the arms is analogous to that of the body; and they appear ſhagreened when examined by the microſcope, whether they be in a ſtate of contraction or extenſion; but if very much contracted, they appear more ſhagreened than the body, though almoſt quite ſmooth when in their utmoſt ſtate of extenſion. In the green polype the appearance of the arm is continually varying; and theſe variations are more ſenſible towards the extremity of the arm than at its origin, but more ſcattered in the parts further on. The extremity is often terminated by a knob, the hairs of which cannot be obſerved without a very powerful magnifier. They have a remarkable inclination of turning towards the light; ſo that if that part of the glaſs on which they are be turned from the light, they will quickly remove to the other.

That ſpecies named the *fuſca* has the longeſt arms, and makes uſe of the moſt curious manœuvers to ſeize its prey. They are beſt viewed in a glaſs ſeven or eight inches deep, when their arms commonly hang down to the bottom. When this, or any other kind, is hungry, it ſpreads its arms in a kind of circle to a conſiderable extent, incloſing in this, as in a net, every inſect which has the misfortune to come within the circumference. (See Animalcule, n° 27.). While the animal is contracted by ſeizing its prey, the arms are obſerved to ſwell like the muſcles of the human body when in action. Though no appearance of eyes can be obſerved in the polype, they certainly have ſome knowledge of the approach of their prey, and ſhow the greateſt attention to it as ſoon as it comes near them. It ſeizes a worm the moment it is touched by one of the arms; and in conveying it to the mouth, it frequently twiſts the arm into a ſpiral like a corkſcrew; by which means the inſect is brought to the mouth in a much ſhorter time than otherwiſe it would be; and ſo ſoon are the inſects on which the polypes feed killed by them, that M. Fontana thinks they muſt contain the moſt powerful kind of poiſon; for the lips ſcarce touch the animal when it expires, though there cannot be any wound perceived on it when dead. The worm, when ſwallowed, appears ſometimes ſingle, ſometimes double, according to circumſtances. When full, the polype contracts itſelf, hangs down as in a kind of ſtupor, but extends again in proportion as the food is digeſted and the excrementitious part is diſcharged. The bodies of the inſects, when ſwallowed, are firſt macerated in the ſtomach, then reduced into fragments, and driven backward and forward from one end of the ſtomach to the other, and even into the arms, however fine they may be; whence it appears that the arms, as well as the other parts of this remarkable creature, are a kind of hollow guts or ſtomachs. In order to obſerve this motion, it is beſt to feed the polypes with ſuch food as will give a lively colour; ſuch, for inſtance, as thoſe worms which are furniſhed with a red juice. Some bits of a ſmall black ſnail being given to a polype, the ſubſtance of the ſkin was ſoon diſſolved into a pulp conſiſting of ſmall black fragments; and on examining the polype with a microſcope, it was found that the particles were driven about in the ſtomach, and that they paſſed into the arms, from thence back into the ſtomach, then to the tail; from whence they paſſed again into the arms, and ſo on. The grains of which the body of the polype conſiſt take their colour from the food with which it is nouriſhed, and become red or black as the food happens to afford the one colour or the other. They are likewiſe more or leſs tinged with theſe colours in proportion to the ſtrength of the nutritive juices; and it is obſervable that they loſe their colour if fed with aliments of a colour different from themſelves. They feed on moſt inſects found in freſh water; and will alſo be ſupported with worms, the larvæ of gnats, &c. and even with ſnails, large aquatic inſects, and fiſh or fleſh, if cut into ſmall bits. Sometimes two polypes lay hold of the ſame worm, and each begins to ſwallow its own end till their mouths meet and the worm breaks. But ſhould this happen not to be the caſe, the one polype will ſometimes devour the other along with its portion. It appears, however, that the ſtomach of one polype is not fitted for diſſolving the ſubſtance of another; for the one which is ſwallowed always gets clear again after being impriſoned for an hour or two.

The manner in which the polypes generate is moſt perceptible in the griſea and fuſca, as being conſiderably larger than the viridis. If we examine one of them in ſummer, when the animals are moſt active, and prepared for propagation, ſome ſmall tubercles will be found proceeding from its ſides, which conſtantly increaſe in bulk, until at laſt in two or three days they aſſume the figure of ſmall polypes. When they firſt begin to ſhoot, the excreſſence becomes pointed, aſſuming a conical figure, and deeper colour than the reſt of the body. In a ſhort time it becomes truncated, and then cylindrical, after which the arms begin to ſhoot from the anterior end. The tail adheres to the body of the parent-animal, but gradually grows ſmaller, until at laſt it adheres only by a point, and is then ready to be ſeparated. When this is the caſe, both the mother and young ones fix themſelves to the ſides of the glaſs, and are ſeparated from each other by a ſudden jerk. The time requiſite for the formation of the young ones is very different, according to the warmth of the weather and the nature of the food eaten by the mother. Sometimes they are fully formed, and ready to drop off, in 24 hours; in other caſes, when the weather is cold, 15 days have been requiſite for bringing them to perfection.

It is remarkable, that there is a reciprocal communication of food betwixt the young and old before they be ſeparated. The young ones, as ſoon as they are furniſhed with arms, catch prey for themſelves, and communicate the digeſted food to the old ones, who on the other hand do the ſame to the young ones. This was fully verified by the following experiment: One of the large polypes of the *fuſca* kind being placed on a ſlip of paper in a little water, the middle of the body of a young one growing out from it was cut open; when the ſuperior part of that end which remained fixed to the parent was found to be open alſo. By cutting over the parent polype on each ſide of the ſhoot, a ſhort cylinder was obtained, open at both ends; which being viewed through a microſcope, the light was obſerved to come through the young one into the ſtomach of the old one. On cutting open the cylindrical portion lengthwiſe, not only the hole of communication was obſerved, but one might ſee through the end of the young one alſo. On changing the ſituation of the two pieces, the light was ſeen through the hole of communication.

This may be ſeen between the parent polype and its young ones after feeding them; for, after the parents have eaten, the bodies of the young ones ſwell as if they themſelves had been eating.

The polypes produce young ones indiſcriminately from all parts of their bodies, and five or ſix young ones have frequently been produced at once; nay, Mr Trembley has obſerved nine or ten produced at the ſame time.

Nothing like copulation among theſe creatures was ever obſerved by Mr Trembley, though for two years he had thouſands of them under his inſpection. To be more certain on this ſubject, he took two young ones the moment they came from their parent, and placed them in ſeparate glaſſes. Both of them multiplied, not only themſelves, but alſo their offspring, which were ſeparated and watched in the ſame manner to the ſeventh generation; they have even the ſame power of generation while adhering to their parent. In this ſtate the parent, with its children and grandchildren, exhibits a ſingular appearance, looking like a ſhrub thick ſet with branches. Thus ſeveral generations ſometimes are attached to one another, and all of them to one parent. Mr Adams gives a figure of one polype with *nineteen* young ones hanging at it; the whole group being about an inch broad, and an inch and an half in length; the old polype eat about twelve monoculi per day, and the young ones about 20 among them.

When a polype is cut tranſverſely or longitudinally into two or three parts, each part in a ſhort time becomes a perfect animal; and ſo great is this prolific power, that a new animal will be produced even from a ſmall portion of the ſkin of the old one. If the young ones be mutilated while they grow upon the parent, the parts ſo cut off will be reproduced, and the ſame property belongs to the parent. A truncated portion will ſend forth young ones before it has acquired a new head and tail of its own, and ſometimes the head of a young one ſupplies the place of that which ſhould have grown out of the old one. If we ſlit a polype longitudinally through the head to the middle of the body, we ſhall have one formed with two heads; and by ſlitting theſe again in the ſame manner we may form one with as many heads as we pleaſe.

A ſtill more ſurpriſing property of theſe animals is, that they may be grafted together. If the truncated portions of a polype be placed end to end, and gently puſhed together, they will unite into a ſingle one. The two portions are firſt joined together by a ſlender neck, which gradually fills up and diſappears, the food paſſing from the one part into the other; and thus we may form polypes not only from portions of the ſame, but of different animals; we may fix the head of one to the body of another, and the compound animal will grow, eat, and multiply, as if it had never been divided. By puſhing the body of one into the mouth of another, ſo far that their heads may be brought into contact, and kept there for ſome time, they will at laſt unite into one animal, only having double the number of arms which it would otherwiſe have had. The *hydra fuſca* may be turned inſide out like a glove, at the ſame time that it continues to live and act as before. The lining of the ſtomach now forms the outer ſkin, and the former epidermis conſtitutes the lining of the ſtomach. If previous to this operation the polype have young ones attached to it, ſuch as are but newly beginning to vegetate turn themſelves inſide out, while the larger ones continue to increaſe in ſize till they reach beyond the mouth of the parent, and are then ſeparated in the uſual manner from the body. When thus turned the polype combines itſelf in many different ways. The fore part frequently cloſes and becomes a ſupernumerary tail. The animal, which was at firſt ſtraight, now bends itſelf, ſo that the two tails reſemble the legs of a pair of compaſſes, which it can open and ſhut. The old mouth is placed as it were at the joint of the compaſſes, but loſes its power of action; to ſupply which, a new one is formed in its neighbourhood; and in a little time there is a new ſpecies of hydra formed with ſeveral mouths.

The ſides of a polype, which has been cut through in a longitudinal direction, begin to roll themſelves up, commonly from one of the extremities, with the outſide of the ſkin inwards; but in a little time they unroll themſelves, and the two cut edges join together, ſometimes beginning at one extremity, and ſometimes approaching throughout their whole length. As ſoon as the edges join, they unite ſo cloſely that no ſcar can be perceived. If a polype be partly turned back, the open part cloſes, and new mouths are formed in different places. Every portion of a polype is capable of devouring inſects almoſt as ſoon as it is cut off: and the voracity of the whole genus is aſtoniſhing; for Mr Adams obſerves, that moſt of the inſects on which they feed bear the ſame proportion to the mouth of a polype that an apple of the ſize of a man's head bears to his mouth.

The *hydra pallens* is very rarely met with, and is deſcribed only by M. Roeſel. It is of a pale yellow colour, growing gradually ſmaller from the bottom; the tail is round or knobbed; the arms are about the length of the body, of a white colour, generally ſeven in number, and are apparently compoſed of a chain of globules. The young are brought forth from all parts of its body.

The *hydratula* is mentioned by many medical writers. Dr Tyſon, in diſſecting an antelope, found ſeveral hydatides or films, about the ſize of a pigeon's egg, filled with water, and of an oval form, faſtened to the omentum; and ſome in the pelvis between the bladder of urine and rectum. He ſuſpected them to be animals for the following reaſons: 1. Becauſe they were included in a membrane like a matrix, ſo looſely, that by opening it with the finger or a knife, the internal bladder, containing the ſerum or lympha, ſeemed nowhere to have any connection with it, but would very readily drop out, ſtill retaining its liquor without ſpilling any. 2. This internal bladder had a neck or white body, more opaque than the reſt, and protuberant from it, with an orifice at its extremity; by which, as with a mouth, it exhauſted the ſerum from the external membrane, and ſo ſupplied its bladder or ſtomach. 3. On bringing this neck near the candle, it moved and ſhortened itſelf. It is found in the abdomen of ſheep, ſwine, mice, &c. lying between the peritoneum and the inteſtines.

The *ſtentorea*, or funnel-like polype, is of three colours, green, blue, and white; but the laſt is the moſt common. They do not form cluſters, but adhere ſingly by the tail to whatever comes in their way: the anterior end is wider than the poſterior; and, being round, gives the animal ſomewhat of a funnel form, though the circle is interrupted by a kind of ſlit or gap. The edge of this gap is ſurrounded with a great number of little fimbrillæ, which by their motions excite a current of water, that forces into the mouth of the animal the ſmall bodies that come within its reach. Mr Trembley ſays, that he has often ſeen a great number of animalcules fall into the mouths of theſe creatures; ſome of which were let out again at an opening which he could not deſcribe. They can faſhion their mouths into ſeveral different forms; and they multiply by dividing neither tranſverſely nor longitudinally, but diagonally.

The *ſocialis* is deſcribed by Muller under the title of *vorticella*. They are found in cluſters; and when viewed by a microſcope, appear like a circle ſurrounded with crowns or ciliated heads, tied by ſmall thin tails to a common centre, from whence they advance towards the circumference, and then turn like a wheel, occaſioning a vortex which brings along with it the food proper for them.

The *anaſtatica*, or cluſtering polypes, form a group reſembling a cluſter, or rather an open flower, ſupported by a ſtem, which is fixed by its lower extremity to ſome of the aquatic plants or extraneous bodies that are found in the water; the upper extremity is formed into eight or nine lateral branches, perfectly ſimilar to each other, which have alſo ſubordinate branches, whoſe collective form much reſembles that of a leaf. Every one of theſe aſſemblages is compoſed of one principal branch or nerve, which makes the main ſtem of the cluſter an angle ſomewhat larger than a right one: the ſmaller lateral branches proceed from both ſides of this nerve, and theſe are ſhorter the nearer their origin is to the principal branch. There is a polype at the extremity, and others on both ſides of the lateral twigs, but at different diſtances from their extremities. They are all exceedingly ſmall, and bell-ſhaped, with a quick motion about the mouth, though it is impoſſible to diſcern the cauſe of it. See ANIMALCULE, n° 24, 26, PULEX, and VORTICELLA.

The ſeveral ſtrange properties recorded of this animal, though very ſurpriſing, are, however, none of them peculiar to it alone. The Surinam toad is well known to produce its young, not in the ordinary way, but in cells upon its back. Mr Sherwood has very lately diſcovered the ſmall eels in ſour paſte to be without exception full of living young ones. And as to the moſt amazing of all its properties, the reproduction of its parts, we know the crab and lobſter, if a leg be broken off, always produce a new one: and Monſ. Bonnet, Monſ. Lyonet, Monſ. de Reaumur, and Mr Folkes, have all found, by experiment, that ſeveral earth and water worms have the ſame property, ſome of them even when cut into thirty pieces. The urtica marina, or ſea-nettle, has been alſo found to have the ſame; and the ſea ſtar fiſh, of which the polype is truly a ſpecies, though it had long eſcaped the ſearches of the naturaliſts, was always well known by the fiſhermen to have it alſo.

Marine POLYPUS, is different in form from the freſh-water polype already deſcribed; but is nouriſhed, increaſes, and may be propagated, after the ſame manner; Mr Ellis having often found, in his inquiries, that ſmall pieces cut off from the living parent, in order to view the ſeveral parts more accurately, ſoon gave indications that they contained not only the principles of life, but likewiſe the faculty of increaſing and multiplying into a numerous iſſue. It has been lately diſcovered and ſufficiently proved by Peyſſonel, Ellis, Juſſieu, Reaumur, Donati, &c. that many of thoſe ſubſtances which had formerly been conſidered by naturaliſts as marine vegetables or ſea-plants, are in reality animal-productions; and that they are formed by polypes of different ſhapes and ſizes, for their habitation, defence, and propagation. To this claſs may be referred the corals, corallines, keratophyta, eſchara, ſponges, and alcyonium: nor is it improbable, that the more compact bodies, known by the common appellations of *ſtar-ſtones*, *brain-ſtones*, *petrified fungi*, and the like, brought from various parts of the Eaſt and Weſt Indies, are of the ſame origin. To this purpoſe Mr Ellis obſerves, that the ocean, in all the warmer latitudes near the ſhore, and wherever it is poſſible to obſerve, abound ſo much with animal life, that no inanimate body can long remain unoccupied by ſome ſpecies. In thoſe regions, ſhips'-bottoms are ſoon covered with the habitations of thouſands of animals: rocks, ſtones, and every thing lifeleſs, are covered with them inſtantly; and even the branches of living vegetables that hang into the water are immediately loaded with the ſpawn of different animals, ſhell-fiſh of various kinds: and ſhell-fiſh themſelves, when they become impotent and old, are the baſis of new colonies of animals, from whoſe attacks they can no longer defend themſelves. For a farther account of this ſyſtem, ſee CORAL and CORALLINES.

POLYPUS of the Heart. See MEDICINE, n° 97, 98, 274, and 290.

POLYSARCIA, or CORPULENCY. See MEDICINE, n° 335.

POLYSCHIDES, or SEA HUNGER. See FUCUS.

POLYSPERMOUS (from ϖολυ and σπερμα *ſeed*), in botany, is applied to ſuch plants as have more than four ſeeds ſucceeding each flower, without any certain order or number.

POLYSYLLABLE, in grammar, a word conſiſting of more than three ſyllables; for when a word conſiſts of one, two, or three ſyllables, it is called a *monoſyllable*, a *diſſyllable*, and *triſyllable*.

POLYSYNDETON. See ORATORY, n° 67.

POLYTHEISM,

1 Definition.

THE doctrine of a plurality of gods or inviſible powers ſuperior to man.

* Sketches of the Hiſt. of Man.

"That there exiſt beings, one or many, powerful above the human race, is a propoſition (ſays Lord Kames*) univerſally admitted as true in all ages and among all nations. I boldly call it *univerſal*, notwithſtanding what is reported of ſome groſs ſavages; for reports that contradict what is acknowledged to be general among men, require more able vouchers than a few illiterate voyagers. Among many ſavage tribes, there are no words but for objects of external ſenſe: it is ſurpriſing that ſuch people are incapable of expreſſing their religious perceptions, or any perception of internal ſenſe? The conviction that men have of ſuperior powers, in every country where there are words to expreſs it, is ſo well vouched, that in fair reaſoning it ought to be taken for granted among the few tribes where language is deficient."

2 Source of religious principles traced

Theſe are judicious obſervations, of which every man will admit the force who has not ſome favourite ſyſtem to build upon the unſtable foundation which his Lordſhip overturns. Taking it for granted, then, that our conviction of ſuperior powers has long been univerſal, the important queſtion is, From what cauſe it proceeds? The ſame ingenious author ſhows, with great ſtrength of reaſoning, that the operations of nature and the government of this world, which to us loudly proclaim the exiſtence of a Deity, are not ſufficient to account for the univerſal belief of ſuperior beings among ſavage tribes. He is therefore of opinion, that this univerſality of conviction can ſpring only from the image of Deity ſtamped upon the mind of every human being, the ignorant equally with the learned. "Nothing leſs (he ſays) is ſufficient: and the original perception which we have of Deity muſt proceed (he thinks) from an internal ſenſe, which may be termed the *ſenſe of Deity*."

We have elſewhere expreſſed our opinion of that philoſophy which accounts for every phenomenon in human nature, by attributing it to a particular inſtinct (ſee INSTINCT); but to this inſtinct or *ſenſe of Deity*, conſidered as complete evidence, many objections, more than uſually powerful, force themſelves upon us. All nations, except the Jews, were once polytheiſts and idolaters. If therefore his Lordſhip's hypotheſis be admitted, either the doctrine of polytheiſm muſt be true theology, or this inſtinct or ſenſe is of ſuch a nature as to have at different periods of the world miſled all mankind. All ſavage tribes are at preſent polytheiſts and idolaters; but among ſavages every inſtinct appears in greater purity and vigour than among people poliſhed by arts and ſciences; and inſtinct never miſtakes its object. The inſtinct or primary impreſſion of nature, which gives riſe to ſelf-love, affection between the ſexes, love of progeny, &c. has in all nations, and in every period of time, a preciſe and determinate object which it inflexibly purſues. How then comes it to paſs, that this particular inſtinct, which if real is ſurely of as much importance as any other, ſhould have uniformly led thoſe who had no other guide to purſue improper objects, to fall into the groſſeſt errors and the moſt pernicious practices? To no purpoſe are we told, that the ſenſe of Deity, like the moral ſenſe, makes no capital figure among ſavages. There is reaſon to believe that the feeling or perception, which is called the *moral ſenſe*, is not wholly inſtinctive; but whether it be or not, a ſingle inſtance cannot be produced in which it multiplies its objects, or makes even a ſavage expreſs gratitude to a thouſand perſons for benefits which his prince alone had power to confer.

For theſe, and other reaſons which might eaſily be aſſigned, we cannot help thinking, that the firſt religious principles muſt have been derived from a ſource different as well from internal ſenſe as from the deductions of reaſon; from a ſource which the majority of mankind had early forgotten; and which, when it was baniſhed from their minds, left nothing behind to prevent the very firſt principle of religion from being perverted by various accidents or cauſes, or, in ſome extraordinary concurrence of circumſtances, from being perhaps entirely obliterated. This ſource of religion every conſiſtent Theiſt muſt believe to be revelation. Reaſon, it is acknowledged, and we ſhall afterwards ſhow (ſee RELIGION), could not have introduced ſavages to the knowledge of God; and we have juſt ſeen, that a *ſenſe* of Deity is an hypotheſis clogged with inſuperable difficulties. Yet it is undeniable, that all mankind have believed in ſuperior inviſible powers: and if reaſon and inſtinct be ſet aſide, there remains no other origin of this

3 To revelation.

this univerſal belief that primeval revelation, corrupted, indeed, as it paſſed by oral tradition from father to ſon, in the courſe of many generations. It is no ſlight ſupport to this doctrine, that if there really be a Deity*, it is highly preſumable, that he would reveal himſelf to the firſt men—creatures whom he had formed with faculties to adore and to worſhip him. To other animals, the knowledge of a Deity is of no importance; to man, it is of the firſt importance. Were we totally ignorant of a Deity, this world would appear to us a mere chaos. Under the government of a wiſe and benevolent Deity, chance is excluded; and every event appears to be the reſult of eſtabliſhed laws. Good men ſubmit to whatever happens without repining, knowing that every event is ordered by Divine Providence: they ſubmit with entire reſignation; and ſuch reſignation is a ſovereign balſam for every misfortune or evil in liſe.

* See Sketches of the Hiſt. of Man.

4
Which taught pure theiſm.

Admitting, then, that the knowledge of Deity was originally derived from revelation, and that the firſt men profeſſed pure theiſm, it ſhall be our buſineſs in the preſent article to trace the riſe and progreſs of *polytheiſm* and *idolatry*; and to aſcertain, if we can, the real opinions of the Pagan world concerning that multitude of gods with which they filled heaven, earth, and hell. In this inquiry, though we ſhall have occaſion to appeal to the writings of Moſes, we ſhall attribute to them no other authority than what is due to records of the earlieſt ages, more ancient and authentic than any others which are now extant.

Whether we believe, with the author of the book of Geneſis, that all men have deſcended from the ſame progenitors; or adopt the hypotheſis of modern theoriſts, that there have been ſucceſſive creations of men, and that the *European* derives his origin from one pair, the *Aſiatic* from another, the woolly-headed *African* from a third, and the copper-coloured *American* from a fourth—polytheiſm and idolatry will be ſeen to have ariſen from the ſame cauſes, and to have advanced nearly in the ſame order from one degree of impiety to another. On either ſuppoſition, it muſt be taken for granted, that the original progenitors were inſtructed by their Creator in the truths of genuine theiſm: and there is no room to doubt, but that thoſe truths, ſimple and ſublime as they are, would be conveyed pure from father to ſon as long as the race lived in one family, and were not ſpread over a large extent of country. If any credit be due to the records of antiquity, the primeval inhabitants of this globe lived to ſo great an age, that they muſt have increaſed to a very large number long before the death of the common parent, who would of courſe be the bond of union to the whole ſociety, and whoſe dictates, eſpecially in what related to the origin of his being and the exiſtence of his Creator, would be liſtened to with the utmoſt reſpect by every individual of his numerous progeny.

Many cauſes, however, would conſpire to diſſolve this family, after the death of its anceſtor, into ſeparate and independent tribes, of which ſome would be driven by violence, or would voluntarily wander, to a diſtance from the reſt. From this diſperſion great changes would take place in the opinions of ſome of the tribes reſpecting the object of their religious worſhip. A ſingle family, or a ſmall tribe baniſhed into a deſert wilderneſs (ſuch as the whole earth muſt then have been), would find employment for all their time in providing the means of ſubſiſtence, and in defending themſelves from beaſts of prey. In ſuch circumſtances they would have little *leiſure* for meditation, and, being conſtantly converſant with objects of ſenſe, they would gradually loſe the *power* of meditating upon the ſpiritual nature of that Being by whom their anceſtors had taught them that all things were created. The firſt wanderers would no doubt retain in tolerable purity their original notions of Deity; and they would certainly endeavour to impreſs thoſe notions upon their children: but in circumſtances infinitely more favourable to ſpeculation than theirs could have been, the human mind dwells not long upon notions purely intellectual. We are ſo accuſtomed to ſenſible objects, and to the ideas of ſpace extenſion, and figure, which they are perpetually impreſſing upon the imagination, that we find it extremely difficult to conceive any being without aſſigning to him a form and a place. Hence a learned writer* has ſuppoſed, that the earlieſt generations of men (even thoſe to whom he contends that frequent revelations were vouchſafed) may have been no better than *anthropomorphites* in their conceptions of the Divine Being.

5
Circumſtances which led to polytheiſm.

* Biſhop Law in his Conſiderations on the Theory of Religion.

6
Firſt ſteps in the progreſs.

Be this as it may, it is not conceivable but that the members of thoſe firſt colonies would quickly loſe many of the arts and much of the ſcience which perhaps prevailed in the parent ſtate; and that fatigued with the contemplation of intellectual objects, they would relieve their overſtrained faculties, by attributing to the Deity a place of abode, if not a human form. To men totally illiterate, the place fitteſt for the habitation of the Deity would undoubtedly appear to be the ſun, the moſt beautiful and glorious object of which they could form any idea; an object, too, from which they could not but be ſenſible that they received the benefits of light and heat, and which experience muſt ſoon have taught them to be in a great meaſure the ſource of vegetation. The great ſpirit therefore inhabiting the ſun, which they would conſider as the *power* of light and heat, was in all probability the firſt object of idolatrous adoration.

7
The ſpirit of light the firſt god of paganiſm.

From looking upon the ſun as the habitation of their God, they would ſoon proceed to conſider it as his body. Of pure mind entirely ſeparated from matter, men in their circumſtances could not long retain the fainteſt notion; but conſcious each of power in himſelf, and experiencing the effects of power in the ſun, they would naturally conceive that luminary to be animated as their bodies were animated. They would feel his influence when above the horizon; they would ſee him moving from eaſt to weſt; they would conſider him when ſet as gone to take his repoſe: and thoſe exertions and intermiſſions of power being analagous to what they experienced in themſelves, they would look upon the ſun as a real animal. Thus would the Divinity appear to their untutored minds to be a compound being like man, partly corporeal and partly ſpiritual; and as ſoon as they imbibed ſuch notions, though perhaps not before, they may be pronounced to have been abſolute idolaters.

When man had once got into this train, their gods would multiply upon them with wonderful rapidity. Darkneſs and cold they could not but perceive to be contrary to light and heat; and not having philoſophy enough to diſtinguiſh between mere privations and poſitive effects, they would conſider darkneſs and cold as entities equally real with light and heat; and attribute theſe different and contrary effects to different and contrary powers. Hence the ſpirit or power of darkneſs was in all probability the ſecond god in the Pagan calendar; and as they conſidered the power of light as a benevolent principle, the ſource of all that is good, they muſt have looked upon the contrary power of darkneſs as a malevolent ſpirit, the ſource of all that is evil. This we know from authentic hiſtory to have been the belief of the Perſian magi, a very ancient ſect, who called their good god *Yazdan*, and alſo *Ormuzd*, and the evil god *Abraman*. Conſidering light as the ſymbol, or perhaps as the body, of *Ormuzd*, they always worſhipped him before the fire, the ſource of light, and eſpecially before the ſun, the ſource of the moſt perfect light; and for the ſame reaſon fires were kept continually burning on his altars. That they ſometimes addreſſed prayers to the evil principle, we are informed by Plutarch in his life of Themiſtocles; but with what particular rites he was worſhipped, or where he was ſuppoſed to reſide, is not ſo evident. Certain it is, that his worſhippers held him in deteſtation; and when they had occaſion to write his name, they always inverted it *(uɐɯɐɹq∀)*, to denote the malignity of his nature. 8 The ſpirit or power of darkneſs the ſecond. 9 Polytheiſm of the Perſian magi.

The principles of the magi, though widely diſtant from pure theiſm, were much leſs abſurd than thoſe of other idolaters. It does not appear that they ever worſhipped their gods by the medium of graven images, or had any other emblems of them than light and darkneſs. Indeed we are told by Diogenes Laertius and Clemens Alexandrinus, that they condemned all ſtatues and images allowing fire and water to be the only proper emblems or repreſentatives of their gods. And we learn from Cicero *, that at their inſtigation Xerxes was ſaid to have burnt all the temples of Greece, becauſe the builders of thoſe edifices impiouſly preſumed to incloſe within walls the gods, to whom all things ought to be open and free, and whoſe proper temple is the whole world. To theſe authorities we may add that of all the hiſtorians, who agree, that when magianiſm was the religion of the court, the Perſian monarchs made war upon images, and upon every emblem of idolatry different from their own.

10 Sabian polytheiſm. The Magi, however, were but one ſect, and not the largeſt ſect of ancient idolaters. The worſhip of the ſun, as the ſource of light and heat, ſoon introduced into the calendar of divinities the other heavenly bodies, the moon, the planets, and the fixed ſtars. Men could not but experience great benefit from thoſe luminaries in the abſence of their chief god; and when they had proceeded ſo far as to admit two divine principles, a good and an evil, it was natural for minds clouded with ſuch prejudices to conſider the moon and the ſtars as benevolent intelligences, ſent to oppoſe the power of darkneſs whilſt their firſt and greateſt divinity was abſent or aſleep. It was thus, as they imagined, that he maintained (for all held that he did maintain) a conſtant ſuperiority over the evil principle. Though to aſtronomers the moon is known to be an opake body of very ſmall dimenſions when compared with a planet or a fixed ſtar, to the vulgar eye ſhe appears much more magnificent than either. By thoſe early idolaters ſhe was conſidered as the divinity ſecond in rank and in power; and whilſt the ſun was worſhipped as the king, ſhe was adored as the queen, of heaven.

The earth, conſidered as the common mother of all things; the ocean, whoſe waters are never at reſt; the air, the region of ſtorms and tempeſts, and indeed all the elements—were gradually added to the number of divinities; not that mankind in this early age had ſo far degenerated from the principles of their anceſtors as to worſhip brute matter. If ſuch worſhip was ever practiſed, which to us is hardly conceivable, it was at a later period, when it was confined to the very loweſt of the vulgar, in nations otherwiſe highly civilized. The polytheiſts, of whom we now treat, conceived every thing in motion to be animated, and animated by an intelligence powerful in proportion to the magnitude of the body moved.

This ſect of idolaters, which remains in ſome parts of the Eaſt to this day, was known by the name of *Sabians*, which they pretend to have derived from *Sabius* a ſon of Seth; and among the books in which their ſacred doctrines are contained, they have one which they call the book of *Seth*. We need hardly obſerve, that theſe are ſenſeleſs and extravagant fables. The name *Sabian* is undoubtedly derived from the Hebrew word *Tſaba*, which ſignifies "a hoſt or army;" and this claſs of polytheiſts was ſo called, becauſe they worſhipped "the hoſt of heaven;" the *Tſaba heſemim*, againſt which Moſes ſo pathetically cautions the people of Iſrael *.

11 Aroſe in Chaldea. This ſpecies of idolatry is thought to have firſt prevailed in Chaldea, and to have been that from which Abraham ſeparated himſelf, when, at the command of the true God, he "departed from his country, and from his kindred, and from his father's houſe." But as it nowhere appears that the Chaldeans had fallen into the ſavage ſtate before they became polytheiſts and idolaters, and as it is certain that they were not ſavages at the call of Abraham, their early Sabiiſm may be thought inconſiſtent with the account which we have given of the origin of that ſpecies of idolatry. If a great and civilized nation was led to worſhip the hoſt of heaven, why ſhould that worſhip be ſuppoſed to have ariſen among ſavages? Theories, however plauſible, cannot be admitted in oppoſition to facts.

True: but we beg leave to reply, that our account of the origin of polytheiſm is oppoſed by no fact; becauſe we have not ſuppoſed that the worſhip of the hoſt of heaven aroſe among ſavages *only*. That ſavages, between whom it is impoſſible to imagine any intercourſe to have had place, have univerſally worſhipped, as their firſt and ſupreme divinities, the *ſun*, *moon*, and *ſtars*, is a fact evinced by every hiſtorian and by every traveller; and we have ſhown how their rude and uncultivated ſtate naturally leads them to that ſpecies of idolatry. But there may have been circumſtances peculiar to the Chaldeans, which led them likewiſe to the worſhip of the heavenly hoſt, even in a ſtate of high civilization.—We judge of the philoſophy of the ancients by that of ourſelves, and imagine that the ſame refined ſyſtem of metaphyſics was cultivated by them as by the followers of *Deſcartes* and *Locke*. But this is a great miſtake; for ſo groſs were the notions of early antiquity, that it may be doubted whether there was a ſingle man unınſpired, who had any notion of mind as a being diſtinct and entirely ſeparated from matter (ſee **Metaphysics**, Part III. c. 4). From ſeveral paſſages in the books of Moſes, we learn, that when in the firſt ages of the world the Supreme Being condeſcended to manifeſt his preſence to men, he generally exhibited ſome ſenſible emblem of his power and glory, and declared his will from the miſt of a preternatural *fire.* It was thus that he appeared to the Jewiſh lawgiver himſelf, when he ſpoke to him from the midſt of a burning buſh; it was by a pillar of cloud and *fire* that he led the Iſraelites from Egypt to the land of Promiſe; and it was in the midſt of ſmoke, and *fire*, and thunderings, that the law was delivered from Mount Sinai.—That ſuch manifeſtations of the Divine Preſence would be occaſionally made to the deſcendants of Noah who ſettled in Chaldea ſoon after the deluge, muſt appear extremely probable to every one who admits the authority of the Hebrew Scriptures: and he who queſtions that authority, has no right to make the objection to which we now reply; becauſe it is only from the book of Geneſis that we know the Chaldeans to have been a civilized people when they fell into idolatry. All hiſtories agree in repreſenting the inhabitants of Chaldea as at a very early period corrupted by luxury and ſunk in vice. When this happened, we muſt ſuppoſe that the moral Governor of the univerſe would withdraw from them thoſe occaſional manifeſtations of himſelf, and leave them to their own inventions. In ſuch circumſtances, it was not unnatural for a people addicted to the ſtudy of aſtronomy, who had been taught to believe that the Deity frequently appeared to their anceſtors in a flame of fire, to conſider the ſun as the place of his permanent reſidence, if not as his body. But when either opinion was firmly eſtabliſhed, polytheiſm would be its inevitable conſequence, and the progreſs of Sabiiſm would, in the moſt poliſhed nation, be ſuch as we have traced it among ſavage tribes.

---

* Deut. c. iv. 19.

12
Paſſed into Egypt, &c.

From Chaldea the idolatrous worſhip of the hoſt of heaven ſpread itſelf over all the Eaſt, paſſed into Egypt, and thence into Greece; for Plato affirms †, that "the firſt inhabitants of Greece ſeemed to him to have worſhipped no other gods but the ſun, moon, earth, ſtars, and heavens, as moſt barbarous nations (continues he) ſtill do." That Sabiiſm, or the worſhip of the hoſt of heaven, was the firſt ſpecies of idolatry, beſides the probability of the thing, and the many alluſions to it in ſacred Scripture, we have the poſitive evidence of the moſt ancient pagan hiſtorians of whoſe writings any part has been tranſmitted to us. Herodotus *, ſpeaking of the religion of the Perſians, ſays, that "they worſhip the *ſun*, *moon*, and *earth*, *fire*, *water*, and the *winds*; and this adoration they have all along paid from the beginning." He teſtifies the ſame thing of the ſavage Africans, of whom he affirms †, that they all worſhipped the *ſun*, and *moon*, and no other divinity. Diodorus Siculus, writing of the Egyptians ‡, tells us, that "the firſt men looking up to the world above them, and terrified and ſtruck with admiration at the nature of the univerſe, ſuppoſed the ſun and moon to be the principal and *eternal gods*." And Sanchoniathon the Phœnician, a more ancient writer than either of theſe, informs us, in the fragment of his hiſtory preſerved by Euſebius, that "the two firſt mortals were Æon and Protogonus; and their children were Genus and Genea, who inhabited Phœnicia; and when they were ſcorched with the heat, they lifted up their hands to the ſun, whom they believed to be the Lord of Heaven, and called him *Baal-ſamen*, the ſame whom the Greeks call Ζευς."

13
And produced ſtatue worſhip.

Hitherto thoſe divinities were worſhiped in perſon, or, as Dr Prideaux expreſſes it, in their *ſacella*, or ſacred tabernacles; for the votaries of each directed their devotions towards the planet which they ſuppoſed to be animated by the particular intelligence whom they meant to adore. But theſe orbs, by their riſing and ſetting, being as much below the horizon as above it, and their groſsly ignorant worſhippers not ſuppoſing it poſſible that any intelligence, however divine, could exert its influence but in union with ſome body, ſtatues or pillars were ſoon thought of as proper emblems of the abſent gods. Sanchoniathon, in the fragment already quoted, informs us, that "*Hyſpouranios* and his brother *Ouſous*, Phœnician patriarchs, erected two pillars, the one to *fire*, and the other to *air* or *wind*, and worſhipped thoſe pillars, pouring out to them libations of the blood of the wild beaſts hunted down in the chace." As theſe early monuments of idolatry were called βαιτυλια, a word evidently derived from the Hebrew *Bethel*, the probability is, that they were altars of looſe ſtones, ſuch as that which was built by Jacob §, and from him received the ſame name. As his was conſecrated to the true God, theirs were conſecrated to the hoſt of heaven; and the form of conſecration ſeems to have been nothing more than the anointing of the ſtone or pillar with oil (A), in the name of the divinity whom it was intended to repreſent. When this ceremony was performed, the ignorant idolaters, who fancied that their gods could not hear them but when they were viſible, ſuppoſed that the intelligences by which the ſun and planets were animated, took poſſeſſion, in ſome inexplicable manner, of the conſecrated pillars, and were as well pleaſed with the prayers and praiſes offered up before thoſe pillars, as with the devotions which were addreſſed towards the luminaries themſelves.—Hence Sanchoniathon calls them *animated* or *living*, *ſtones*, λιθους εμψυχους, from the portion of the Divine Spirit which was believed to reſide in them; and as they were dedicated to the hoſt of heaven, they were generally erected on the tops of mountains; or in countries which, like Egypt, were low and level, they were elevated to a great height by the labour of men.

14
With the idolatry of high places.

It has been ſuppoſed, that this practice of raiſing the pillars on *high places* proceeded from a deſire to make the objects of worſhip conſpicuous and magnificent: but we are ſtrongly inclined to believe, that the erectors of Βαιτυλια had ſomething farther in view, and that they thought of nothing leſs than to bring the ſacred ſtone or pillar as near as poſſible to the god whom it repreſented. Whatever be in this, we know that the practice itſelf prevailed univerſally through the eaſt; and that

† In Cratyl.

† Lib. iv. cap. 188.

‡ Lib. I.

§ Geneſis, ch. xxxv.

(A) Hence the proverb of a ſuperſtitious man, παντα λιθον λιπαρον προσκυνει, *he kiſſes or adores every anointed ſtone*; which Arnobius calls *lubricatam lapidem, et ex olivi unguine ſordidatum.*—Stillingfleet's *Origines Sacræ.*

there was nothing which the Jewiſh legiſlator more ſtrictly enjoined his people to deſtroy, than the altars, ſtatues, and pillars, erected for idolatrous worſhip upon mountains and high places. "Ye ſhall utterly deſtroy (ſays he) all the places wherein the nations which ye ſhall poſſeſs ſerved their gods, upon the *high mountains*, and upon the *hills*, and under every green tree. And ye ſhall overthrow their *altars*, and break down their *pillars*, and burn their *groves* with fire*."

The mention of *groves* by the Hebrew lawgiver, brings to our recollection another ſpecies of idolatry, which was perhaps the ſecond in order, as men deviating from the principles of pure theiſm were more and more intangled in the labyrinths of error. The Chaldeans, Egyptians, and all the eaſtern nations who believed in a ſuperintending providence, imagined that the government of this world, the care of particular nations, and even the ſuperintendence of groves, rivers, and mountains, in each nation, was committed by the gods to a claſs of ſpirits ſuperior to the ſoul of man, but inferior to thoſe heavenly intelligences which animated the ſun, the moon, and the planets. Theſe ſpirits were by the Greeks called *δαιμονες*, *dæmons*, and by the Romans *genii*. Timæus the Locrian, who flouriſhed before Plato, ſpeaking of the puniſhment of wicked men, ſays†, all theſe things hath Nemeſis decreed to be executed in the ſecond period, by the miniſtry of vindictive terreſtrial dæmons, who are overſeers of human affairs; to which dæmons, the Supreme God, the ruler over all, hath committed the government and adminiſtration of this world, which is made up of *gods*, *men*, and *animals*.

15
Origin of dæmon-worſhip

Concerning the origin of theſe intermediate beings, ſcholars and philoſophers have framed various hypotheſes. The belief of their exiſtence may have been derived from five different ſources.

1. It ſeems to have been impoſſible for the limited capacities of thoſe men, who could not form a notion of a God diveſted of a body and a place, to conceive how the influence and agency of ſuch a being could every inſtant extend to every point of the univerſe. Hence, as we have ſeen, they placed the heavenly regions under the government of a multitude of heavenly gods, the *ſun*, the *moon*, and the *ſtars*. But as the neareſt of thoſe divinities was at an immenſe diſtance from the earth, and as the intelligence animating the earth itſelf had ſufficient employment in regulating the general affairs of the whole globe, a notion inſinuated itſelf into the untutored mind, that theſe ſuperior governors of univerſal nature found it neceſſary, or at leaſt expedient, to employ ſubordinate intelligences or *dæmons* as miniſters to execute their beheſts in the various parts of their widely extended dominions.

2. Such an univerſal and uninterrupted courſe of action, as was deemed neceſſary to adminiſter the affairs of the univerſe, would be judged altogether inconſiſtent with that ſtate of *indolence*, which, eſpecially in the eaſt, was held an indiſpenſable ingredient in perfect felicity. It was this notion, abſurd as it is, which made Epicurus deny the *providence*, whilſt he admitted the *exiſtence* of gods. And if it had ſuch an effect upon a philoſopher who in the moſt enlightened ages had many followers, we need not ſurely wonder if it made untaught idolaters imagine that the governor or governors of the univerſe had devolved a great part of their trouble on deputies and miniſters.

3. When men came to reflect on the infinite diſtance between themſelves and the gods, they would naturally form a wiſh, that there might ſomewhere exiſt a claſs of intermediate intelligences, whom they might employ as mediators and interceſſors with their far diſtant divinities. But what men earneſtly wiſh, they very readily believe. Hence the ſuppoſed diſtance of their gods would, among untutored barbarians, prove a fruitful ſource of intermediate intelligences, more pure and more elevated than human ſouls.

4. Theſe three opinions may be denominated popular; but that which we are now to ſtate, wherever it may have prevailed, was the offspring of philoſophy.—On this earth we perceive a ſcale of beings riſing gradually above each other in perfection, from mere brute matter through the various ſpecies of foſſils, vegetables, inſects, fiſhes, birds, and beaſts, up to man. But the diſtance between man and God is infinite, and capable of admitting numberleſs orders of intelligences, all ſuperior to the human ſoul, and each riſing gradually above the other till they reach that point, wherever it may be, at which creation ſtops. Part of this immenſe chaſm the philoſophers perceived to be actually filled by the heavenly bodies; for in *philoſophical* polytheiſm there was one inviſible God ſupreme over all theſe: but ſtill there was left an immenſe vacuity between the human ſpecies and the moon, which was known to be the loweſt of the heavenly hoſt; and this they imagined muſt certainly be occupied by inviſible inhabitants of different orders and diſpoſitions, which they called good and evil *dæmons*.

5. There is yet another ſource from which the univerſal belief of good and evil demons may be derived, with perhaps greater probability than from any or all of theſe. If the Moſaic account of the creation of the world, the peopling of the earth, and the diſperſion of mankind, be admitted as true (and a more conſiſtent account has not as yet been given or deviſed), ſome knowledge of good and evil *angels* muſt neceſſarily have been tranſmitted from father to ſon by the channel of oral tradition. This tradition would be corrupted at the ſame time, and in the ſame manner, with others of greater importance. When the true God was ſo far miſtaken as to be conſidered, not as the ſole governor of the univerſe, but only as the ſelf-exiſtent power of light and good, the Devil would be elevated from the rank of a rebellious created ſpirit to that of the independent power of darkneſs and evil; the angels of light would be transformed into good demons, and thoſe of darkneſs into demons that are evil. This account of the origin of dæmonology receives no ſmall ſupport from Plato, who derives one branch of it wholly from tradition. "With reſpect to thoſe demons (ſays he‡) who inhabit the ſpace between the earth and the moon, to underſtand and declare their generation is a taſk too arduous for my ſlender abilities. In this caſe we muſt credit the report of men of other times, who, according to their own account, were the deſcendants of the gods, and had, by ſome means or other, gained exact intelligence of that myſtery from their anceſtors. We muſt not queſtion the veracity of the children of the gods, even though they ſhould tranſgreſs the bounds

---

‡ Timæus.

of probability, and produce no evidence to ſupport their aſſertions. We muſt, I ſay, notwithſtanding, give them credit, becauſe they profeſs to give a detail of facts with which they are intimately acquainted, and the laws of our country oblige us to believe them."

Though theſe dæmons were generally inviſible, they were not ſuppoſed to be pure diſembodied ſpirits.—Proclus, in his Commentary upon Plato's Timæus, tells us, that "every dæmon ſuperior to human ſouls conſiſted of an intellectual mind and an ethereal vehicle." Indeed it is very little probable, that thoſe who gave a body and a place to the Supreme God, ſhould have thought that the inferior orders of his miniſters were ſpirits entirely ſeparated from matter. Plato himſelf divides the claſs of dæmons into three orders*; and whilſt he holds their ſouls to be particles or emanations from the divine eſſence, he affirms that the bodies of each order of dæmons are compoſed of that particular element in which they for the moſt part reſide. "Thoſe of the firſt and higheſt order are compoſed of pure ether; thoſe of the ſecond order conſiſt of groſſer air; and dæmons of the third or loweſt rank have vehicles extracted from the element of water. Dæmons of the firſt and ſecond orders are inviſible to mankind. The aquatic dæmons, being inveſted with vehicles of groſſer materials, are ſometimes viſible and ſometimes inviſible. When they do appear, though faintly obſervable by the human eye, they ſtrike the beholder with terror and aſtoniſhment." Dæmons of this laſt order were ſuppoſed to have paſſions and affections ſimilar to thoſe of men; and though all nature was full of them, they were believed to have local attachments to mountains, *rivers*, and *groves*, where their appearances were moſt frequent. The reaſon of theſe attachments ſeems to be obvious. Polytheiſm took its riſe in countries ſcorched by a burning ſun; and dæmons by their compoſition being neceſſarily ſubject in ſome degree to the influence of heat and cold, it was natural to ſuppoſe that they, like men, would delight in the ſhady grove and in the purling ſtream. Hence the earlieſt altars of paganiſm were generally built in the midſt of *groves*, or on the banks of *rivers*; becauſe it was believed that in ſuch places were aſſembled multitudes of thoſe intelligences, whoſe office it was to regulate the affairs of men, and to carry the prayers and oblations of the devout to the far-diſtant reſidence of the celeſtial gods. Hence too are to be derived the mountain and river gods, with the dryads and hamadryads, the ſatyrs, nymphs, and fawns, which held a place in the creed of ancient paganiſm, and make ſo conſpicuous a figure in the Greek and Roman poets.

16
In groves, and on the banks of rivers.

Theſe different orders of intelligences, which, though worſhipped as gods or demigods, were yet believed to partake of human paſſions and appetites, led the way to the deification of departed heroes and other eminent benefactors of the human race. By the philoſophers all ſouls were believed to be emanations from the divinity; but "gratitude † and admiration, the warmeſt and moſt active affections of our nature, concurred to enlarge the object of religious worſhip, and to make man regard the inventors of arts and the founders of ſociety as having in them more than a common ray of the divinity. So that god-like benefits, beſpeaking as it were a god-like mind, the deceaſed parent of a people was eaſily advanced into the rank of dæmon. When the religious bias was in ſo good a train, natural affection would have its ſhare in promoting this new mode of adoration. Piety to parents would naturally take the lead, as it was ſupported by gratitude and admiration, the *primum mobile* of the whole ſyſtem: and in thoſe early ages, the *natural father* of the tribe often happened to be the *political father* of the people, and the founder of the ſtate. Fondneſs for the offspring would next have its turn; and a diſconſolate father, at the head of a people, would contrive to ſooth his grief for the untimely death of a favourite child, and to gratify his pride under the want of *ſucceſſion*, by paying divine honours to its memory." "For a father ‡ afflicted with untimely mourning, when he had made an image of his child ſoon taken away, now honoured him as a god, who was then a dead man, and delivered to thoſe that were under him ceremonies and ſacrifices." That this was the origin and progreſs of the worſhip of departed ſouls, we have the authority of the famous fragment of Sanchoniathon already quoted, where the various motives for this ſpecies of idolatry are recounted in expreſs words. "After many generations (ſays he) came *Chryſor*; and he invented many things uſeful to civil life, for which, after his deceaſe, he was worſhipped as a *god*. Then flouriſhed *Ouranos* and his ſiſter *Ge*, who deified and offered ſacrifices to their father *Hypſiſtos*, when he had been torn in pieces by wild beaſts. Afterwards *Cronos* conſecrated *Muth* his ſon, and was himſelf conſecrated by his ſubjects."

17
Deification of departed heroes,

In the reign of Cronos flouriſhed a perſonage of great reputation for wiſdom, who by the Egyptians was called *Thoth*, by the Phœnicians *Taautos*, and by the Greeks *Hermes*. According to Plutarch, he was a profound politician, and chief counſellor to Oſiris, then the king, and afterwards the principal divinity, of Egypt: and we are told by *Philo Byblius*, the tranſlator of Sanchoniathon, "that it was this *Thoth* or *Hermes* who firſt took the matters of religious worſhip out of the hands of unſkilful men, and brought them into due method and order." His object was to make religion ſerviceable to the intereſts of the ſtate. With this view he appointed *Oſiris* and other departed princes to be joined with the ſtars and worſhipped as gods; and being by Cronos made king of Egypt, he was, after his death, worſhipped himſelf as a god by the Egyptians. To this honour, if what is recorded of him be true, he had indeed a better title than moſt princes; for he is ſaid to have been the inventor of letters, arithmetic, geometry, aſtronomy, and hieroglyphics, and was therefore one of the greateſt benefactors of the human race which any age or country has ever produced.

18
A political invention which introduced

That the gods of Greece and Rome were derived from Egypt and Phœnicia, is ſo univerſally known, that it is needleſs to multiply quotations in order to prove that the progreſs of polytheiſm among the Greeks and Romans was the ſame with that which we have traced in more ancient nations. The following tranſlation, however, of the account given by Heſiod of the deification of departed heroes, with which we have been favoured by a learned and ingenious friend, is ſo juſt, and in our opinion ſo beautiful, that we cannot deny ourſelves the pleaſure of giving it to our readers.

"The gods who dwell on high Olympus' hill,
Firſt fram'd a golden race of men, who liv'd
Under old Saturn's calm auſpicious ſway.
Like gods they liv'd, their hearts devoid of care,

---

* Epinionis.

† Warburton's Div. Leg.

‡ Wiſdom of Solomon xiv. 15.

Beyond the reach of pain and piercing woes;
Th' infirmities of age nor felt, nor fear'd.
Their nerves with youthful vigour ſtrung, their days
In jocund mirth they paſt, remote from ills.—
Now when this godlike race was lodg'd in earth,
By Jove's high will to demigods they roſe,
And airy dæmons, who benign on earth
Converſe—the guides and guardians of mankind.
In darkneſs veil'd, they range earth's utmoſt bound,
Diſpenſing wealth to mortals. This reward
From bounteous Jove awaits illuſtrious deeds ||."

19 National and tutelar gods.

The deification of departed heroes and ſtateſmen was that which in all probability introduced the univerſal belief of *national* and *tutelar* gods, as well as the practice of worſhipping thoſe gods through the medium of *ſtatues* cut into a *human figure*. When the founder of a ſtate or any other public benefactor was elevated to the rank of a god, as he was believed ſtill to retain human paſſions and affections, it was extremely natural to ſuppoſe that he would regard with a favourable eye that nation for which he had done ſo much upon earth; that he would oppoſe its enemies, and protect the laws and inſtitutions which he himſelf had given it. By indulging the ſame train of ſentiment, each city, and even every family of conſequence, found *Lares* and *Penates* among their departed anceſtors, to whom they paid the warmeſt adoration, and under whoſe protection they believed their private affairs to be placed. As thoſe national and houſehold gods were believed to be in their deified ſtate clothed with airy bodies, ſo thoſe bodies were ſuppoſed to retain the form which their groſſer bodies had upon earth. The image of a departed friend might perhaps be formed by the hand of ſorrowful affection, before the ſtatue or the ſhrine of a deity was thought of; but when that friend or benefactor became the object of religious adoration, it was natural for his votaries to enliven their devotion by the view of his ſimilitude. Maximus Tyrius tells us §, that "there is no race of men, whether barbarian or Grecian, living on the ſea-coaſt or on the continent, wandering in deſerts or living in cities, which hath not conſecrated ſome kind of ſymbol or other in honour of the gods." This is certainly true; but there is no good evidence that the firſt ſymbols of the gods were ſtatues of men and women. Whilſt the ſun and other heavenly bodies continued to be the ſole objects of religious worſhip, the ſymbols conſecrated to them were pillars of a *conical* or *pyramidal* figure; and if ſuch pillars are ever called *graven* images by Moſes and other ancient writers, it was probably on account of the *allegoric figures* and *characters*, or hieroglyphic writing, with which they were inſcribed.

20 Hero-worſhip engrafted on the planetary.

Hitherto we have conſidered the ſouls of departed heroes as holding the rank only of demons or demigods; but they gradually roſe in the ſcale of divinities, till they dethroned the heavenly bodies, and became themſelves the *dii majorum gentium*. This revolution was effected by the combined operation of the prince and the prieſt; and the firſt ſtep taken towards it ſeems to have been the complimenting of their heroes and public benefactors with the name of that being which was moſt eſteemed and worſhipped. "Thus a king for his beneficence was called the *ſun*, and a queen for her beauty the *moon*. Diodorus relates, that Sol firſt reigned in Egypt, called ſo from the luminary of that name in the heavens. This will help us to underſtand an odd paſſage in the fragment of Sanchoniathon, where it is ſaid that *Cronus had ſeven ſons by Rhea, the youngeſt of whom was a* GOD *as ſoon as* BORN. The meaning probably is, that this youngeſt ſon was called after ſome luminary in the heavens to which they paid divine honours; and theſe honours came in proceſs of time to be transferred to the terreſtrial nameſake. The ſame hiſtorian had before told us, that the ſons of Genos, mortals like their father, were called by the names of the elements—*light*, *fire*, and *flame*, of which they had diſcovered the uſe."

21 Which in time it ſupplanted.

"As this adulation advanced into an eſtabliſhed worſhip, they turned the compliment the other way, and called the planet or luminary after the hero, the better to accuſtom the people, even in the act of *Planet-Worſhip*, to this *new* adoration. Diodorus, in the paſſage already quoted, having told us, that by the firſt inhabitants of Egypt the ſun and moon were ſuppoſed to be the principal and eternal gods, adds, that the former was called Osiris, and the latter Isis. This was indeed the general practice; for we learn from Macrobius, that the Ammonites called the ſun *Moloch*; the Syrians *Adad*; the Arabs *Dionyſus*; the Aſſyrians *Belus*; the Phœnicians *Saturn*; the Carthaginians *Hercules*; and the Palmyrians *Elegabalus*. Again, by the Phrygians the moon was called *Cybele*, or the mother of the gods; by the Athenians *Minerva*; by the Cyprians *Venus*; by the Cretans *Diana*; by the Sicilians *Proſerpine*; by others *Hecate*, *Bellona*, *Veſta*, *Urania*, *Lucina*, &c. Philo Byblius explains this practice: "It is remarkable (ſays he) that the ancient idolators impoſed on the *elements*, and on thoſe parts of nature which they eſteemed gods, *the names of their kings*: for the natural gods which they acknowledged were only the ſun, moon, planets, elements, and the like; they being now in the humour of having gods of both claſſes, the *mortal* and the *immortal*."

"As a farther proof that *hero*-worſhip was thus ſuperinduced upon the *planetary*, it is worthy of obſervation, that the firſt ſtatues conſecrated to the *greater* hero-gods—thoſe who were ſuppoſed to be *ſupreme*—were not of a human form, but *conical* or *pyramidal*, like thoſe which in the earlieſt ages of idolatry were dedicated to the ſun and planets. Thus the ſcholiaſt on the Veſpæ of Ariſtophanes tells us, that the ſtatues of Apollo and Bacchus were *conic* pillars or obeliſks; and Pauſanias, that the ſtatue of Jupiter Meilichius repreſented a *pyramid*; that of the Argive Juno did the ſame, as appears from a verſe of Phoronis quoted by Clemens Alexandrinus ‡; and indeed the practice was univerſal as well amongſt the early barbarians as amongſt the Greeks. But it is well known that the ancients repreſented the *rays of light* by pillars of a conical or pyramidal form; and therefore it follows, that when they erected ſuch pillars as repreſentatives of their hero-gods, theſe latter had ſucceeded to the titles, rights, and honours of the *natural* and *celeſtial divinities**.’

But though it ſeems to be certain that *hero*-worſhip was thus engrafted on the *planetary*, and that ſome of thoſe heroes in proceſs of time ſupplanted the planets themſelves, this was ſuch a revolution in theology as could not have been ſuddenly effected by the united influence of the prince and the prieſt. We doubt not

|| Εργων και ἡμερων, lib. i. verſ. 100, &c.

§ Diſſert. 38.

‡ Strom. l. 1.

* Warburton's Div. Leg. book 3. ſect. 6.

22 Progreſs of this revolution in theology. the fact that SOL was believed to have reigned in Egypt, and was afterwards worſhipped under the name of *Oſiris*; but it was ſurely impoſſible to perſuade any nation, however ſtupid or prone to idolatry, that a man, whom they *remembered* diſcharging the duties of their ſovereign and legiſlator, was the identical ſun whom they beheld in the heavens. Oſiris, if there was in Egypt a king of that name, may have been deified immediately after his death, and honoured with that worſhip which was paid to good *dæmons*; but he muſt have been dead for ages before any attempt was made to perſuade the nation that he was the *ſupreme God*. Even then great addreſs would be requiſite to make ſuch an attempt ſucceſsful. The prince or prieſt who entered upon it would probably begin with declaring from the oracle, that the divine intelligence which animates and governs the ſun had deſcended to earth and animated the perſon of their renowned legiſlator; and that, after their laws were framed, and the other purpoſes ſerved for which the deſcent was made, the ſame intelligence had returned to its original reſidence and employment among the celeſtials. The poſſibility of this double tranſmigration from heaven to earth and from earth to heaven, would without difficulty be admitted in an age when the pre-exiſtence of ſouls was the univerſal belief. Having proceeded thus far in the apotheoſis of dead men, the next ſtep taken in order to render it in ſome degree probable that the early founders of ſtates, and inventors of arts, were divine intelligences clothed with human bodies, was to attribute to one ſuch benefactor of mankind the actions of many of the ſame name. Voſſius, who employed vaſt erudition and much time on the ſubject, has proved, that before the æra of the Trojan wars moſt kings who were very powerful, or highly renowned for their ſkill in legiſlation, &c. were called *Jove;* and when the actions of all theſe were attributed to one *Jove* of *Crete*, it would be eaſy for the crafty prieſt, ſupported by all the power and influence of the ſtate, to perſuade an ignorant and barbarous people, that he whoſe wiſdom and heroic exploits ſo far ſurpaſſed thoſe of ordinary men muſt have been the ſupreme God in human form.

23 Vices of the pagan gods. This ſhort ſketch of the progreſs of polytheiſm and idolatry will enable the reader to account for many circumſtances recorded of the pagan gods of antiquity, which at firſt view ſeem very ſurpriſing, and which at laſt brought the whole ſyſtem into contempt among the philoſophers of Athens and Rome. The circumſtances to which we allude are the immoral characters of thoſe divinities, and the abominable rites with which they were worſhipped. Jupiter, Apollo, Mars, and the whole rabble of them, are deſcribed by the poets as raviſhers of women and notorious adulterers. Hermes or Mercury was a thief, and the god of thieves. Venus was a proſtitute, and Bacchus a drunkard. The malice and revenge of Juno were implacable; and ſo little regard was any of them ſuppoſed to pay to the laws of honour and rectitude, that it was a common practice of the Romans, when beſieging a town, to evocate the tutelar deity, and to tempt him by a reward to betray his friends and votaries †. In a word, they were, in the language of the poet,

> "Gods partial, changeful, paſſionate, unjuſt,
> "Whoſe attributes were rage, revenge, and luſt."

24 Accounted for. This was the natural conſequence of their origin. Having once animated human bodies, and being ſuppoſed ſtill to retain human paſſions and appetites, they were believed, in their ſtate of deification, to feel the ſame ſenſual deſires which they had felt upon earth, and to purſue the ſame means for their gratification. As the men could not well attempt to ſurpaſs the gods in purity and virtue, they were eaſily perſuaded by artful and profligate prieſts, that the moſt acceptable worſhip which could be rendered to any particular deity was to imitate the example of that deity, and to indulge in the practices over which he preſided. Hence the worſhip of Bacchus was performed during the night by men and women mixing in the dark after intemperate eating and drinking. Hence too it was the practice in Cyprus and ſome other countries to ſacrifice to Venus the virginity of young women ſome days before their marriage, in order, as it was pretended, to ſecure their chaſtity ever afterwards; and, if Herodotus may be credited, every woman among the Babylonians was obliged once in her life to proſtitute herſelf in the temple of the goddeſs *Mylitte* (Venus), that ſhe might thenceforward be proof againſt all temptation.

25 Progreſs of idolatry regular and univerſal. The progreſs of polytheiſm, as far as we have traced it, has been regular; and after the enormous error of forſaking the worſhip of the true God was admitted, every ſubſequent ſtep appears to be natural. It would be no difficult taſk to prove that it has likewiſe been univerſal. Sir William Jones, the learned preſident of the Aſiatic Society, has diſcovered ſuch a ſtriking reſemblance between the gods of ancient Greece and thoſe of the pagans of Hindoſtan †, as puts it beyond a doubt that thoſe divinities had the ſame origin. The GANESA of the Hindoos he has clearly proved to be the JANUS of the Greeks and Romans. As the latter was repreſented with two and ſometimes with four faces, as emblems of prudence and circumſpection, the former is painted with an elephant's head, the well-known ſymbol among the Indians of ſagacious diſcernment. 26 Indian idolatry. The SATURN of Greece and Rome appears to have been the ſame perſonage with the MENU or SATYAVRATA of Hindoſtan, whoſe patronymic name is VAIVASWATA, or *child of the ſun*; which ſufficiently marks his origin. Among the Romans there were many Jupiters, of whom one appears from Ennius to have been nothing more than the firmament perſonified.

> Aſpice hoc ſublime candens, quem invocant omnes
> JOVEM.

But this Jupiter had the ſame attributes with the Indian god of the viſible heavens called INDRA or the *king*, and DIVESPETIR or the *lord of the ſky*, whoſe conſort is *Sachi*, and whoſe weapon is *vajra* or the thunderbolt. INDRA is the regent of winds and ſhowers; and though the eaſt is peculiarly under his care, yet his Olympus is the north pole, allegorically repreſented as a mountain of gold and gems. With all his power he is conſidered as a ſubordinate deity, and far inferior to the Indian triad BRAHMA, VISHNOU, and MAHADEVA or SIVA*, who are three forms of one and the ſame godhead. The preſident having traced the reſemblance between the idolatry of Rome and India through many other gods, obſerves, that "we muſt not be ſurpriſed at finding, on a cloſe examination, that the characters of all the pagan deities melt into each other, and at laſt into one or two; for it ſeems a well-founded opinion, that the whole crowd of gods and goddeſſes in ancient Rome, and likewiſe in Hindoſtan, mean only the powers of nature, and principally thoſe of the ſun, expreſſed in a variety of ways, and by a multitude of fanciful names."

---

† T. Livii, l. v. c. 21. et Macrob. Satur. lib. iii, c. 9.

† Aſiatic Reſearches, vol. i.

* Plate CCCCXI.

Nor is it only in Greece, Rome, Egypt, and India, that the progreſs of idolatry has been from planetary to hero-worſhip. From every account which modern travellers have given us of the religion of ſavage nations, it appears that thoſe nations adore, as their firſt and greateſt gods, the ſun, moon, and ſtars; and that ſuch of them as have any other divinities have proceeded in the ſame road with the celebrated nations of antiquity, from the worſhip of the heavenly bodies to that of celeſtial demons, and from celeſtial demons to the deification of dead men. It appears likewiſe that they univerſally believe their hero-gods and demi-gods to retain the paſſions, appetites, and propenſities of men.

27 Scandinavian and Saxon idolatry.

That the Scandinavians and our Saxon anceſtors had the ſame notions of the gods with the other pagans whoſe opinions we have ſtated, is evident from their calling the days of the week by the names of their divinities, and from the forms of the ſtatues by which thoſe divinities were repreſented *. 1. The idol of the ſun, from which *Sunday* is derived, among the Latins *dies Solis*, was placed in a temple, and adored and ſacrificed to; for they believed that the ſun did co-operate with this idol. He was repreſented like a man half naked, with his face like the ſun, holding a burning wheel with both hands on his breaſt, ſignifying his courſe round the world; and by its fiery gleams, the light and heat with which he warms and nouriſheth all things.—2. The idol of the moon, from which cometh our *Monday*, *dies Lunæ*, anciently *Moonday*, appears ſtrangely ſingular, being habited in a ſhort coat like a man. Her holding a moon expreſſes what ſhe is; but the reaſon of her ſhort coat and long-eared cap is loſt in oblivion.—3. *Tuiſco*, the moſt ancient and peculiar god of the Germans, repreſented in his garment of a ſkin according to their ancient manner of clothing, was next to the ſun and moon, the idol of higheſt rank in the calendar of northern paganiſm. To him the third day in the week was dedicated; and hence is derived the name *Tueſday*, anciently *Tuiſday*, called in Latin *dies Martis*, though it muſt be confeſſed that Mars does not ſo much reſemble this divinity as he does Odin or Woden.

* Plate CCCCXI.

4. *Woden* was a valiant prince among the Saxons. His image was prayed to for victory over their enemies; which, if they obtained, they uſually ſacrificed the priſoners taken in battle to him. Our *Wedneſday* is derived from him, anciently *Wodneſday*. The northern hiſtories make him the father of *Thor*, and *Friga* to be his wife.

5. *Thor* was placed in a large hall, ſitting on a bed canopied over, with a crown of gold on his head, and 12 ſtars over it, holding a ſceptre in the right hand. To him was attributed the power over both heaven and earth; and that as he was pleaſed or diſpleaſed he could ſend thunder, tempeſts, plagues, &c. or fair, ſeaſonable weather, and cauſe fertility. From him our *Thurſday* derives its name, anciently *Thorſday*; among the Romans *dies Jovis*, as this idol may be ſubſtituted for Jupiter.

6. *Frigo* repreſented both ſexes, holding a drawn ſword in the right hand and bow in the left; denoting that women as well as men ſhould fight in times of need. She was generally taken for a goddeſs; and was reputed the giver of peace and plenty, and cauſer of love and amity. Her day of worſhip was called by the Saxons *Frigedeag*, now *Friday*, *dies Veneris*; but the habit and weapons of this figure have a reſemblance of Diana rather than Venus.

7. *Seater*, or *Crodo*, ſtood on the prickly back of a perch. He was thin-viſaged and long-haired, with a long beard, bare-headed and bare-footed, carrying a pail of water in his right hand wherein are fruit and flowers, and holding up a wheel in his left, and his coat tied with a long girdle. His ſtanding on the ſharp fins of this fiſh ſignified to the Saxons, that by worſhipping him they ſhould paſs through all dangers unhurt; by his girdle flying both ways was ſhown the Saxons freedom; and by the pail with fruit and flowers, was denoted that he would nouriſh the earth. From him, or from the Roman deity Saturn, comes *Saturday*.

Such were the principal gods of the northern nations: but theſe people had at the ſame time inferior deities, who were ſuppoſed to have been tranſlated into heaven for their heroic deeds, and whoſe greateſt happineſs conſiſted in drinking *ale* out of the ſkulls of their enemies in the *hall of Woden*. But the limits preſcribed to the preſent article do not permit us to purſue this ſubject; nor is it neceſſary that we ſhould purſue it. The attentive reader of the article MYTHOLOGY, of the hiſtories given in this work of the various divinities of paganiſm, and of the different nations by whom thoſe divinities were worſhipped, will perceive that the progreſs of polytheiſm and idolatry has been uniform over the whole earth.

28 Brute-worſhip of the Egyptians.

There is, however, one ſpecies of idolatry more wonderful than any thing that has yet been mentioned, of which our readers will certainly expect ſome account. It is the worſhip of *brutes*, *reptiles*, and *vegetables*, among the Egyptians. To the Greeks and Romans, as well as to us, that ſuperſtition appeared ſo monſtrous, that to enumerate every hypotheſis, ancient and modern, by which philoſophers have endeavoured to account for it, would ſwell this article beyond all proportion. Brute-worſhip prevailed at ſo early a period in Egypt, that the philoſophers of antiquity, whoſe writings have deſcended to us, had little or no advantage over the moderns in purſuing their reſearches into its origin; and among the modern hypotheſes, thoſe of *Moſheim* and *Warburton* appear to us by much the moſt probable of any that we have ſeen (B). The former of theſe learned writers attributes it wholly to the policy of the prince and

---

(B) There is, however, another hypotheſis worthy of ſome attention, if it were only for the learning and ingenuity of its author. The celebrated Cudworth infers, from the writings of Philo and other Platoniſts of the Alexandrian ſchool, that the ancient Egyptians held the Platonic doctrine of ideas exiſting from eternity, and conſtituting, in one of the perſons of the godhead, the intelligible and archetypal world. (See PLATONISM.) Philo, and the craft of the prieſt. The latter contends, with much earneſtneſs and ingenuity, that it reſulted from the uſe of hieroglyphic writing. We are ſtrongly inclined to believe that both theſe cauſes contributed to the production of ſo portentous an effect; and that the uſe of hieroglyphics as ſacred ſymbols, after they were laid aſide in civil life, completed that wonderful ſuperſtition which the craft of the prieſt and the policy of the prince had undoubtedly begun.

29
Introduced with a political view.

We learn from Herodotus*, that in his time the number of uſeful animals in Egypt was ſo ſmall as hardly to be ſufficient for tillage and the other purpoſes of civil life; whilſt ſerpents and other noxious animals, ſuch as the crocodile, wolf, bear, and hippopotamus, abounded in that country. From this fact Moſheim very naturally concludes†, that the founders of ſociety and government in Egypt would by every art endeavour to increaſe the number of uſeful animals as the number of inhabitants increaſed; and that with this view they would make it criminal to kill or even to hurt ſheep, cows, oxen, or goats, &c. whilſt they would wage perpetual war upon the noxious animals and beaſts of prey. Such animals as were aſſiſting to them in the carrying on of this warfare would be juſtly conſidered as in a high degree uſeful to ſociety. Hence the moſt grievous puniſhments were decreed againſt the killing, or ſo much as the wounding, of the *ichneumon* and *ibis*; becauſe the former was looked upon as the inſtinctive enemy of the crocodile, and the latter of every ſpecies of ſerpents*. The learned writer, however, obſerves, that in Egypt as in other countries, people would be tempted to ſacrifice the good of the public to the gratification of their own appetites, and ſometimes even to the indulgence of a momentary caprice. Hence he thinks it was found neceſſary to ſtrengthen the authority of the laws enacted for the preſervation of uſeful animals by the ſanctions of religion: and he ſays, that with this view the prieſts declared that certain animals were under the immediate protection of certain gods; that ſome of thoſe animals had a divine virtue reſiding in them; and that they could not be killed without the moſt ſacrilegious wickedneſs, incurring the higheſt indignation of the gods. When once the idolatrous Egyptians were perſuaded that certain animals were ſacred to the immortal gods, and had a divine virtue reſiding in them, they could not avoid viewing thoſe animals with ſome degree of veneration; and the prieſts, taking advantage of the ſuperſtition of the people, appointed for each ſpecies of ſacred animals appropriated rites and ceremonies, which were quickly followed with building ſhrines and temples to them, and approaching them with oblations, and ſacrifices, and other rites of divine adoration.

To corroborate this hypotheſis, he obſerves, that, beſides the animals ſacred over all Egypt, each province and each city had its particular animal to which the inhabitants paid their devotions. This aroſe from the univerſal practice among idolaters of conſecrating to themſelves *Lares* and *Penates*; and as the animals which were worſhipped over the whole kingdom were conſidered as ſacred to the *Dii majorum gentium*, ſo the animals whoſe worſhip was confined to particular cities or provinces were ſacred to the *Lares* of thoſe cities and provinces. Hence there was in Upper Egypt a city called *Lycopolis*, becauſe its inhabitants worſhipped the wolf, whilſt the inhabitants of *Thebes* or *Heliopolis* paid their devotions to the eagle, which was probably looked upon as ſacred to the ſun. Our author, however, holds it as a fact which will admit of no diſpute, that there was not one noxious animal or beaſt of prey worſhipped by the Egyptians till after the conqueſt of their country by the Perſians. That the earlieſt gods of Egypt were all benevolent beings, he appeals to the teſtimony of Diodorous Siculus; but he quotes Herodotus and Plutarch, as agreeing that the latter Egyptians worſhipped an evil principle under the name of *Typhon*. This *Typhon* was the inveterate enemy of *Oſiris*, juſt as *Ahraman* was of *Ormuzd*; and therefore he thinks it in the higheſt degree probable that the Egyptians derived their belief of two ſelf-exiſtent principles, a good and an evil, from their Perſian conquerors, among whom that opinion prevailed from the earlieſt ages.

From whatever ſource their belief was derived, Typhon was certainly worſhipped in Egypt, not with a view of obtaining from him any good, for there was nothing good in his nature, but in hopes of keeping him quiet, and averting much evil. As certain animals had long been ſacred to all the benevolent deities, it was natural for a people ſo beſotted with ſuperſtition as the Egyptians to conſecrate emblems of the ſame kind to their god Typhon. Hence aroſe the worſhip of *ſerpents*, *crocodiles*, *bears*, and other noxious animals and beaſts of prey. It may indeed ſeem at firſt ſight very inconſiſtent to deify ſuch animals, after they had been in the practice for ages of worſhipping others for being

* Lib. 2. c. 65.

† Cudworth, Intellect. Syſt. cap. 4. n° 158.

* See Ichneumon and Ibis.

Philo, he obſerves, did not himſelf conſider thoſe ideas as ſo many diſtinct *ſubſtances* and *animals*, much leſs as *gods*; but he mentions others who deified the whole of this intelligible ſyſtem as well as its ſeveral parts. Hence, when they paid their devotions to the *ſenſible ſun*, they pretended to worſhip only the divine *idea* or *archetype* of that luminary: and hence, thinks our learned author, the ancient Egyptians, by falling down to bulls, and cows, and crocodiles, meant at firſt to worſhip only the divine and eternal *ideas* of thoſe animals. He allows, indeed, that as few could entertain any thoughts at all of thoſe eternal ideas, there were ſcarcely any who could perſuade themſelves that the *intelligible ſyſtem* had ſo much reality in it as the *ſenſible things of nature*; and hence he thinks the devotion which was originally paid to the divine ideas had afterwards no higher object than the brutes and vegetables of which thoſe ideas were the eternal patterns.

This hypotheſis is ingenious, but not ſatisfactory. There is no evidence that the myſterious doctrine of Plato concerning *ideas* had anywhere been thought of for ages after brute-worſhip was eſtabliſhed in Egypt. Of the ſtate of Egyptian theology at that early period, Philo, and the other philoſophers of the Alexandrian ſchool, had no better means of forming a judgment than we have; and they laboured under many Grecian prejudices, which muſt have prevented them from judging with our impartiality.

their deſtroyers; but it is to be remembered, that long before the deification of crocodiles, &c. the real origin of brute-worſhip was totally forgotten by the people, if they were ever acquainted with it. The crafty prieſt who wiſhes to introduce a gainful ſuperſtition, muſt at firſt employ ſome plauſible reaſon to delude the multitude; but after the ſuperſtition has been long and firmly eſtabliſhed, it is obviouſly his buſineſs to keep its origin out of ſight.

Such is Moſheim's account of the origin and progreſs of that ſpecies of idolatry which was peculiar to Egypt; and with reſpect to the *riſe* of *brute*-worſhip, it appears perfectly ſatisfactory. But the Egyptians worſhipped ſeveral ſpecies of vegetables; and it ſurely could be no part of the policy of wiſe legiſlators to preſerve *them* from deſtruction, as vegetables are uſeful only as they contribute to animal ſubſiſtence. We are therefore obliged to call in the aid of Warburton's hypotheſis to account for this branch of Egyptian ſuperſtition.

30 Continued by the means of hieroglyphic writing, and

That learned and ingenious author having proved *, with great clearneſs and ſtrength of argument, that hieroglyphic writing was prior to the invention of alphabetic characters; and having traced that kind of writing from ſuch rude pictures, as thoſe which were in uſe among the Mexicans, through all the different ſpecies of what he calls *euriologic*, *tropical*, and *ſymbolic* hieroglyphics (See HIEROGLYPHICS)—ſhows, by many quotations from ancient authors, that the Egyptian prieſts wrapt up their theology in the ſymbolic hieroglyphics, after alphabetic characters had baniſhed from the tranſactions of civil life a mode of communicating information neceſſarily ſo obſcure. Theſe ſymbols were the figures of animals and vegetables, denoting, from ſome imaginary analogy, certain attributes of their divinities; and when the vulgar, forgetting this analogy, ceaſed to underſtand them as a ſpecies of writing, and were yet taught to conſider them as ſacred, they could not well view them in any other light than as emblems of the divinities whom they adored. But if rude ſculptures upon ſtone could be emblematical of the divinities, it was ſurely not unnatural to infer, that the living animals and vegetables which thoſe ſculptures repreſented muſt be emblems of the ſame divinities more ſtriking and more ſacred. Hence the learned author thinks aroſe that wonderful ſuperſtition peculiar to the Egyptians, which made them worſhip not only animals and vegetables, but alſo a thouſand chimeras of their own creation; ſuch as figures with human bodies and the heads or feet of brutes, or with brutal bodies and the heads and feet of men.

Theſe two hypotheſes combined together appear to us to account ſufficiently for the idolatry of Egypt, monſtrous as it was. We are perſuaded, that with reſpect to the *origin* of brute worſhip, Moſheim is in the right (c); and it was a very eaſy ſtep for people in ſo good training to proceed upon the crutches of hieroglyphics to the worſhip of plants and thoſe chimeras, which, as they never had a real exiſtence in nature, could not have been thought of as emblems of the divinity, had they not been uſed in that ſymbolic writing which Warburton ſo ably and ingeniouſly explains.

To this account of the origin of brute-worſhip we are fully aware that objections will occur. From a learned friend, who peruſed the article in manuſcript, we have been favoured with one which, as it is exceedingly plauſible, we ſhall endeavour to obviate. "Brute-worſhip was not peculiar to Egypt. The Hindoos, it is well known, have a religious veneration for the cow and the alligator; but there is no evidence that in India the number of uſeful animals was ever ſo ſmall as to make the interference of the prince and the prieſt neceſſary for their preſervation; neither does it appear that the Hindoos adopted from any other people the worſhip of a ſelf-exiſtent principle of evil." Such is the objection. To which we reply,

31 Carried from Egypt into India.

That there is every reaſon to believe that brute-worſhip was introduced into India by a colony of Egyptians at a very remote period. That between theſe two nations there was an early intercourſe, is univerſally allowed: and though the learned preſident of the Aſiatic Society has laboured to prove, that the Egyptians derived all that wiſdom for which they were famed, as well as the rudiments of their religious ſyſtem, from the natives of Hindoſtan, he does not appear to us to have laboured with ſucceſs. To examine his arguments at length would ſwell this article beyond its due proportion; and we have noticed ſome of them elſewhere (ſee PHILOLOGY, n° 33 and 39.) At preſent we ſhall only obſerve, that Seſoſtris undoubtedly made an inroad into India, and conquered part of the country, whilſt we nowhere read of the Hindoos having at any time conquered the kingdom of Egypt. Now, though the victors have ſometimes adopted the religion of the vanquiſhed, the contrary has happened ſo much more frequently, and is in itſelf a proceſs ſo much more natural, that this ſingle circumſtance affords a ſtrong preſumption that the Egyptian monarch would rather impoſe his gods upon the Hindoos than adopt theirs and carry them with him to Egypt. Brute-worſhip might likewiſe be introduced into Hindoſtan by thoſe vaſt colonies of Egyptians who took refuge in that country from the tyranny and oppreſſion of the ſhepherd-kings. That ſuch colonies did ſettle on ſome occaſion or other in India, ſeems undeniable from monuments ſtill remaining in that country of forms which could hardly have occurred to a native of Aſia, though they are very natural as the workmanſhip of Africans. But we need not reaſon in this manner. We have ſeen a manuſcript letter from Mr Burt, a learned ſurgeon in Bengal, and a member of the Aſiatic Society, which puts it beyond a doubt that great numbers of Egyptians had at a very early

* Div. Leg. book 4th, ſect. 4th.

(c) To prove that it was merely to preſerve and increaſe the breed of uſeful animals in Egypt, that the prince and the prieſt *firſt* taught the people to conſider ſuch animals as ſacred, he argues thus: "Hæc ita eſſe, non ex eo tantum liquet, quod paulo ante obſervavi, nullas beſtias univerſo Ægyptiorum populo ſacras fuiſſe, præter eas, quæ manifeſtam regioni utilitatem comparant; ſed inde quoque apparet, quod longe major ratio habita fuit femellarum inter animalia, quam marium. Boves diis immolare licebat, vaccas nullo modo. Canes fœmina contumulabantur, non item mares." *Lege* HERODOT. *Hiſtor*. lib. ii. cap. 41. & cap. 67.

early period not only ſettled in Hindoſtan, but alſo brought with them writings relating to the hiſtory of their country. As the ſhepherd-kings were enemies to the arts and to literature, it is probable that this ſettlement took place on their conqueſt of Egypt. Mr Burt's words are: "Mr Wilford, lieutenant of engineers, has extracted moſt wonderful diſcoveries from the Shanſcrit records; ſuch as the origin and hiſtory of the Egyptian pyramids, and even the account of the expence in their building." Upon our hypotheſis there is nothing incredible in this account; upon the hypotheſis of Sir William Jones, it is not eaſy to be conceived how the hiſtory of *Egyptian* pyramids could have found a place in the *Shanſcrit* records.

We may admit that the Hindoos have never adopted from the Perſians or Egyptians the worſhip of an independent principle of evil, and yet diſpoſe of the other part of the objection with very little difficulty. It will be ſeen by and bye, that the bramins believe a kind of triad of hypoſtaſes in the divine nature, of which one is viewed as the *deſtroyer*, and known by ſeveral names, ſuch as *Siva* and *Iſwara*. When brute-worſhip was introduced into Hindoſtan, it was not unnatural to conſider the alligator as emblematical of *Iſwara;* and hence in all probability it is that the Hindoos believe that a man cannot depart more happily from this world than by falling into the Ganges, and being devoured by one of thoſe ſacred animals. Upon the whole, the brute-worſhip of the Hindoos, inſtead of militating againſt our account of that monſtrous ſuperſtition as it prevailed in Egypt, ſeems to lend no ſmall ſupport to that account, as there was unqueſtionably an early intercourſe between the two nations, and as colonies of Egyptians ſettled in India. To him who is not ſatisfied with our reaſoning on this ſubject, we beg leave to recommend an attentive peruſal of Maurice's *Indian Antiquities*, where he will find many facts brought together, which tend to prove that Egypt has a juſt claim to a higher antiquity than India.

32
Polytheiſts acknowledged one ſupreme God,

Having thus traced the riſe and progreſs of polytheiſm and idolatry as they prevailed in the moſt celebrated nations of antiquity, we now proceed to inquire into the real opinions of thoſe nations concerning the nature of the gods whom they adored. And here it is evident from the writings of Homer, Heſiod, and the other poets, who were the principal theologians among the Greeks and Romans, that though heaven, earth, hell, and all the elements, were filled with divinities, there was yet one who, whether called *Jove*, *Oſiris*, *Ormuzd*, or by any other title, was conſidered as ſupreme over all the reſt. "Whence each of the gods was generated (ſays Herodotus*), or whether they have all exiſted from eternity, and what are their *forms*, is a thing that was not known till very lately; for Heſiod and Homer were, as I ſuppoſe, not above four hundred years my ſeniors; and theſe were they who introduced the theogony among the Greeks, and gave the gods their ſeveral names." Now Heſiod †, towards the beginning of his theogony, expreſsly invokes his muſe to celebrate in ſuitable numbers the generation of the immortal gods who had ſprung from the earth, the dark night, the ſtarry heavens, and the ſalt ſea. He calls up on her likewiſe to ſay, "in what manner the gods, the earth, the rivers, ocean, ſtars, and firmament, were generated, and what divine intelligences had ſprung from them of benevolent diſpoſitions towards mankind." From this invocation, it is evident that the poet did not conſider the gods of Greece as ſelf-exiſtent beings: neither could he look upon them as *creatures;* for of creation the ancient Greeks had no conception (ſee METAPHYSICS, n° 264.); but he conſidered them as emanations coeval with the earth and heavens, from ſome ſuperior principles; and by the divine intelligences ſprung from them, there cannot be a doubt but that he underſtood benevolent dæmons. The firſt principles of all things, according to the ſame Heſiod, were *Chaos*, and *Tartarus*, and *Love;* of which only the laſt being active, muſt undoubtedly have been conceived by this father of Grecian polytheiſm to be the greateſt and only ſelf-exiſting god. This we ſay muſt undoubtedly have been Heſiod's belief, unleſs by *Tartarus* we here underſtand a ſelf-exiſtent principle of evil; and in that caſe his creed will be the ſame with that of the ancient Perſians, who, as we have ſeen, believed in the ſelf exiſtence as well of *Ahraman* as of *Ormuzd*.

33
From whom the other divinities were generated;

Heſiod is ſuppoſed to have taken his theology from Orpheus; and it is evident that his doctrine concerning the generation of the gods is the ſame with that taught in certain verſes* uſually attributed to Orpheus, in which Love and Chaos are thus brought together. "We will firſt ſing (ſays the poet) a pleaſant and delightful ſong concerning the ancient Chaos, how the heavens, earth, and ſeas, were formed out of it; as alſo concerning that all-wiſe *Love*, the oldeſt and ſelf-perfect principle, which actively produced all theſe things, ſeparating one from another." In the original paſſage, Love is ſaid not only to be πολυμητις of *much wiſdom* or *ſagacity*, and therefore a real intelligent ſubſtance; but alſo to be πρεσϐυτατος and αυτοτελες the *oldeſt* and *ſelf-perfect*, and therefore a being of ſuperior order to the other divinities who were generated together with the elements over which they were conceived to preſide.

With the theology of Homer our readers of all deſcriptions are ſo well acquainted, that we need not ſwell the article with quotations, to prove that the father of epic poetry held *Jove* to be the father of gods and men. But the doctrine of the poets was the creed of the vulgar Greeks and Romans; and therefore we may conclude, that thoſe nations, though they worſhipped gods and lords innumerable, admitted but one, or at the moſt two (D), ſelf-exiſtent principles; the one good and the other evil. It does not indeed appear, that in the

ſyſtem

* Lib. 2. c. 51.

† Verſ. 104—112.

* Argonaut. pag. 17. ed. Steph.

(D) Plutarch is commonly ſuppoſed, and we think juſtly ſuppoſed, to have been a believer in two ſelf-exiſtent principles, a good and an evil. His own opinion, whatever it was, he declares *(de Iſide et Oſiride)* to have been moſt ancient and univerſal, and derived from theologers and lawgivers by poets and philoſophers. "Though the firſt author of it be unknown yet (ſays he) it hath been ſo firmly believed *everywhere*, that traces of it are to be found in the ſacrifices and myſteries both of the *barbarians* and the *Greeks*. There is a confuſed mixture of good and evil in every thing, and nothing is produced by nature *pure*. Wherefore

34 Though each was by the vulgar conſidered as unaccountable in his own province.

ſyſtem of vulgar paganiſm the ſubordinate gods were accountable to their chief for any part of their conduct, except when they tranſgreſſed the limits of the provinces aſſigned them. Venus might conduct the amours of heaven and earth in whatever manner ſhe pleaſed; Minerva might communicate or with-hold wiſdom from any individual with or without reaſon; and we find, that in Homer's battles the gods were permitted to ſeparate into parties, and to ſupport the Greeks or Trojans according as they favoured the one or the other nation. Jove indeed ſometimes called them to order; but his interference was thought partial, and an inſtance of tyrannical force rather than of juſt authority. The vulgar Greeks, therefore, although they admitted but one, or at moſt two, ſelf-exiſtent principles, did not conſider the inferior divinities as mediators between them and the ſupreme, but as gods to whom their worſhip was on certain occaſions to be ultimately directed.

35 Creed of the philoſophers and

The creed of the philoſophers ſeems to have been different. Such of them as were theiſts, and believed in the adminiſtration of Providence, admitted of but one God, to whom worſhip was ultimately due; and they adored the ſubordinate divinities as his children and miniſters, by whom the courſe of Providence was carried on. With reſpect to the origin of thoſe divinities, Plato is very explicit; where he tells us[*], that "when all the gods, both thoſe who move viſibly round the heavens, and thoſe who appear to us as often as they pleaſe, were generated, that God, who made the whole univerſe, ſpoke to them after this manner: Ye gods of gods, of whom I myſelf am father, attend." Cicero teaches the very ſame doctrine with Plato concerning the gods[†]; and Maximus Tyrius, who ſeems to have underſtood the genius of polytheiſm as thoroughly as any man, gives us the following clear account of that ſyſtem as received by the philoſophers.

"I will now more plainly declare my ſenſe[‡] by this ſimilitude: Imagine a great and powerful kingdom or principality, in which all agree freely and with one conſent to direct their actions according to the will and command of one ſupreme king, the oldeſt and the beſt; and then ſuppoſe the bounds and limits of this empire not to be the river Halys, nor the Helleſpont, nor the Meotian lake, nor the ſhores of the ocean; but heaven above, and the earth beneath. Here then let that great king ſit immoveable, preſcribing to all his ſubjects laws, in the obſervance of which conſiſt their ſafety and happineſs: the partakers of his empire being many, both viſible and inviſible gods; ſome of which that are neareſt, and immediately attending on him, are in the higheſt regal dignity, feaſting as it were at the ſame table; others again are their miniſters and attendants; and a third ſort are inferior to them both: and thus you ſee how the order and chain of this government deſcends down by ſteps and degrees from the ſupreme God to the earth and men." In this paſſage we have a plain acknowledgment of one ſupreme God, the ſovereign of the univerſe, and of three inferior orders of gods, who were his miniſters in the government of the world; and it is worthy of obſervation, that the ſame writer calls theſe intelligences θεους θεου παιδας και φιλους, *gods, the ſons and friends of God.* He likewiſe affirms, that all ranks of men, and all nations on earth, whether barbarous or civilized, held the ſame opinions reſpecting one ſupreme Numen and the generation of the other gods.

"If there were a meeting (ſays he[*]) called of all theſe ſeveral profeſſions, a painter, a ſtatuary, a poet, and a philoſopher, and all of them were required to declare their ſenſe concerning *the God;* do you think that the painter would ſay one thing, the ſtatuary another, the poet a third, and the philoſopher a fourth? No; nor the Scythian neither, nor the Greek, nor the Hyperborean. In other things we find men ſpeaking very diſcordantly, all men as it were differing from all. But amidſt this war, contention, and diſcord, you may find everywhere, throughout the whole world, one uniform law and opinion, that there is ONE GOD, THE KING AND FATHER OF ALL, and many gods, the SONS OF GOD, who reign with God. Theſe things both the Greek and barbarian affirm, both the inhabitants of the continent and of the ſea-coaſt, both the wiſe and the unwiſe."

36 Indian Bramins.

This account of philoſophical polytheiſm receives no ſmall ſupport from the Aſiatic Reſearches of Sir William Jones. "It muſt always be remembered (ſays that accompliſhed ſcholar), that the learned Indians, as they are inſtructed by their own books, acknowledge only

[*] Timæus.

[†] Tuſc. Queſt. lib. 1. c. 29. et de Nat. Deorum, paſſim.

[‡] Diſſert. 1.

[*] Ibid.

---

fore it is not one only diſpenſer of things, who, as it were, out of ſeveral veſſels diſtributeth theſe ſeveral liquors of good and evil, mingling them together, and daſhing them as he pleaſes; but there are two diſtinct and contrary powers or principles in the world, one of them always leading, as it were to the right hand, but the other tugging the contrary way. For if nothing can be made without a cauſe, and that which is good cannot be the cauſe of evil, there muſt needs be a diſtinct principle in nature for the production of evil as well as good."

That this is palpable manicheiſm (ſee MANICHEISM), appears to us ſo very evident, as to admit of no debate. It appeared in the ſame light to the learned Cudworth; but that author labours to prove that Plutarch miſtook the ſenſe of Pythagoras, Empedocles, Heraclitus, Anaxagoras, and Plato, when he attributed to them the ſame opinions which were held by himſelf. Moſheim, on the other hand, has put it beyond a doubt, that whatever was Plutarch's belief reſpecting the origin of evil and the exiſtence of two independent principles, it was taken implicitly from the writings of Plato. But the pious chancellor of *Gottingen*, actuated by the ſame motives with Cudworth, wiſhes to perſuade his readers, that by Plato and Plutarch nothing *active* was underſtood by their evil principle but only *that tendency to confuſion*, which was then deemed inſeparable from matter. But that ſomething more was meant ſeems undeniable; for immediately after the words which we have quoted, Plutarch proceeds to affirm that the wiſeſt men declare θεους ειναι δυο καθαπερ αντιτεχνους, *that there are two gods, as it were of contrary trades or crafts*, of which one is the author of all good and the other of all evil. See *Moſheim. ed. Cudworth. Syſtem. Intellect.* lib. i. cap. 4. § 13.

Plate CCCCXI.

only one Supreme Being, whom they call **Brahme**, or **the great one**, in the neuter gender. They believe his eſſence to be infinitely removed from the comprehenſion of any mind but his own; and they ſuppoſe him to manifeſt his power by the operation of his divine ſpirit, whom they name **Vishnou** the *pervader*, and **Ne'ra'yan** or *moving on the waters*, both in the maſculine gender; whence he is often denominated the *firſt male*. When they conſider the divine power as exerted in *creating* or giving exiſtence to that which exiſted not before, they call the deity **Brahma'**; when they view him in the light of *deſtroyer*, or rather *changer of forms*, they give him a thouſand names, of which **Siva**, **Iswara**, and **Mahadeva**, are the moſt common; and when they conſider him as the preſerver of created things, they give him the name of **Vishnou**. As the ſoul of the world, or the pervading *mind*, ſo finely deſcribed by Virgil, we ſee **Jove** repreſented by ſeveral Roman poets; and with great ſublimity by Lucan in the well known ſpeech of Cato concerning the Ammonian oracle. 'Jupiter is wherever we look, wherever we move.' This is preciſely the Indian idea of **Vishnou**: for ſince the power of preſerving created things by a ſuperintending providence belongs eminently to the godhead, they hold that power to exiſt tranſcendently in the *preſerving* member of the triad, whom they ſuppoſe to be **everywhere always**, not in ſubſtance, but in ſpirit and energy." This ſupreme god **Brahme**, in his triple form, is the only ſelf-exiſtent divinity acknowledged by the philoſophical Hindoos. The other divinities **Genesa**, **Indra**, **Cuvera**, &c. are all looked upon either as his creatures or his children; and of courſe are worſhipped only with inferior adoration.

37
Why the philoſophers worſhipped the inferior divinities.

It was upon this principle of the generation of the gods, and of their acting as miniſters to the ſupreme *Numen*, that all the philoſophers of Greece, who were not atheiſts, worſhipped many divinities, though they either openly condemned or ſecretly deſpiſed the traditions of the poets reſpecting the amours and villanies of Jupiter, Venus, Mercury, and the reſt of the tribe. It was the ſame principle ſincerely admitted, and not an ill-timed jeſt, as has been abſurdly ſuppoſed, that made Socrates, after he had ſwallowed the poiſon, requeſt his friend to offer a votive cock for him to Eſculapius.

But a theogony was not peculiar to the Greeks, Romans, and the Hindoos; it made part of every ſyſtem of polytheiſm. Even the Egyptians themſelves, the groſſeſt of all idolaters, believed in one ſelf-exiſting God, from whom all their other divinities deſcended by generation. This appears probable from the writings of Horus Apollo, Jamblicus, Porphyry, and many other ancient authors; but if the inſcription on the gates of the temple of *Neith* in *Sais*, as we have it from Plutarch and Proclus, be genuine, it will admit of no doubt. This famous inſcription, according to the laſt of theſe writers, was to this purpoſe: "I am whatever is, whatever ſhall be, and whatever hath been. My veil no man hath removed. The offſpring which I brought forth was the ſun (E)."

The Perſian magi, as we have ſeen, believed in two ſelf-exiſtent principles, a good and an evil: but if Diogenes Laertius deſerves to be credited, they held that fire, earth, and water, which they called gods, were generated of theſe two. It was obſerved in the beginning of this article, that the firſt object of idolatrous worſhip was probably the ſun, and that this ſpecies of idolatry took its riſe in Chaldea or Perſia. But when it became the practice of eaſtern monarchs to conceal themſelves wholly from their people, the cuſtom, as implying dignity, was ſuppoſed to prevail as well in heaven as on earth; and Zoroaſter, the reformer of the Perſian theology, taught*, that "Ormuzd was as far removed from the ſun as the ſun is removed from the earth." According to this modification of magianiſm, the ſun was one of the generated gods, and held the office of prime miniſter or vicegerent to the inviſible fountain of light and good. Still, however, a ſelf-exiſtent principle of evil was admitted; but though he could not be deſtroyed or annihilated by any power, it was believed that he would at laſt be completely vanquiſhed by Ormuzd and his miniſters, and rendered thenceforward incapable of producing any miſchief.

* Plutarch, de Iſide et Oſir.

From this ſhort view of polytheiſm, as we find it delineated by the beſt writers of antiquity, we think ourſelves warranted to conclude, that the whole pagan world believed in but *one*, or at moſt *two*, **self-existent gods**, from whom they conceived all the other divinities to have deſcended in a manner analogous to human generation. It appears, however, that the vulgar pagans conſidered each divinity as ſupreme and unaccountable within his own province, and therefore intitled to worſhip, which reſted ultimately in himſelf. The philoſophers, on the other hand, ſeem to have viewed the inferior gods as accountable for every part of their conduct to him who was their ſire and ſovereign, and to have paid to them only that inferior kind of devotion which the church of Rome pays to departed ſaints. The vulgar pagans were ſunk in the groſſeſt ignorance, from which ſtateſmen, prieſts, and poets, exerted their utmoſt influence to keep them from emerging; for it was a maxim which, however abſurd, was univerſally received, that "there were many things true in religion*, which it was not convenient for the vulgar to know; and ſome things which, though falſe, it was yet expedient that they ſhould believe." The polytheiſm and idolatry of the vulgar, therefore, was their misfortune rather than their fault. But the philoſophers were wholly "without excuſe*; becauſe that when they knew God, they glorified him not as God, neither were thankful, but became vain in their imaginations, and their fooliſh heart was darkened. Profeſſing themſelves wiſe, they became fools, and worſhipped and ſerved the creature more than the Creator, who is God bleſſed for ever."

38
Vulgar polytheiſts leſs culpable than the philoſophers.

* Varro apud D. Auguſt. de Civ. Dei.

(E) Τα οντα, και τα εσομενα, και τα γεγονοτα, εγω ειμι. Τον εμον χιτωνα ουδεις απεκαλυψεν. Ὁν εγω καρπον ετεκον, ἡλιος εγενετο. The antiquity of this inſcription is admitted by Cudworth, denied by Moſheim, and doubted by Jablonſki. The reader who wiſhes to know their arguments may conſult Moſheim's edition of the *Intellectual Syſtem*, and Jablonſki's *Pantheon Ægyptiorum*.

POLYTRICHUM, in botany: A genus of the order of muſci, belonging to the cryptogamia claſs of plants. The anthera is operculated, and placed upon a very ſmall apophyſis or articulation; the calyptra villous; the ſtar of the female is on a diſtinct individual. There are three ſpecies; the moſt remarkable of which is the commune, or great golden maiden-hair, frequently to be met with in the bogs and wet places of Britain. It grows in patches, the ſtalks erect, generally ſingle and unbranched, from three inches to a foot, or even a yard high. The leaves are numerous, ſtiff, lanceolate, acute, growing round the ſtalk without order, and, if viewed with a microſcope, appear to have their edges finely ſerrated. They are of a bright green when young and freſh, but reddiſh when dried or in decay: the filaments, or peduncles, are of a ſhining red, or orange colour, from two to four inches long, ariſing ſingly from the top of the ſtalks, and ſurrounded at their baſe with a cylindrical tubular vagina, or perichætium. The anthera, or capſule, is quadrangular, green at firſt, afterwards yellow, and red when ripe, having an annular pedeſtal, or apophyſis, at its baſe. The operculum is flat, with a projecting point in the centre; and underneath is a whitiſh circular membrane, placed in the middle of the capſule's orifice, and ſuſtained there by numerous arched threads, or cilia, connected by one end to the circumference of this membrane, and by the other faſtened to the ring of the anthera. The pollen, or, as others term it, the ſeed, is freed from the anthera or capſule through the ſpace between the cilia. The calyptra is twofold, an internal and external one; both which at firſt entirely cover and hang over the anthera. The internal one is conical, membranaceous, and ſmooth; the external one is compoſed only of tawny hairs, connected into a ſort of mat, lacerated at the baſe, and ſerving like a roof of thatch to defend the other. Beſides the ſtalks before deſcribed, there are commonly ſome others near at hand, which are deſtitute both of filaments and capſules, but are terminated with a kind of roſaceous cup, either of a bright red or yellowiſh colour, compoſed of leaves of different ſizes, the outermoſt broad, the innermoſt lanceolate, growing gradually more and more fine and ſlender to the centre. This cup is looked upon by Linnæus as the female flower of this moſs; but Haller is of opinion, that it is only the gem or origin of a new ſtalk, which frequently riſes from its centre. and this again becomes ſometimes proliferous. There are two varieties of this moſs: the firſt has much ſhorter ſtalks than the preceding, and often branched; the leaves ſtiffer, erect, and more crowded; in other reſpects the ſame. The other has a ſtalk ſcarcely more than half an inch high, terminated with a cluſter of linear, erect, rigid leaves, for the moſt part entire on the edges, and tipped each with a white hair. The filament is about an inch high, and the capſule quadrangular. The female flower, or gem, is of a bright red colour.

The firſt kind, when it grows long enough for the purpoſe, is ſometimes uſed in England and Holland to make brooms or bruſhes. Of the female ſort the Laplanders, when obliged to ſleep in deſert places, frequently make a ſpeedy and convenient bed. Their manner of doing it is curious: Where this moſs grows thick together, they mark out, with a knife, a piece of ground, about two yards ſquare, or of the ſize of a common blanket; then beginning at one corner, they gently ſever the turf from the ground, and as the roots of the moſs are cloſely interwoven and matted together, they by degrees ſtrip off the whole circumſcribed turf in one entire piece; afterwards they mark and draw up another piece, exactly correſponding with the firſt; then, ſhaking them both with their hands, they lay one upon the ground, with the moſs uppermoſt, inſtead of a mattraſs, and the other over it, with the moſs downwards, inſtead of a rug; and between them both take a comfortable nap, free from fleas and bugs, and without fear of contagious diſtempers. It is probable they might take the hint of making ſuch a bed from the bear, a cohabitant of their country, which prepares his winter-quarters with a large collection of this ſame moſs. See MUSCI, p. 473. and Plate CCCXXI.

POLYXÆNUS, or POLYÆNUS. See POLYÆNUS.

POLYXO, a prieſteſs of Apollo's temple in Lemnos. She was likewiſe nurſe to queen Hypſipyle. It was by her advice that the Lemnian women murdered all their huſbands.——There was another Polyxo, a native of Argos, who married Tlepolemus ſon of Hercules. She followed him to Rhodes after the murder of his uncle Licymnius; and when he departed for the Trojan war with the reſt of the Greek princes, ſhe became the ſole miſtreſs of the kingdom. After the Trojan war, Helen fled from Peloponneſus to Rhodes, where Polyxo reigned. Polyxo detained her; and to puniſh her as being the cauſe of a war in which Tlepolemus had periſhed, ſhe ordered her to be hanged on a tree by her female ſervants, diſguiſed in the habit of Furies.

POMACEÆ, (*pomum* "an apple,") the name of the 36th order in Linnæus's Fragments of a Natural Method, the genera of which have a pulpy eſculent fruit of the apple, berry, and cherry kind. See BOTANY, Sect. vi. p. 465.

POMATUM, an unguent generally uſed in dreſſing the hair. It is alſo uſed as a medicine. See PHARMACY, nº 636, &c.

POMEGRANATE. See PUNICA.

POMERANIA, a province of Germany, in the circle of Upper Saxony, with the title of a duchy. It is bounded on the north by the Baltic Sea, on the eaſt by Pruſſia and Poland, on the ſouth by the marquiſate of Brandenburg, and on the weſt by the duchy of Mecklenburg; and is about 250 miles in length, and in ſome places 75 miles and in others 50 in breadth. It is watered by ſeveral rivers, the moſt conſiderable of which are the Oder, the Pene, the Rega, the Perſant, the Wipper, the Stolp, the Lupo, and the Lobo. The air is cold; but the ſoil abounds in paſtures, and produces corn, of which a great deal is exported. It is a flat country; containing many lakes, woods, and foreſts, and has ſeveral good harbours. It is divided into the Hither and Farther Pomerania, and the territories of the kings of Sweden and Pruſſia in this duchy are divided by the river Pene.

POMET (Peter), an able druggiſt at Paris, was born in 1658. He collected at a great expence from all countries drugs of every kind, and rendered himſelf celebrated by his book entitled *Hiſtoire Generale des Drogues*

POLYTHEISM. Plate CCCCXI.

Drogues, which is the moſt complete book on the ſubject that has yet been printed. He gave demonſtrations with reſpect to his drugs in the king's garden, and a catalogue of all the drugs contained in his work, with a liſt of all the rarities of his cabinet, which he propoſed to publiſh by ſubſcription; but was prevented by his death, which happened in 1699, upon the very day when the patent for a penſion granted him by Louis XIV. was made out.

POMFRET (John), an Engliſh poet, ſon of the rector of Luton in Bedfordſhire, was born in 1667, and educated at Cambridge; after which he took orders, and was preſented to the living of Malden in Bedfordſhire. About 1703 he went to London for inſtitution to a larger and very conſiderable living; but was ſtopped ſome time by Compton, then biſhop of London, on account of theſe four lines of his poem, entitled the Choice:

> " And as I near approach'd the verge of life,
> Some kind relation (for I'd have no wife)
> Should take upon him all my worldly care,
> While I did for a better ſtate prepare."

The parentheſes in theſe lines were ſo maliciouſly repreſented, that the good biſhop was made to believe that Pomfret preferred a miſtreſs to a wife. But he was ſoon convinced that this repreſentation was the mere effect of malice, as Pomfret at that time was actually married. The oppoſition, however, which his ſlanderers had made to him had its effect; for, being by this obliged to ſtay in London longer than he intended, he catched the ſmallpox, and died of it, aged 35.

He publiſhed a volume of his poems in 1699, with a very modeſt and ſenſible preface. Two pieces of his were publiſhed after his death by his friend Philalethes; one intitled Reaſon, and written in 1700, when the diſputes about the Trinity ran high; the other *Dies Noviſſima*, or the "Laſt Epiphany," a Pindaric ode. His verſification is not unmuſical; but there is not the force in his writings which is neceſſary to conſtitute a poet. A diſſenting teacher of his name, and who publiſhed ſome rhimes upon ſpiritual ſubjects, occaſioned fanaticiſm to be imputed to him; but his friend Philalethes has juſtly cleared him from the imputation. Pomfret had a very ſtrong mixture of devotion in him, but no fanaticiſm.

"The Choice (ſays Dr Johnſon) exhibits a ſyſtem of life adapted to common notions, and equal to common expectations; ſuch a ſtate as affords plenty and tranquillity, without excluſion of intellectual pleaſures. Perhaps no compoſition in our language has been oftener peruſed than Pomfret's Choice. In his other poems there is an eaſy volubility; the pleaſure of ſmooth metre is afforded to the ear, and the mind is not oppreſſed with ponderous, or entangled with intricate, ſentiment. He pleaſes many; and he who pleaſes many muſt have merit."

POMME, or POMMETTE, in heraldry, is a croſs with one or more balls or knobs at each of the ends.

POMMEL, or PUMMEL, in the manege, a piece of braſs or other matter at the top and in the middle of the ſaddle-bow.

POMMERCULLIA, in botany: A genus of the monogynia order, belonging to the triandria claſs of plants; and in the natural method ranking under the 4th order, *Gramina*. The calyx is bivalved, and ſhaped like a top; the valvula quadrifid, and bearded on the back. The corolla has two unequal valves; the filaments three, with long pointed antheræ; the ſtyle ſimple. The whole flower forms itſelf into a ſharp point, and the corolla ſerves as a covering to the ſeed, which is long, clear, and ſmooth. There is only one ſpecies, viz, the Dianthoides.

POMŒRIUM, in Roman antiquity, was, according to Livy, that ſpace of ground, both within and without the walls, which the augurs, at the firſt building of cities, ſolemnly conſecrated, and on which no edifices were allowed to be raiſed. Plutarch gives this account of the ceremony of drawing the pomœrium: "They dug a trench, and threw into it the firſt-fruits of all things, either good by cuſtom, or neceſſary by nature; and every man taking a ſmall turf of earth of the country from whence he came, they caſt them in promiſcuouſly. Then making this trench their centre, they deſcribed the city in a circle round it. After this, the founder yoking a bull and a cow together, ploughed a deep furrow, with a brazen ploughſhare, round the bounds. The attendants took care that all the clods fell inwards, *i. e.* toward the city. This furrow they called *pomœrium*, and built the wall upon it."—Plutarch, in this account, is to be underſtood as ſpeaking of Rome.

POMOERIUM Proferre, ſignifies to extend or enlarge a city, which could not be done by any, but thoſe who had taken away ſome part of an enemy's country in war. But this qualification was ſometimes diſpenſed with. *Pomœrium* is *quaſi pone mœnia*, "behind the walls."

POMONA, in fabulous hiſtory, the tutelar deity of orchards and fruit-trees. See VERTUMNUS.

POMPEII (anc. geog.), a town of Campania near Herculaneum, and deſtroyed along with it by the great eruption of Veſuvius in the time of Titus. See HERCULANEUM. It is about 15 miles from Naples, and ſix or ſeven from Portici—So much has been ſaid and written on the diſcovery of this place, as makes it unneceſſary for us to ſay much: we ſhall therefore only give a ſhort extract on the ſubject from an anonymous work lately publiſhed, apparently of conſiderable merit. "On entering the city (ſays our author *), the firſt object is a pretty ſquare, with arcades, after the preſent manner of Italy. This was, as it is imagined, the quarter of the ſoldiers; numbers of military weapons being found here.

*Comparative Sketch of England and Italy, with Diſquiſitions on National Advantages.

"A narrow, but long ſtreet, with ſeveral ſhops on each ſide, is now perfectly cleanſed from its rubbiſh, and in good preſervation. Each houſe has a court. In ſome of them are paintings all freſco, principally in chiaroſcuro; and their colours not in the leaſt injured by time. The few colours which the ancients knew were extracted only from minerals; and this may be a ſufficient reaſon for their freſhneſs. The ſtreet is paved with irregular ſtones of a foot and half or two feet long, like the Appian way.

"In diſcovering this city, it was at firſt doubted whether it were actually Pompeii: but the name inſcribed over the gateway put it beyond all doubt. The ſkeletons found were innumerable. It is ſaid that many had ſpades in their hands, endeavouring, probably at firſt, to clear away the torrent of aſhes with which they were deluged. Indeed the ſatisfaction which is felt at the view of ancient habitations, is much allayed by inevitable reflections on this frightful ſcene of deſolation, though at the diſtance of ſo many centuries.

"An ancient villa is alſo ſeen entire at a little diſtance feom Pompeii. The houſe is really elegant and ſpacious, but only two ſtories high. The pavement of the chambers is compoſed of teſſelated marble, and, when poliſhed, diſplays the deſign perfectly well.—There is ſome at the muſeum of Portici brought from this place, which the eye would really miſtake for painting. Under the houſe is a fine triangular cellar, of which each part is 100 feet long, well filled with amphoræ. The ſkeletons of 29 perſons were found here, ſuppoſed to have fled to it for ſafety. Each houſe is filled with aſhes: they have almoſt penetrated through every crevice; and it is incredible how ſuch a volume of them could have been thrown out by Veſuvius with ſufficient force to have reached ſo far." See Swinburne's *Travels in the Two Sicilies*, vol. 2. p. 98, &c.; Lady Miller's *Letters*, or *De La Lande;* Captain Sutherland's *Tour up the Straits, from Gibraltar to Conſtantinople*, p. 75. &c.; Dr Smith's *Sketch of a Tour on the Continent*, in 1786 and 1787, vol. 2. p. 118, &c.; and Watkins's *Tour through Swiſſerland, Italy*, &c.

POMPEY the GREAT, (Cneius Pompeius Magnus), the renowned rival of Julius Cæſar. Being defeated by him at the battle of Pharſalia, owing to the defection of his cavalry, he fled to Egypt by ſea, where he was baſely aſſaſſinated by order of Theodotus, prime miniſter to Ptolomy the Younger, then a minor, 48 B. C*.

*See Rome

POMPEYS (Cneius and Sextus), his ſons, commanded a powerful army when they loſt their illuſtrious father. Julius Cæſar purſued them into Spain, and defeated them at the battle of Munda, in which Cneius was ſlain, 45 B. C. Sextus made himſelf maſter of Sicily; but being defeated in the celebrated naval engagement at Actium by Auguſtus and Lepidus, he fled to Aſia with only 7 ſhips, the remains of his fleet, which conſiſted of more than 350; and from thence, unable to continue the war, he was obliged to retire to Leſbos, where renewing the war by raiſing an army, and ſeizing on ſome conſiderable cities, Marcus Titius, in the intereſt of Marc Antony, gave him battle, defeated him, took him priſoner and baſely put him to death, 35 B. C. See ROME.

POMPEY's-Pillar. See ALEXANDRIA, p. 393.

POMPILUS, in ichthyology, a ſpecies of CORYPHOENA.

POMPONATIUS (Peter), an eminent Italian philoſopher, was born at Mantua in 1462. He was of ſo ſmall a ſtature that he was little better than a dwarf; yet he poſſeſſed an exalted genius, and was conſidered as one of the greateſt philoſophers of the age in which he lived. He taught philoſophy, firſt at Padua and afterwards at Bologna, with the higheſt reputation. He had frequent diſputations with the celebrated Achillini, whoſe puzzling objections would have confounded him, had it not been for his ſkill in parrying them by ſome joke. His book *De Immortalitate Animæ*, publiſhed in 1516, made a great noiſe. He maintained, that the immortality of the ſoul could not be proved by philoſophical reaſons; but ſolemnly declared his belief of it as an article of faith. This precaution did not, however, ſave him; many adverſaries roſe up againſt him, who did not ſcruple to treat him as an atheiſt; and the monks procured his book, although he wrote ſeveral apologies for it, to be burnt at Venice. His book upon Incantations was alſo thought very dangerous. He ſhows in it, that he believed nothing of magic and ſorcery; and he lays a prodigious ſtreſs on occult virtues in certain men, by which they produced miraculous effects. He gives a great many examples of this; but his adverſaries do not admit them to be true, or free from magic.—Paul Jovius ſays, that he died in 1525, in his grand climacteric. He was three times married; and had but one daughter, to whom he left a large ſum of money. He uſed to apply himſelf to the ſolution of difficulties ſo very intenſely, that he frequently forgot to eat, drink, ſleep, and perform the ordinary functions of nature: nay, it made him almoſt diſtracted, and a laughing-ſtock to every one, as he himſelf tells us.

POMPONIUS MELA. See MELA.

POMUM, an APPLE; a ſpecies of ſeed-veſſel, compoſed of a ſucculent fleſhy pulp; in the middle of which is generally found a membranous capſule, with a number of cells, or cavities, for containing the ſeeds. Seed-veſſels of this kind have no external opening or valve. At the end oppoſite to the foot-ſtalk is frequently a ſmall cavity, called by the gardeners the *eye of the fruit*, and by botaniſts *umbilicus*, the "navel," from its fancied reſemblance to the navel in animals. Gourd, cucumber, melon, pomegranate, pear, and apple, furniſh inſtances of the fruit or ſeed-veſſel in queſtion.

POND, or *FISH-Pond*. See *FISH-Ponds*.

POND, is a ſmall pool or lake of water from whence no ſtream iſſues. In the *Tranſactions of the Society inſtituted at London for the Encouragement of Arts, Manufactures, and Commerce*, vol. viii. and printed in the year 1790, there is a ſhort account of a machine for draining ponds without diſturbing the mud. It was communicated to the ſociety, together with a drawing and model of the machine, by Lieutenant-colonel Danſey. The model was made from the deſcription of a machine uſed by a gentleman near Taunton for many years before, for ſupplying a caſcade in his pleaſure-grounds.—The colonel's regiment was then lying at Windſor; and thinking that the invention might be uſeful to ſupply the grand caſcade at Virginia-water, he made the model, and preſented it to the king, who was graciouſly pleaſed to approve of it. In conſequence of which, by his majeſty's deſire, a penſtock on that principle was conſtructed from the model at one of the ponds in the neighbourhood.—The colonel thinks the machine may be uſeful in the hands of men of ſcience, and applicable to ſilk, cotton, and other mills, where a ſteady and uniform velocity of water is wanted; which might be regulated at pleaſure, occaſioning no current to diſturb the mud or fiſh, as the ſtream conſtantly runs from the ſurface. He ſays he has often made the experiment by the model in a tub of water.

Of this machine we have given an engraving, taken from the abovementioned Tranſactions; and we ſhall now add the deſcription which accompanies the plate in that work.

Plate CCCCXIII

In figure 1. A is the pipe, loaded with a rim of lead, of ſuch weight as ſerves to ſink it below the ſurface of the water. B is the diſcharging pipe, laid through the bank HI. C is the joint on which the pipe A turns its form, which is ſhown fig. 2. D is the ball or float, which, ſwimming on the ſurface of the pond, prevents the pipe A from deſcending deeper than the length of the chain by which they are connected. E is a chain winding on the windlaſs F, and ſerving to raiſe the tube A above the ſurface of the water, when the machinery is not in uſe. G is a ſtage. HI is the bank, repreſented as if cut through at I, to ſhow the tube B lying within it. K is a poſt to receive the tube A when lowered, and to prevent its ſinking in the mud. In figure 2. A is a caſt cylinder, with a plate or cheek, B, which is faſtened to the timber of the tube on one ſide, but not on the other, as the part of the cylinder C turns in the hollow of the wooden tube when it is immerged. A piece of ſtrong ſole leather is put inſide the braſs-plate B, to prevent leaking.

Pond-Weed, in botany. See POTAMOGETON.

PONDICHERRY, is a large town of Aſia, in the peninſula on this ſide the Ganges, and on the coaſt of Coromandel. Its ſituation is low, and the ſhips anchor about a mile and a half from it; nor can the boats or canoes come nearer it than a muſket-ſhot, on account of the breakers, ſo that the blacks come in flat-bottomed boats to carry the men and merchandiſes to the fleet. The fort is 200 paces from the ſea, and very irregular; built with bricks, and covered with fine plaſter, reſembling white marble. The huts of the blacks lie here and there, and the walls are of bamboos mixed with the branches of trees. The French are greatly addicted to women, from whom they catch diſeaſes that render them pale, livid, and meagre, with a frightful aſpect. However, ſeveral of the French are married to a ſort of Portugueſe women, who are of a mixed breed, being a kind of Mulattoes. The country about it is barren, and conſequently moſt of their proviſions are brought from other places. Their trade conſiſts of cotton-cloth, ſilks, pepper, ſaltpetre, and other merchandiſes that are brought from Bengal. With regard to the religion of the natives, the moſt numerous are the Gentoos; but there are Mahometans or Moors who hold a great many ridiculous opinions. The Gentoos are of different ſects, and that of the Brahmins are prieſts. The cuſtom of women burning themſelves with the bodies of their dead huſbands was very common, but of late much diſcountenanced. The ſlaves or ſervants are very numerous, and their chief food is rice. This place was taken, and the fortifications demoliſhed, by Colonel Coote; it was reſtored to the French by the peace of 1763; and was retaken in the beginning of the preſent war with the French republic. It is 60 miles ſouth of Fort St George. E. Long. 79. 58. N. Lat. 11. 42.

PONDICO, an iſland of the Archipelago, lying on the gulph of Zitun, near the coaſt of Negropont. It is ſmall and uninhabited, as well as two others that lie near it.

PONG-HOU *Iſles*, in the province of Fo-kien in China, form an archipelago between the port of Emouy and the iſland of Formoſa. A Chineſe garriſon is kept here, with one of thoſe mandarins who are called *literati*, whoſe principal employment is to watch the trading veſſels which paſs from China to Formoſa, or from Formoſa to China.

As theſe iſlands are only ſand-banks or rocks, the inhabitants are obliged to import every neceſſary of life; neither ſhrubs nor buſhes are ſeen upon them; all their ornament conſiſts of one ſolitary tree. The harbour is good, and ſheltered from every wind; it has from 20 to 25 feet depth of water. Although it is an uncultivated and uninhabited iſland, it is abſolutely neceſſary for the preſervation of Formoſa, which has no port capable of receiving veſſels that draw above 8 feet of water.

PONIARD, a little pointed dagger, very ſharp edged; borne in the hand, or at the girdle, or hid in the pocket. The word is formed from the French *poignard*, and that from *poignnée*, "handful."—The poniard was anciently of very great uſe; but it is now in a good meaſure ſet aſide, except among aſſaſſins.—Sword and poniard were the ancient arms of dueliſts; and are ſaid to continue ſtill ſo among the Spaniards. The practice of ſword and poniard ſtill make a part of the exerciſe taught by the maſters of defence.

PONS, a town of France, in Saintonge, very famous in the time of the Huguenots. It is ſeated on a hill, near the river Suigne, 10 miles from Saintes. W. Long. 0. 30. N. Lat. 45. 36.

PONT-DU-GARD, is a bridge of France, in Lower Languedoc, built over the river Gardon, which ſerved for an aqueduct. It is a very remarkable and a moſt magnificent work, and was raiſed by the ancient Romans. It conſiſts of three bridges, one above another; the uppermoſt of which was the aqueduct, to convey water to the city of Niſmes, which is eight miles to the ſouth. They are altogether 192 feet high, and the uppermoſt 580 feet long. They are conſtructed between two rocks. E. Long. 4. 26. N. Lat. 43. 58.

PONTEDERIA, in botany: A genus of the monogynia order, belonging to the hexandria claſs of plants; and in the natural method ranking under the ſixth order, *Enſatæ*. The corolla is monopetalous, ſexfid, bilabiate; there are three ſtamina inſerted into the top, and three into the tube of the corolla; the capſule is bilocular.

PONTEFRACT, or POMFRET, a town of the Weſt Riding of Yorkſhire in England, ſituated on the river Are. It is ſaid to take its name from a broken bridge, which is ſuppoſed to have been laid anciently over that marſhy ſpot called the *Waſh*. Here are the ruins of a noble old caſtle, were Richard II. was barbarouſly murdered, and two of Edward V.'s uncles. The collegiate chapel of St Clement, which had a dean, three prebendaries, &c. is ſtill diſtinguiſhable in it. This town has a good market, and fairs for horſes, ſheep, and other cattle. It is a corporation, governed by a mayor, recorder, aldermen, and burgeſſes and gives title of earl to the family of Fermor. In the reign of Queen Elizabeth, 200 l. was left by George Talbot, earl of Shrewſbury, to be lent for ever, at 5 l. a time, on proper ſecurity, for three years, to the poor artificers of the town; and Thomas Wentworth, Eſq: anceſtor to the marquis of Rockingham, left 200l. to the charity-ſcool. A branch of the great Roman military way called *Erminſtreet*, which paſſed from Lincoln to York, may be traced betwixt town and Doncaſter. The adjacent country yields plenty of limeſtone, together with liquorice and ſkirrets, W. Long. 1. 5. N. Lat. 53. 42.

PONTIFEX, Pontiff, or *High-prieſt*, a perſon who has the ſuperintendance and direction of divine worſhip as the offering of ſacrifices and other religious ſolemnities. The Romans had a college of pontiffs; and over theſe a ſovereign pontiff, or pontifex maximus, inſtituted by Numa, whoſe function it was to preſcribe the ceremonies each god was to be worſhipped withal, compoſe the rituals, direct the veſtals, and for a good while to perform the buſineſs of augury, till, on ſome ſuperſtitious occaſion, he was prohibited intermeddling therewith. The office of the college of pontiffs was to aſſiſt the high-prieſt in giving judgment in all caſes relating to religion, inquiring into the lives and manners of the inferior prieſts, and puniſhing them if they ſaw occaſion, &c. The Jews too had their pontiffs; and among the Romaniſts, the pope is ſtill ſtyled the *ſovereign pontiff*.

PONTIFICATE, is uſed for the ſtate or dignity of a pontiff or high-prieſt; but more particularly in modern writers for the reign of a pope.

PONTIUS (Pilate.) See Pilate.

PONTON, or Pontoon, in war, a kind of flat bottomed boat, whoſe carcaſe of wood is lined within and without with tin: they ſerve to lay bridges over rivers for the artillery and army to march over. The French pontoons, and thoſe of moſt other powers, are made of copper on the outſide: though theſe coſt more at firſt, yet they laſt much longer than thoſe of tin; and when worn out, the copper ſells nearly for as much as it coſt at firſt; but when ours are rendered uſeleſs, they ſell for nothing. Our pontoons are 21 feet long, five feet broad, and depth within two feet 1.5 inches.

Pontoon-Carriage, is made with two wheels only, and two long ſide-pieces, whoſe fore-ends are ſupported by a limber; and ſerves to carry the pontoon, boards, croſs-timbers, anchors, and every other thing neceſſary for making a bridge.

Pontoon-Bridge, is made of pontoons ſlipped into the water, and placed about five or ſix feet aſunder; each faſtened with an anchor, when the river has a ſtrong current; or to a ſtrong rope that goes acroſs the river, running through the rings of the pontoons. Each boat has an anchor, cable, baulks, and cheſts. The baulks are about five or ſix inches ſquare, and 21 feet long. The cheſts are boards joined together by wooden bars, about three feet broad and 12 feet long. The baulks are laid acroſs the pontoons at ſome diſtance from one another, and the cheſts upon them joined cloſe; which makes a bridge in a very ſhort time, capable of ſupporting any weight.

PONT St Esprit, is a town of France, in Languedoc, in the dioceſe of Uſez. It is ſeated on the river Rhone, over which is one of the fineſt bridges in France. It is 840 yards long, and conſiſts of 26 arches. Each pier is pierced with an aperture, in order to facilitate the paſſage of the water where the river is high. The town is large, but the ſtreets are narrow and ill-built. It formerly contained ſeveral churches and convents. It is 17 miles ſouth of Viviers, and 55 north-eaſt of Montpelier. E. Long. 4. 46. N. Lat. 44. 13.

1 Etymology of the name.

PONTUS, the name of an ancient kingdom of Aſia, originally a part of Cappadocia; bounded on the eaſt by Colchis, on the weſt by the river Halys, on the north by the Euxine Sea, and on the ſouth by Armenia Minor. Some derive the name of Pontus from the neighbouring ſea, commonly called by the Latins *Pontus Euxinus*; others from an ancient king named *Pontus*, who imparted his name both to the country and the ſea; but Bochart deduces it from the Phœnician word *botno*, ſignifying a filberd, as if that nut abounded remarkably in this place. But this derivation ſeems to be very far fetched; and the common opinion that the country derived its name from the ſea, ſeems by far the moſt probable. The kingdom was divided into three parts; the firſt, named *Pontus Gallaticus*, extending from the river Halys to the Thermodon; the ſecond, named *Pontus Polemonaicus*, extended from the Thermodon to the borders of *Pontus Cappadocicus*; and this laſt extended from Pontus Polemonaicus to Colchis, having Armenia Minor and the upper ſtream of the Euphrates for its ſouthern boundary.

2 Artabazes the firſt king.

It is commonly believed, that the firſt inhabitants of Pontus were deſcended from Tubal; but in proceſs of time mixed with Cappadocians, Paphlagonians, and other foreign nations, beſides many Greek Colonies which ſettled in thoſe parts, and maintained their liberty till the time of Mithridates the Great and Pharnaces. The firſt king of this country whom we find mentioned in hiſtory is Artabazes, who had the crown beſtowed on him by Darius (a) Hyſtaſpes. The next was Rhodobates, who reigned in the time of Darius Nothus. After him came Mithridates, who, refuſing to pay the uſual tribute to the Perſians, was defeated by Artaxerxes Mnemon; but a peace was ſoon after concluded by the mediation of Tiſſaphernes. Beſides this, we hear nothing of him farther than that he was treacherouſly taken priſoner by Clearchus afterwards tyrant of Heraclea, and obliged to pay a large ſum for his ranſom.

3 Mithridates I.

Mithridates I. was ſucceeded by Ariobarzanes, who being appointed by Artaxerxes governor of Lydia, Ionia, and Phrygia, employed the forces that were under his care in the extending of his own dominions, and ſubduing thoſe of his natural prince. The king of Perſia ſent one Autophrodates againſt him; but Ariobarzanes, having with great promiſes prevailed on Ageſilaus and Timothæus the Athenian to come to his aſſiſtance, obliged Autophrodates to retire. He then rewarded Ageſilaus with a great ſum of money, and, beſtowed on Timothæus the cities of Seſtos and Abydos, which he had lately taken from the Perſians. He uſed his utmoſt endeavours to reconcile the Lacedemonians and Thebans; but not being able to bring the latter to any reaſonable terms, he aſſiſted the Lacedemonians with vaſt ſums of money. The Athenians ſhowed ſo much reſpect for this prince, that they not only made him free of their city, but granted both him and his children whatever they aſked of them. He was murdered in the 28th year of his reign by one Mithridates, whom authors ſuppoſe to have been his ſon. This happened at the time that Alexander the Great invaded Aſia, ſo that Pontus for a time fell under the power of the Macedonians.

(a) This country, together, with the adjacent provinces, was in different periods under the dominion of the Aſſyrians, Medes, and Perſians; the laſt of whom divided Cappadocia into ſatrapies or governments, and beſtowed that diviſion which was afterwards called *Pontus* on one of the anceſtors of Mithridates. This regulation was effected in the reign of Darius the ſon of Hyſtaſpes, and has been regarded as the date of the kingdom.

4 Ariobarzanes ſhakes off the Macedonian yoke.

In the reign of Antigonus, Mithridates the ſon of Ariobarzanes ſhook off the Macedonian yoke; the particulars of which event are related as follow. Antigonus having dreamed that he had a field in which gold grew after the manner of corn, and that Mithridates cut it down and carried it into Pontus, began to be very jealous of him, and ordered him to be put to death privately. But Mithridates, having got notice of the king's intention, withdrew into Paphlagonia, attended only by ſix horſemen. Here, being joined by many others, he poſſeſſed himſelf of Ciniatum, a ſtrong hold ſituated near mount Olgaſys; from whence, as his army continually increaſed, he made an irruption into Cappadocia; and having driven the commanders of Antigonus from that part which borders upon Pontus, he entered his paternal kingdom, which, in ſpite of the utmoſt efforts of Antigonus, he held for the ſpace of 26 years, and tranſmitted to his poſterity.

Under the reigns of Mithridates III. Ariobarzanes II. and Mithridates IV. the immediate ſucceſſors of Mithridates II. nothing remarkable happened. But Mithridates V. made war on the inhabitants of Sinope, a city on the coaſt of Paphlagonia. He made himſelf maſter of all the adjacent places; but finding the whole peninſula, on which Sinope itſelf ſtood, well fortified and garriſoned, not only by the inhabitants, but by their allies the Rhodians, he abandoned the enterpriſe. He afterwards proved a great friend to the Rdodians, and aſſiſted them with money to repair the loſſes they had ſuſtained by an earthquake. He entered alſo into a ſtrict alliance with Antiochus the Great, who married one of his daughters named *Laodice*.

5 Pharnaces I. differs with the Romans.

After the death of Mithridates V. his ſon Pharnaces I. attacking the city of Sinope, unexpectedly took it by ſtorm. On this the Rhodians ſent ambaſſadors to Rome, complaining of the behaviour of the king of Pontus; but Pharnaces was ſo far from being intimidated by their threats, that he invaded the territories of Eumenes their great ally. The latter ſent ambaſſadors to Rome, and entered into an alliance with Ariarathes king of Cappadocia. Pharnaces, in his turn, ſent ambaſſadors to Rome, complaining of Eumenes and Ariarathes; upon which ſome Romans were ſent into Aſia to inquire into the ſtate of matters. Theſe found Eumenes and his aſſociates willing to accomodate the difference, but Pharnaces in a quite oppoſite diſpoſition, which they accordingly reported at Rome.

6 Concludes a moſt diſadvantageous peace,

In the mean time a war was commenced between Eumenes and Pharnaces; but the latter, being diſappointed of aſſiſtance from Seleucus king of Syria, whom the Romans would not allow to join him, was at laſt forced to ſue for peace; which was granted him upon the following conditions: That he ſhould forthwith withdraw his forces from Galatia, and diſannul all engagements and alliances with the inhabitants of that country; that he ſhould in like manner evacuate Paphlagonia, and ſend back ſuch as he had from thence carried into ſlavery; that he ſhould reſtore to Ariarathes all the places which he had taken during the war, the hoſtages of both kings, all their priſoners without ranſom, and moreover ſhould deliver up to them ſuch of their ſubjects as from the firſt breaking out of the war had fled to him; that he ſhould return to Morzias, a petty king in theſe parts, and to Ariarathes, 900 talents which he had ſeized in the war, and pay down 300 more to Eumenes as a fine for invading his dominions without provocation. Mithridates, king of Armenia, having in this war joined Pharnaces, was, by the articles of the treaty, obliged to pay 300 talents to Ariarathes for having aſſiſted his enemy contrary to an alliance at that time ſubſiſting between them. Soon after Pharnaces died, and left the kingdom to his ſon Mithridates VI. more weakened by this peace than by the moſt deſtructive war.

7 His ſon enters into alliance with the Romans.

The new king entered into an alliance with the Romans, and proved ſuch a faithful friend, that he was rewarded by the ſenate with Phrygia Major, and honoured with the title of the friend and ally of the people of Rome. After a long and proſperous reign, he was murdered by ſome of his intimate acquaintance, and was ſucceeded by his ſon Mithridates VII. ſurnamed the *Great*.

8 Mithridates the Great a cruel prince.

The new prince, though not exceeding 13 years of age, began his reign with moſt inhuman acts of cruelty to his mother and neareſt relations. His father, by his laſt will, had appointed him and his mother joint heirs to the kingdom; but he, claiming the whole, threw her into priſon, where ſhe ſoon died through the hard uſage ſhe met with. Thoſe to whom the care of his education was committed, obſerving him to be of a cruel and unruly temper, made various attempts on his life, but could never effect their deſign, as the king was always on his guard, and armed, in that tender age, againſt all kind of treachery, without ſhowing the leaſt diffidence.

7 His extraordinary qualities.

In his youth Mithridates took care to inure himſelf to hardſhips, paſſing whole months in the open air, employed in the exerciſe of hunting, and often taking his reſt amidſt the frozen ſnow. When he came of age, he married his ſiſter named *Laodice*, by whom he had a ſon named *Pharnaces*. After this he took a journey through many different kingdoms of Aſia, having nothing leſs in view than the whole continent. He learned their different languages, of which he is ſaid to have ſpoken 22; took an eſtimate of their ſtrength; and above all viewed narrowly their ſtrong holds and fortified towns. In this journey he ſpent three years; during which time, a report being ſpread abroad that he was dead, his wife Laodice had a criminal converſation with one of the lords of her court, and had a ſon by him. When her huſband returned, ſhe preſented him with a poiſoned bowl; but Mithridates had accuſtomed himſelf to take poiſon from his infancy, ſo that it had now no other effect than to haſten the deſtruction of his wife, which very ſoon took place, together with all thoſe who had been any way acceſſory to her diſloyalty and incontinence.

The king now began to put in execution his ſchemes of conqueſt. However, he certainly took the wrong method by attacking firſt thoſe nations which were immediately under the protection of Rome, and thus at once provoking that powerful people to fall upon him.

10 Conquers ſeveral countries.

He began with Paphlagonia, which the Romans had declared a free ſtate. This country he eaſily reduced, and divided between himſelf and Nicomedes king of Bithynia, at that time his ally. The Romans remonſtrated; but Mithridates, inſtead of paying any regard to their remonſtrances, invaded Galatia, which was immediately under their protection. This he alſo reduced, and then turned his eyes on Cappadocia. But as the kingdom of Cappadocia was at that time held by Ariarathes, who was a great favourite of the Romans, and married to the ſiſter of Mithridates, the latter hired an aſſaſſin to diſpatch Ariarathes, after which he thought he might ſucceed better in his deſigns.

11 Cauſes the king of Cappadocia to be murdered.

After the death of Arinrathes, Cappadocia was invaded by Nicomedes king of Bithynia, who drove out the ſon, and married the widow of Ariarathes. This gave Mithridates a plauſible pretence for invading Cappadocia; which he inſtantly did, and drove Nicomedes quite out of the country. Thus Mithridates gained conſiderable reputation, not only as a warrior, but as a juſt and good-natured prince; for as it was not known that he had any hand in the murder of Ariarathes, every one imagined that he had undertaken the war againſt Nicomedes, merely to revenge the quarrel of his nephew, and to reſtore him to his right. To keep up the farce a little longer, Mithridates actually withdrew his troops out of the country, and left the young prince maſter of the kingdom. In a ſhort time, however, he began to preſs the young king of Cappadocia to recal the aſſaſſin Gordius, who had murdered his father: but this the king of Cappadocia refuſed with indignation; and Mithridates, being determined on a quarrel at all events, took the field with an army of 80,000 foot, 10,000 horſe, and 600 chariots armed with ſcythes.

12 Aſſaſſinates his own nephew.

With this force he imagined he ſhould carry all before him: but finding the king of Cappadocia ready to oppoſe him with a force no way inferior to his own, he had recourſe to treachery; and inviting his nephew to a conference, ſtabbed him, in the ſight of both armies, with a dagger which he had concealed in the plaits of his garment. This barbarous and unexpected piece of treachery had ſuch an effect on the Cappadocians that they threw down their arms, and ſuffered Mithridates, without oppoſition, to ſeize upon all their ſtrong holds. He reſigned the kingdom, however, to his ſon, a child of eight years of age. The care of the young prince, and of the whole kingdom, he committed to Gordius; but the Cappadocians, diſdaining to be ruled by ſuch a ſcandalous aſſaſſin, placed on the throne the brother of Ariarathes, who had kept himſelf concealed in ſome part of Aſia. His reign, however, was of ſhort duration; he being ſoon after driven out by Mithridates, and the Cappadocians again reduced. The unhappy prince died of grief; and in him ended the family of Pharnaces, who had ruled Cappadocia from the time of Cyrus the Great.

13 Nicomedes king of Bithynia attempts to deceive the Romans.

Nicomedes, king of Bythynia, being now greatly afraid of Mithridates, and ſuppoſing that his own dominions would next fall a prey to the ambitious conqueror, ſuborned a youth of a comely and majeſtic aſpect to pretend that he was a third ſon of Ariarathes, to go to Rome, and demand the kingdom of Cappadocia as his juſt right. He was received by the ſenate with the greateſt kindneſs, and Laodice the wife of Nicomedes even confirmed the deceit by her oath.

14 The deceit expoſed by Mithridates.

But in the mean time Mithridates having got intelligence of the plot, ſent notice of it by Gordius to the Romans, ſo that the impoſture was ſoon known at Rome alſo. The conſequence of this was, that the ſenate commanded Mithridates to relinquiſh Cappadocia, and Nicomedes that part of Paphlagonia which he poſſeſſed; declaring both theſe countries free. The Cappadocians proteſted that they could not live without a king; upon which they were allowed to chooſe one of their own nation. Mithridates uſed all his intereſt in favour of Gordius; but he being excluded by the Romans, one Ariobarzanes was choſen by the majority of votes.

15 Ariobarzanes ſettled on the throne of Cappadocia by the Romans, but driven out by Mithridates,

To enforce this election, Sylla was ſent into Cappadocia. He had the character of an ambaſſador, but the real intent of his coming was to diſappoint the ambitious deſigns of Mithridates. With an handful of forces he defeated a numerous army of Cappadocians and Armenians commanded by Gordius, and ſettled Ariobarzanes on the throne. But no ſooner was Sylla gone than Mithridates ſtirred up Tigranes king of Armenia againſt Ariobarzanes, who, without making any reſiſtance, fled to Rome, and Tigranes reſtored the kingdom to Ariarathes the ſon of Mithridates. At the ſame time died the king of Bithynia; upon which Mithridates immediately invaded that country, and drove out Nicomedes the natural ſon of the late king. But the expelled prince, having fled to Rome, and being aſſiſted by that powerful republic, the king of Pontus was ſoon obliged to abandon Bithynia and Cappadocia.

16 Who engages in a war with the Romans,

The Romans now being exceedingly jealous of the power and ambition of Mithridates, reſolved to humble him at all events. For this purpoſe they ſent ambaſſadors to the kings of Bithynia and Cappadocia, deſiring them to make frequent inroads into the neighbouring territories of Mithridates, and behave there as they pleaſed; aſſuring them of powerful aſſiſtance in caſe they ſhould have occaſion. Ariobarzanes could not by any means be induced to provoke ſo powerful a neighbour; but Nicomedes being induced, partly by promiſes and partly by menaces, to comply, entered Pontus, where he laid waſte whole provinces with fire and ſword. Mithridates complained to the Roman legates: but they replied, that he himſelf had been the firſt aggreſſor; that Nicomedes had only paid him in his own coin, and that they would not allow him to hurt their friend and ally.

17 Defeats Ariobarzanes and Altinius,

Upon this Mithridates, entering Cappadocia with a numerous army, put to flight the united forces of Ariobarzanes and Altinius the Roman legate; thus making himſelf once more maſter of this kingdom. In the mean time he ſent ambaſſadors to Rome, complaining of the proceedings of Nicomedes: but his ambaſſadors met with a very indifferent reception; being enjoined to tell their maſter, that he muſt either reſtore the kingdom of Cappadocia to Ariobarzanes, and make peace with Nicomedes, or be accounted an enemy of the Roman people. With this anſwer they were commanded to depart the city that very day, and told that no more ambaſſadors could be admitted till ſuch time as their commands were obeyed.

In the mean time both parties prepared for war. The Roman legates in Aſia drew together all the forces they could muſter in Bithynia, Cappadocia, Paphlagonia, and Galatia; and, being joined by Caſſius governor of Aſia, took the field againſt Mithridates in the year 19 B. C. They divided their army into ſeveral ſmall bodies: Caſſius encamped on the confines of Bithynia and Galatia; Manius Aquilius with his body poſſeſſed himſelf of the avenues leading from Pontus into Bithynia; Quintus Oppius ſecured the entrance into Cappadocia; and the admirals Minucius Rufus and C. Popilius lay with a fleet of 300 ſail at Byzantium, to prevent the enemy from entering the Euxine ſea. Each of the generals had under his command an army of 40,000 men; beſides a body of 50,000 foot and 6000 horſe brought to their aſſiſtance by Nicomedes.

18
And Nicomedes and Marius Aquilius.

On the other hand, Mithridates having invited ſeveral of the neighbouring nations to join him, collected an army of 250,000 foot, 50,000 horſe, 130 chariots armed with ſcythes; beſides 300 ſhips and 100 galleys. Part of this force he detached againſt Nicomedes; and utterly defeated him, though much ſuperior in number, as he was taking poſſeſſion of an advantageous poſt by order of Caſſius. Another part he detached againſt Manius Aquilius, whom he alſo defeated with the loſs of 10,000 killed on the ſpot, and 3000 taken priſoners; on which the other Roman generals abandoned their poſts, the fleet alſo diſperſed, and moſt of the ſhips were either taken or ſunk by the admirals of Mithridates.

19
Over-runs Aſia-Minor.

The king of Pontus now reſolving to improve the opportunity, and drive the Romans entirely out of Aſia, over-ran all Phrygia, Myſia, Aſia Proper, Caria, Lycia, Pamphylia, Paphlagonia, and Bithynia, with all the reſt of the countries which had either belonged to or ſided with the Romans, as far as Ionia. He was received everywhere with the greateſt demonſtrations of joy; the inhabitants flocking to him in white garments, and calling him their father, deliverer, their god, and the great and ſole lord of all Aſia. What gained him the affections of the people was his kind uſage to the priſoners he had taken in the two engagements abovementioned; for he not only ſent them all home without ranſom, but furniſhed them with plenty of proviſions, and money ſufficient to defray their expences by the way. Ambaſſadors flocked to him from all parts; and among others, from Laodicea on the Lycos, to whom the king promiſed his protection, provided they delivered up to him Q. Oppius governor of Pamphylia, who had fled thither for protection. This requeſt was readily complied with; Oppius was ſent to him in chains, with lictors walking before him in deriſion of the Roman pride and oſtentation. Mithridates was overjoyed to ſee a Roman general and proconſul in his power; and his joy was ſoon after increaſed by the arrival of Manius Aquilius, whom the Leſbians, revolting from the Romans, ſent to him in fetters, together with many other Romans of diſtinction who had taken ſhelter among them. As he had been the chief author of the war, Mithridates led him about with him wherever he went, either bound on an aſs, or on foot coupled with one Baſtarnes a public malefactor, compelling him to proclaim to the crowds who came to ſee him, that he was Manius Aquilius the Roman legate. When he came to Pergamus, he cauſed him firſt to be publicly whipped, then to be put on the rack, and laſtly melted gold to be poured down his throat.

20
Puts Aquilius to death.

Mithridates being now looked upon as invincible, all the free cities of Aſia received him as their ſovereign, contributing large ſums towards the defraying the expences of the war; by which means he became poſſeſſed of ſuch treaſures as enabled him to keep ſeveral numerous armies in the field for five years without levying any taxes on his ſubjects. As many Roman citizens were diſperſed in the provinces which Mithridates had ſubdued, he conſidered theſe as ſo many ſpies who would not fail to ſend an account of his proceedings to Rome: for which reaſon he reſolved to cut them all off at once by a general maſſacre; which barbarous policy, it is ſaid, had never been heard of till his time, but has been ſince practiſed by other nations. He diſpatched private letters to all the governors and magiſtrates of the cities where the Romans reſided, enjoining them on pain of death, and the entire deſtruction of their country, to cauſe all the Italian race, women and children not excepted, to be murdered on the 30th day from the date of his letters, and to let their bodies lie unburied in the open fields. One moiety of their goods was to be forfeited to the king, and the other beſtowed as a reward on the aſſaſſins. Whatever ſlave murdered his maſter was to receive his liberty, and one half of the debt was to be remitted to the debtor that ſhould kill his creditor. Whoever concealed an Italian, under any pretence whatever, was to be puniſhed with immediate death. On the fatal day, all the gates of the cities being ſhut, and the avenues kept with ſoldiers, the king's orders were proclaimed, which cauſed an univerſal horror, not only among the unhappy victims themſelves, but among thoſe who had any feelings of humanity, at ſeeing themſelves obliged either to betray and murder their innocent gueſts, friends, and relations, or to become liable to a cruel death. However, as moſt of the Aſiatics bore a mortal hatred to the Romans, and were moreover animated by the promiſe of an ample reward, the orders were without delay put in execution. The inhabitants of Epheſus, where Mithridates then reſided, dragged ſuch as had taken ſanctuary in the temple of Diana from the very ſtatue of the goddeſs, and put them to the ſword. The Pergamenians diſcharged ſhowers of darts upon them as they embraced the ſtatues in the temple of Eſculapius. At Adramyttium in Myſia many were murdered in the water, while they were attempting, with their children on their backs, to ſwim over to the iſland of Leſbos. The Caunians, who not long before had been delivered from the yoke of the Rhodians, and reſtored to their ancient privileges, excelled all the reſt in cruelty: for, as if they had apoſtatiſed from human nature, they took pleaſure in tormenting and butchering the innocent children before their mothers' eyes; ſome of them running diſtracted, and others dying with grief at a ſight which nature could not bear. The Trallians were the only people on the continent who would not have the cruelty to imbrue their hands in the blood of the innocent Italians. However, as the king's orders were peremptory, they hired one Theophilus a Paphlagonian to diſpatch the few Romans that lived among them. He, having ſhut them all up together in the temple of Concord, firſt cut off their hands as they embraced the ſtatues of the gods, and then hacked them in pieces. Many Romans were ſaved on the floating iſlands of Lydia called *Calaminæ*, where they concealed themſelves till ſuch time as they found an opportunity of eſcaping out of Aſia. Nevertheleſs,

21
Cruelly maſſacres all the Romans in Aſia.

theleſs, according to Plutarch and Dion, 150,000 Roman citizens were maſſacred on that day; but, according to others, only 80,000.

22
Reduces the iſland of Cos.

Mithridates having now got rid of thoſe whom he was in dread of on the continent, embarked great part of his forces in order to reduce the iſlands of the Archipelago. At Cos he was gladly received, and had delivered up to him the young Alexander, ſon of Alexander king of Egypt, who being driven out of that country, was killed by Chareas a ſea-captain as he was retiring in a ſmall veſſel to Cyprus. With the young prince, they put into the king's hands vaſt ſums of money, with all the golden veſſels and jewels, to an immenſe value, which his grandmother Cleopatra had been amaſſing for many years. To the young prince Mithridates gave an education ſuitable for a king's ſon, but kept the treaſures to himſelf. Here likewiſe he found 800 talents in ready money, which, at the firſt breaking out of the war, had been depoſited by the Jews of Aſia, and were deſigned for the temple of Jeruſalem.

23
But fails in his attempt upon Rhodes.

From Cos Mithridates ſteered his courſe for Rhodes, where at that time all the Romans who had eſcaped the maſſacre abovementioned found a ſanctuary, and, amongſt others, L. Caſſius the proconſul. The Rhodians, however, being very expert in maritime affairs, Mithridates did not think proper to venture an engagement. As the enemy's fleet advanced, therefore, he retired; but ſix of the Rhodian ſhips coming up with 25 of his, a ſharp action enſued, in which the Rhodians ſunk two of the king's ſhips, and put the reſt to flight. In this encounter, though Mithridates had never ſeen a ſea-fight before, he behaved with great intrepidity; but one of the ſhips of his own ſquadron falling foul of that which carried him, he was very near being taken priſoner. From this time forth he abhorred the ſea, and took an averſion to all the Chians, becauſe the pilot of that ſhip was a Chian. However, he again appeared before the iſland; but was forced anew to leave it with diſgrace, and to give over all thoughts of reducing it.

24
His generals reduce all Greece.

Mithridates now retired into Aſia, with a deſign to ſettle the civil government of the countries which he had conquered, committing the care of the war to his generals. Archelaus, his generaliſſimo, was ſent into Greece with an army of 120,000 men; where, by treachery, he made himſelf maſter of Athens, and either put to the ſword or ſent to Mithridates all thoſe who favoured or were ſuſpected to favour the Romans. From Athens he diſpatched parties to reduce the neighbouring caſtles and the iſland of Delos, which they did accordingly; but Orobius, a Roman general, hearing that the enemy kept no guards, but paſſed their time in carouſing and debauchery, fell upon them unexpectedly, and cut off the whole party, except Apellicon the commander.

In the mean time, Metrophanes, another of the king's generals, entering Eubœa, laid waſte the whole country, exerting his rage chiefly againſt the cities of Demetrias and Magneſia, which refuſed to open their gates to him. But as he was ſailing off with a great booty, Bryttius, the prætor or governor of Macedonia, coming up with him, ſunk ſome of his ſhips, and took others, putting all the priſoners to the ſword. Mithridates, upon the news of this loſs, ſent his ſon Ariarathes with a powerful army to invade Macedonia; which he ſoon reduced, together with the kingdom of Thrace, driving the Romans everywhere before him. The generals whom he ſent into other quarters were no leſs ſucceſsful; ſo that Mithridates had, according to Aulus Gellius, 25 different nations who paid him homage. The ſame author adds, that he was ſkilled in every one of their various languages, ſo that he could converſe with the natives without an interpreter. Among theſe nations we find the Rhoxani, now the Ruſſians or Muſcovites whom Deiphontus, one of the king's generals, brought under ſubjection, after having ſlain in an engagement 50,000 of the barbarians.

25
Sylla ſent againſt him.

All this time the Romans had been too much taken up with their own domeſtic quarrels to take ſuch effectual meaſures as they otherwiſe would have done for checking the progreſs of Mithridates. But at laſt, having received certain advice that the king deſigned to invade Italy, and that he had even been ſolicited to do ſo by ſome of the revolted Italians, they ſent againſt him Lucius Sylla, who had already given ſufficient proofs of his courage, conduct, and experience in war. He had with him only five legions and a few cohorts. With this inconſiderable force he landed in Attica, and in a ſhort time made himſelf maſter of the capital; Archelaus not daring, or, according to others, through treachery, not caring, to engage him. As Sylla had but a few frigates, he ſent Lucullus to the iſland of Rhodes, with orders to the Rhodians to join him with their fleet. The undertaking was very dangerous, as the king's fleet in a manner covered the ſea. However, Lucullus, deſpiſing all danger, ventured out, and ſailed, without meeting with any perverſe accident, to Syria, Egypt, Libya, and Cyprus; from whence he returned with ſuch ſupplies of ſhips and experienced mariners, as enabled Sylla, after their conjunction with the Rhodians, to act offenſively by ſea alſo. Archelaus now diſpatched meſſengers to Taxiles, who commanded in Thrace and Macedon, deſiring him to join him with all his forces; which the other readily did, and between both muſtered an army of 120,000 men. Sylla met them near Cheronæa with only 15,000 foot and 1500 horſe; but gave them a moſt dreadful overthrow, no fewer than 110,000 of the Aſiatics being ſlaughtered, while the Romans loſt only 12 men.

26
Who totally defeats his generals in Greece.

27
Flaccus and Fimbria ſent into Aſia.

This ſucceſs having raiſed envy and jealouſy againſt Sylla in Rome, the ſenate ſent Lucius Valerius Flaccus, the conſul of that year, with two legions into Aſia, in appearance to attack Mithridates on that ſide, but with private inſtructions to fall upon Sylla himſelf, if they found him diſaffected to the ſenate. As Flaccus was a man of no experience in war, C. Fimbria, a ſenator of great repute among the ſoldiery, was appointed to attend him with the character of legate and lieutenant-general. Sylla was at that time in Bœotia; but, hearing what had happened at Rome, he marched with all expedition into Theſſaly, with a deſign to meet Flaccus, who, he expected, was to land in that province. But no ſooner had he left Bœotia, than the country was over-run by an army of Aſiatics, under the command of Dorylaus the king's chief favourite. On this advice Sylla returned into Bœotia, where he gained two ſignal victories, which put an end to the war in Greece. In the firſt of theſe Dorylaus loſt 150,000 of his men according to ſome, or 200,000 according to others; and in the next all the reſt. In this laſt engagement

28
Sylla gains two other victories in Greece.

20,000

20,000 were driven into a river, where they all periſhed; an equal number were purſued into a marſh, and entirely cut off; the reſt were killed in the heat of battle, the Romans giving no quarter to men who had treated their fellow-citizens after ſuch a barbarous manner in Aſia. Plutarch tells us, that the marſhes were dyed with blood; that the courſe of the river was ſtopped by the dead bodies; and that even in his time, that is, near 200 years after, a great number of bows, helmets, coats of mail, and ſwords were found buried in the mud. Archelaus, who had joined Dorylaus with a body of 10,000 men a few days before the battle, lay three days ſtripped among the ſlain till he found a ſmall veſſel which carried him to Eubœa, where he gathered what forces he could, but was never again able to appear in the field. Indeed Livy tells us, that Archelaus betrayed the king's cauſe; and Aurelius Victor, that the king's fleet was intercepted by Sylla through the treachery of Archelaus: adding, that there was a good underſtanding between the two commanders, as was plain from Sylla's beſtowing upon Archelaus 10,000 acres of land near the city of Chalcis in Eubœa. Strabo alſo informs us, that Archelaus was afterwards greatly eſteemed and careſſed by Sylla and the ſenate; but Sylla himſelf in his commentaries, and Dio, endeavour to clear Archelaus from all ſuſpicion of treachery.

In the mean time, Sylla having given up Bœotia to be plundered by his ſoldiers, marched into Theſſaly, where he took up his winter-quarters, cauſed his old ſhips to be refitted and ſeveral new ones built, in order to paſs over into Aſia in the beginning of the ſpring, that he might drive from thence not only Mithridates, but his rival Flaccus alſo, whom the ſenate, out of oppoſition to him, had appointed governor of that province. But before he arrived, ſome differences having ariſen between Flaccus and Fimbria, the latter was by the conſul deprived of his command. Upon this Fimbria, having gained over the ſoldiery to his ſide, made war on the conſul, took him priſoner, put him to death, and aſſumed the command of all the Roman forces in Aſia. In this ſtation he behaved with the greateſt cruelty, inſomuch that his name became more odious than even that of Mithradites itſelf. This hatred the king of Pontus endeavoured to improve to his own advantage; and therefore commanded his ſon, by name alſo *Mithridates*, to join Taxiles, Diophantes, and Menander, three of his moſt experienced commanders, to return at the head of a numerous army into Aſia; not doubting but the inhabitants, thus haraſſed by Fimbria, would ſhake off the Roman yoke when they ſaw ſuch a powerful army in the field ready to protect them. But Fimbria, diſtruſting the Aſiatics, marched out to meet the enemy, and offered them battle before they entered the province. As the king's army was greatly ſuperior to the Romans in number, the latter ſuffered greatly in the engagement, but held out till night parted them, when they withdrew to the oppoſite ſide of a river, which was at a ſmall diſtance from the field of battle. Here they deſigned to intrench themſelves: but in the mean time a violent ſtorm ariſing, Fimbria laid hold of that opportunity to repaſs the river and ſurpriſe the enemy; of whom he made ſuch havock as they lay in their tents, that only the commanders and ſome few troops of horſe eſcaped. Among theſe was the king's ſon; who, attended by a few horſe, got ſafe to Pergamus, where his father reſided. But Fimbria, purſuing him night and day without intermiſſion, entered Pergamus ſword in hand; and hearing that both Mithridates and his ſon had fled from thence a few hours before, he continued his purſuit, and would have taken the king himſelf, had he not entered Pitane with a conſiderable body of horſe. The place was cloſely inveſted by Fimbria; but as he had no ſhips to block it up by ſea alſo, he ſent a meſſenger to Lucullus, who commanded the Roman navy in Aſia, intreating him, as he tendered the welfare of the republic, to make what haſte he could to Pitane, and aſſiſt him in taking the moſt inveterate enemy the Romans had. But Lucullus, preferring the gratification of a private pique to the good of his country, refuſed to come: and thus allowed the fleet of Mithridates to carry him in ſafety to Mitylene.

29 Fimbria puts Flaccus to death,

30 Defeats the forces of Mithridates,

31 And beſieges the king;

32 Who is ſuffered by Lucullus to eſcape.

Soon after the king's departure, Fimbria took Pitane by ſtorm, and reduced moſt of the cities of Aſia, particularly Troy, which he alſo took by ſtorm in eleven days, and put moſt of the inhabitants to the ſword, becauſe they had ſent an embaſſy to Sylla, offering to ſubmit to him rather than to Fimbria.—To add to the misfortunes of Mithridates, his fleet was entirely defeated in two engagements by Lucullus; ſo that he began to be weary of the war, and therefore deſired Archelaus to conclude a peace upon as honourable terms as he could. The king himſelf had afterwards alſo a conference with Sylla, and a peace was concluded in 85 B. C. on the following terms, viz. That Mithridates ſhould relinquiſh all his conqueſts, and content himſelf with his paternal dominions, which were confined within the limits of Pontus: that he ſhould immediately reſign Bithynia to Nicomedes, and Cappadocia to Ariobarzanes, and releaſe without ranſom all the priſoners he had taken during the war: that he ſhould pay to the Romans 2000, or as others will have it 3000, talents, and deliver up to Sylla 80 ſhips with all their arms and ammunition, and 500 archers; and laſtly, that he ſhould not moleſt ſuch cities or perſons as had during the war revolted from him and ſided with the Romans.

33 Peace concluded.

Sylla, having thus concluded the war with great glory to himſelf and advantage to the republic, turned his army againſt Fimbria; but the latter, finding himſelf in no condition to oppoſe his rival by force, had recourſe to treachery, and attempted to get Sylla murdered. The plot miſcarried, and Fimbria put an end to his own life; upon which Sylla, having now an uncontrouled power in Aſia, declared the Chians, Rhodians, Lycians, Magneſians, and Trojans, free, and friends of the people of Rome, by way of reward for their having ſided with the Romans: but on the other cities he laid heavy fines; condemning them in one year to pay 20,000 talents, and quartering his ſoldiers in the houſes of thoſe who had ſhown diſaffection to the Romans. Each private man was to receive of his landlord 16 drachmas a-day, and each officer 50; and beſides, both were to be ſupplied with proviſions, not only for themſelves, but for ſuch of their friends as they thought proper to invite. By theſe impoſitions moſt of the people of Aſia were reduced to beggary; eſpecially the inhabitants of Epheſus, who had above all others ſhown their hatred to the Romans. Sylla then, having collected immenſe treaſure, ſet ſail for Italy; leaving behind him Lucullus with the character of *quæſtor*, and Muræna with that of *prætor*.

The two legions which Fimbria had commanded were given to Muræna, becauſe Sylla ſuſpected them of an inclination to the faction of Marius, whoſe party he was going to cruſh at Rome.

34
Mithridates reduces the nations which had revolted from him.

Mithridates in the mean time no ſooner returned into Pontus, than he ſet about the reduction of thoſe nations which had revolted from him during the war. He began with the Colchi; who immediately ſubmitted, upon condition that Mithridates would give his ſon for a king over them. This was complied with; but the old king had thenceforward a jealouſy of his ſon, and therefore firſt impriſoned and then put him to death. Soon after this, the king having made great preparations under pretence of reducing the Boſphori, a warlike nation who had revolted from him, the Romans began to be jealous. Their jealouſy was further increaſed by Archelaus, who fled to them, and aſſured them that the preparations of Mithridates were not at all deſigned againſt the Boſphori. On hearing this, Muræna invaded Pontus without any farther provocation. The king put him in mind of the articles of peace concluded with Sylla: but Muræna replied that he knew of no ſuch articles; for Sylla had ſet nothing down in writing, but contented himſelf with the execution of what had been agreed upon. Having given this anſwer, the Roman general began to lay waſte and plunder the country, without ſparing even the treaſures or temples conſecrated to the gods. Having put all to fire and ſword on the frontiers of Pontus towards Cappadocia, he paſſed the river Halys, and on that ſide poſſeſſed himſelf of 400 villages without oppoſition; for Mithridates was unwilling to commit any hoſtilities before the return of an ambaſſador whom he had ſent to Rome to complain of the conduct of Muræna. At laſt the ambaſſador returned, and with him one Callidius; who, in public aſſembly, commanded Muræna to forbear moleſting a friend and ally of the Roman people; but afterwards, calling him aſide, he had a private conference with him, in which it is ſuppoſed, as he brought no decree of the ſenate, that he encouraged him to purſue the war. Whatever might be in this, it is certain that Muræna ſtill continued to practiſe the ſame hoſtilities, and even made an attempt on Sinope, where the king reſided and the royal treaſures were kept. But as the town was well fortified, he was forced to retire with ſome loſs. In the mean time Mithridates himſelf taking the field, appeared at the head of a powerful army, drove the Romans out of their camp, and forced them with great ſlaughter to ſave themſelves over the mountains into Phrygia; which ſudden victory again induced many cities to join Mithridates, and gave him an opportunity once more of driving the Romans out of Cappadocia.

35
The Romans invade his territories without provocation,

36
But are defeated.

In the mean time, Sylla, being created dictator at Rome, ſent a meſſenger to Muræna, charging him in his name not to moleſt Mithridates, whom he had honoured with the title of a friend and ally of Rome. Muræna did not think proper to diſregard this meſſage; and therefore immediately abandoned all the places he had ſeized, and Mithridates again renounced Cappadocia, giving his own ſon as an hoſtage of his fidelity. Being then at leiſure to purſue his other plans, Mithridates fell upon the Boſphori; and, having ſoon ſubdued them, appointed Machares one of his ſons king of the country. But leading his army from thence againſt the Achæans, a people bordering on the Colchi, and originally deſcended from the Greeks, who returning from Troy had miſtaken their way into Greece and ſettled there, he was defeated with the loſs of three-fourths of his men. On his return to Pontus, however, he recruited his army, and made vaſt preparations to invade them anew; but in the mean time, hearing of Sylla's death, he came to the imprudent reſolution of entering into a ſecond war with the Romans. Having therefore induced his ſon-in-law Tigranes, king of Armenia, to invade Cappadocia, he himſelf entered Paphlagonia at the head of 120,000 foot diſciplined after the Roman manner, 16,000 horſe, and 100 chariots armed with ſcythes. This country readily ſubmitted; after which the king marched into Bithynia, which alſo ſubmitted without oppoſition; the province of Aſia followed the example of the reſt; for theſe countries being oppreſſed with exorbitant taxes, looked upon him as their deliverer. In entering the cities of Aſia, he cauſed M. Marius or Varius, whom Sertorius had ſent him out of Spain to diſcipline his troops, walk before him with the enſigns of conſular dignity as if he was the chief magiſtrate; the king following as one of his attendants. He made ſeveral cities free; but at the ſame time acquainted the inhabitants, that they were indebted to Sertorius for their liberty; and thus, by the connivance of that general, many cities revolted from the Romans without knowing that they had done ſo. But in the mean time Julius Cæſar, being at that time at Rhodes, whither he had gone to ſtudy oratory, and hearing what havock the king's officers made in the adjacent countries, he collected what troops he could, and falling unexpectedly upon them, drove them quite out of the province of Aſia.

37
Engages in a new war with the Romans.

38
Lucullus and Cotta ſent againſt him.

The Roman ſenate, now finding a war unavoidable, appointed Lucullus to manage it. The other conſul Cotta, having ſolicited an employment in this war, was ſent with a fleet to guard the Propontis and defend Bithynia. Lucullus having raiſed one legion in Italy, paſſed over with it into Aſia, where he was joined by four others, two of which, as they had ſerved under Fimbria, proved at firſt very mutinous and refractory; nor were the other two much better, having been immerſed in the Aſiatic luxuries. The diſciplining of theſe troops took up a conſiderable time, which was prejudicial to the Roman affairs; for almoſt all the Aſiatics were ready to revolt, and Mithridates was making the greateſt preparations. One of his armies was ordered to march into Cappadocia, under the command of Diophantus Matharus, in order to oppoſe Lucullus if he ſhould attempt to enter Pontus on that ſide; another, commanded by Mithridates in perſon, conſiſted of 150,000 foot, 12,000 horſe, and 100 chariots armed with ſcythes; a third army, commanded by Marius and Eumachus, two generals of great experience in war, was encamped in the neighbourhood of Heraclea in Pontus.

39
Mithridates is at firſt ſucceſsful,

The beginning of the war proved favourable to Mithridates. Cotta being deſired by Lucullus to keep his fleet within the harbour, as being inferior to that of Mithridates, reſolved to take the firſt opportunity of fighting the king by land, not doubting of an eaſy victory. Having for this purpoſe collected all the forces he could, Cotta diſpatched his legate, P. Rutilius, with a con-a conſiderable body to obſerve the motions of the enemy. This commander being met by Marius and Eumachus, an engagement enſued, in which the Romans were defeated, and the greateſt part of them, together with their commander, cut in pieces. The ſame miſfortune befel ſeveral other officers of diſtinction ſent out to oppoſe Mithridates; who, being elated with ſucceſs, ordered his admiral to ſail into the very harbour, and fire the Roman fleet. This was accordingly performed without the leaſt oppoſition from Cotta; and 60 ſhips were taken, ſunk, or burnt, on that occaſion.

40 But is reduced to great ſtraits by Lucullus.

41 Who cuts off great numbers of his men.

Theſe victories having increaſed the rebellious diſpoſition of the Aſiatics, made Lucullus haſten his march in order to ſtop the progreſs of the enemy. But finding the king's army much more numerous than he expected, he thought proper to decline an engagement. However, ſeveral ſkirmiſhes happened, in which the Romans had always ſo much the advantage, that they became impatient for a general engagement. But Lucullus did not at this time chooſe to run ſo great a riſk; and therefore Mithridates, ſeeing he could not force the Romans to a battle, decamped in the night-time, and by day-break reached Cyzicum, a moſt important city, and greatly attached to the Romans. Lucullus purſued him; and, falling on his rear, killed 10,000, and took 13,000 priſoners. After this, the Roman general, by a manœuvre, gained an important paſs, which enabled him to cut off all communication between the army of Mithridates and the neighbouring country. The king, ſeeing himſelf thus in danger of famine, redoubled his efforts to gain the city; but finding that he could not batter down the walls, he reſolved to undermine them. In this alſo he was unſucceſsful; the beſieged ſunk countermines, and had very near taken the king himſelf in one of his own mines. In the mean time, winter coming on, the army of Mithridates was ſo diſtreſſed for want of proviſions, that many died of hunger, while the ſurvivors were forced to feed on the fleſh of their dead companions. The famine was followed by a plague; which deſtroyed ſuch numbers, that Mithridates was obliged to think of are treat; and even this was become very dangerous. However, he laid hold of the opportunity when Lucullus went away to beſiege a neighbouring caſtle, and ſent off the greateſt part of his cavalry in the night; ordering them not to halt till they were out of the reach of the enemy. But Lucullus having got intelligence of their march, ſuddenly returned, and purſued them ſo cloſe, that he came up with them as they were paſſing a river, took 600 horſe, all their beaſts of burden, 15,000 men, and put the reſt to the ſword. On his return he fell in with Ariſtonicus the king's admiral, whom he took, juſt as he was ready to ſail with a large ſum of money deſigned to bribe the Roman army. In the mean time Mithridates, finding himſelf reduced to the laſt extremity, embarked in the night-time with the greateſt part of the forces, while Marius and Eumachus, with 30,000 men, made the beſt of their way to Lampſacus. But being cloſely purſued by the Romans, they were overtaken at the river Œſopus, which at that time was not fordable, by reaſon of its having been ſwelled by heavy rains. Twenty thouſand were killed on the ſpot; nor could a ſingle man have eſcaped, had not the Aſiatics ſcattered great quantities of gold and ſilver in the way, that the march of the Romans might be retarded by their ſtopping to gather it up. Lucullus on his return entered Cyzicum amidſt the acclamations of the citizens; who afterwards inſtituted public ſports in honour of him, which they called *Lucullea.* The city was declared free and all the privileges, exemptions, and immunities, beſtowed upon the citizens which were enjoyed by the inhabitants of Rome itſelf.

42 Lucullus gains a great victory at ſea.

From Cyzicum, Lucullus marched along the coaſt of the Helleſpont till he came to Troas; where he equipped his fleet, and put to ſea in queſt of Marius, Alexander, and Dionyſius, three of the king's generals, who had a fleet of 50 ſhips, with 10,000 land forces on board. Lucullus came up with them near the iſland of Lemnos, took 32 of their ſhips, and put a great number of their land-forces to the ſword. The day after the engagement the three generals were diſcovered in a cave where they had concealed themſelves, and dragged from thence to Lucullus; who after having ſeverely upbraided Marius for fighting againſt his country, cauſed him to be put to death. Alexander and Dionyſius were reſerved for the triumph; but the latter poiſoned himſelf to avoid that diſgrace. Lucullus then ſteered his courſe for Bithynia, on receiving intelligence that Mithridates had appeared with his fleet on thoſe coaſts: but the king having notice of his approach, made what haſte he could to gain Pontus, and arrived at Heraclea on board a pirate named *Selemus;* with whom he was obliged to truſt himſelf, his fleet being diſperſed by a violent ſtorm, and the ſhip that carried him caſt away.

43 Farther ſucceſſes of Lucullus.

In the mean time Mithridates was no leſs unfortunate by land than by ſea. Triarius, one of the officers of Lucullus, reduced the cities of Apamea, Pruſa, Pruſias, and Nicæa. From thence he marched with all expedition to Nicomedia, where the king himſelf was, and near which place Cotta lay encamped. But before the two armies could be joined, Mithridates eſcaped, firſt to Heraclea, which was betrayed to him, and from thence to Sinope. Nor was Lucullus himſelf all this time inactive. Having reduced all Paphlagonia and Bithynia, he marched through Cappadocia, and joined Cotta and Triarius at Nicomedia, with a deſign to invade Pontus; but hearing that Heraclea was in the hands of Mithridates, he diſpatched Cotta to reduce that city. Triarius was ordered with the fleet to the Helleſpont and Propontis, to intercept the king's fleet, which was daily expected from Spain with ſupplies from Sertorius. Lucullus himſelf, with the main ſtrength of the army, purſued his march into Pontus. His army was greatly haraſſed, eſpecially in the narrow paſſes between Cappadocia and Pontus, by flying parties of the enemy. But the greateſt inconvenience was the want of proviſions, as the king's troops had laid waſte all the country round; inſomuch that Lucullus having loſt almoſt all his beaſts of burden, was obliged to take along with the army 30,000 Galatians, each of them carrying a ſack of corn on his back. At laſt, however, he gained the plains of Pontus; where proviſions were ſo plentiful, that an ox was ſold for a drachma, and every thing elſe in proportion.

The Roman general having now carried the war into the enemy's country, divided his forces, and at the ſame time inveſted a very ſtrong town named *Amiſus;* another called *Eupatoria,* built by Mithridates, and made the place of his reſidence; and another, named *Themiſcyra*, ſituated on the banks of the Thermodoon. Eupatoria was ſoon taken, but Themiſcyra made a vigorous reſiſtance. The townſmen galled the Romans to ſuch a degree, that, not daring to approach the walls openly, they contented themſelves with undermining them: but in this too they met with no ſmall difficulty; for the enemy countermined, and often engaged them, under ground, letting into the mines bears and other wild beaſts, with ſwarms of bees, which obliged them to abandon their works. However, the town was at laſt obliged to ſurrender for want of proviſions. As for Amiſus, Lucullus himſelf ſat down before it: but finding it ſtrongly fortified and garriſoned with the flower of the king's troops, the Roman general thought proper to reduce it by famine; and on this occaſion his countrymen firſt complained of him as protracting the war for his own advantage.

44
The army of Mithridates mutinies, which obliges the king to fly into Armenia.

In the mean time Mithridates having recruited his ſhattered army, advanced to Cabiræ, a city not far diſtant from Amiſus. Lucullus, leaving part of the army to continue the ſiege, marched at the head of the reſt to oppoſe Mithridates. But the king having drawn his cavalry into a general engagement, defeated them with conſiderable loſs, and drove them back to the mountains, through the paſſes of which Lucullus had lately marched to attack him. This check obliged the Roman general to retire to a riſing ground near the city of Cabiræ, where the enemy could not force him to an engagement. Here proviſions beginning to grow ſcarce, Lucullus ſent out ſtrong parties from his army into Cappadocia, the only place from whence he could have ſupplies. One of theſe parties entirely defeated Taxiles and Diophantes, two of the king's generals, who had been ſtationed there to prevent Lucullus from having any communication with the country. The king, upon the news of this defeat, reſolved to break up his camp and retire, not queſtioning but that Lucullus would attack him as ſoon as his forces returned. This reſolution he no ſooner imparted to his nobles, than they began privately to ſend away their moſt valuable goods; which being found out by the ſoldiers, they took it in ſuch bad part that no intelligence had been given them, that they plundered their baggage, and put thoſe who had the care of it to the ſword. After this they betook themſelves to flight, crowding out of the gates in the utmoſt confuſion. The king haſtened to ſtop their flight; but nobody ſhowing him the leaſt reſpect, he was carried away by the crowd, and in great danger of being trampled to death. Having with difficulty made his eſcape, he retired with a ſmall retinue, firſt to Cabiræ, and then to his ſon-in-law Tigranes king of Armenia. Lucullus diſpatched the beſt part of his cavalry to purſue the fugitives; while he himſelf with the reſt, inveſted the camp of Mithridates, where thoſe remained who could not fly with the reſt. The camp was eaſily taken; but moſt of the ſoldiers made their eſcape, while the Romans, contrary to their general's orders, were buſied in plundering. Lucullus then purſued hard after the king; who, being overtaken by a company of Galatians, cauſed a mule loaded with part of his treaſures to be driven in among them, by which means he made his eſcape while they quarrelled about the booty. Mithridates, remembering in his flight, that he had left his ſiſters, wives, and concubines at Pharnacia, diſpatched an eunuch, named *Bacchus* or *Bacchides*, with orders to put them all to death, leſt they ſhould fall into the hands of the enemy; which was accordingly done.

After the flight of Mithridates, the Romans no longer met with any oppoſition; the king's governors flocking from all parts to put themſelves under the protection of the conqueror. Among theſe was the grandfather of Strabo the geographer, whom the king had diſobliged by putting to death his couſin-german Tibias, and his ſon Theophilus. He was a man of ſuch credit, that it was no ſooner heard that he had abandoned the king's party, than 15 other commanders delivered up to Lucullus the places with which they had been intruſted; and about the ſame time Triarius falling in with the king's fleet near the iſland of Tenedos, obtained a complete victory, having either taken or ſunk 60 of the enemy's veſſels.

All this time Cotta had been employed without ſucceſs in beſieging Heraclea, which he could never have reduced without the aſſiſtance of Triarius. That commander, having defeated the fleet, ſoon reduced the town to ſuch diſtreſs, that a third part of the garriſon died of hunger; upon which the governor, Conacorix, privately agreed with Triarius to deliver one of the gates to him. This was accordingly done; and the Romans, entering, made a terrible ſlaughter of the helpleſs inhabitants. But in the mean time Cotta, provoked at ſeeing himſelf deprived both of all ſhare of the booty, and the honour of reducing a place before which he had ſat ſo long, fell upon his countrymen as they were buſied in plundering; which would have occaſioned a great deal of bloodſhed, had not Triarius promiſed to divide the booty equally. Conacorix, in order to conceal his treachery, after marching out of Heraclea, ſeized on two forts belonging to the Romans; and Triarius being ſent to recover them, Cotta, in his abſence, plundered the city anew, rifled the temples which the other had ſpared, put all the citizens he could meet with to the ſword, and having carried off every thing valuable, at laſt ſet fire to the city in ſeveral places, by which means it was ſoon reduced to aſhes. Cotta then, having no farther occaſion for his troops, diſmiſſed the auxiliaries, reſigned his legions to Lucullus, and put to ſea himſelf in order to return to Rome. But he had ſcarce got out of the harbour, when part of his ſhips, being overloaded with the ſpoils of the city, ſunk; and the others were by a violent north wind daſhed againſt the ſhore, which occaſioned the loſs of a great part of the booty. However, on his return to Rome, he was highly applauded by the ſenate, and honoured with the title of *Ponticus*.

Lucullus, having now reduced Pontus, marched againſt the Chaldeans, Tibarenians, and inhabitants of Armenia Minor; who voluntarily ſubmitted to him, and put him in poſſeſſion of all their ſtrong holds. From Armenia, he returned before Amiſus, which ſtill held out; Callimachus, governor of the place, having haraſſed the Romans to ſuch a degree by engines of his own contriving, that they had given over their aſſaults, and contented themſelves with blocking it up by land, though the garriſon was at the ſame time plentifully ſupplied with proviſions by ſea. Lucullus, on his arrival, ſummoned the city to ſurrender, offering the inhabitants very honourable terms; but, being refuſed, he made a general aſſault at the time when he knew that Callimachus uſed to draw off great part of his troops to give them ſome reſpite. The Romans applying their ſcaling ladders, got over the wall before Callimachus could come to the aſſiſtance of thoſe whom he had left to guard it; however, by ſetting the city on fire, he found means in that confuſion to make his eſcape. Lucullus commanded his men to uſe their utmoſt endeavours to ſave the city; but they being intent only upon plundering, regarded nothing but the furniture. At laſt the fire was extinguiſhed by a violent ſhower; and Lucullus, having with much ado reſtrained his ſoldiers from committing any farther exceſſes, repaired the city in ſome meaſure before he left it, and ſuffered the inhabitants to enjoy their poſſeſſions in peace.

45 Tigranes defeated by Lucullus,

Nothing was now wanting but the captivity of Mithridates himſelf to put a final period to the war; and therefore Lucullus demanded him from his ſon-in-law Tigranes. But though that prince could not be prevailed to ſee Mithridates on account of his miſconduct, he could as little be induced to deliver him up to his enemies. After this refuſal, however, he for the firſt time condeſcended to ſee his father-in-law, after he had reſided a year and eight months in his dominions. In a private conference held by the two kings, it was agreed, that Tigranes ſhould march againſt the Romans, and Mithridates with 10,000 horſe return into Pontus, where he ſhould make what levies he could, and rejoin Tigranes, before Lucullus, who was then employed in the ſiege of Sinope, could enter Armenia. But, in the mean time, Sinope having ſurrendered, Lucullus with all poſſible expedition marched againſt Tigranes, and, having drawn him into a general engagement, gave him an entire defeat, as is related under the article ARMENIA.

46 But reſolves to try another campaign,

47 Mithridates defeated.

Mithridates was marching to his aſſiſtance, when he met his ſon-in-law flying with a ſmall retinue to ſhelter himſelf in ſome remote corner of the kingdom. He encouraged him to raiſe new forces; not doubting but that another campaign would repair all former loſſes, provided he would commit to his management every thing relating to the war. To this Tigranes agreeing, as he thought him more fit to deal with the Romans than himſelf, orders were iſſued out for raiſing a new army, and all the Armenians able to bear arms ſummoned to meet at the place of the general rendezvous. Out of theſe Mithridates choſe 70,000 foot and 35,000 horſe; and having trained them up during the winter, after the Roman diſcipline, in the beginning of the ſpring he left part of them with Tigranes, and marched himſelf with the reſt into Pontus, where he recovered many important places, and overcame in a pitched battle M. Fabius, whom Lucullus had appointed governor of that province. Being fluſhed with this ſucceſs, as ſoon as the wounds he received in the engagement ſuffered him to move, he purſued Fabius, and beſieged him in the city of Cabira, whither he had retired; but in the mean time Triarius, who was marching out of Aſia to join Lucullus, hearing what diſtreſs the Romans were in, haſtened to their relief, and appearing unexpectedly on the neighbouring hill, ſtruck ſuch terror into the enemy, that they raiſed the ſiege, and made the beſt of their way into Cappadocia. Triarius purſued them, and got ſo near them as to be parted only by a river. Here he halted with a deſign to paſs the river after he had allowed his men ſome reſt; for they were tired out with long marches. But Mithridates was before-hand with him, and croſſing the river on a bridge, where he had placed a ſtrong guard, attacked the Romans with great reſolution before they had time to refreſh themſelves. The battle was bloody, and the event doubtful, till the bridge breaking down with the weight of the multitude that paſſed, the king's troops who had engaged, relying chiefly on their numbers, began to loſe courage, ſeeing they could receive no farther aſſiſtance; and the Romans charging them with freſh vigour, they betook themſelves to a precipitate flight. After this engagement, as winter came on, both armies were glad to retire to their winter-quarters.

48 Defeats Triarius.

During the winter, Mithridates raiſed new forces; and having received conſiderable ſupplies from Tigranes, took the field early in the ſpring, in hopes of driving the Romans quite out of Pontus, before Lucullus, who had work enough on his hands in Armenia, could come to their aſſiſtance. With this view he marched ſtraight againſt Triarius and Sornatius, to whom Lucullus had committed the care and defence of that province; and finding them encamped near the city of Gaziurſa, proffered them battle; which they declining, he ſent a ſtrong detachment to beſiege a caſtle where the Romans had left all their baggage, hoping they would rather venture an engagement to relieve the place, than loſe all they had got with ſo much toil and labour during the war: neither was he diſappointed in his hopes; for though Triarius was for keeping cloſe in his camp till the arrival of Lucullus, whom he daily expected, having acquainted him with the danger, the ſoldiers hearing that the caſtle was beſieged, declared in a tumultuous manner, that if he did not lead them they would march to the relief of the place without his leave. Triarius being thus forced by his own men to fight, drew out his forces againſt the king, whoſe army was three times his number; but while they were upon the point of engaging, both armies were by a violent ſtorm forced to retire to their reſpective camps; but Triarius receiving that very day intelligence of the approach of Lucullus, and fearing he would ſnatch the victory out of his hands, reſolved to make a bold puſh, and next morning by break of day attack the king in his camp. If he conquered, the glory he thought would be entirely his own; if he were overcome, the enemy could reap no great advantage from his victory, Lucullus being at hand with a powerful army. The king, in that ſurpriſe, putting himſelf at the head of a few troops of his guards, ſuſtained the brunt of the Romans, till the reſt of his army drawing up came to his relief, and attacked the enemy with ſuch fury, that the Roman foot were forced to give way, and were driven into a moraſs, where they were ſurrounded, and great numbers of them cut in pieces.

Their horſe were likewiſe put to flight, and purſued with great ſlaughter, till a Roman centurion in the king's ſervice, pitying his countrymen, attempted to kill him. The king's life was ſaved by his breaſtplate; but as he received a deep wound in the thigh, he was obliged to give over the purſuit himſelf, and thoſe that were about him cauſed the retreat to be ſounded, which, as it was unexpected, occaſioned a great confuſion in the whole army. The centurion was immediately cut in pieces; but the Roman horſe in the mean time getting the ſtart of the enemy, found means to make their eſcape. Above 7000 of the Romans were killed in that battle; and among them 150 centurions and 24 tribunes, the greateſt number of officers that had been loſt in any engagement to that day. Mithridates being cured of his wound, that he might not for the future be expoſed to ſuch dangers, cauſed all the Romans that ſerved in his army to be formed into one body, as if they were to be ſent out on a party, and then ordered them to retire to their tents, where they were all to a man cut in pieces.

49 All the Romans in the ſervice of Mithridates maſſacred.

The king, however elated with ſucceſs, yet would not engage Lucullus; but with long marches haſtened into Armenia Minor, and encamped upon a hill near the town of Talura, expecting Tigranes, who was advancing with a ſtrong army to join him. Lucullus, in purſuit of Mithridates, marched over the field of battle, leaving thoſe unburied who had fallen in the engagement, which alienated the minds of the ſoldiery from him, and they began to be very mutinous; being ſtirred up by Appius Claudius, whom Lucullus had turned out of his command for his vile behaviour, notwithſtanding he was nearly related to him, Lucullus having married his ſiſter. The diſcontent that prevailed in the army came to ſuch a height, that Lucullus was obliged to lie ſtill in his camp all that ſummer; the ſoldiers declaring in a mutinous manner, that they would not follow him any longer, nor ſerve under a general who refuſed to ſhare the booty with them.

50 Lucullus recalled, which retrieves the affairs of Mithridates.

Theſe complaints, and the general diſcontent that reigned in the army, obliged the ſenate to recal Lucullus, and appoint Manius Acilius Glabrio, conſul of that year, in his room. Glabrio arriving in Bithynia, gave notice by public cries to all the cities, that the ſenate had diſcharged Lucullus and his army, and confiſcated his goods for protracting the war and refuſing to comply with their injunctions. Hereupon Lucullus was abandoned by the greater part of his army, and forced to retire into Galatia, not being in a condition to make head againſt the joint forces of the two kings; who, laying hold of that opportunity, recovered the beſt part of Pontus, Bithynia, Cappadicia, and Armenia Minor: for though Glabrio had haſtened into Pontus, as if he had intended to engage the enemy and rob Lucullus of the victory, yet, upon the firſt news of the approach of the two kings, he thought fit to retire and leave the country open on all ſides to the enemy.

51 Pompey ſent againſt him.

When this was heard at Rome, a law was enacted there by C. Manilius, a tribune of the people, whereby the management of the war againſt Mithridates and Tigranes was committed to Pompey, and likewiſe the provinces of Cilicia, then under Quintus Marcius, and of Bithynia under Glabrio. By the ſame law he was continued in that unlimited power by ſea, with which he was inveſted when he firſt ſet out againſt the pirates of Cilicia. In virtue of this law, Pompey, who had juſt then ended the war with the Cilician pirates, took upon him the command of the army, and directed all the allies of the Roman people to join him with all poſſible expedition: but before he took the field, he renewed the alliance which Sylla and Lucullus had concluded with Phrahates king of Parthia, and then ſent friendly propoſals to Mithridates; who at firſt ſeemed inclined to give ear to them, and accordingly diſpatched an ambaſſador to the Roman army to treat of a peace. Pompey required of him to lay down his arms if he was in earneſt, and deliver up to him all thoſe who had revolted from the Romans during the war. This demand was no ſooner reported abroad in the king's camp, but the deſerters, who were very numerous in the king's army, betaking themſelves to their arms, threatened to put Mithridates himſelf to death; and would have occaſioned a great diſturbance, had not the king appeaſed the growing tumult, by aſſuring them, that he had ſent ambaſſadors, not to treat of a peace, but only to take, under pretence of ſuing for peace, a view of the enemy's ſtrength. He moreover obliged himſelf, by a ſolemn oath in the preſence of the whole army, never to enter into any treaty of friendſhip with the Romans, nor to deliver up to them ſuch as had ever ſerved under him.

52 Mithridates rejects his propoſals of peace.

Pompey, finding his propoſals rejected, advanced againſt the king with an army of 30,000 foot and 20,000 horſe, as Plutarch writes, or 30,000, as we read in Appian, all choſen troops; for he diſcharged moſt of thoſe who had ſerved under Glabrio and Lucullus. As he entered Galatia, he was met by Lucullus, who endeavoured to perſuade him to march back, the war being near finiſhed, and even deputies ſent by the republic to ſettle the province of Pontus; but not being able to prevail with him, after mutual complaints againſt each other, they parted; and Pompey removing his camp, commanded the troops that were with Lucullus to join him, except 1600 whom he left to attend Lucullus in his triumph. From thence Lucullus ſet out for Rome, where he was received by the ſenate with great marks of eſteem, moſt men thinking him highly injured by the authors of the Manilian law. Pompey purſued his march into Pontus; but finding that he could not by any means draw the king to a battle, he marched back into Armenia Minor, with a deſign either to reduce that province, or oblige Mithridates to venture a battle in order to relieve it. Mithridates followed him at ſome diſtance; and entering Armenia, encamped on a hill over-againſt the Romans, and, by intercepting their convoys, reduced them to ſuch diſtreſs, that they were obliged to remove to a more convenient place, the king cutting off many in their rear, and haraſſing them with frequent attacks, till he fell into an ambuſcade laid by Pompey, whoſe perſonal courage and prudent conduct on that occaſion confirmed the king in his reſolution not to hazard a general engagement. The two armies encamped over-againſt each other; Pompey on one hill, and the king on another, near the city of Daſtira, in the province of Aciſilene, at a ſmall diſtance from the Euphrates, which divides Aciſilene from Armenia Minor.

53 Is beſieged by Pompey.

Here Pompey, ſeeing he could neither draw the king to a battle, nor force his camp, which was pitched on a ſteep and craggy mountain, began to block him up with a ditch which he carried round the bottom of the hill where the king was encamped; and meeting with no oppoſition, finiſhed his work, and quite cut off the enemy's communication with the country. Pompey was amazed to ſee the king thus tamely ſuffer himſelf to be ſhut up; and could not help ſaying, That he was either a great fool or a great coward: a fool, if he did not apprehend the danger he was in; a coward, if, being appriſed of it, he did not to the utmoſt of his power prevent it. By this ditch, which was 150 furlongs in circuit, and defended by many forts raiſed at ſmall diſtances from each other, the king was ſo cloſely beſieged, that he could neither ſend out parties to forage, nor receive the ſupplies that came to him from Pontus. He was thus beſieged for the ſpace of 45 or 50 days; and his army reduced to ſuch ſtraits, that, having conſumed all their proviſions, they were at laſt forced to live on their dead horſes. Hereupon Mithridates reſolved at all events to break through the Roman fortifications: and accordingly, having put to the ſword all thoſe that were ſick or diſabled, that they might not fall into the enemy's hands, he attacked in the dead of the night the Roman guards; and having overpowered them with his numbers, got ſafe into the open fields, and continued his march all night towards Armenia Major, where he was expected by Tigranes.

54
But breaks through the Roman lines.

Pompey next morning by break of day purſued the enemy with his whole army; and having with much ado overtaken them, found the king encamped on a hill, to which there was but one aſcent, and that guarded by a ſtrong body of foot. The Romans encamped over-againſt them; but Pompey, fearing the king ſhould make his eſcape in the night-time, privately decamped, and taking the ſame rout the enemy were to hold in order to gain Armenia, poſſeſſed pimſelf of all the eminences and defiles through which the king was to paſs. Mithridates thinking that Pompey was returned to his former camp, purſued his march, and about the duſk of the evening entered a narrow valley, which was ſurrounded on all ſides by ſteep hills. On theſe hills the Romans lay concealed, expecting the ſignal to fall upon the enemy and attack them on all ſides at once, while they were tired with their march, and ſeemingly, as they had ſent out no ſcouts, in great ſecurity. Pompey was at firſt for putting off the attack till the next morning, thinking it not ſafe to engage in the night-time among ſuch ſteep and craggy mountains; but was at laſt prevailed upon, by the earneſt prayers and intreaties of all the chief officers of the army, to fall upon the enemy that very night. It was therefore agreed, that in the dead of the night all the trumpets ſhould at once ſound the charge, that this ſignal ſhould be followed by an univerſal ſhout of the whole army, and that the ſoldiers ſhould make what noiſe they could, by ſtriking their ſpears againſt the braſs veſſels that were uſed in the camp. The king's army at this ſudden and unexpected noiſe, which was echoed again by the mountains, imagined at firſt that the gods themſelves were come down from heaven to deſtroy them; and the Romans charging them on all ſides with ſhowers of ſtones and arrows from the tops of the hills, they betook themſelves to a precipitate flight; but finding all the paſſes beſet with ſtrong bodies of horſe and foot, were forced to fly back into the valley, where, for many hours together, they were expoſed to the enemy's ſhot, without being able, in that confuſion, either to attack them or defend themſelves. They attempted indeed to make ſome reſiſtance when the moon roſe; but the Romans running down upon them from the hills, did not give them time to draw up, and the place was ſo narrow that they had not room even to make uſe of their ſwords. The king loſt on that occaſion 10,000 men according to Appian, but 40,000, according to Eutropius and others. On Pompey's ſide there fell between 20 and 30 private men, and two centurions.

55
Is over-reached by Pompey, and totally defeated.

56
Diſtreſs of Mithridates.

Mithridates, at the head of 800 horſe, broke through the Roman army, and being after this effort abandoned by all the reſt, becauſe they were cloſely purſued by the enemy, he travelled all night attended by three perſons only, *viz.* his wife, or, as Plutarch calls her, his *concubine*, by name *Hypſicratia*, his daughter Dripetine, and an officer. At day-break he fell in with a body of mercenary horſe, and 3000 foot, who were marching to join him. By theſe he was eſcorted to the caſtle of Sinoria, ſituated on the borders of the two Armenias. As great part of his treaſures were lodged here, he rewarded very liberally thoſe who accompanied him in his flight; and taking 6000 talents, withdrew into Armenia. As ſoon as he entered the borders, he diſpatched ambaſſadors to Tigranes, acquainting him with his arrival; but that prince, who was then on the point of concluding a ſeparate peace with the Romans, clapped his ambaſſadors in irons, pretending that his ſon Tigranes, had at the inſtigation of Mithridates, revolted firſt to the Parthians, and then to the Romans. Mithridates finding himſelf thus abandoned, even by his ſon-in-law, left Armenia; and directing his courſe towards Colchis, which was ſubject to him, and not as yet invaded by the Romans, paſſed the Euphrates the fourth day, and got ſafe into his own territories.

Pompey ſent out ſeveral parties in purſuit of the king; but remained himſelf with the main body of the army in the field of battle, where he built a city, calling it from that remarkable victory *Nicopolis*. This city, with the adjoining territory, he beſtowed upon ſuch of his ſoldiers as were old or diſabled; and many flocking to it from the neighbouring countries, it became in a ſhort time a very conſiderable place. This battle was certainly attended with very fatal conſequences for Mithridates; who was forced, his army being entirely either cut off or diſperſed, to abandon his own dominions, and fly for ſhelter to the moſt remote parts of Scythia. Pompey having concluded a peace with Tigranes, as we have related in the hiſtory of Armenia, and ſettled the affairs of that kingdom, began his march in purſuit of Mithridates through thoſe countries that lie about mount Caucaſus. The barbarous nations through which he paſſed, chiefly the Albanians and Iberians, attempted to ſtop his march, but were ſoon put to flight. However, he was obliged, by the exceſſive cold and deep roads, to paſs the winter near the river Cyrus. Early in the ſpring he purſued his march; but meeting with great oppoſition from the Iberians, a warlike nation, and entirely devoted to Mithridates, he was employed moſt part of the ſummer in reducing them. In the mean time, Mithridates, who had wintered at Dioſcurias, on the iſthmus between the Euxine and Caſpian ſeas, and had been joined there by ſuch of his troops as had made their eſcape from the late unfortunate battle, continued his flight through the countries of the Achæans, Zygians, Heniochians, Cercetans, Moſchi, and Colchians. Of theſe nations ſome received him kindly, and even entered into alliance with him; through others he was forced to make himſelf a way with his ſword.

57
He flies into Scythia, and from thence into other countries.

Pompey took the ſame rout, directing his courſe

58 Pompey's further conqueſts.

by the ſtars, eſpecially in the northern parts of Scythia, and carrying with him even proviſion of water, to ſupply the army in the vaſt deſerts through which he marched. He ſpent two years in warring with theſe nations, and was often in danger of loſing both his life and his army: but at laſt he overcame them all; and believing Mithridates, of whom he could have no account, to be dead, he marched back into Armenia Minor, where he allowed ſome reſt to his ſoldiers, who were quite worn out with the hardſhips they had endured in that expedition. Having refreſhed his army, he marched into Pontus, to reduce ſome ſtrong holds which were ſtill garriſoned by the king's troops. While he was at Aſpis in Pontus, many of the king's concubines were brought to him; but he ſent them all home to their parents, without offering them the leaſt injury, and thereby gained the affection of the chief lords of Pontus, whoſe daughters they were. The ſtrong caſtle of Symphori was delivered up to him by Stratonix, one of the king's concubines, upon no other terms than that he would ſpare her ſon Xiphares, who was with the king, in caſe he ſhould fall into his hands. She likewiſe diſcovered to him great treaſures hid under ground, which he, with great generoſity, beſtowed upon her, reſerving for himſelf only ſome veſſels to ſet off his triumph. Having taken another fort, called the *New Caſtle*, and to that time looked upon as impregnable, he found in it great ſtore of gold, ſilver, and other valuable things, which he afterwards conſecrated to Jupiter Capitolinus. Here, in looking over the king's manuſcripts, he came to diſcover where the reſt of his treaſures were concealed, what troops he could raiſe and maintain, what ſums were yearly paid him by his ſubjects and tributaries, &c. whereby he could make a true eſtimate of his whole power and wealth. Amongſt other manuſcripts he found ſome books of phyſic, wrote by Mithridates himſelf, which he commanded Lenæas, a learned grammarian, to tranſlate into Latin.

59 Mithridates appears again at the head of a conſiderable army.

Pompey, having thus reduced all Pontus, marched into Syria, with a deſign to recover that kingdom, and paſſing through Arabia to penetrate as far as the Red Sea. But while he was employed in this expedition, news was brought him that Mithridates, whom he believed dead, had appeared unexpectedly in Pontus at the head of a conſiderable army, and ſurpriſed Panticapæum, a famous empory at the mouth of the Euxine Sea. He had lain all this time concealed in the territories of a Scythian prince adjoining to the Palus Mœotis; but hearing that Pompey had left Pontus, and was engaged in other wars, he ventured out of his hiding-place, reſolved either to recover his paternal kingdom, or die in the attempt. He returned privately into Pontus and managed matters there ſo dexterouſly, that the Roman garriſons knew nothing of his arrival till he appeared with a conſiderable army in the field. He advanced firſt to the caſtle of Symphori; and underſtanding that Stratonix had delivered it up to Pompey, on condition he would ſave the life of her ſon in caſe he ſhould take him priſoner, the king immediately cauſed the youth, who was in his army, to be put to death, and his body to be left unburied, Stratonix beholding from the walls the cruel and unnatural murder, for he was her ſon by Mithridates, and had ſerved him with great fidelity. At the ſame time he ſent ambaſſadors to Pompey to treat of a peace, offering to pay a yearly tribute to the republic, on condition he reſtored to him his kingdom. Pompey replied, that he would hearken to no propoſals whatſoever, without the king came to treat with him in perſon, as Tigranes had done. This Mithridates looked upon as nowiſe conſiſtent with his dignity; and therefore laying aſide all thoughts of an accommodation, began to make what preparations he could for renewing the war.

60 Recovers ſeveral places.

He ſummoned all his ſubjects that were able to bear arms to meet at an appointed place; and having choſen out of the whole multitude 60 cohorts, each conſiſting of 100 men, he incorporated them with the regular troops that were already on foot. Being now in a condition to act offenſively, for Pompey had left but a ſmall number of troops in Pontus, he poſſeſſed himſelf of Phanagorium, Cherſoneſus, Theodoſia, Nymphæum, and ſeveral other important places. But in the mean time, Caſtor, whom Mithridates had appointed governor of Phanagorium, falling out with Tripho, one of the king's favourite eunuchs, killed him, and dreading the king's reſentment, ſtirred up the inhabitants to a revolt: by which means Phanagorium was again loſt; but the caſtle, which was defended by four of the king's ſons, Artaphernes, Darius, Xerxes, and Oxathres, held out for ſome time. The king haſtened to their relief; but the caſtle being ſet on fire by the rebels, they were forced to ſurrender themſelves to Caſtor before his arrival. Theſe four ſons, with one of the king's daughters, by name *Cleopatra*, Caſtor ſent to the Romans; and fortifying himſelf in the town, perſuaded moſt of the neighbouring cities, which were oppreſſed with heavy taxes, and ſtrangely haraſſed by the king's collectors, to join in the rebellion.

61 His ſubjects diſcontented.

62 His extraordinary deſign of invading Italy.

Mithridates finding that he could neither rely upon the ſoldiery, moſt of them being forced into the ſervice, nor on his other ſubjects, who were diſſatisfied by reaſon of the exorbitant taxes, ſent ambaſſadors to invite the princes of Scythia to his relief, and with them his daughters, to be beſtowed in marriage upon ſuch as ſhowed themſelves moſt inclined to aſſiſt him. But as the ambaſſadors he employed on this occaſion were eunuchs, a race of men no leſs abhorred by the army than favoured by the king, over whom they had a great aſcendant, eſpecially in his old age, the ſoldiers who were ſent to attend them on their journey, put them all to the ſword as ſoon as they were out of the king's reach, and delivered his daughters up to the Romans. Mithridates, finding himſelf thus deprived of his children, betrayed by his army, and forſaken even by thoſe on whom he chiefly relied, could not yet be induced to ſubmit to the Romans, though Pompey promiſed him honourable conditions, provided he came to treat with him in perſon. In this deſperate condition, he left no ſtone unturned to ſtir up the princes of Aſia againſt the Romans, eſpecially the Parthians; but finding them awed by the great opinion they all had of Pompey, he had recourſe at laſt to the European Gauls whom he underſtood to be at war with the Romans; and having ſent before ſome of his truſty friends to engage them in his favour, taking leave of his own kingdom, he began his long march, deſigning to paſs through Boſphorous, Cimmerius, Scythia,

thia, Panonia, &c. and joining the Gauls, paſs the Alps, and invade Italy.

This deſign was no ſooner known in the army, but the ſoldiers openly began to complain and mutiny; exaggerating the boldneſs of the attempt, the length of the march, and the unſurmountable difficulties that muſt neceſſarily attend ſuch a deſperate enterpriſe. The chief commanders did all that lay in their power to divert him from it; repreſenting to him, that if he was not able to cope with the Romans in his own kingdom, much leſs would he be a match for them in Italy or Gaul, where they could daily receive new ſupplies; whereas he would loſe the greateſt part of his army in ſo long and difficult a march, and the reſt perhaps in the firſt engagement, without any poſſibility of repairing the loſs. But all was to no purpoſe; for they found him ſo unalterably fixed in his reſolution, that he cauſed thoſe to be put to death who with moſt warmth remonſtrated againſt it, not ſparing even his own ſon Exipodras, for dropping ſome unguarded expreſſions on that occaſion. Thus they were forced to let him purſue his own meaſures, till they found a more proper opportunity to oppoſe them, which ſoon after offered, as they were encamped at Boſphorus Cimmerius, on their march into Scythia.

63
His ſon Pharnaces revolts.

Here Pharnaces, the king's favourite ſon, whom he had appointed to ſucceed him, obſerving the general diſcontent that reigned in the army, began to entertain thoughts of placing the crown on his own head; and not doubting but the ſoldiery would ſtand by him, if he declared againſt the intended expedition into Italy, openly proteſted among the Roman deſerters, who were a conſiderable part of the army, that if they would follow him he would return into Pontus. The Romans who were well appriſed of the danger that attended ſuch an undertaking, and had moſt of all exclaimed againſt it, promiſed to ſupport him to the utmoſt of their power, and even encouraged him, upon ſome expreſſions which he purpoſely dropped, to aſſume the title of *king*, a title which his father ſeemed determined to hold till he had deſtroyed, by his raſh and deſperate attempts, himſelf, his friends, and his army. Pharnaces, finding he could depend on the Romans, engaged the ſame night moſt of the chief commanders in his party, and by their means the greater part of the ſoldiery. It was agreed, that next morning by break of day all thoſe who had declared in his favour ſhould appear in arms, and with a loud ſhout proclaim Pharnaces king; which was done accordingly, and the ſhout returned even by thoſe whom Pharnaces had not thought fit to let into the ſecret. The king, who had taken up his quarters in the city, being awakened by the noiſe, ſent out ſome of his domeſtics to know what had happened in the army. Neither did the officers or ſoldiers diſſemble the matter, but boldly anſwered, that they had choſen a young king inſtead of an old dotard governed by eunuchs.

Hereupon Mithridates mounting on horſeback, and attended by his guards, went out to appeaſe the tumult: but his guards forſaking him, and his horſe being killed under him, he was obliged to fly back into the city; from whence he ſent ſeveral of his attendants one after another to deſire of his ſon a ſafe conduct for himſelf and his friends. But as none of the meſſengers returned, ſome being ſlain, and others ſiding with the new king, Mithridates endeavoured to move his ſon to compaſſion, by ſignifying to him from the walls the diſtreſſed condition he was reduced to by a ſon whom he had favoured above the reſt of his children; but finding him nowiſe affected by his ſpeech, turning to the gods, he beſeeched them with many tears to make his ſon know one day by experience the grief and agony which a father muſt feel in ſeeing his love and tenderneſs requited with ſuch ungrateful and monſtrous returns. Having thus ſpoke, he thanked in a very obliging manner thoſe who had ſtood by him to the laſt, and exhorted them to make their ſubmiſſion to the new king on the beſt terms they could procure; adding, that as for himſelf, he was determined not to outlive the rebellion of a ſon whom he had always diſtinguiſhed with particular marks of paternal affection.

64
Mithridates attempts to deſtroy himſelf.

After this, he withdrew into the apartment of his wives and concubines, where he firſt took poiſon himſelf, and then preſented it to them, and to his favourite daughters Mithridatis and Niſſa, who not long before had been betrothed to the kings of Egypt and Cyprus. To the women it proved immediate death; but on the king, who from his infancy had inured his conſtitution to poiſonous potions, it had ſo ſlow an operation, that he was forced, through fear of falling into the rebels' hands, to recur to his ſword. Neither did the wound, as he was greatly weakened by the poiſon, prove mortal: ſo that the rebels, having in the mean time ſtormed the town, and broke into the houſe, found the king wallowing in his blood, but ſtill alive, and in his ſenſes; which Pharnaces hearing, ſent ſome of thoſe that were about him to dreſs his wounds, with a deſign to deliver him up to the Romans, and thereby ingratiate himſelf with Pompey.—But, in the mean time, a Gaul, who ſerved in the army, by name *Bitætus*, or *Bithocus*, entering the king's room in queſt of booty, and being touched with compaſſion in ſeeing him forſaken by all his friends, and ſtruggling on the bare ground with the pangs of death, drawing his ſword, put an end to his preſent agonies, and prevented the inſults which he chiefly apprehended if he ſhould fall alive into his ſon's hands. The barbarian is ſaid, when he firſt ſaw the king, to have been ſo awed with the majeſty of his countenance, that, forgetful of his booty, he fled out of the room; but being called back, and earneſtly intreated by the dying prince to put an end to his miſery, he ſummoned all his courage to perform, as he did, with a trembling hand, that office; and immediately retired without touching any thing that belonged to the king, though the hopes of a rich booty was the only motive that had led him thither.

65
A Gaul puts an end to his life out of compaſſion.

66
Exceſſive joy of the Romans at his death.

Pompey, who was at that time engaged in a war with the Jews, received the firſt notice of the death of Mithridates as he was on his march to Jeruſalem. The meſſenger who brought the joyful tidings was ſent by Pharnaces, and appeared unexpectedly before Pompey with the branch of a laurel, as was cuſtomary on the like occaſions, twiſted round the head of his javelin. When he heard what had happened at Panticapæum, he was ſo impatient to impart it to the ſoldiery, that he could not even wait till they had raiſed him a mount of turf from whence to ſpeak to the army, according to the cuſtom of the camp; but ordered thoſe who were by him to form a kind of mount with their ſaddles, and from thence acquainted the ſoldiery that Mithridates had laid violent hands on himſelf, and his ſon Pharnaces was ready to acknowledge the kingdom as a gift of the people of Rome, or reſign it if they were unwilling he ſhould reign. This news was received with joyful ſhouts of the whole army, and the day ſolemnized with feaſts and ſacrifices throughout the camp, as if in Mithridates alone all the enemies of the republic had died. Pompey diſpatched without delay a meſſenger with letters to the ſenate, acquainting them with the death of Mithridates, and the ſubmiſſion of his ſon Pharnaces. When his letters were read, the ſenators were ſo overjoyed, that they appointed at the propoſal of Cicero, then conſul, 12 days for returning due thanks to the gods, who had delivered them from ſuch an inſulting and powerful enemy; and the tribunes of the people enacted a law, whereby Pompey, in conſideration of his eminent ſervice in the Mithridatic war, was to wear a crown of laurel, with the triumphal gown at the Circenſian ſports, and a purple gown at the ſcenical plays.

67
Submiſſive embaſſy of Pharnaces to Pompey;

Pharnaces, when he heard of his father's death, cauſed his body to be preſerved in brine, propoſing to preſent it to Pompey, who had promiſed to return into Pontus after the reduction of Judæa, and there ſettle matters to his ſatisfaction. And accordingly having taken the city and temple of Jeruſalem, he ſet out with two legions for Pontus; and being arrived at Sinope, he was there met by ambaſſadors from Pharnaces, acquainting him, that their maſter had forbore aſſuming the title of king till his will and pleaſure were known; that he put both himſelf and the kingdom entirely into his hands; and that he was willing to attend him at what time or place he thought fit to appoint. The ſame ambaſſadors delivered up to Pompey thoſe who had taken Manius Aquilius the Roman legate, whom Mithridates had put to a cruel death, all the priſoners, hoſtages, and deſerters, whether Romans, Greeks, or Barbarians, and the body of Mithridates with his rich apparel and arms, which were greatly admired by Pompey and the other Romans. Both ſoldiers and officers flocked to ſee the king's body; but Pompey declined that ſight; and, ſaying that all enmity between that great prince and the people of Rome was ended with his life, he returned the body to the ambaſſadors, and cauſed it to be interred with the utmoſt pomp and magnificence among his anceſtors in the burying-place of the kings of Pontus, Pompey defraying all the charges of that ceremony, which was the moſt coſtly and pompous that ever had been ſeen in thoſe parts. With the body Pompey reſtored his wearing apparel and armour; but the ſcabbard of his ſword, which coſt 400 talents, was ſtolen by Rublius a Roman, and ſold to Ariarathes king of Cappadocia; and his cap or turban, which was a very curious piece of workmanſhip, was privately taken by one Caius, who preſented it to Fauſtus the ſon of Sylla, in whoſe houſe it was kept, and ſhown for many years after among the many rarities which Sylla had brought out of Aſia.

Pompey beſtowed the kingdom of Boſphorus on Pharnaces, and honoured him with the title of a friend and ally of the people of Rome. Pharnaces being thus acknowledged king of Boſphorus, ſent orders to all the garriſons of Pontus to ſubmit themſelves with the caſtles and treaſures with which they were entruſted, to Pompey, who by that means amaſſed an immenſe booty. In the city of Talaura, which Mithridates uſed to call his wardrobe, he found 2000 cups of onyx ſet in gold, with ſuch ſtore of gold and ſilver veſſels, of coſtly furniture, of ſaddles, bridles, and trappings, ſet with jewels and precious ſtones, that the Roman commiſſaries ſpent 30 days in taking the inventory of the whole. In another caſtle he found three large tables with nine ſalvers of maſſy gold, enriched with precious ſtones to an ineſtimable value; the ſtatues of Minerva, Mars, and Apollo, of pure gold and moſt curious workmanſhip; and a pair of gaming-tables of two precious ſtones, three feet broad, and four feet long, on which was a moon of gold weighing 30 pounds, with their men, all of the ſame precious ſtone. In a fort ſituated among the mountains, were delivered up to him the king's ſtatue of maſſy gold, eight cubits high, his throne and ſceptre, and the bed of Darius the ſon of Hyſtaſpes. Moſt of theſe treaſures had been tranſmitted to him from his anceſtors, chiefly from Darius king of Perſia; ſome belonging to the Ptolemies of Egypt, and had been depoſited by Cleopatra, as we have hinted above, in the hands of the Coans, who delivered them to Mithridates; and great part of them had been collected by the king himſelf, who was very fond of rich and ſtately furniture.

68
Who beſtows upon him the kingdom of Boſphorus.

Pompey having thus got entire poſſeſſion of Pontus, and reduced it to the form of a Roman province, marched into *Aſia* properly ſo called; and having wintered at Epheſus, early in the ſpring ſet out for Italy, with a fleet of 700 ſhips. As he brought over his army with him, the ſenate was under no ſmall apprehenſion leſt he ſhould make himſelf abſolute, and rule without controul. But he no ſooner landed at Brunduſium, than he diſbanded the army, without waiting for any decree either of the ſenate or people; what neither his friends nor his enemies had believed. His triumph laſted two whole days; and though he was attended in his triumphal chariot by 324 captives of diſtinction, among whom were five ſons and two daughters of Mithridates, yet he would not ſuffer any of them to be put to death, as had been done by others; but ſent them all back, except ſuch as were of royal extraction, to their reſpective countries, and even ſupplied them with money to defray the charges of their journey. After his triumph he delivered into the treaſury 20,000 talents, though, at the diſmiſſing of the army, he had divided 16,000 talents among the tribunes and centurions, 2000 ſeſtertiums among the quæſtors, and had given to each ſoldier 50 ſeſtertiums.

69
Pharnaces falls out with the Romans.

Pompey had no ſooner left Aſia, but Pharnaces fell unexpectedly upon the Phanagorenſes, a people of Boſphorus, whom Pompey had declared free, becauſe they had revolted the firſt of all from Mithridates, and by their example induced others to abandon the king's party. Pharnaces beſieged their chief city Phanagoria, and kept them blocked up till, for want of proviſions, they were forced to ſally out, and put all to the iſſue of a battle; which proving unſucceſsful, they delivered up themſelves and their city to the conqueror. Some years after, the civil war breaking out between Cæſar and Pompey, he laid hold of that opportunity to recover the provinces which his father had formerly poſſeſſed; and having raiſed a conſiderable army, overran Pontus, Colchis, Bithynia, Armenia, and the kingdom of Moſchis, where he plundered, as Strabo obſerves, the temple of the goddeſs Leucothea. He took the ſtrong and important city of Sinope, but could not reduce Amiſus. But, in the mean time, Cæſar having got the better of Pompey and his party, appointed Cn. Domitius Calvinus governor of Aſia, enjoining him to make war upon Pharnaces with the legions that were quartered in that province. Domitius immediately diſpatched ambaſſadors to Pharnaces, commanding him to withdraw his troops from Armenia and Cappadocia. The king returned anſwer, that he was willing to abandon Cappadocia, but as for the kingdom of Armenia Minor, it was part of his hereditary dominions; and therefore he would not reſign it till he had an opportunity of laying his pretenſions before Cæſar himſelf, whom he was ready to obey in all things. Hereupon Domitius drawing together what forces he could, marched into Cappadocia, which he recovered without oppoſition, Pharnaces having abandoned it to make a ſtand in Armenia, which lay nearer his own dominions. Thither Domitius purſued him; and having overtaken him near Nicopolis, found his army drawn up in battle-array, and the king ready to come to an engagement; which Domitius not declining, both armies advanced.

70 And defeats them.

The king, at the head of a choice body of men, fell upon the Romans' left wing, conſiſting moſtly of raw and undiſciplined Aſiatics; and having without much ado put them to flight, penetrated to the centre, where the thirty-fifth legion, the only one which Domitius had, after a faint reſiſtance, gave ground, and, retiring to the neighbouring mountains, left their allies to ſhift for themſelves, who were all cut off. Domitius with the remains of his ſcattered army marched back into Cappadocia; and from thence, winter drawing on, into the province of Aſia. The king being puffed up with this victory, and hearing that Cæſar, with the flower of the Roman forces, was engaged at the ſiege of Alexandria, appointed one Aſander governor of Boſphorus, and marched himſelf into Cappadocia in purſuit of Domitius, with a deſign to invade Aſia, and recover all the provinces which had been once ſubdued by his father. Bithynia and Cappadocia readily ſubmitted; but Armenia the Leſſer, which was held by Dejotarus, made ſo vigorous a reſiſtance, that he was forced to give over the enterpriſe, leſt the Romans ſhould in the mean time ſtrengthen themſelves in Aſia, whither he was in haſte to march, in hopes of meeting there with the ſame ſucceſs as his father Mithridates had done. But before he reached that province, he was informed that Aſander had revolted, in hopes of gaining thereby the good-will of the Romans, and obtaining of them the kingdom of Boſphorus for himſelf. At the ſame time, he received intelligence that Cæſar, having at laſt reduced Alexandria, and ſettled the affairs of Egypt and Syria, was marching into Armenia.

71 Attempts to outwit Julius Cæſar,

He was not a little diſmayed at this news, and therefore without delay diſpatched ambaſſadors to ſue for peace; hoping that Cæſar, who was haſtening into Italy with a deſign to paſs over into Africa, would willingly give ear to any propoſals of that nature.—Cæſar courteouſly entertained the ambaſſadors; and though he did not propoſe to agree to their conditions, yet, that he might come upon Pharnaces unawares, he ſhowed himſelf very deſirous of entering into a treaty of peace. But, in the mean time, he purſued his march with all poſſible expedition; and arriving on the confines of Pontus, ordered all the troops that were quartered in the neighbouring provinces to join him; for he had brought from Alexandria but one legion, namely the ſixth, and that conſiſting of 1000 men only, the reſt having been killed at the ſiege of Alexandria. Beſides this veteran legion, he found at the place of general rendezvous three others, but all of them very indifferently armed, and worſe diſciplined. With theſe forces, however, ſuch as they were, he advanced againſt Pharnaces; who being greatly frightened at his approach, by reaſon of the ſucceſs that had attended him in all his expeditions, again diſpatched ambaſſadors to him with a crown of gold, offering him his daughter in marriage, and promiſing to do whatever he ſhould require. The ambaſſadors took care to let him know that their maſter, though highly obliged to Pompey, yet had never been prevailed upon to ſend him any ſupplies during the civil war, which Dejotarus, king of Armenia the Leſſer, whom he had honoured with his friendſhip, had done. Cæſar returned for anſwer, that he was willing to conclude a peace with Pharnaces, provided [illegible]e retired without delay from Pontus, returned all the captives and hoſtages whether Roman or their allies, and reſtored the goods of the Roman citizens and publicans which he had ſeized ſince he firſt took up arms. He added, that as to his not ſending ſupplies to Pompey, they ought rather to have concealed ſuch an ungrateful proceeding of their maſter than alleged it as any merit, ſince the forſaking of one to whom he was indebted for his crown, beſpoke him a man of mean, ſelfiſh, and unworthy principles.

Pharnaces, upon the return of his ambaſſadors, acquainted Cæſar that he agreed to the conditions; but finding that Cæſar's affairs called him into Italy, he required a longer term of time for the performance of what was ſtipulated between them, ſtarting daily new difficulties, in hopes that Cæſar would in the mean time be obliged to depart, and leave his affairs of Pontus in the ſame poſture he had found them. Cæſar ſeeing himſelf diſappointed, and put off from day to day, could not longer brooke the king's deceitful behaviour. Wherefore he determined to put himſelf at the head of his ſmall army, and attack the enemy in his camp when he leaſt expected it. And accordingly, marching out in the night, he came by break of day in ſight of the king's army; and uttering theſe words, *Shall this treacherous parricide go unpuniſhed?* broke into the camp at the head of 1000 horſe. The king's chariots, which were armed with ſcythes, cauſed ſome ſmall diſorder among Cæſar's horſe; but in the mean time the reſt of his army coming up, he put the enemy to flight, and obtained a complete victory.

72 By whom he is entirely defeated.

This battle was fought near the place where Mithridates had routed with great ſlaughter the Roman army under the command of Triarius. Moſt of the king's army were either taken or cut in pieces; but Pharnaces himſelf had the good luck to make his eſcape while the Romans were buſy in plundering the camp. This victory was ſo quick, that

Cæſar in a letter to his friend Aminitius, or Anitius, at Rome, expreſſed it in three words, thus: "I came, I ſaw, I conquered." He ever afterwards uſed to call Pompey a fortunate rather than a great commander, ſince he had gained his chief glory in the Mithridatic war, fighting with ſo cowardly an enemy. He divided the rich booty and the ſpoils of his camp among his ſoldiers; and becauſe Mithridates had erected a trophy near that place as a monument of his victory over Triarius, which Cæſar, as it was conſecrated to the gods, did not think lawful to pull down, he ſet up another over-againſt it to tranſmit to poſterity his victory over Pharnaces. After this victory he recovered and reſtored to the allies of the people of Rome all the places which Pharnaces had poſſeſſed himſelf of during the war, declared Amiſus a free city, and appointed Mithridates Pergamenus king of Boſphorus in the room of Pharnaces.

Having thus ſettled the affairs of Pontus, he ſet ſail for Italy; leaving Domitius Calvinus to purſue the war againſt Pharnaces, if he ſhould appear again in the field. Pharnaces had retired after the battle to Sinope with 1000 horſe, where he was quickly beſieged by Domitius, to whom he ſurrendered the town, upon no other condition than that he ſhould be ſuffered to retire into Boſphorus with the ſmall body that attended him. This Domitius willingly granted; but cauſed all the king's horſes to be killed, ſince he had aſked a ſafe-conduct only for his horſemen. With theſe and a band of Scythians and Sarmatians he attempted to recover the kingdom of Boſphorus; but being met between Theodocia and Panticapeum, both which cities he had reduced, by Aſander, who was ſtill in poſſeſſion of the kingdom, a ſharp engagement enſued, wherein the king's men, as not being uſed to fight on foot, were put to flight, and Pharnaces himſelf, who remained alone in the field, was ſurrounded by the enemy, and cut in pieces, after having reigned in Boſphorus Cimmerius, the kingdom which Pompey had beſtowed upon him, according to Appian, fifteen years, according to others, ſeventeen.

73
Is killed in another engagement.

Upon the death of Pharnaces the kingdom of Pontus, was again reduced to the form of a province, and ſo continued to the triumvirate of Marc Antony, who after the battle at Philippi conferred it upon Darius the ſon of Pharnaces for his ſervices during the civil war. He continued faithful to the Romans; but did nothing during his reign worth mentioning.

74
Pontus again made a kingdom by Marc Antony.

Darius was ſucceeded in the kingdom by Polemon, likewiſe preferred to that honour by Marc Antony. He was the ſon of Zeno, a famous orator of Laodicea, and greatly favoured by Antony. From him that part of Pontus which borders on Cappadocia borrowed the name of *Polemoniacus*. He attended Marc Antony in his expedition againſt the Parthians; and being taken priſoner in that unſucceſsful battle fought by Statianus, he was ſent by the king of the Medes, an ally of the Parthians, to conclude a peace with the Romans. In which embaſſy he acquitted himſelf ſo well, that Antony added the kingdom of Armenia to his own dominions. In the war between Antony and Auguſtus he ſided with the former: but after the battle of Actium he was received into favour by the latter; and being ſent by Agrippa againſt Scribonius, who upon the death of Aſander had uſurped the kingdom of Boſphorus, he overcame him, and reduced the kingdom of Colchis, which was beſtowed upon him by Agrippa, who likewiſe honoured him with the title of *friend and ally of the people of Rome*. He afterwards waged war with the neighbouring barbarians refuſing to live in ſubjection to the Romans; but was overcome, taken, and put to death, by the Aſpungitani, a people bordering, according to Strabo, on the Palus Mœotis.

Upon his death his ſon Polemon II. was by the emperor Caligula raiſed to the throne of Boſphorus and Pontus. But the emperor obliged him to exchange the kingdom of Boſphorus with part of Cilicia; and Nero, with his conſent, reduced that part of Pontus which he enjoyed to the form of a province. He fell in love with Berenice, daughter to Agrippa king of Judæa; and in order to marry her embraced the Jewiſh religion. But as ſhe ſoon became tired of his riotous way of living, and returned to her father; ſo he renounced his new religion, and again embraced the ſuperſtitions of Paganiſm. Polemon dying without iſſue, the ancient kingdom of Pontus was parcelled out into ſeveral parts, and added to the provinces of Bithynia, Galatia, and Cappadocia, only that part of it which was called *Pontus Polemoniacus* retaining the dignity of a diſtinct and ſeparate province. During the civil diſcords between Veſpaſian and Vitellius, one Anicetus, firſt a ſlave, afterwards freedman, to king Polemon, and laſtly commander of the royal navy, took up arms with a deſign to reſcue the kingdom from the Roman bondage; and being joined by great multitudes drawn together with the proſpect of ſpoil, over-ran the country, and poſſeſſed himſelf of Trapeſund, a city founded by the Grecians on the utmoſt confines of Pontus. Here he cut in pieces a cohort made up of the inhabitants, but which had been formerly preſented with the privilege of Roman citizens. He likewiſe burnt the fleet, and with ſcorn and inſults ſcoured the ſea; Mucianus having called to Byzantium moſt of the Roman galleys. Hereupon Veſpaſian, who was at that time in Syria, ſent Verdius Gemnius into Pontus with a choice body of auxiliaries from the legions. He aſſailing the enemy while they were in diſorder, and roaming aſunder in purſuit of prey, drove them into their veſſels; then with ſome galleys chaſed Anicetus into the mouth of the river Chobus, where he thought himſelf ſafe under the protection of Sedochus king of the Lazians, whoſe alliance he had purchaſed with large ſums and rich preſents. Sedochus at firſt refuſed to deliver him up to the Romans; but was ſoon prevailed upon, partly by threats, partly by preſents, to ſurrender both him and all the other fugitives who had taken ſanctuary in his dominions. Thus ended that ſervile war; and the kingdom of Pontus continued to be a province of the empire till the time of David and Alexis Comneni, who being driven from Conſtantinople by the French and Venetians A. D. 1204, under the command of Baldwin earl of Flanders, ſettled, the one at Heraclea, the other at Trebiſond. The troubles that aroſe among the Latins gave Alexis Comnenus an opportunity of erecting here a new empire, which comprehended great part of Pontus, and was known by the name of the *empire of Trebiſond*. The Comneni held it about 250 years, till the time of Mohammed II. who carried David Comnenus, the laſt emperor of Trebiſond, priſoner to Conſtantinople, A. D. 1462, with all his family, and ſubjected his empire to that of Conſtanti-

nople; in which abject ſlavery Trebiſond and all Pontus have continued ever ſince.

PONTYPOOL, a town of Monmouthſhire in England, ſeated between two hills. It is but a ſmall place, though noted for its iron-mills, great manufacture of japanned mugs, &c. W. Long. 3. 6. N. Lat. 51. 42.

PONZA, or **PONTIA**, is a ſmall iſland of the Tuſcan Sea, well known to be the place to which many illuſtrious Romans were formerly baniſhed. It is ſituated on the coaſt of Italy near Terracina, and in the neighbourhood of other ſmall iſlands or rocks named *Palmarole*, *Zannone*, &c. between the iſland of Ventotienne and Monte Circello. All theſe iſlands were viſited by Sir William Hamilton in the year 1785; and an account of his journey is given in a letter to Sir J. Banks, which appeared in the Phil. Tranſ. vol. lxxvi. p. 365. Sir William arrived at Ponza on the 20th Auguſt; and, according to his account, it lies about 30 miles from Ventotienne. On the 21ſt he went round it in a boat. Its length is about five miles, but its breadth is nowhere above half a mile, and in ſome places not more than 500 feet. It is ſurrounded by a multitude of detached rocks, ſome of them very high, and moſt of them compoſed of a compact lava. There are many irregularly formed baſaltes, but none in large columns. In ſome places they have a reddiſh tinge from iron ochre, are very ſmall, and irregularly laid over one another. Some ſtand perpendicularly, others obliquely, and ſome lie horizontally. The rocks themſelves in which theſe maſſes are found are lava of the ſame nature with the baſaltes. At firſt ſight they appear like the ruins of ancient Roman brick or tyle buildings. One rock is compoſed of large ſpherical baſaltes, and in other places our author found the lava inclined to take the like ſpherical form, though on a much ſmaller ſcale, ſome of the former baſaltes being near two feet in diameter. All theſe rocks, in our author's opinion, have been detached by the ſea from this iſland, which is entirely compoſed of volcanic matter, lavas, and tufas of various qualities and colours, as green, yellow, black, and white. Some of theſe matters are more compact in their texture than others; and in ſome parts great tracts ſeem to have undergone ſimilar operations, which ſtill ſubſiſt at a ſpot called the *Piſciarelli*, on the outſide of the Solfatara, near Puzzole, and where a hot ſulphureous vitriolic acid vapour converts all which it penetrates, whether lavas, tufas, volcanic aſhes, or pumice-ſtones, into a pure clay, moſtly white, or with a tint of red, blue, green, or yellow.

In one part of this iſland there is a ſort of tufa remarkably good for the purpoſe of building. It is as hard as Bath-ſtone, and nearly of the ſame colour, without any mixture of lava or pumice-ſtone, which uſually abound in the tufas of Naples, Baia, and Puzzoli.

The iſland of Palmarole which is about four miles from Ponza, is not much more than a mile in circumference. It is compoſed of the ſame volcanic matter, and probably was once a part of Ponza; and in our author's opinion it looks as if the iſland of Zannone, which lies about the ſame diſtance from Ponza, was once likewiſe a part of the ſame; for many rocks of lava riſe above water in a line betwixt the two laſt-mentioned iſlands, and the water there is much more ſhallow than in the gulf of Terracina.

Zannone is much larger and higher than Palmarole; and that half of it next the continent is compoſed of a lime-ſtone ſimilar to that of the Apennines near it; the other half is compoſed of lavas and tufas, reſembling in every other reſpect the ſoil of the iſlands juſt deſcribed. Neither Palmarole nor Zannone are inhabited; but the latter furniſhes abundance of bruſhwood for the uſe of the inhabitants of Ponza, whoſe number, including the garriſon, amounts to near 1700. The uninhabited iſland of St Stefano in like manner furniſhes wood for the people of Ventotienne. It is probable that all theſe iſlands and rocks may in time be levelled by the action of the ſea. Ponz, in its preſent ſtate, is the mere ſkeleton of a volcanic iſland; little more than its hard or vitrified parts remaining, and they ſeem to be ſlowly and gradually mouldering away. The governor of the caſtle of Ponza, who had reſided there 53 years, told our author that the iſland was ſtill ſubject to earthquakes; that there had been one violent ſhock there about four years before; but that the moſt violent one he ever felt was on the very day and at the hour that Liſbon was deſtroyed. Two houſes out of three which were then on the iſland were thrown down. "This (ſays our author) ſeems to prove that the volcanic matter which gave birth to theſe iſlands is not exhauſted."

Fig. 1. Plate CCCCXII. is a plan of the iſland of Ponza as it is given in the Philoſophical Tranſactions. Fig. 2. is a view of the inſide of the harbour of the iſland. A in the ſame figure is a rock of lava. In many parts it is formed into regular baſaltes of a reddiſh colour, tinged in all probability with ſome ochre. Moſt of the detached rocks of the iſland reſemble this. BB repreſents a tract of volcanic country, converted by a hot ſulphureous vitriolic acid vapour into a pure clay, the ground colour of which is moſtly white.—Fig. 3. is a view from the outſide of the harbour, near the lighthouſe. C is a rock of volcanic matter converted to pure clay; D is a rock of the ſame kind, with ſtrata of pumice-ſtone: E is a rock of lava, inclining to take baſaltic forms; and F is a rock compoſed of ſpherical baſaltes.

POOD is a Ruſſian weight, equal to 40 Ruſſian or 36 Engliſh pounds.

POOL is properly a reſervoir of water ſupplied with ſprings, and diſcharging the overplus by ſluices, defenders, weirs, and other cauſeways.

POOL, a ſea-port town of Dorſetſhire in England. It is ſurrounded on all ſides by the ſea, except on the north, where there is an entrance through a gate. It was formerly nothing but a place where a few fiſhermen lived: but in the reign of Henry VI. it was greatly enlarged, and the inhabitants had the privilege to wall it round. It was alſo made a county of itſelf, and ſent two members to parliament. It is governed by a mayor, a ſenior bailiff, four other juſtices, and an indeterminate number of burgeſſes. The town conſiſts of a church and about 600 houſes, with broad paved ſtreets; and has a manufactory of knit hoſe. It is 47 miles weſt-ſouth-weſt of Wincheſter, and 110 weſt-by-ſouth of London. W. Long. 2. 0. N. Lat. 50. 42.

POOLE (Matthew), a very learned writer in the 17th century, was born at York in 1624. He was educated at Emanuel-college, Cambridge, and afterwards incorporated in the univerſity of Oxford. He ſucceeded Dr Anthony Tuckney in the rectory of St Michael de Quern, in London, about 1648. In 1658 he ſet on foot a project for maintaining youths of great parts at the univerſities, and had the approbation of the heads of houſes in both of them. He ſolicited the affair with ſo much vigour, that in a ſhort time 900 l. *per annum* was procured for that purpoſe; but this deſign was laid aſide at the Reſtoration. In 1662 he was ejected from his living for nonconformity. He was ten years employed in compoſing his *Synopſis Criticorum*, &c. Beſides this great work he publiſhed ſeveral other pieces. When Dr Oates's depoſitions concerning the popiſh plot were printed, our author found his name in the liſt of thoſe who were to be cut off, on the account (as was ſuppoſed) of what he had written againſt the papiſts in his *Nullity of the Romiſh Faith*. So that he was obliged to retire into Holland, where he died in 1679, and left behind him the character of a very able critic and caſuiſt.

POOP, the ſtern of a ſhip; or the higheſt, uppermoſt, and hinder part of a ſhip's hull. See STERN.

POOR, in law, an appellation given to all thoſe who are in ſuch a low and mean condition, that they either are or may become a burden to the community.

They who rank pity amongſt the original impulſes of our nature rightly contend, that when it prompts us to the relief of human miſery, it indicates ſufficiently the Divine intention, and our duty. Indeed, the ſame concluſion is deducible from the exiſtence of the paſſion, whatever account be given of its origin. Whether it be inſtinct, or a habit founded in aſſociation (ſee PASSION), it is in fact a property of our nature which God appointed: and the final cauſe for which it was appointed is to afford to the miſerable, in the compaſſion of their fellow-creatures, a remedy for thoſe inequalities and diſtreſſes to which many are neceſſarily expoſed under every poſſible rule for the diſtribution of property. That the poor have a claim upon the rich, founded in the law of nature, can be queſtioned by no man who admits the benevolence of the Deity, and conſiders his purpoſe in creating the world (ſee THEOLOGY, Part I. Sect. ii.); and upon this claim the Chriſtian Scriptures are more explicit than almoſt upon any other.

The rights of the poor, however, to be relieved by the rich, as they originate, in nature, and are ſanctioned by Chriſtianity, are evidently of that kind which is called *imperfect* (See MORAL *Philoſophy*, nº 151.) It is ſurely needleſs to warn our readers in this place, that imperfect rights are in themſelves as ſacred, and the duties reſulting from them as obligatory in *foro conſcientiæ*, as the moſt rigid claims of juſtice. Every one knows, that they are called *imperfect* only becauſe the extent of them in particular inſtances cannot be aſcertained by poſitive laws, nor the breach of them be puniſhed by the civil magiſtrate. Hence the apoſtle, tho' he enjoins a weekly contribution to be made for the poor in the church of Corinth, yet leaves the ſum to be contributed by each individual wholly undetermined. "Now concerning the collection for the ſaints, as I have given order to the churches of Galatia, even ſo do ye. Upon the firſt day of the week let every one of you lay by him in ſtore as God hath *proſpered him*." By which St Paul certainly recommends to every man to contribute, not a fixed ſum, but as much as, from a deliberate compariſon of his fortune, with the reaſonable expences and expectations of his family, he finds he can ſpare for charitable purpoſes.

It is well known that thoſe weekly contributions were laid at the feet of the apoſtles, who transferred the management of the fund thence ariſing to deacons elected by the people, and ordained by them to ſee that the money was properly diſtributed. Hence, under Chriſtianity, the maintenance of the poor became chiefly an eccleſiaſtical concern; and when that holy and benevolent religion was eſtabliſhed in the Roman empire, a fourth part of the tithes was in ſome countries of Europe, and particularly in England, ſet apart for that purpoſe. Afterwards, when the tithes of many pariſhes were appropriated to the monaſteries, theſe ſocieties were the principal reſource of the poor, who were farther relieved by voluntary contributions. Judge Blackſtone obſerves, that till the ſtatute 26 Hen. VIII. cap. 26. he finds no compulſory method for providing for the poor; but upon the total diſſolution of the monaſteries, abundance of ſtatutes were made in the reign of King Henry VIII. Edward VI. and Elizabeth, which at laſt eſtabliſhed the

Poor's Rate, or legal aſſeſſment for the ſupport of the poor in England. The ſums that had been appropriated for charitable uſes before the reformation were immenſe, and the wealth that had been accumulated through a ſucceſſion of ages by mendicant orders of religious perſons was inconceivably great; nor was it in the power of any laws to confine men who were in the poſſeſſion of ſuch wealth from gratifying thoſe deſires which money can ſo eaſily find means of ſupplying. Yet among the various abuſes to which this opulence had given riſe, theſe religious orders had never ſo far loſt ſight of their original inſtitution as ever to neglect the poor. Theſe were indeed provided for by them with an indiſcriminate profuſion of largeſſe, better proportioned to their own opulence than to the wants of the claimants, who were too often, without examination, all equally ſerved, whether deſerving or undeſerving of that bounty which they claimed.

When the *religious houſes*, as they were called, were entirely ſuppreſſed at the reformation, and the wealth that belonged to them was diverted into other channels, the poor, who had been in uſe to receive their ſupport from thence, were of courſe left entirely deſtitute; and this ſoon became a grievance ſo intolerable not only to the poor themſelves, but to the whole nation, as to excite an univerſal deſire to have it remedied. Accordingly, by the 14 Eliz. cap. 5. power was given to the juſtices to lay a general aſſeſſment; and this hath continued ever ſince. For by 43 Eliz. cap. 2. the churchwardens and overſeers of the poor of every pariſh, or the greater part of them (with the conſent of two juſtices, one of whom is of the quorum, dwelling in or near the pariſh), are empowered to raiſe weekly, or otherwiſe, by taxation of every inhabitant, parſon, vicar, and other, and of every occupier of lands, houſes, &c. materials for employing the poor, and competent ſums for their relief. Notice ſhall be given in church of every ſuch rate the next Sunday after it is allowed, which may be inſpected by every inhabitant, paying 1s. and copies of it granted on demand, 6d. being paid for every 24 names; and a churchwarden or overſeer refuſing, ſhall forfeit 20 l. to the party aggrieved. The rate is to be levied by diſtreſs on thoſe who refuſe to pay it; and, by 17 Geo. II. cap. 2. cap. 38. appeals againſt it are allowed.

If the juſtices find that the inhabitants of any pariſh are not able to levy among themſelves ſufficient ſums for the purpoſes ſpecified in the act, they may aſſeſs any other pariſh within the hundred; and if the hundred be unable to grant neceſſary relief, they may rate and aſſeſs any pariſh within the county. 43 Eliz. cap. 2.

In order to compel huſbands and parents to maintain their own families, the law hath provided, that all perſons running away out of their pariſhes, and leaving their families upon the pariſh, ſhall be deemed and ſuffer as incorrigible rogues (7 Jac. cap. 4.) And if a perſon merely threatens to run away and leave his wiſe and children upon the pariſh, he ſhall upon conviction, before one juſtice by confeſſion, or oath of one witneſs, be committed to the houſe of correction for any time not exceeding one month (17 Geo. II. cap. 5.) For the farther maintenance of the poor, there are many fines and forfeitures payable to their uſe; as for ſwearing, drunkenneſs, deſtroying the game, &c. And alſo parts of waſtes, woods, and paſtures, may be encloſed for the growth and peſervation of timber and underwood for their relief. See *Work-Houſe*.

The famous ſtatute of the 43d of Elizabeth, which is the baſis of all the poor-laws in England, was conſtructed with a cautious forethought that can perhaps be equalled by few laws that ever were enacted; and if proſpective reaſoning alone were to be relied on in matters of legiſlation, it ſeemed impoſſible to amend it: yet experience has now proved, with a moſt demonſtrative certainty, that it is not ſo ſalutary as was undoubtedly expected.

The perſons who compoſed that law had before their eyes ſuch a recent proof of the abuſe that had been made of the charitable benificence of individuals, that they ſeem to have been chiefly ſolicitous to obviate ſimilar abuſes in future; and to guard againſt that partial kind of ſeduction, they rather chooſe to eſtabliſh a deſpotic power which ſhould be authorized to wreſt from every individual in the nation whatever ſums it might think proper to call for, truſting to a few feeble devices which they contrived, for curbing that power which was virtually armed with force ſufficient to ſet all theſe aſide whenever it pleaſed. The conſequence has been, that the ſums levied for the relief of the poor, which were at firſt but ſmall are now enormous, and that the demands are increaſing in ſuch a rapid manner as to give riſe to the moſt ſerious and well-grounded apprehenſions. In the year 1774, parliament inſtituted an inquiry into the amount of the poor's-rates in England and Wales, and again in 1783 On comparing theſe together, the riſe during that ſhort period was found to be in England upwards of 850,000 l. *per annum*, being nearly in the proportion of one-third of the rate at the firſt period. In Wales, during the ſame period of time, the rates were more than doubled. Nor was this a temporary ſtart, but a part only of a gradual progreſſion. Mr Wenderdon, in his View of England, obſerves, that "in the year 1680 the poor's-rates produced no more than 665,390 l. in 1764 they ſtood at 1,200,000 l. and in 1773 they were eſtimated at 3,000,000 l." It is a known fact (ſays Mr Beaufoy, in the debate on Mr Gilbert's poor bill, April 17th 1788), that within the laſt nine years, the poor's-rates have increaſed one-third, and ſhould they continue increaſing in the ſame proportion for 50 or 53 years they would amount to the enormous ſum of 11,230,000 l. a burden which the country could not poſſibly bear. It was therefore, he added, highly neceſſary that ſomething ſhould be attempted to prevent this alarming addition, if not to annihilate the preſent glaring miſconduct in the management of the poor."

Such has been the fate of England with regard to poor laws.

In Scotland, the reformation having been carried forward with a ſtill more violent precipitancy than in England, and the funds of the regular clergy being more entirely alienated, the caſe of the poor there became ſtill more ſeemingly deſperate, and the clamours were alſo there conſiderable at that time. Then alſo it was that the Scottiſh court, imitating as uſual at that time the practice of England, made ſeveral feeble attempts to introduce a ſyſtem of compulſory poor's-rates into that country, but never digeſted the ſyſtem ſo thoroughly as to form a law that could in any caſe be carried into effect. Many crude laws on this head were indeed enacted; but all of them ſo evidently inadequate for the purpoſe, that they never were, even in one inſtance that we have heard of, attempted at the time to be carried into effect. Indeed it ſeems to have been impoſſible to carry them into effect; for they are all ſo abſurd and contradictory to each other, that hardly a ſingle clauſe of any one of them can be obeyed without tranſgreſſing others of equal importance.

The laſt ſtatute which in Scotland was enacted on this ſubject bears date September 1ſt 1691, William and Mary, parl. 1. ſeſſ. 7. chap. 21. and it "ratifies and approves *all* former acts of parliament and proclamations of council for repreſſing of beggars, and maintaining and employing the poor." If this law therefore were now in force, and it never was repealed, no perſon could with impunity countervail any one of thoſe ſtatutes which it ratifies; but to be convinced how impoſſible it is to obſerve them all, the attentive reader needs only to conſider thoſe laws and proclamations with reſpect to the following particulars, *viz.*

1. *The perſons appointed to make up the poor's roll.* By the act 1579 this duty is entruſted to the provoſt and bailies within burgh, and the judge conſtitute be the king's commiſſion in paroches to landwart. By act 1663, it is the heritors of each pariſh. By act 1672, it is the miniſters and elders of each pariſh who are to make up this liſt. By the proclamation of 1692, it is the heritors, miniſters, and elders of every pariſh. By that of 1693, it is the magiſtrates of royal burghs, and the heritors of vacant [country] pariſhes; in both caſes without either miniſter or elders. Among this chaos of contradictions how it is poſſible to act without tranſgreſſing ſome law.

2. Not leſs contradictory are the enactments in regard *to the perſons who are to pay*, and the mode of apportioning the ſums among them. By act 1579, the haill inhabitants of the parochin ſhall be taxed and ſtented according to the eſtimation of their ſubſtance, without exception of perſons. By that of 1663, the one-half is to be paid by the heritors, and the other half by the tenants and poſſeſſors, according to their means and ſubſtance. By the proclamation of 1692, the one-half is

to be paid by the heritors, the other by the houſeholders of the pariſh. By that of 1693, in burghs royal, the magiſtrates are to ſtent themſelves, conform to ſuch order and cuſtom uſed and wont in laying on ſtents, annuities, or other public burdens, in the reſpective burgh, as may be moſt effectual to reach all the inhabitants; and the heritors of ſeveral vacant [landwart] pariſhes to ſtent themſelves for the maintenance of the reſpective poor.

3. A ſtill greater diverſity takes place in regard to the *application of the ſums ſo ſtented*. By the act 1579, it would ſeem that the whole of the money aſſeſſed was to be applied to the uſe of the helpleſs poor alone, and no part of it for the relief of thoſe who were capable of working. By the act 1663, on the contrary, the whole of this aſſeſſment is to be applied for the ſupport of thoſe *only who are able to work*. This is ſtill more ſpecially provided for by the act 1672; where the poor who are unable to work are to be ſupported by the weekly collections at the kirk doors; and the ſtented aſſeſſments to be applied to the ſupport of thoſe in the correction houſes.

It would be tireſome to enumerate all the contradictions that theſe laws authoriſe. In regard *to the perſons who are required to carry theſe acts into execution*, it is at different times the chancellor; magiſtrates; commiſſioners of exciſe; ſheriffs; juſtices of the peace; miniſters and elders; the preſbyteries; heritors, miniſters, and elders; heritors alone; commiſſioners nominated by preſbyteries and appointed by the king; the lords of the privy council: in ſhort, no two laws can be found that do not vary from each other in this reſpect one way or other.

The ſame variations take place with regard to the building of correction-houſes, confinement and puniſhment of vagrants, application of their work, awarding their ſervices and thoſe of children. In ſhort, there is not one particular in which theſe laws do not vary from and contradict each other; ſo that, let any perſon try to act in virtue of any one of them, it is impoſſible for him to avoid going in direct oppoſition to the enactments of ſome other law which is of equal force with that he has choſen for his guide. In theſe circumſtances it is ſo far from being ſurpriſing that theſe acts have been ſuffered to remain in perpetual deſuetude, that it would have been truly wonderful if this had not been the caſe. They have, however, been permitted to remain on the ſtatute-book as a diſgrace to the times when they were formed, and, as a ſtumbling-block to thoſe that were to follow. That not one of them is now in force was lately proved by a learned and public-ſpirited gentleman, to whom his country is on that and many other accounts deeply indebted. Refuſing to pay the poor's tax, with which he was aſſeſſed by the overſeers of the pariſh in which he happened to reſide, he ſtood an action in the court of ſeſſion, and prevailed, upon the broad ground, *that there is no law* IN FORCE *in Scotland by which an* INVOLUNTARY *poor's rate can be eſtabliſhed in any pariſh*.

But how, it will be aſked by our readers, are the poor in Scotland really maintained? We anſwer, by the private alms of individuals, and by certain funds under the management of the *kirk-ſeſſions* (ſee PRESBYTERIANS). It is the univerſal practice, each Lord's day, in every pariſh, for ſuch of the audience as are in eaſy circumſtances, to give to the poor ſuch an offering of alms as they ſhall deem proper. This offering is generally dropped into a baſon placed at the church-door, and under the immediate care of an elder. When the ſervice is begun, the elder removes with the baſon, which he keeps under his charge till the congregation be diſmiſſed. The ſeſſion then meets, and the money is told over, its amount marked down in the ſeſſion account book, and depoſited in a box kept for that purpoſe. This box has uſually a ſmall ſlit in the top, through which the pieces of money can be dropped without opening it; and it is cloſed with two locks, the key of one of which is uſually kept by the miniſter and the other by the kirk-treaſurer, ſo that it can never be opened but in the preſence of theſe two at leaſt.

A kirk-ſeſſion, when regularly conſtituted, muſt always conſiſt of the miniſter, elders, ſeſſion-clerk, and kirk-treaſurer. None of theſe ever receive any ſalary except the ſeſſion-clerk, who is uſually the ſchoolmaſter of the pariſh, and has a ſmall ſalary allowed for minuting the tranſactions. The kirk-treaſurer is for the moſt part one of the elders; and he is an important member of this court. Without his intervention no diſtribution of the poor's funds is deemed legal; nor can any payments be made, receipts granted, or money transferred, but by him; the miniſter and ſeſſion being perſonally liable to make good all money that may otherwiſe be given away, ſhould it ever afterwards be challenged by any heritor in the pariſh.

The precautions taken for the diſtribution of the poor's funds are likewiſe ſimple and excellent, and are as follow.

No money can be legally iſſued from the poor's funds even by the treaſurer and ſeſſion, unleſs legal proof can be brought that public intimation has been given from the pulpit immediately after divine ſervice, and before the congregation has diſperſed, that a diſtribution of poor's money is to be made by the ſeſſion, at ſuch a time and place, ſpecifying the ſame, and inviting all who have intereſt in the caſe to attend if they ſhall incline. This intimation muſt be made a full fortnight before the time of diſtribution; and as every heritor (owner of landed property) in the pariſh has a right to vote in the diſtribution of the poor's funds, they may all, if they ſo incline, then attend and exerciſe that right: but if none of them ſhould attend, which is often the caſe, the ſeſſion has then a right to proceed; and whatever they ſhall thus do, is deemed ſtrictly legal, and is liable to no challenge. But ſhould they proceed without having given this previous intimation, they may, if the heritors ſhould afterwards challenge it, be made to repay out of their own pockets every ſhilling they ſhall have ſo iſſued. It ſometimes happens, that young miniſters, through heedleſſneſs in this reſpect, expoſe themſelves and families to conſiderable trouble and loſs, which by attention might be eaſily avoided. In the ſame way, ſhould a miniſter and ſeſſion, without the intervention of a treaſurer regularly conſtituted, lend upon bond or otherwiſe any of the poor's funds, and ſhould the perſon ſo borrowing afterwards fail, theſe lenders are perſonally liable to make good the whole, and any heritor in the pariſh who chooſes it can compel him to do ſo.

The members of the ſeſſion are alſo liable to pay all loſſes, and to account for all ſums that it can be inſtructed they received, if they neglect to keep regular books, in which every tranſaction ſhall be entered: Or, if theſe books have not been reviſed and approved of by the preſbytery (A); but if they ſhall have been ſo reviſed, they cannot be challenged for omiſſion of forms, and can only be made to account for errors, or frauds, or evident dilapidations.

Under this wiſe and economical ſyſtem of management, it has been found by the experience of more than 200 years, that in the low parts of the country, where the pariſhes are in general of ſuch moderate extent as to admit of the people of every part of the pariſh generally to attend divine ſervice every Lord's day, the ordinary funds have been amply ſufficient to ſupply all the real demands of the poor, and in moſt pariſhes a fund has been accumulated from the ſavings of ordinary years to help the deficiencies that may ariſe in years of uncommon ſcarcity.

Beſides the weekly collections, the extra offerings at the adminiſtration of the Lord's ſupper, the pious donations of charitable individuals, which are all voluntary, together with ſome ſmall fees paid for the uſe of a *mortcloth* (a black velvet pall) at funerals, which is generally purchaſed with the poor's money, go to make up this parochial fund. Nor muſt any one believe that the money which comes through the hands of the adminiſtrators of the poor's funds is all that is beſtowed upon the poor in Scotland; far from it: there are a thouſand other channels through which the indigent derive conſolation and ſupport, all of them tending to produce the happieſt effects upon ſociety. A ſon feels himſelf aſhamed to think that his parents ſhould require the aſſiſtance of another to ſupport them; he therefore ſtrains every nerve when in the vigour of life to ſpare a little of his earning to render their old age more eaſy than it might have been; and ſweet to a parent is the bread that is given by the pious attention of a child. If there are ſeveral children, they become emulous who ſhall diſcover moſt kindneſs. It is a pious contention which ſerves to unite them the cloſer to each other, by commanding their mutual eſteem.

Directly contrary to this is the effect of the poor laws of England, where, in London at leaſt, it is not uncommon to ſee men in good buſineſs neglecting their aged and diſeaſed parents for no better reaſon than that the pariſh is bound to find them bread. Theſe laws have other pernicious conſequences; for they are obviouſly ſubverſive of induſtry as well as morality among the lower orders of the people. "This is a heavy charge, but no leſs true than heavy. Fear of want is the only effectual motive to induſtry with the labouring poor: remove that fear, and they ceaſe to be induſtrious. The ruling paſſion of thoſe who live by bodily labour, is to ſave a pittance for their children, and for ſupporting themſelves in old age. Stimulated by deſire of accompliſhing thoſe ends, they are frugal and induſtrious; and the proſpect of ſucceſs is a continual feaſt to them. Now, what worſe can malice invent againſt ſuch a man, under colour of friendſhip, than to ſecure bread to him and his children whenever he takes a diſlike to work; which effectually deadens his ſole ambition, and with it his honeſt induſtry? Relying on the certainty of a proviſion againſt want, he relaxes gradually till he ſinks into idleneſs; idleneſs leads to profligacy; profligacy begets diſeaſes; and the wretch becomes an object of public charity before he has run half his courſe. Wiſely therefore is it ordered by Providence, that charity ſhould in every inſtance be voluntary, to prevent the idle and profligate from depending on it for ſupport. During the reign of Elizabeth, when the monaſteries were recently ſuppreſſed, and all their revenues ſquandered, ſome compulſion might be neceſſary to prevent the poor from ſtarving. A temporary proviſion for this purpoſe, ſo contrived as not to ſuperſede voluntary charity, but rather to promote it, would have been a meaſure extremely proper. Unlucky it is for England that ſuch a meaſure was overlooked; but the queen and her parliaments had not the talent of foreſeeing conſequences without the aid of experience. A perpetual tax for the poor was impoſed, the moſt pernicious tax, ſays Lord Kames (B), that ever was impoſed in any country."

POPA-MADRE, is a town of South America, in Terra Firma. In this place there is a convent and chapel dedicated to the Virgin Mary, to whoſe image the Spaniards in thoſe parts go in pilgrimage, particularly thoſe who have been at ſea. It is ſeated on a high mountain, 50 miles eaſt of Carthagena. W. Long. 74. 32. N. Lat. 10. 15.

POPÆ. See VICTIMARIUS.

POPAYAN, a province of South America, in the kingdom of New Granada, between the audience of Panama, that of Quito, and the South Sea; 400 miles in length, and 300 in breadth. A chain of barren mountains runs through the country from north to ſouth; and near the ſea the ſoil is ſo ſoaked with almoſt continual rains, that few care to reſide there, except for the ſake of the gold that is met with in great plenty in the ſands of the rivulets. This bewitching metal brings many in ſearch of it, though it is a great doubt whether they ever return back alive or not. For this reaſon the ſavage Americans are ſtill maſters of a great part of it, and continually annoy the Spaniards.

POPAYAN, the capital town of a province of that name in South America, with a biſhop's ſee, a Spaniſh governor, and where the courts of juſtice are held. The inhabitants are almoſt all Creoles. It is 220 miles north-eaſt of Quito. W. Long. 75. 55. N. Lat. 2. 35.

POPE, a name which comes from the Greek word Παπα, and ſignifies *Father*. In the eaſt this appellation is given to all Chriſtian prieſts; and in the weſt, biſhops were called by it in ancient times: but now for

many

(A) The preſbytery is by law appointed auditor of the poor's accounts of the ſeveral pariſhes within its bounds; and if they find any difficult caſe occur in the diſcharge of this duty, they may lay it before the ſynod for advice.

(B) See *Sketches of Man*, book ii. ſketch 10. where many other arguments equally forcible are urged againſt all involuntary *poor-rates*, and where many ingenious expedients are propoſed for gradually aboliſhing them where they are eſtabliſhed.

many centuries it has been appropriated to the biſhop of Rome, whom the Roman Catholics look upon as the common father of all Chriſtians.

Much has been ſaid, much written, and many warm diſputes have been carried on concerning the pope, and the power belonging to him, within theſe two or three laſt centuries. We ſhall here, without entering into controverſy, lay down diſtinctly, from the beſt authority, what the Roman Catholics really believe concerning the *pope*, after having deſcribed the manner of his election; and we ſhall give ſome other particulars relating to this ſubject that ſeem to deſerve notice, and are in this country not generally known.

All in communion with the ſee of Rome unanimouſly hold, that our Saviour Jeſus Chriſt conſtituted St Peter the apoſtle chief paſtor under himſelf, to watch over his whole flock here on earth, and to preſerve the unity of it; giving him the power requiſite for theſe ends. They alſo believe, that our Saviour ordained, that St Peter ſhould have ſucceſſors with the like charge and power, to the end of time. Now, as St Peter reſided at Rome for many years, and ſuffered martyrdom there, they conſider the biſhops of Rome as his ſucceſſors in the dignity and office of the univerſal paſtor of the whole Catholic church. There have been ſome varieties in the manner of chooſing the biſhop of Rome in different ages, as alterations may be made in diſcipline; but ſtill the clergy of Rome have juſtly had the chief part in that election: and that clergy is now repreſented by, or in ſome manner conſiſts of, *the cardinals*, who have for ſeveral centuries been the ſole electors of the pope.

Theſe *cardinals* or *principal perſons* of the church of Rome are 70 in number, when the *ſacred college*, as it is called, is complete. Of theſe ſix are cardinal biſhops, the biſhops of Oſtia, of Porto, Albano, Sabino, Tuſculum or Fraſcati, and Præneſte or Paleſtrina; which are the ſix ſuburbicarian churches; fifty are cardinal prieſts, who have all titles from pariſh churches in Rome; and fourteen are cardinal deacons, who have their titles from churches in Rome of leſs note, called *Diaconias* or *Deaconries*. Theſe cardinals are created by the pope when there happen to be vacancies; and ſometimes he names one or two only at a time; but commonly he defers the promotion until there be ten or twelve vacancies or more; and then at every ſecond ſuch promotion the emperor, the kings of Spain and France, and of Britain, when Catholic, are allowed to preſent one each, to be made cardinal, whom the pope always admits if there be not ſome very great and evident objection. Theſe cardinals are commonly promoted from among ſuch clergymen as have borne offices in the Roman court; ſome are aſſumed from religious orders; eminent eccleſiaſtics of other countries are likewiſe often honoured with this dignity, as the archbiſhops of Toledo and Vienna are at preſent cardinal prieſts of Rome. Sons of ſovereign princes have frequently been members of the ſacred college; and there ends the direct line of the royal family of Stuart. Their diſtinctive dreſs is ſcarlet, to ſignify that they ought to be ready to ſhed their blood for the faith and church, when the defence and honour of either require it. They wear a ſcarlet cap and hat: the cap is given to them by the pope if they are at Rome, and is ſent to them if they are abſent; but the hat is never given but by the pope's own hand. Theſe cardinals form the pope's ſtanding council or *conſiſtory* for the management of the public affairs of church and ſtate. They are divided into different *congregations* for the more eaſy diſpatch of buſineſs; and ſome of them have the principal offices in the pontifical court, as that of cardinal-vicar—penitentiary—chancellor—camerlingo or chamberlain—perfect of the ſignature of juſtice—perfect of memorials—and ſecretary of ſtate. They have the title given them of *eminence* and *moſt eminent*. But here we conſider them principally as the perſons entruſted with the choice of the pope. See Cardinal.

On the demiſe of a pope his pontifical ſeal is immediately broken by the chamberlain, and all public buſineſs is enterrupted that can be delayed: meſſengers are diſpatched to all the Catholic ſovereigns to acquaint them of the event, that they may take what meaſures they think proper; and that the cardinals in their dominions, if any there be, may haſten to the future election if they chooſe to attend; whilſt the whole attention of the ſacred cellege is turned to the preſervation of tranquillity in the city and ſtate, and to the neceſſary preparations for the future election. The cardinal chamberlain has, during the vacancy of the holy ſee, great authority; he coins money with his own arms on it, lodges in the pope's apartments, and is attended by body-guards. He, and the firſt cardinal biſhop, the firſt cardinal prieſt, and the firſt cardinal deacon, have, during that time, the government almoſt entirely in their hands. The body of the deceaſed pope is carried to St Peter's, where funeral ſervice is performed for him with great pomp for nine days, and the cardinals attend there every morning. In the mean time, all neceſſary preparations for the election are made; and the place where they aſſemble for that purpoſe, which is called the *conclave*, is fitted up in that part of the Vatican palace which is neareſt to St Peter's church, as this has long been thought the moſt convenient ſituation. Here is formed by partitions of wood a number of cells or chambers equal to the number of cardinals, with a ſmall diſtance between every two, and a broad gallery before them. A number is put on every cell, and ſmall papers with correſponding numbers are put into a box: every cardinal, or ſome one for him, draws out one of theſe papers, which determines in what cell he is to lodge. The cells are lined with cloth; and there is a part of each one ſeparated for the conclaviſts or attendants, of whom two are allowed to each cardinal, and three to cardinal princes. They are perſons of ſome rank, and generally of great confidence; but they muſt carry in their maſter's meals, ſerve him at table, and perform all the offices of a menial ſervant. Two phyſicians, two ſurgeons, an apothecary, and ſome other neceſſary officers, are choſen for the conclave by the cardinals.

On the 10th day after the pope's death the cardinals, who are then at Rome, and in a competent ſtate of health, meet in the chapel of St Peter's, which is called the *Gregorian chapel*, where a ſermon on the choice of a pope is preached to them, and maſs is ſaid for invoking the grace of the Holy Ghoſt. Then the cardinals proceed to the conclave in proceſſion two by two, and take up their abode. When all is properly ſettled, the conclave is ſhut up, having boxed *wheels* or places of communication in convenient quarters: there are alſo ſtrong guards placed all around. When any foreign cardinal arrives after the incloſure, the conclave is opened for his admiſſion. In the beginning every cardinal ſigns a paper, containing an obligation, that if he ſhall be raiſed to the papal chair he will not alienate any part of the pontifical dominion; that he will not be prodigal to his relations; and any other ſuch ſtipulations as may have been ſettled in former times or framed for that occaſion.

We come now to the election itſelf; and that this muſt be effectual, two thirds of the cardinals preſent muſt vote for the ſame perſon. As this is often not eaſily obtained, they ſometimes remain whole months in the conclave. They meet in the chapel twice every day for giving their votes; and the election may be effectual by *ſcrutiny*, *acceſſion*, or *acclamation*. Scrutiny is the ordinary method; and conſiſts in this: every cardinal writes his own name on the inner part of a piece of paper, and this is folded up and ſealed; on a ſecond fold of the ſame paper a conclaviſt writes the name of the perſon for whom his maſter votes. This, according to agreements obſerved for ſome centuries, muſt be one of the ſacred college. On the outer ſide of the paper is written a ſentence at random, which the voter muſt well remember. Every cardinal, on entering into the chapel, goes to the altar and puts his paper into a large chalice.

When all are convened, two cardinals number the votes; and if there are more or leſs than the number of cardinals preſent, the voting muſt be repeated. When that is not the caſe, the cardinal appointed for the purpoſe reads the outer ſentence, and the name of the cardinal under it, ſo that each voter hearing his own ſentence and the name joined with it, knows that there is no miſtake. The names of all the cardinals that are voted for are taken down in writing, with the number of votes for each; and when it appears that any one has two-thirds of the number preſent in his favour the election is over: but when this does not happen, the voting papers are all immediately burnt without opening up the inner part. When ſeveral trials of coming to a concluſion by this method of *ſcrutiny* have been made in vain, recourſe is ſometimes had to what is called *acceſſion*. By it, when a cardinal perceives that one or very few votes are wanting to any one for whom he had not voted at that time, he may ſay that he *accedes* to the one who has near the number of votes requiſite; and if his one vote ſuffices to make up the two-thirds, or if he is followed by a ſufficient number of *acceders* or new voters for the ſaid cardinal, the election is accompliſhed. Laſtly, a pope is ſometimes elected by *acclamation*; and that is, when a cardinal, being pretty ſure that he will be joined by a number ſufficient, cries out in the open chapel, that ſuch an one ſhall be pope. If he is ſupported properly, the election becomes unanimous; thoſe who would perhaps oppoſe it foreſeeing that their oppoſition would be fruitleſs, and rather hurtful to themſelves. It is to be obſerved, that the emperor of Germany and the kings of France and Spain claim a right of excluding one cardinal from being pope at every election. Hence, when the ambaſſador at Rome of any of theſe ſovereigns perceives that any cardinal, diſagreeable to his maſter, according to the inſtructions he has received, is like to be made pope, he demands an audience of the conclave, is admitted, and there declares his maſter's will, which is always attended to for the common good. But each of thoſe ſovereigns is allowed thus to exclude only one at one time; and they unwillingly and ſeldom put this right in execution.

When a pope is choſen in any of the three abovementioned ways, the election is immediately announced from the balcony in the front of St Peter's, homage is paid to the new pontiff, and couriers are ſent off with the news to all parts of Chriſtendom. The pope appoints a day for his coronation at St Peter's, and for his taking poſſeſſion of the patriarchal church of St John Lateran; all which is performed with great ſolemnity. He is addreſſed by the expreſſion of *Holineſs*, and *moſt holy Father*.

Let us now proceed to ſee what authority Roman Catholics attribute to the pope thus choſen. They believe, then, that the biſhop of Rome is, under Chriſt, ſupreme paſtor of the whole church; and as ſuch is not only the firſt biſhop in order and dignity, but has alſo a power and juriſdiction over all Chriſtians, in order to preſerve unity and purity of faith and moral doctrine, and to maintain order and regularity in all churches. Wherefore they hold, that when the pope underſtands that any error has been broached againſt faith or manners, or that any conſiderable difference on ſuch ſubjects has ariſen in any part of Chriſtendom, it belongs to him, after due deliberation and conſultation, to iſſue out his paſtoral decree, condemning the error, clearing up the doubt, and declaring what has been delivered down, and what is to be believed. Some Catholic divines are of opinion that the pope cannot err, when he thus addreſſes himſelf *to all the faithful* on matters of doctrine. They well know, that as a private doctor he may fall into miſtakes as well as any other man; but they think, that when he teaches the whole church Providence muſt preſerve him from error; and they apprehend, that this may be deduced from the promiſes of Chriſt to St Peter, and from the writings of the ancient fathers. However, this infallibility of the pope, even when he pronounces in the moſt ſolemn manner, is only an opinion, and not an article of Roman Catholic faith. Wherefore, when he ſends for the doctrinal decrees, the other biſhops, who are alſo guardians of the faith in an inferior degree, may, with due reſpect, examine theſe decrees; and if they ſee them agree with what has been always taught, they either formally ſignify their acceptance, or they tacitly acquieſce, which, conſidering their duty, is equivalent to a formal approbation. When the acceptation of the generality of the biſhops has been obtained, either immediately or after ſome mutual correſpondence and explanation, the decrees of the pope thus accepted come to be the ſentence of the whole church, and are believed to be beyond the poſſibility of error!

Sometimes it may happen that the diſputes and difference may be ſo great and intricate, that to the end it may be ſeen more clearly what has really been delivered down; and to give all poſſible ſatisfaction, it may appear proper to convene all the biſhops who can conveniently attend to one place, to learn from them more diſtinctly what has been taught and held in their reſpective churches. Roman Catholics believe that it belongs to the pope to call ſuch general councils, and to preſide in them in perſon or by his legates. They likewiſe hold, that when the pope has approved the decrees of ſuch councils concerning faith or manners, ſuch decrees are then final, and muſt be received as ſuch by all Catholics. In all this they believe, that the particular aſſiſtance of the Holy Ghoſt is with the paſtors of the church, that ſo *the gates of hell may never prevail againſt her.*

The ſee of Rome, according to Roman Catholics, is the centre of Catholic unity. All their biſhops communicate with the pope, and by his means with one another, and ſo form one body. However diſtant their particular churches may be, they all meet at Rome either in perſon or by their delegates, or at leaſt by their letters. And, according to the diſcipline of the latter ages, though they are preſented to the pope for their office from their reſpective countries, yet from him they muſt receive their bulls of conſecration before they can take poſſeſſion of their ſees.

In matters of church diſcipline, the pope, as chief paſtor, not only ought to take care that the canons actually in force be obſerved in all churches, but he may alſo make new canons and regulations when he ſees it neceſſary or expedient for the ſpiritual benefit of the faithful, according to times and circumſtances. But in doing this he muſt not infringe the eſtabliſhed rights or cuſtoms with injury to any perſon; which if, through miſtake or wrong information, he ſhould ever do, the perſons who think themſelves aggrieved may remonſtrate with reſpect and ſue for redreſs. He may eſtabliſh new epiſcopal ſees, where there have been none before; and he may alter the limits of former dioceſes; but in ſuch alterations he always of courſe conſults the temporal ſovereign, if in communion with him. He ſends paſtors to preach the goſpel to all countries where the Catholic religion is not by law eſtabliſhed; and to him appeals may be made from all parts of Chriſtendom in eccleſiaſtical cauſes of great importance.

The pope may diſpenſe with the obſervation of eccleſiaſtical canons when there are juſt reaſons for it, as may frequently happen; he may alſo diſpenſe with vows when they are made with that expreſs or tacit condition (A) that he really may diſpenſe with them; he may alſo on ſome occaſions declare that obligations have really ceaſed when that is truly the caſe, from a great alteration of circumſtances: But he can never grant any diſpenſation, to the injury of any third perſon, and can never allow any one to do what is unjuſt, or to ſay what he knows to be falſe, whatever advantage might be expected from it.

The pope is alſo a temporal prince, and poſſeſſes conſiderable dominions in the middle part of Italy, beſides Avignon, which the French have lately taken from him, and the duchy of Benevento incloſed within the kingdom of Naples. It is alſo ſuppoſed that the kingdom of Naples and Sicily, and the duchies of Parma and Placentia, are ſtill held of him in fief as they were before. His predeceſſors have acquired theſe poſſeſſions at different times and on different occaſions, by various donations, conceſſions, treaties, and agreements, in like manner as has happened with regard to the eſtabliſhment of other ſovereignties; and his title to them is like to that of other potentates to their reſpective poſſeſſions. The revenue ariſing from this eſtate, and what he receives for various reaſons from Catholic countries, which is now much reduced, is employed for the ſupport of government, in ſalaries to the officers of his court, for the education of clergymen, and for the maintaining of miſſionaries in infidel countries. Great ſums are particularly expended for the propagation of the Chriſtian faith in different parts of Aſia, eſpecially in Armenia, Syria, and China. Nor is it much to be wondered at, if the families, of which the ſovereign pontiffs happen to have been born, acquire greater riches and ſplendor from that connection. The princely families of Barberini, Borgheſe, Chigi, Corſini, Albani, are examples of this kind; but regulations have been made in later times to prevent exceſſive nepotiſm. Beyond the limits of his own temporal dominions the pope has no temporal power or juriſdiction, excepting what any nation may be pleaſed to allow him: when any thing of that kind has been granted or brought in by cuſtom, it is evident that it ought not to be taken away raſhly nor without juſt reaſon. But, as chief paſtor of the church, he has no right to any temporal juriſdiction over his flock. As ſuch, his power is entirely ſpiritual, and has no means of coercion originally or neceſſarily connected with it, but only eccleſiaſtical cenſures. It muſt be owned, that the popes, in ſome ages, ſometimes imagining that they could do much good, ſometimes by the conſent, or even at the deſire, of the ſovereigns, and ſometimes no doubt out of ambitious views, have interfered a great deal in the temporal affairs of the different kingdoms of Europe, which has frequently given ſcandal and done harm to religion. But it is known to thoſe moſt verſant in hiſtory, that their faults of this kind have been exaggerated, and their conduct often miſunderſtood or miſrepreſented. However, in this a Roman Catholic is not obliged to approve what they have done; nay, without acting contrary to his religion, he may judge of them freely, and blame them if he think they deſerve it; only he will do it with reſpect and regret. Thus a Roman Catholic may either apologiſe, if he think he can do it, for the conduct of Innocent III. in depoſing king John of England; or, without being guilty of any offence againſt his religion, he may blame the pontiff for what he did on that occaſion; becauſe the power of the pope to depoſe princes, or to abſolve ſubjects from their allegiance, was never propoſed as an article of faith, or made a term of communion with the church of Rome. Some Catholic divines, indeed, eſpecially among the Jeſuits, are univerſally known to have held this extravagant and dangerous opinion; but by far the greater part of them condemn and abhor it as abſurd and impious: and ſurely it is but fair and juſt to allow them to know beſt what they themſelves believe. And here, to conclude, we ſhall add, that it is very deſirable that Chriſtians of all denominations endeavour to underſtand one another better than they have often done; and inſtead of ſuppoſing imaginary differences, ſtrive to remove real ones, for the general good of mankind, for the glory of God, and honour of religion; and that all vie with one another to excel in juſt and charitable ſentiments, language, and behaviour.

(A) Any other man may unqueſtionably do the ſame when they are made with that expreſs condition.

The reader, who wiſhes to know what can be urged for and againſt the ſupremacy of pope, and who is fitted by his knowledge of eccleſiaſtical hiſtory to underſtand the nature of the queſtion at iſſue, may conſult, on the one hand, the works of Bellarmine, together with a ſmal tract lately publiſhed in Engliſh, under the title of *The Divine Economy of Chriſt in his kingdom or Church;* and on the other, Barrow's treatiſe *on the Pope's Supremacy*, together with Chillingworth's *Religion of Proteſtants*, &c.

Pope (Alexander), a celebrated Engliſh poet, was deſcended from good families, and born the 8th of June 1688, at London, where his father was then a conſiderable merchant. He was taught to read very early by an aunt; and learned to write without any aſſiſtance, by copying printed books. The family being of the Romiſh religion, he was put, at eight years of age, under one Taverner, a prieſt, who taught him the rudiments of the Latin and Greek tongues together; and ſoon after was ſent to a Popiſh ſeminary at Wincheſter, from whence he was removed to a ſchool at Hyde-Park Corner. He diſcovered early an inclination to verſifying; and the tranſlations of Ogilby and Sandys from Virgil and Ovid firſt falling in his way, they were his favourite authors. At twelve he retired with his parents to Binfield, in Windſor Foreſt; and there became acquainted with the writings of Spenſer, Waller, and Dryden. Dryden ſtruck him moſt, probably becauſe the caſt of that poet was moſt congenial with his own; and therefore he not only ſtudied his works intenſely, but ever after mentioned him with a kind of rapturous veneration. He once obtained a ſight of him at a coffee-houſe, but never was known to him: a misfortune which he laments in theſe ſhort but expreſſive words, *Virgilium tantum vidi*. Though Pope had been under more tutors than one, yet it ſeems they were ſo inſufficient for the purpoſe of teaching, that he had learned very little from them: ſo that, being obliged afterwards to begin all over again, he may juſtly be conſidered as one of the *αυτοδιδακτοι* or *ſelf-taught*. At fifteen he had acquired a readineſs in the two learned languages; to which he ſoon after added the French and Italian. He had already ſcribbled a great deal of poetry in various ways; and this year ſet about an epic poem called *Alcander*. He long after communicated it to Atterbury, with a declared intention to burn it; and that friend concurred with him: "Though (adds he) I would have interceded for the firſt page, and put it, with your leave, among my curioſities." What the poet himſelf obſerves upon theſe early pieces is agreeable enough; and ſhows, that though at firſt a little intoxicated with the waters of Helicon, he afterwards arrived to great ſobriety of thinking. "I confeſs (ſays he) there was a time when I was in love with myſelf; and my firſt productions where the children of Self-love upon Innocence. I had made an epic poem, and panegyrics on all the princes; and I thought myſelf the greateſt genius that ever was. I cannot but regret theſe delightful viſions of my childhood, which like the fine colours we ſee when our eyes are ſhut, are vaniſhed for ever." His paſtorals, begun in 1704, firſt introduced him to the wits of the time; among which were Wycherly and Walſh. This laſt gentleman proved a ſincere friend to him; and ſoon diſcerning that his talent lay, not ſo much in ſtriking out new thoughts of his own, as in improving thoſe of other men, and in an eaſy verſification, told him, among other things, that there was one way left open for him to excel his predeceſſors in, which was correctneſs: obſerving, that though we had ſeveral great poets, yet none of them were correct. Pope took the hint, and turned it to good account; for no doubt the diſtinguiſhing harmony of his numbers was in a great meaſure owing to it. The ſame year, 1704, he wrote the firſt part of his Windſor Foreſt, though the whole was not publiſhed till 1710. In 1708, he wrote the Eſſay on Criticiſm: which production was juſtly eſteemed a maſterpiece in its kind, and ſhowed not only the peculiar turn of his talents, but that thoſe talents, young as he was, were ripened into perfection. He was not yet twenty years old; and yet the maturity of judgment, the knowledge of the world, and the penetration into human nature, diſplayed in that piece, were ſuch as would have done honour to the greateſt abilities and experience. But whatever may be the merit of the Eſſay on Criticiſm, it was ſtill ſurpaſſed, in a poetical view, by the Rape of the Lock, firſt completely publiſhed in 1712. The former excelled in the didactic way, for which he was peculiarly formed; a clear head, ſtrong ſenſe, and a ſound judgment, being his characteriſtical qualities; but it is the creative power of the imagination that conſtitutes what is properly called a *poet;* and therefore it is in the Rape of the Lock that Pope principally appears one, there being more *vis imaginandi* diſplayed in this poem than perhaps in all his other works put together. In 1715, he gave out propoſals for publiſhing a tranſlation of Homer's Iliad, by ſubſcription; in which all parties concurred ſo heartily, that he acquired a conſiderable fortune by it. The ſubſcription amounted to 6000 l. beſides 1200 l. which Lintot the bookſeller gave him for the copy. Pope's finances being now in good condition, he purchaſed a houſe at Twickenham, whither he removed with his father and mother in 1715: where the former died about two years after. As he was a Papiſt, he could not purchaſe, nor put his money to intereſt on real ſecurity; and as he adhered to the cauſe of King James, he made it a point of conſcience not to lend it to the new government; ſo that, though he was worth near 20,000 l. when he laid aſide buſineſs, yet, living afterwards upon the quick ſtock, he left but a ſlender ſubſiſtance to his family. Our poet, however, did not fail to improve it to the utmoſt: he had already acquired much by his publications, and he was all attention to acquire more. In 1717, he publiſhed a collection of all he had printed ſeparately; and proceeded to give a new edition of Shakeſpeare; which, being publiſhed in 1721, diſcovered that he had conſulted his fortune more than his fame in that undertaking. The Iliad being finiſhed, he engaged upon the like footing to undertake the Odyſſey. Mr Broome and Mr Fenton did part of it, and received 500l. of Mr Pope for their labours. It was publiſhed in the ſame manner, and on the ſame conditions to Lintot; excepting that, inſtead of 1200 l. he had but 600l. for the copy. This work being finiſhed in 1725, he was afterwards employed with Swift and Arbuthnot in printing ſome volumes of Miſcellanies. About this time he narrowly eſcaped loſing his life, as he was returning home in a friend's chariot; which, on paſſing a bridge, happened to be overturned, and thrown with the horſes into the river.

The glaſſes were up, and he was not able to break them: ſo that he had immediately been drowned, if the poſtillion had not broke them, and dragged him out to the bank. A fragment of the glaſs, however, cut him ſo deſperately, that he ever after loſt the uſe of two of his fingers. In 1727 his Dunciad appeared in Ireland; and the year after in England, with notes by Swift, under the name of *Scriblerus*. This edition was preſented to the king and queen by Sir Robert Walpole; who, probably about this time, offered to procure Pope a penſion, which however he refuſed, as he had formerly done a propoſal of the ſame kind made him by Lord Halifax. He greatly cultivated the ſpirit of independency; and "Unplac'd, unpenſion'd, no man's heir or ſlave," was frequently his boaſt. He ſomewhere obſerves, that the life of an author is a ſtate of warfare: he has ſhown himſelf a complete general in this way of warring. He bore the inſults and injuries of his enemies long; but at length, in the Dunciad, made an abſolutely univerſal ſlaughter of them: for even Cibber, who afterwards advanced to be the hero of it, could not forbear owning, that nothing was ever more perfect and finiſhed in its kind than this poem. In 1729, by the advice of Lord Bolingbroke, he turned his pen to ſubjects of morality; and accordingly we find him, with the aſſiſtance of that noble friend, who furniſhed him with the materials, at work this year upon the Eſſay on Man. The following extract of a letter to Swift diſcovers the reaſon of his Lordſhip's advice: "Bid him (ſays Bolingbroke) talk to you of the work he is about, I hope in good earneſt; it is a fine one, and will be, in his hands, an original. His ſole complaint is, that he finds it too eaſy in the execution. This flatters his lazineſs: it flatters my judgement; who always thought, that, univerſal as his talents are, this is eminently and peculiarly his, above all the writers I know, living or dead; I do not except Horace." Pope tells the dean in the next letter, that "the work Lord Bolingbroke ſpeaks of with ſuch abundant partiality, is a ſyſtem of ethics, in the Horatian way." In purſuing the ſame deſign, he wrote his Ethic Epiſtles: the fourth of which, upon Taſte, giving great offence, as he was ſuppoſed to ridicule the duke of Chandos under the character of Timon, is ſaid to have put him upon writing ſatires, which he continued till 1739. He ventured to attack perſons of the higheſt rank, and ſet no bounds to his ſatirical rage. A genuine collection of his letters was publiſhed in 1737. In 1738, a French tranſlation of the Eſſay on Man, by the Abbé Reſnel, was printed at Paris; and Mr Crouſaz, a German profeſſor, animadverted upon this ſyſtem of ethics, which he repreſented as nothing elſe but a ſyſtem of naturaliſm. Mr Warburton, afterwards biſhop of Glouceſter, wrote a commentary upon the Eſſay; in which he defends it againſt Crouſaz, whoſe objections he ſuppoſes owing to the faultineſs of the Abbé Reſnel's tranſlation. The poem was republiſhed in 1740, with the commentary. Our author now added a fourth book to the Dnnciad, which was firſt printed ſeparately in 1742: but the year after, the whole poem came out together, as a ſpecimen of a more correct edition of his works. He had made ſome progreſs in that deſign, but did not live to complete it. He had all his life long been ſubject to the head ach; and that complaint, which he derived from his mother, was now greatly increaſed by a dropſy in his breaſt, under which he expired the 30th of May 1744, in the 56th year of his age. In his will, dated December 12. 1743, Miſs Blount, a lady to whom he was always devoted, was made his heir during her life; and among other legacies, he bequeathed to Mr Warburton the property of all ſuch of his works, already printed, as he had written, or ſhould write commentaries upon, and which had not otherwiſe been diſpoſed of or alienated; with this condition, that they were publiſhed without future alterations. In diſcharge of this truſt, that gentleman gave a complete edition of all Mr Pope's works, 1751, in 9 vols, 8vo. A work, entitled, *An Eſſay on the Writings and Genius of Pope*, by Mr Warton, 2 vols 8vo, will be read with pleaſure by thoſe who deſire to know more of the perſon, character, and writings of this excellent poet. Lord Orrery's account of him is very flattering: "If we may judge of him by his works (ſays this noble author), his chief aim was to be eſteemed a man of virtue. His letters are written in that ſtyle; his laſt volumes are all of the moral kind; he has avoided trifles, and conſequently has eſcaped a rock which has proved very injurious to Swift's reputation. He has given his imagination full ſcope, and yet has preſerved a perpetual guard upon his conduct. The conſtitution of his body and mind might really incline him to the habits of caution and reſerve. The treatment which he met with afterwards, from an innumerable tribe of adverſaries, confirmed this habit; and made him ſlower than the dean in pronouncing his judgment upon perſons and things. His proſe-writings are little leſs harmonious than his verſe; and his voice, in common converſation was ſo naturally muſical, that I remember honeſt Tom Southern uſed to call him the *little nightingale*. His manners were delicate, eaſy, and engaging; and he treated his friends with a politeneſs that charmed, and a generoſity that was much to his honour. Every gueſt was made happy within his doors; pleaſure dwelt under his roof, and elegance preſided at his table."

Yet, from Dr Johnſon's account of his domeſtic habits, we have reaſon to doubt the latter part of this character. His parſimony (he informs us) appeared in very petty matters, ſuch as writing his compoſitions on the backs of letters, or in a niggardly reception of his friends, and a ſcantineſs of entertainment—as the ſetting a ſingle pint on the table to two friends, when, having himſelf taken two ſmall glaſſes, he would retire, ſaying, I leave you to your wine. He ſometimes, however, the Doctor acknowledges, made a ſplendid dinner; but this happened ſeldom. He was very full of his fortune, and frequently ridiculed poverty; and he ſeems to have been of an opinion not very uncommon in the world, that to want money is to want every thing. He was almoſt equally proud of his connection with the great, and often boaſted that he obtained their notice by no meanneſs or ſervility. This admiration of the great increaſed in the advance of life; yet we muſt acknowledge, that he could derive but little honour from the notice of Cobham, Burlington, or Bolingbroke.

By natural deformity, or accidental diſtortion, his vital functions were ſo much diſordered, that his life was a long diſeaſe; and from this cauſe aroſe many of his peculiarities and weakneſſes. He ſtood conſtantly

Pope.

in need of female attendance; and to avoid cold, of which he was very ſenſible, he wore a fur doublet under his ſhirt, &c. The indulgence and accommodation which his ſickneſs required, had taught him all the unpleaſing and unſocial qualities of a valetudinary man.—When he wanted to ſleep, he nodded in company; and once ſlumbered at his own table when the prince of Wales was talking of poetry. He was extremely troubleſome to ſuch of his friends as aſked him out, which many of them frequently did, and plagued the ſervants beyond deſcription. His love of eating is another fault to which he is ſaid to have fallen a ſacrifice. In all his intercourſe with mankind, he had great delight in artifice, and endeavoured to attain all his purpoſes by indirect and unſuſpected methods.

In familiar converſation it is ſaid he never excelled; and he was ſo fretful and ſo eaſily diſpleaſed, that he would ſometimes leave Lord Oxford's ſilently without any apparent reaſon, and was to be courted back by more letters and meſſages than the ſervants were willing to carry.

Dr Johnſon alſo gives a view of the intellectual character of Pope, and draws a parallel between Dryden and him. For particulars, however, we muſt refer our readers to *Johnſon's Lives of the Poets*.

Pope's Dominions, or *Eccleſiaſtical States*, a country of Italy, bounded on the north by the gulph of Venice and the Venetian dominions, on the ſouth by the Mediterranean, on the eaſt by the kingdom of Naples and the Adriatic, and on the weſt by Tuſcany and Modena. It is 400 miles long on the coaſt of the Adriatic from Naples to the Venetian territory. It is but narrow, however, from north to ſouth, not being more than 80 miles broad from the gulph of Venice to the Tuſcan ſea.

The ſoil, in general, of the pope's dominions is very fertile, but ill cultivated; and there are many fens and marſhy grounds which are very prejudicial to the air. That the lands are badly cultivated and inhabited, the air bad, and the inhabitants poor, idle, lazy, and groſsly ſuperſtitious, is owing to a variety of cauſes. With reſpect to the accommodations of life, this country is but in a very indifferent condition; for, notwithſtanding the fertility of its ſoil, its advantageous ſituation for traffic, the large ſums ſpent in it by travellers, or remitted to it from foreign countries, and its having, for its ruler, the ſucceſſor of St Peter, the prince of the apoſtles, and the vicar of Jeſus Chriſt; yet it is poor and thin of inhabitants, ill cultivated, and without trade and manufactures. This is partly owing to the great number of holidays, of ſturdy beggars called *pilgrims*, and of hoſpitals and convents, with the amazing but perhaps uſeleſs wealth of churches and convents, and the inquiſition: but the chief cauſe is the ſeverity of the government, and the grievious exactions and hardſhips to which the ſubjects are expoſed. The legates, though moſtly clergymen, whoſe thoughts ſhould be chiefly employed about laying up treaſures in heaven, and who ought to ſet an example to the laity of diſintereſtedneſs and a contempt of this world, too often, it is ſaid, ſcruple no kind of rapaciouſneſs: even the holy father himſelf, and the cardinals, frequently make the enriching of their nephews and other relations, and the aggrandizing their families, too much the buſineſs of their lives. The extenſive claims and great pretenſions of the pope are well known, and by a large part of Chriſtendom, are now treated with contempt and mockery. The Reformation gave a great blow to his ſpiritual power; and the French revolution has leſſened it ſtill more. His temporal dominions, however, ſtill continue much the ſame; though how long this may be the caſe, conſidering how much he hath loſt, and is daily loſing, of his ghoſtly empire, and the veneration in which he was formerly held, it is difficult to ſay. See Pope, p. 378. col. 1.—The Campania of Rome is under the pope's immediate government; but the other provinces are governed by legates and vice-legates, and there is a commander in chief of the pope's forces in every province. The pope is choſen by the cardinals in the conclave: See this particularly deſcribed under Pope. The pope holds a conſiſtory of cardinals on eccleſiaſtical affairs; but the cardinals do not meddle with his civil government. The pope's chief miniſter is the cardinal-patron, uſually his nephew, who amaſſes an immenſe eſtate, if the reign be of any long duration. The cardinal that is choſen pope muſt generally be an Italian, and at leaſt 55 years of age. The ſpiritual power of the pope, though far ſhort of what it was before the Reformation, is ſtill conſiderable. It is computed that the monks and regular clergy, who are abſolutely at his devotion, do not amount to leſs than 2,000,000 of people, diſperſed through all the Roman Catholic countries, to aſſert his ſupremacy over princes, and promote the intereſt of the church. The revenues of theſe monks do not fall ſhort of L. 20,000,000 Sterling, beſides the caſual profits ariſing from offerings, and the people's bounty to the church, who are taught that their ſalvation depends on this kind of benevolence.

Pope, Popery.

The pope's revenues, as a temporal prince, may amount to about L. 1,000,000 Sterling *per aunum*, ariſing chiefly from the monopoly of corn, the duties on wine and other proviſions. Over and above theſe, vaſt ſums are continually flowing into the papal treaſury from all the Roman Catholic countries, for diſpenſations, indulgences, canonizations, annates, the pallia, and inveſtitures of archbiſhops, biſhops, &c.

The pope has a conſiderable body of regular forces, well clothed and paid; but his fleet conſiſts only of a few galleys. His life-guards are 40 Switzers, 75 cuiraſſiers, and as many light horſe. Since the beginning of this war, we are told, he has likewiſe had a guard of Engliſh horſe.

POPERY, in eccleſiaſtical hiſtory, comprehends the religious doctrines and practices adopted and maintained by the church of Rome. The following ſummary, extracted chiefly from the decrees of the council of Trent, continued under Paul III. Julius III. and Pius IV. from the year 1545 to 1563, by ſucceſſive ſeſſions, and the creed of pope Pius IV. ſubjoined to it, and bearing date November 1564, may not be unacceptable to the reader. One of the fundamental tenets, ſtrenuouſly maintained by popiſh writers, is the infallibility of the church of Rome; though they are not agreed whether this privilege belongs to the pope or a general council, or to both united; but they pretend that an infallible living judge is abſolutely neceſſary to determine controverſies, and to ſecure peace in the Chriſtian church. However, Proteſtants allege, that the claim of infallibility in any church is not juſtified by the authority of Scripture; much leſs does it pertain to the church of Rome; and that it is inconſiſtent with the nature of religion, and the perſonal obligations of its profeſſors; and that it has proved ineffectual to the end for which it is ſuppoſed to be granted, ſince popes and councils have diſagreed in matters of importance, and they have been incapable, with the advantage of this pretended infallibility, of maintaining union and peace.

Another eſſential article of the popiſh creed is the ſupremacy of the pope, or his ſovereign power over the univerſal church. See Pope.

Farther, the doctrine of the ſeven ſacraments is a peculiar and diſtinguiſhing doctrine of the church of Rome: theſe are baptiſm, confirmation, the euchariſt, penance, extreme unction, orders, and matrimony.

The council of Trent (ſeſſ. 7. can. 1.) pronounces an anathema on thoſe who ſay, that the ſacraments are more or fewer than ſeven, or that any one of the above number is not truly and properly a ſacrament. And yet it does not appear that they amounted to this number before the 12th century, when Hugo de St Victore and Peter Lombard, about the year 1144, taught that there were ſeven ſacraments. The council of Florence, held in 1438, was the firſt council that determined this number. Theſe ſacraments confer grace, according to the decree of the council of Trent (ſeſ. 7. can. 8.) *ex opere operato*, by the mere adminiſtration of them: three of them, viz. baptiſm, confirmation, and orders, are ſaid (can. 9.) to impreſs an indelible character, ſo that they cannot be repeated without ſacrilege; and the efficacy of every ſacrament depends on the intention of the prieſt by whom it is adminiſtered (can. 11.) Pope Pius expreſsly enjoins, that all theſe ſacraments ſhould be adminiſtered according to the received and approved rites of the Catholic church. With regard to the euchariſt in particular, we may here obſerve, that the church of Rome holds the doctrine of tranſubſtantiation; the neceſſity of paying divine worſhip to Chriſt under the form of the conſecrated bread, or hoſt; the propitiatory ſacrifice of the maſs, according to their ideas of which Chriſt is truly and properly offered as a ſacrifice as often as the prieſt ſays maſs; it practiſes likewiſe ſolitary maſs, in which the prieſt alone, who conſecrates, communicates, and allows communion only in one kind, viz. the bread, to the laity. Seſſ. 14.

The doctrine of merits is another diſtinguiſhing tenet of popery; with regard to which the council of Trent has expreſsly decreed (ſeſſ. 6. can. 32.) that the good works of juſtified perſons are truly meritorious; deſerving not only an increaſe of grace, but eternal life, and an increaſe of glory; and it has anathematized all who deny this doctrine. Of the ſame kind is the doctrine of ſatisfactions; which ſuppoſes that penitents may truly ſatisfy, by the afflictions they endure under the diſpenſations of Providence, or by voluntary penances to which they ſubmit, for the temporal penalties of ſin, to which they are ſubject, even after the remiſſion of their eternal puniſhment. Seſſ. 6. can 30. and ſeſſ. 14. can. 8. and 9. In this connection we may mention the popiſh diſtinction of venial and mortal ſins: the greateſt evils ariſing from the former are the temporary pains of purgatory; but no man, it is ſaid, can obtain the pardon of the latter without confeſſing to a prieſt, and performing the penances which he impoſes.

The council of Trent (ſeſſ. 14. can. 1.) has expreſsly decreed, that every one is accurſed, who ſhall affirm that penance is not truly and properly a ſacrament, inſtituted by Chriſt in the univerſal church, for reconciling thoſe Chriſtians to the divine majeſty, who have fallen into ſin after baptiſm: and this ſacrament, it is declared, conſiſts of two parts, the matter and the form; the matter is the act of the penitent, including contrition, confeſſion, and ſatisfaction; the form of it is the act of abſolution on the part of the prieſt. Accordingly it is enjoined, that it is the duty of every man, who hath fallen after baptiſm, to confeſs his ſins once a year, at leaſt, to a prieſt: that this confeſſion is to be ſecret; for public confeſſion is neither commanded nor expedient: and that it muſt be exact and particular, including every kind and act of ſin, with all the circumſtances attending it. When the penitent has ſo done, the prieſt pronounces an abſolution; which is not conditional or declarative only, but abſolute and judicial. This ſecret, or auricular confeſſion, was firſt decreed and eſtabliſhed in the fourth council of Lateran, under Innocent III. in 1215, (cap. 21.) And the decree of this council was afterwards confirmed and enlarged in the council of Florence, and in that of Trent; which ordains, that confeſſion was inſtituted by Chriſt, that by the law of God it is neceſſary to ſalvation, and that it has been always practiſed in the Chriſtian church. As for the penances impoſed on the penitent by way of ſatisfaction, they have been commonly the repetition of certain forms of devotion, as pater-noſters, or ave-marias, the payment of ſtipulated ſums, pilgrimages, faſts, or various ſpecies of corporal diſcipline. But the moſt formidable penance, in the eſtimation of many who have belonged to the Romiſh communion, has been the temporary pains of purgatory. But under all the penalties which are inflicted or threatened in the Romiſh church, it has provided relief by its indulgences, and by its prayers or maſſes for the dead, performed profeſſedly for relieving and reſcuing the ſouls that are detained in purgatory.

Another article that has been long authoritatively enjoined and obſerved in the church of Rome, is the celibacy of her clergy. This was firſt enjoined at Rome by Gregory VII. about the year 1074, and eſtabliſhed in England by Anſelm archbiſhop of Canterbury about the year 1175; though his predeceſſor Lanfranc had impoſed it upon the prebendaries and clergy that lived in towns. And though the council of Trent was repeatedly petitioned by ſeveral princes and ſtates to aboliſh this reſtraint, the obligation of celibacy was rather eſtabliſhed than relaxed by this council; for they decreed, that marriage contracted after a vow of continence, is neither lawful nor valid; and thus deprived the church of the poſſibility of ever reſtoring marriage to the clergy. For if marriage, after a vow, be in itſelf unlawful, the greateſt authority upon earth cannot diſpenſe with it, nor permit marriage to the clergy, who have already vowed continence.

To the doctrines and practices above recited may be farther added the worſhip of images, of which Proteſtants accuſe the Papiſts. But to this accuſation the Papiſt replies, that he keeps images by him to preſerve

Papiſt Miſrepreſented and Repreſented.

in his mind the memory of the perſons repreſented by them; as people are wont to preſerve the memory of their deceaſed friends by keeping their pictures. He is taught (he ſays) to uſe them ſo as to caſt his eyes upon the pictures or images, and thence to raiſe his heart to the things repreſented, and there to employ it in meditation, love, and thankſgiving, deſire of imitation, &c. as the object requires.

Theſe pictures or images have this advantage, that they inform the mind by one glance of what in reading might require a whole chapter. There being no other difference between them, than that reading repreſents leiſurely and by degrees; and a picture, all at once. Hence he finds a convenience in ſaying his prayers with ſome devout pictures before him, he being no ſooner diſtracted, but the ſight of theſe recals his wandering thoughts to the right object; and as certainly brings ſomething good into his mind, as an immodeſt picture diſturbs his heart with filthy thoughts. And becauſe he is ſenſible that theſe holy pictures and images repreſent and bring to his mind ſuch objects as in his heart he loves, honours, and venerates; he cannot but upon that account love, honour, and reſpect, the images themſelves.

Ibid.

The council of Trent likewiſe decreed, that all biſhops and paſtors who have the cure of ſouls, do diligently inſtruct their flocks, *that it is good and profitable to deſire the interceſſion of ſaints reigning with Chriſt in heaven*. And this decree the Papiſts endeavour to defend by the following obſervations. They confeſs that we have but one Mediator of redemption; but affirm that it is acceptable to God that we ſhould have many mediators of interceſſion. Moſes (ſay they) was ſuch a mediator for the Iſraelites; Job for his three friends; Stephen for his perſecutors. The Romans were thus deſired by St Paul to be his mediators; ſo were the Corinthians, ſo the Epheſians, *Ep. ad* Rom. Cor. Eph. ſo almoſt every ſick man deſires the congregation to be his mediators, by remembering him in their prayers. And ſo the Papiſt deſires the bleſſed in heaven to be his mediators; that is, that they would pray to God for him. But between theſe living and dead mediators there is no ſimilarity: the living mediator is preſent, and certainly hears the requeſt of thoſe who deſire him to intercede for them; the dead mediator is as certainly abſent, and cannot poſſibly hear the requeſts of all thoſe who at the ſame inſtant may be begging him to intercede for them, unleſs he be poſſeſſed of the divine attribute of omnipreſence; and he who gives that attribute to any creature is unqueſtionably guilty of idolatry. And as this decree is contrary to one of the firſt principles of natural religion, ſo does it receive no countenance from Scripture, or any Chriſtian writer of the three firſt centuries. Other practices peculiar to the Papiſts are the religious honour and reſpect that they pay to ſacred relicks; by which they underſtand not only the bodies and parts of the bodies of the ſaints, but any of thoſe things that appertained to them, and which they touched; and the celebration of divine ſervice in an unknown tongue: to which purpoſe the council of Trent hath denounced an anathema on any one who ſhall ſay that maſs ought to be celebrated only in the vulgar tongue; ſeſſ. 25. and ſeſſ. 22. can. 9. Though the council of Lateran under Innocent III. in 1215 (can. 9.) had expreſsly decreed, that becauſe in many parts within the ſame city and dioceſe there are many people of different manners and rites mixed together, but of one faith, the biſhops of ſuch cities or dioceſes ſhould provide fit men for celebrating divine offices, according to the diverſity of tongues and rites, and for adminiſtering the ſacraments.

We ſhall only add, that the church of Rome maintains, that unwritten traditions ought to be added to the holy Scriptures, in order to ſupply their defect, and to be regarded as of equal authority; that the books of the Apocrypha are canonical ſcripture; that the vulgate edition of the Bible is to be deemed authentic; and that the Scriptures are to be received and interpreted according to that ſenſe which the holy mother church, to whom it belongs to judge of the true ſenſe, hath held, and doth hold, and according to the unanimous conſent of the fathers.

Such are the principal and diſtinguiſhing doctrines of Popery, moſt of which have received the ſanction of the council of Trent, and that of the creed of pope Pius IV. which is received, profeſſed, and ſworn to by every one who enters into holy orders in the church of Rome; and at the cloſe of this creed, we are told that the faith contained in it is ſo abſolutely and indiſpenſably neceſſary, that no man can be ſaved without it.

Many of the doctrines of Popery were relaxed, and very favourably interpreted by M. de Meaux, biſhop of Condom, in his Expoſition of the Doctrine of the Catholic Church, firſt printed in the year 1671: but this edition, which was charged with perverting, in endeavouring to palliate, the doctrine of the church, was cenſured by the doctors of the Sorbonne, and actually ſuppreſſed; nor does it appear that they ever teſtified their approbation in the uſual form of ſubſequent and altered editions. It has, however, been lately publiſhed in England; by a clergyman of the Romiſh church, whoſe integrity, piety, and benevolence, would do honour to any communion.

POPHAM (Sir John), lord chief juſtice of the common pleas in the reign of Queen Elizabeth, was the eldeſt ſon of Edward Popham, Eſq; of Huntworth in Somerſetſhire, and born in the year 1531. He was ſome time a ſtudent of Baliol college in Oxford; "being then (ſays Ant. Wood) given at leiſure hours to many ſports and exerciſes." After quitting the univerſity, he fixed in the Middle Temple; where, during his noviciate, he is ſaid to have indulged in that kind of diſſipation to which youth and a vigorous conſtitution more naturally incline than to the ſtudy of voluminous *reports*: but, ſatiated at length with what are called the *pleaſures of the town*, he applied ſeduloufly to the ſtudy of his profeſſion, was called to the bar, and in 1568 became ſummer or autumn reader. He was ſoon after made ſerjeant at law, and ſolicitor-general in 1579. In 1581, he was appointed attorney-general, and treaſurer of the Middle temple. In 1592, he was made lord chief juſtice of the king's bench, and the ſame year received the honour of knighthood. In the year 1601, his lordſhip was one of the council detained by the unfortunate earl of Eſſex, when he formed the ridiculous project of defending himſelf in his houſe: and, on the earl's trial, he gave evidence againſt him relative to their detention. He died in the year 1607, aged 76; and was buried in the ſouth aiſle of the church at Wellington in Somerſetſhire, where he generally reſided as often as it was in his power to retire. He was thought ſomewhat ſevere in the execution of the law againſt capital offenders: but his ſeverity had the happy effect of reducing the number of highway robbers. He wrote, 1. Reports and caſes adjudged in the time of Queen Elizabeth. 2. Reſolutions and judgments upon caſes and matters agitated in all the courts at Weſtminſter in the latter end of Queen Elizabeth's reign.

POPLAR, in botany. See Populus.

POPLITÆUS, in anatomy, a ſmall muſcle obliquely pyramidal, ſituated under the ham. See Anatomy, *Table of the Muſcles*.

POPPY, in botany. See Opium and Papaver.

POPULAR, ſomething that relates to the common people.

POPULATION, means the ſtate of a country with reſpect to the number of people. See *Bills of Mortality* and *Political-Arithmetic*.

The queſtion concerning the number of men exiſting upon earth, has been variouſly determined by different writers. Riccioli ſtates the population of the globe at 1000 millions, Voſſius at 500; the Journaliſts of Trevoux at 720; and the editor (Xavier de Feller) of the ſmall Geographical Dictionary of Voſgien, reprinted at Paris in 1778, at 370 millions. This laſt eſtimate is perhaps too low, although the writer profeſſes to have taken conſiderable pains to aſcertain the point with as much accuracy as the nature of the ſubject will admit. It may, perhaps, not be deemed unworthy the attention of the curious ſpeculatiſt to obſerve, that aſſuming the more probable ſtatement of the learned Jeſuits of Trevoux, and that the world has exiſted about 6006 years in its preſent ſtate of population, then the whole number of perſons who have ever exiſted upon earth ſince the days of Adam amounts only to about one hundred and thirty thouſand millions; becauſe 720,000,000 × 182 (the number of generations in 6006 years) = 131,040,000,000. See on this ſubject the authors abovementioned, as likewiſe Beauſobre's *Etude de la Politique*.

With regard to the population of England, the reader may conſult, together with our article *Political-Arithmetic*, An inquiry into the preſent State of Population, &c. by W. Wales, F. R. S. and Mr Howlett's Examination of Dr Price's Eſſay, on the ſame ſubject.

POPULUS, the Poplar: A genus of the octandria order, belonging to the diœcia claſs of plants; and in the natural method ranking under the 50th order, *Amentaceæ*. The calyx of the amentum is a lacerated, oblong, and ſquamous leaf; the corolla is turbinated, oblique, and entire. The female has the calyx of the amentum and corolla the ſame as in the male; the ſtigma is quadrifid; the capſule bilocular, with many pappous ſeeds.

The poplar, one of the moſt beautiful of the aquatic trees, has frequently been introduced into the poetical deſcriptions of the ancients; as by Virgil, *Ecl.* vii. 66. ix. 41. *Georg.* ii. 66. iv. 511. *Æn.* viii. 31. 276. by Ovid, *Amom. Parid.* 27. by Horace, *Carm.* ii. 3. and by Catulus, *Nupt. Pil. et Thet.* 290. &c. &c.

Species. 1. The alba, or abele-tree, grows naturally in the temperate parts of Europe. Its leaves are large, and divided into three, four, or five lobes, indented on their edges, of a very dark colour on their upper ſide, but very white and downy on the under ſide; ſtanding upon footſtalks an inch long. The young branches have a purple bark, and are covered with a white down; but the bark of the ſtem and older branches is grey. In the beginning of April, the male flowers or catkins appear, which are cylindrical, and about three inches long. About a week after come out the female flowers or catkins, which have no ſtamina like thoſe of the male. Soon after theſe come out, the male catkins fall off; and in five or ſix weeks after the female flowers will have ripe ſeeds incloſed in a hairy covering. The catkins will then drop, and the ſeeds be wafted by the winds to a great diſtance. 2. The major, or white poplar, has its leaves rounder than the firſt, and not much above half their ſize: they are indented on their edges, and are downy on their under ſide, but not ſo white as thoſe of the former, nor are their upper ſurfaces of ſuch a deep green colour. 3. The nigra, or black poplar, has oval heart-ſhaped leaves, ſlightly crenated on their edges; they are ſmooth on both ſides, and of a light green colour. 4. The tremula, or aſpen-tree, has roundiſh, angularly indented leaves: they are ſmooth on both ſides, and ſtand on long footſtalks, and ſo are ſhaken by the leaſt wind; from whence it has the title of the *trembling poplar*, or *aſpen-tree*. 5. The balſamifera, or Carolina poplar, is a native of Carolina, where it becomes a large tree. The ſhoots of this ſort grow very ſtrong in Britain, and are generally angular; with a light green bark like the willow. The leaves on young trees, and alſo thoſe on the lower ſhoots, are very large, almoſt heart-ſhaped, and crenated; but thoſe upon the older trees are ſmaller: as the trees advance, their bark becomes lighter, approaching to a greyiſh colour. 6. The tacamahaca, grows naturally in Canada and other parts of North America. This is a tree of a middling growth, ſending out on every ſide many ſhort thick ſhoots, which are covered with a light brown bark, garniſhed with leaves differing from one another in ſhape and ſize; moſt of them are almoſt heart-ſhaped; but ſome are oval, and others nearly ſpear-ſhaped; they are whitiſh on their under ſide, but green on their upper.

Culture. Theſe trees may be propagated either by layers or cuttings, as alſo from ſuckers which the white poplars ſend up from their roots in great plenty. The beſt time for tranſplanting theſe ſuckers is in October, when their leaves begin to decay. Theſe may be placed in a nurſery for two or three years, to get ſtrength before they are planted out where they are deſigned to remain; but if they are propagated from cuttings, it is better to defer the doing of that until February, at which time truncheons of two or three feet long ſhould be thruſt about a foot and a half into the ground.—Theſe will readily take root; and if the ſoil in which they are planted be moiſt, they will arrive at a conſiderable bulk in a few years. The black poplar is leſs apt to take root from large truncheons; therefore it is a better method to plant cuttings of it about a foot and a half in length, thruſting them a foot deep in the ground. This ſort will grow almoſt on any ſoil, but will thrive beſt in moiſt places. The Carolina poplar may alſo be propagated by cuttings or layers; but the laſt is the method generally practiſed, and the plants raiſed by it are leſs moiſt than others. The ſhoots of this tree, while young, are frequently killed down to a conſiderable length by the froſt in winter; but as the trees grow older, their ſhoots are not ſo vigorous, and become more ligneous, ſo are not liable to the ſame diſaſter. But the trees ſhould be planted in a ſheltered ſituation: for as their leaves are very large, the wind has great power over them; and the branches being tender, they are frequently broken or ſplit by the winds in ſummer, when they are much expoſed. The tacamahaca ſends up a great number of ſuckers from its roots, by which it multiplies in plenty; and every cutting which is planted will take root.

Uſes. The wood of theſe trees, eſpecially of the abele, is good for laying floors, where it will laſt for many years; and on account of its extreme whiteneſs is by many preferred to oak; yet, on account of its ſoft contexture, being very ſubject to take the impreſſion of nails, &c. it is leſs proper on this account than the harder woods. The abele likewiſe deſerves particular notice, on account of the virtue of its bark in curing intermitting fevers. The Reverend Mr Stone, in Phil. Tranſ. vol. LIII. p. 195. tells us, that he gathers the bark in ſummer when it is full of ſap, and having dried it by a gentle heat, gives a dram powdered every four hours betwixt the fits. In a few obſtinate caſes, he mixed one-fifth part of Peruvian bark with it. It is remarkable how nature has adapted remedies to diſeaſes. Intermitting fevers are moſt prevalent in wet countries; and this tree grows naturally in ſuch ſituations. The bark of it is an object well worthy the attention of phyſicians; and if its ſucceſs upon a more enlarged ſcale of practice prove equal to Mr Stone's experiments, the world will be much indebted to him for communicating them. This bark will alſo tan leather.

The inner bark of the black poplar is uſed by the inhabitants of Kamſchatka as a material for bread; and paper has ſometimes been made of the cottony down of the ſeeds. The roots have been obſerved to diſſolve into a kind of gelatinous ſubſtance, and to be coated over with a tubular cruſtaceous ſpar, called by naturaliſts *oſteocolla**, formerly imagined to have ſome virtue in producing the callus of a fractured bone. The buds of the ſixth ſpecies are covered with a glutinous reſin, which ſmells very ſtrong, and is the gum tacamahaca of the ſhops. The beſt, called, from its being collected in a kind of gourd ſhells, *tacamahaca in ſhells*, is ſomewhat unctuous and ſoftiſh, of a pale yellowiſh or greeniſh colour, an aromatic taſte, and a fragrant delightful ſmell, approaching to that of lavender or ambergriſe. This ſort is very rare; that commonly found in the ſhops is in ſemitranſparent globes or grains, of a whitiſh, yellowiſh, browniſh, or greeniſh colour, of a leſs grateful ſmell than the foregoing. This reſin is ſaid to be employed externally by the Indians for diſcuſſing and maturating tumours, and abating pains in the limbs. It is an ingredient in ſome anodyne, hyſteric, cephalic and ſtomachic plaſters; but the fragance of the finer ſort ſufficiently points out its utility in other reſpects.

* See Oſteocolla.

M. Fougeroux de Bondaroy, from a ſet of experiments on the ſubject, gives an account of the uſes of the ſeveral kinds of poplar, the ſubſtance of which is as follows: He finds that the wood of the black poplar is good and uſeful for many purpoſes; that the Lombardy poplar, *populus faſtigata*, is of very little value; that the Virginia poplar, *populus Virginiana*, affords a wood of excellent quality, that may be applied to many uſes. The Carolina poplar, *populus Carolinenſis—heterophilla*, (Linn.) is a very quick grower; beautiful when ſound, but liable to be hurt by cold. Its wood appeared to M. de Bondaroy to be of little value; but M. Maleſherbes, who cut down a large tree of this ſort, was aſſured by his carpenter that the wood was very good.—That the tacamahaca, *populus tacamahaca balſamifera*, is a dwarfiſh plant (A), of little value.—That the liard, *populus Canadenſis*, is a large tree, the wood light, not eaſy to be ſplit, and fit for ſeveral uſes.—That the white poplar, *populus alba*, is a large growing tree, affording a wood of excellent quality, and is among the moſt valuable of this ſpecies.—That the trembling poplar, *populus tremula*, (Linn.) is neither ſo large a tree nor affords ſuch wood as the former. Theſe are in few words the principal reſult of the experiments of this gentleman on this claſs of plants. A few other ſorts are mentioned, but nothing deciſive with regard to them is determined.

From ſome experiments made by M. Dambourney, it appears that the poplar may be uſefully employed in dyeing. The Italian poplar gives a dye of as fine a luſtre, and equally durable, as that of the fineſt yellow wood, and its colour is more eaſily extracted. It is likewiſe very apt to unite with other colours in compoſition. Beſides the *populus faſtigata*, M. Dambourney tried alſo the black poplar, the Virginian *ditto*, the balſam *ditto* or *liard*, the white *ditto*, and the trembling poplar; and found that all theſe dyed wool of a nut-colour, fawn-colour *(vigagne)*, Nankin, muſk, and other grave ſhades, according to the quantity of wood employed, and the length of time it was boiled.

POQUELIN or **POCQUELIN** (John Baptiſt.) See MOLIERE.

PORANA, in botany; a genus of the monogynia order, belonging to the pentandria claſs of plants. The corolla is campanulated; the calyx is quinquefid, and larger than the fruit; the ſtyle ſemibifid, long, and permanent; the ſtigmata globular; the perianthium bivalved.

1 What is called porcelain.

PORCELAIN, a fine kind of earthen ware, chiefly manufactured in China, and thence called *China-ware*. All earthen wares which are white and ſemitranſparent are generally called *porcelains*: but amongſt theſe, ſo great differences may be obſerved, that, notwithſtanding the ſimilarity of their external appearance, they cannot be conſidered as matters of the ſame kind. Theſe differences are ſo evident, that even perſons who are not connoiſſeurs in this way prefer much the porcelain of ſome countries to that of others.

2 Origin of the name.

The word *porcelain* is of European derivation; none of the ſyllables which compoſe it can even be pronounced or written by the Chineſe, whoſe language com-

---

(A) We have ſeen it above 30 feet high.

prehends no ſuch ſounds. It is probable that we are indebted to the Portugueſe for it: the word *porcellana*, however, in their language, ſignifies properly a cup or diſh; and they themſelves diſtinguiſh all works of porcelain by the general name of *loca*. Porcelain is called in China *tſé-ki*.

3 Art of making it in greater perfection in the Eaſt than in Europe.

The art of making porcelain is one of thoſe in which Europe has been excelled by oriental nations. The firſt porcelain that was ſeen in Europe was brought from Japan and China. The whiteneſs, tranſparency, fineneſs, neatneſs, elegance, and even the magnificence of this pottery, which ſoon became the ornament of ſumptuous tables, did not fail to excite the admiration and induſtry of Europeans; and their attempts have ſucceeded ſo well, that in different parts of Europe earthen wares have been made ſo like the oriental, that they have acquired the name of *porcelain*. The firſt European porcelains were made in Saxony and in France; and afterwards in England, Germany, and Italy: but as all theſe were different from the Japaneſe, ſo each of them had its peculiar character.

4 Beſt Chineſe porcelain at King-te-tching.

The fineſt and beſt porcelain of China is made in a village called *King-te-tching*, in the province of Kiang-ſi. This celebrated village is a league and a half in length, and we are aſſured that it contains a million of inhabitants. The workmen of King-te-tching, invited by the attracting allurements of the European trade, have eſtabliſhed manufactories alſo in the provinces of Fo-kien and Canton; but this porcelain is not eſteemed.—The emperor Kang-hi was deſirous of having ſome made under his own inſpection at Pe-king. For this purpoſe he collected workmen, together with tools, and all materials neceſſary; furnaces were alſo erected, but the attempt miſcarried. The village of *King-te-tching* ſtill continues the moſt celebrated place in the empire for beautiful porcelain, which is tranſported to all parts of the world, and even to Japan.

5 Origin of the art.

We are unable to diſcover who firſt found out the art of making porcelain, nor is it known whether the Chineſe were indebted to chance for it, or to the repeated efforts of inventive genius; we cannot even determine its antiquity with preciſion; we know only from the annals of Feou-leang, a city in the diſtrict to which King-te-tching belongs, that, ſince the year 442 of our era, the workmen of this village have always furniſhed the emperors with porcelain; and that one or two mandarins were ſent from court to inſpect their labours. It is, however, ſuppoſed that the invention of porcelain is much older than that epocha.

6 F. d'Entrecolles firſt gave an account of Chineſe porcelain.

7 Nature of the materials, and mode of preparing the paſte.

We are indebted to Father d'Entrecolles, a Romiſh miſſionary, for a very accurate account of the manner in which porcelain is made in China; and as he lived in King-te-tching, his information muſt have been the very beſt poſſible. We ſhall therefore give his account of the Chineſe manner of making it, as abridged by Groſier in his *General Deſcription of China*. The principal ingredients of the fine porcelain are *pe-tun-tſe* and *kao-lin*, two kinds of earth from the mixture of which the paſte is produced. The *kao-lin* is intermixed with ſmall ſhining particles; the other is purely white, and very fine to the touch. Theſe firſt materials are carried to the manufactories in the ſhape of bricks. The pe-tun-tſe, which is ſo fine, is nothing elſe but fragments of rock taken from certain quarries, and reduced to powder. Every kind of ſtone is not fit for this purpoſe. The colour of that which is good, ſay the Chineſe, ought to incline a little towards green. A large iron club is uſed for breaking theſe pieces of rock: they are afterwards put into mortars; and, by means of levers headed with ſtone bound round with iron, they are reduced to a very fine powder. Theſe levers are put in action either by the labour of men, or by water, in the ſame manner as the hammers of our paper-mills. The duſt afterwards collected is thrown into a large veſſel full of water, which is ſtrongly ſtirred with an iron ſhovel. When it has been left to ſettle for ſome time, a kind of cream riſes on the top, about four inches in thickneſs, which is ſkimmed off, and poured into another veſſel filled with water: the water in the firſt veſſel is ſtirred ſeveral times; and the cream which ariſes is ſtill collected, until nothing remains but the coarſe dregs, which, by their own weight, precipitate to the bottom: theſe dregs are carefully collected, and pounded anew.

With regard to what is taken from the firſt veſſel, it is ſuffered to remain in the ſecond until it is formed into a kind of cruſt at the bottom. When the water above it ſeems quite clear, it is poured off by gently inclining the veſſel, that the ſediment may not be diſturbed; and the paſte is thrown into large moulds proper for drying it. Before it is entirely hard, it is divided into ſmall ſquare cakes, which are ſold by the hundred. The colour of this paſte, and its form, have occaſioned it to receive the name of *pe-tun-tſe*.

The koa-lin, which is uſed in the compoſition of porcelain, requires leſs labour than the pe-tun-tſe. Nature has a greater ſhare in the preparation of it. There are large mines of it in the boſoms of certain mountains, the exterior ſtrata of which conſiſt of a kind of red earth. Theſe mines are very deep, and the kao-lin is found in ſmall lumps, that are formed into bricks after having gone through the ſame proceſs as the pe-tun-tſe. Father d'Entrecolles thinks, that the earth called *terre de Malte*, or St Paul's earth, has much affinity to the kao-lin, although thoſe ſmall ſhining particles are not obſerved in it which are interſperſed in the latter.

It is from the kao-lin that fine porcelain derives all its ſtrength; if we may be allowed the expreſſion, it ſtands it inſtead of nerves. It is very extraordinary, that a ſoft earth ſhould give ſtrength and conſiſtency to the pe-tun-tſe, which is procured from the hardeſt rocks. A rich Chineſe merchant told F. d'Entrecolles, that the Engliſh and Dutch had purchaſed ſome of the pe-tun-tſe, which they tranſported to Europe with a deſign of making porcelain; but having carried with them none of the kao-lin, their attempt proved abortive, as they have ſince acknowledged. "They wanted (ſaid this Chineſe, laughing) to form a body, the fleſh of which would ſupport itſelf without bones."

8 A new ſubſtance diſcovered and uſed by the Chineſe.

The Chineſe have diſcovered, within theſe few years, a new ſubſtance proper to be employed in the compoſition of porcelain. It is a ſtone, or rather ſpecies of chalk, called *hoa-che*, from which the phyſicians prepare a kind of draught that is ſaid to be deterſive, aperient, and cooling. The manufacturers of porcelain have thought proper to employ this ſtone inſtead of kao-lin. It is called hoa, becauſe it is glutinous, and has a great reſemblance to ſoap. Porcelain made with hoa-che is very rare, and much dearer than any other. It has an exceeding fine grain, and, with regard to the painting, if it be compared with that of the common porcelain, it appears to ſurpaſs it as much as vellum does paper. This porcelain is, beſides, ſo light, that it ſurpriſes thoſe who are accuſtomed to handle other kinds; it is alſo much more brittle; and it is very difficult to hit upon the proper degree of tempering it.

Hoa-che is ſeldom uſed in forming the body of the work; the artiſt is contented ſometimes with making it into a very fine ſize, in which the veſſel is plunged when dry, in order that it may receive a coat before it is painted and varniſhed: by theſe means it acquires a ſuperior degree of beauty.

When hoa-che is taken from the mine, it is waſhed in rain or river water, to ſeparate it from a kind of yellow earth which adheres to it. It is then pounded, put into a tub filled with water to diſſolve it, and afterwards formed into cakes like kao-lin. We are aſſured that hoa-che, when prepared in this manner, without the mixture of any other earth, is alone ſufficient to make porcelain. It ſerves inſtead of kao-lin; but it is much dearer. Kao-lin coſts only ten-pence Sterling; the price of hoa-che is half-a-crown: this difference, therefore, greatly enhances the value of porcelain made with the latter.

9
The ſplendor and whiteneſs of their porcelain derived from oil or varniſh.

To pe-tun-tſe and kao-lin, the two principal elements, muſt be added the oil or varniſh from which it derives its ſplendor and whiteneſs. This oil is of a whitiſh colour, and is extracted from the ſame kind of ſtone which produces the pe-tun-tſe, but the whiteſt is always choſen, and that which has the greeneſt ſpots. The oil is obtained from it by the ſame proceſs uſed in making the pe-tun-tſe: the ſtone is firſt waſhed and pulverized; it is then thrown into water, and after it has been purified it throws up a kind of cream. To 100 pounds of this cream is added one pound of che-kao, a mineral ſomething like alum, which is put into the fire till it becomes red-hot and then pounded. This mineral is a kind of runnet, and gives a conſiſtence to the oil, which is however carefully preſerved in its ſtate of fluidity. The oil thus prepared is never employed alone, another oil muſt be mixed with it, which is extracted from lime and fern aſhes, to 100 pounds of which is alſo added a pound of che-kao. When theſe two oils are mixed, they muſt be equally thick; and in order to aſcertain this, the workmen dip into each of them ſome cakes of the pe-tun-tſe, and by inſpecting their ſurfaces cloſely after they are drawn out, thence judge of the thickneſs of the liquors. With regard to the quantity neceſſary to be employed, it is uſual to mix 10 meaſures of ſtone-oil with one meaſure of the oil made from lime and fern aſhes.

10
Their mode of mixing the ſubſtances.

The firſt labour conſiſts in again purifying the pe-tun-tſe and the kao-lin. The workmen then proceed to mix theſe two ſubſtances together. For fine porcelain they put an equal quantity of the kao-lin and the pe-tun-tſe; for the middling ſort they uſe four parts of the kao-lin and ſix of the pe-tun-tſe. The leaſt quantity put of the former is one part to three of the pe-tun-tſe. When this mixture is finiſhed, the maſs is thrown into a large pit, well paved and cemented in every part; it is then trod upon, and kneaded until it becomes hard. This labour is ſo much the more fatiguing, as it muſt be continued without intermiſſion: were it interrupted, all the other labourers would remain unemployed. From this maſs, thus prepared, the workmen detach different pieces, which they ſpread out upon large ſlates, where they knead and roll them in every direction, carefully obſerving to leave no vacuum in them, and to keep them free from the mixture of any extraneous body. A hair or a grain of ſand would ſpoil the whole work. When this paſte has not been properly prepared, the porcelain cracks, and melts or becomes warped.

11
And of faſhioning the works.

All plain works are faſhioned with the wheel. When a cup has undergone this operation, the outſide of its bottom is quite round. The workman firſt gives it the requiſite height and diameter, and it comes from his hands almoſt the moment he has received it. He is under the neceſſity of uſing expedition, as he is paid not quite a farthing per board, and each board contains 26 pieces. This cup paſſes then to a ſecond workman, who forms its baſe. A little after it is delivered to a third, who applies it to his mould, and gives it a proper form; when he takes it off the mould, he muſt turn it very ſoftly, and be careful not to preſs it more on one ſide than on another; without this precaution it would become warped or disfigured. A fourth workman poliſhes it with a chiſſel, eſpecially around the edges, and diminiſhes its thickneſs, in order to give it a certain degree of tranſparency. At length, after having paſſed through all the hands neceſſary for giving it all its ornaments, it is received, when dry, by the laſt workman, who faſhions its bottom with a chiſſel. It is aſtoniſhing to ſee with what dexterity and expedition the workmen convey theſe vaſes from one to another. We are aſſured, that a piece of porcelain, before it is finiſhed, muſt paſs through the hands of 70 perſons.

12
Large works executed in parts and cemented.

Large works are executed in parts which are faſhioned ſeparately. When all the pieces are finiſhed, and almoſt dry, they are put together and cemented with paſte made of the ſame ſubſtance, and ſoftened with water. Some time after, the ſeams are poliſhed with a knife, both without and within; and when the veſſel is covered with varniſh, it entirely conceals them, ſo that the leaſt trace of them is not to be ſeen. It is in this manner that ſpouts, handles, rings, and other parts of the ſame nature, are added. This is the caſe, particularly in thoſe pieces which are faſhioned upon moulds or modelled with the hands, ſuch as emboſſed works, groteſque images, idols, figures of trees or animals, and buſts, which the Europeans order. All theſe are formed of four or five pieces joined together, which are afterwards brought to perfection with inſtruments proper for carving, poliſhing, and finiſhing, the different traces which the mould has left imperfect. With regard to thoſe flowers and ornaments which are not in relief, they are either engraven or imprinted with a ſtamp. Ornaments in relief prepared ſeparately, are alſo added to pieces of porcelain, almoſt in the ſame manner as lace is put upon a coat.

13
Their manner of painting porcelain;

After a piece of porcelain has been properly faſhioned, it then paſſes into the hands of the painters. Theſe hoa-pei, or painters in porcelain, are equally indigent as the other workmen; they follow no certain plan in their art, nor are they acquainted with any of the rules of drawing; all their knowledge is the effect of practice, aſſiſted by a whimſical imagination. Some of them, however, ſhow no inconſiderable ſhare of taſte in painting flowers, animals, and landſcapes, on porcelain, as well as upon the paper of fans, and the ſilk uſed for filling up the ſquares of lanterns. The labour of painting, in the manufactories of which we have ſpoken, is divided among a great number of hands. The buſineſs of one is entirely confined to tracing out the firſt coloured circle, which ornaments the brims of the veſſel; another deſigns the flowers, and a third paints them; one delineates waters and mountains, and another birds and other animals: human figures are generally the worſt executed.

14 And of making it appear covered with veins.

The tſou-you, which is a kind of oil procured from white flint, has the peculiar property of making thoſe pieces of porcelain upon which it is laid appear to be covered with an infinitude of veins in every direction; at a diſtance one would take them for cracked vaſes, the fragments of which have not been diſplaced. The colour communicated by this oil is a white, ſomewhat inclining to that of aſhes. If it be laid upon porcelain, entirely of an azure blue, it will appear in the ſame manner to be variegated with beautiful veins. This kind of porcelain is called *tſoui-ki*.

25 A ſingular ſecret which they have now loſt.

The Chineſe make vaſes alſo ornamented with a kind of fret-work, perforated in ſuch a manner as to reſemble very fine lace. In the middle is placed a cup proper for holding any liquid; and this cup makes only one body with the former, which appears like lace wrapped round it. The Chineſe workmen had formerly the ſecret of making a ſtill more ſingular kind of porcelain: they painted upon the ſides of the veſſel fiſhes, inſects, and other animals, which could not be perceived until it was filled with water. This ſecret is in a great meaſure loſt: the following part of the proceſs is, however, preſerved. The porcelain, which the workman intends to paint in this manner, muſt be extremely thin and delicate. When it is dry the colour is laid on pretty thick, not on the outſide, as is generally done, but on the inſide. The figures painted upon it, for the moſt part, are fiſhes, as being more analogous to the water with which the veſſel is filled. When the colour is thoroughly dry, it is coated over with a kind of ſize, made from porcelain-earth; ſo that the azure is entirely incloſed between two laminæ of earth. When the ſize becomes dry, the workmen pours ſome oil into the veſſel, and afterwards puts it upon a mould aad applies it to the lath. As this piece of porcelain has received its conſiſtence and body within, it is made as thin on the outſide as poſſible, without penetrating to the colour; its exterior ſurface is then dipped in oil, and when dry it is baked in a common furnace. The art of making theſe vaſes requires the moſt delicate care, and a dexterity which the Chineſe perhaps do not at preſent poſſeſs. They have, however, from time to time made ſeveral attempts to revive the ſecret of this magic painting, but their ſucceſs has been very imperfect. This kind of porcelain is known by the name of *kia-tſing*, "preſſed azure."

16 Their mode of baking porcelain

After the porcelain has received its proper form, its colours, and all the intended ornaments, it is tranſported from the manufactory to the furnace, which is ſituated ſometimes at the other end of King te-tching. In a kind of portico, which is erected before it, may be ſeen heaps of boxes and caſes made of earth, for the purpoſe of incloſing the porcelain. Each piece, however inconſiderable it may be, has its caſe; and the Chineſe workman, by this procedure, imitates nature, which, in order to bring the fruits of the earth to proper maturity, clothes them in a covering, to defend them from the exceſſive heat of the ſun during the day, and from the ſeverity of the cold during the night.

In the bottom of theſe boxes is put a layer of fine ſand, which is covered over with powder of the kao-lin, to prevent the ſand from adhering too cloſely to the bottom of the veſſel. The piece of porcelain is then placed upon this bed of ſand, and preſſed gently down, in order that the ſand may take the form of the bottom of the veſſel, which does not touch the ſides of its caſe: the caſe has no cover. A ſecond, prepared in the ſame manner, and containing its veſſel, is fitted into the firſt, ſo that it entirely ſhuts it, without touching the porcelain which is below; and thus the furnace is filled with piles of caſes, which defend the pieces they contain from the too direct action of the fire.

With regard to ſmall pieces of porcelain, ſuch as tea-cups, they are incloſed in common caſes about four inches in height. Each piece is placed upon a ſaucer of earth about twice as thick as a crown-piece, and equal in breadth to its bottom. Theſe ſmall baſes are alſo ſprinkled over with the duſt of the kao-lin. When the caſes are large, the porcelain is not placed in the middle, becauſe it would be too far removed from the ſides, and conſequently from the action of the fire.

Theſe piles of caſes are put into the furnace, and placed upon a bed of coarſe ſand, half a foot in thickneſs; thoſe which occupy the middle ſpace are at leaſt ſeven feet high. The two boxes which are at the bottom of each pile remain empty, becauſe the fire acts too feebly upon them, and becauſe they are partly covered by the ſand. For the ſame reaſon, the caſe placed at the top of each pile is alſo ſuffered to be empty. The piles which contain the fineſt porcelain are placed in the middle part of the furnace, the coarſeſt are put at its farther extremity; and thoſe pieces which have the moſt body and the ſtrongeſt colouring are near its mouth.

Theſe different piles are placed very cloſely in the furnace; they ſupport each other mutually by pieces of earth, which bind them at the top, bottom, and middle; but in ſuch a manner that a free paſſage is left for the flame to inſinuate itſelf everywhere around them.

17 Nature of their furnaces.

Before each of theſe furnaces for baking porcelain there is a long porch, which conveys air, and ſupplies in certain reſpects the place of a bellows. It ſerves for the ſame purpoſes as the arch of a glaſshouſe. "Theſe furnaces (ſays Father d'Entrecolles), which were formerly only ſix feet in height and the ſame in length, are conſtructed now upon a much larger plan: at preſent they are two fathoms in height, and almoſt four in breadth; and the ſides and roof are ſo thick, that one may lay the hand upon them without being incommoded by the heat. The dome or roof is ſhaped like a funnel, and has a large aperture at the top, through which clouds of flame and ſmoke inceſſantly iſſue. Beſides this principal aperture, there are five others ſmaller, which are covered with broken pots, but in ſuch a manner that the workman can increaſe or diminiſh the heat according as it may be found moſt convenient: through theſe alſo he is enabled to diſcover when the porcelain is ſufficiently baked. Having uncovered that hole which is neareſt the principal aperture, he takes a pair of pincers, and opens one of the caſes: if he obſerves a bright fire in the furnace, if all the caſes be red-hot, and if the colours of the porcelain appear with full luſtre, he judges that it is in a proper ſtate; he then diſcontinues the fire, and entirely cloſes up the mouth of the furnace for ſome time. In the bottom of the furnace there is a deep hearth about two feet in breadth, over which a plank is laid, in order that the workman may enter to arrange the porcelain. When the fire is kindled on this hearth, the mouth of the furnace is immediately cloſed up, and an aperture is left only ſufficient for the admiſſion of faggots about a foot in length, but very narrow. The furnace is firſt heated for a day and night; after which two men keep continually throwing wood into it, and relieve each other by turns: 180 loads are generally conſumed for one baking. As the porcelain is burning hot, the workman employs for the purpoſe of taking it out long ſcarfs or pieces of cloth, which are ſuſpended from his neck."

18 Their different claſſes of porcelain.

The Chineſe divide their porcelain into ſeveral claſſes, according to its different degrees of fineneſs and beauty. The whole of the firſt is reſerved for the emperor. None of theſe works ever come into the hands of the public, unleſs they have blemiſhes or imperfections which render them unworthy of being preſented to the ſovereign. It is much to be doubted whether any of the largeſt and fineſt porcelain of China has ever been brought to Europe; the miſſionaries at leaſt aſſure us that none of that kind is ſold at Canton. The Chineſe ſet ſome value upon the Dreſden porcelain, and ſtill more upon that which comes from the manufactories of France.

19 Porcelain firſt examined ſcientifically by Reaumur.

The illuſtrious Reaumur firſt attended to the manufacture of porcelain as a ſcience, and communicated his reſearches in two memoirs before the Academy of Sciences in 1727 and 1729. He did not ſatiſfy himſelf with conſidering the external appearance, the painting and gilding, which are only ornaments not eſſential to the porcelain, but he endeavoured to examine it internally; and having broken pieces of the Japaneſe, Saxon, and French porcelains, he examined the difference of their grains (which name is given to their internal ſtructure). The grain of the Japaneſe porcelain appeared to him to be fine, cloſe, compact, moderately ſmooth, and ſomewhat ſhining. The grain of the Saxon porcelain was found to be ſtill more campact, not granulous, ſmooth, ſhining like enamel. Laſtly, the porcelain of St Cloud had a grain much leſs cloſe and fine than that of Japan; not, or but little, ſhining; and reſembling the grain of ſugar.

20 Different kinds of it.

From theſe firſt obſervations Mr Reaumur perceived that porcelains differed conſiderably. That he might examine them further, he expoſed them to a violent heat. More eſſential differences than theſe of the grain appeared upon this trial; for the Japaneſe porcelain was unalterable by the fire, and all the European were melted.

21 Its true compoſition diſcovered by Reaumur.

This eſſential difference betwixt the Japaneſe and European porcelains ſuggeſted to Mr Reaumur a very ingenious thought, and in many reſpects true, concerning the nature of porcelain in general. As all porcelains ſomewhat reſemble glaſs in conſiſtence and tranſparency, though they are leſs compact and much leſs tranſparent, Mr Reaumur conſidered them as ſemivitrifications. But every ſubſtance may appear, and may actually be, in a ſemivitrified ſtate in two ways: for, firſt, it may be entirely compoſed of vitrifiable or fuſible matters; and in this caſe, by expoſing it to the action of fire, it will be actually melted or vitrified, if the heat be ſufficiently ſtrong and long continued. But as this change is not made inſtantly eſpecially when the heat is not very violent; and as it paſſes through different ſtages or degrees, which may be more eaſily obſerved as the heat is better managed: hence, by ſtopping in proper time the application of heat to porcelain made in this manner, we may obtain it in an intermediate ſtate betwixt thoſe of crude earths and of completely vitrified ſubſtances, and alſo poſſeſſed of the ſemitranſparency and of the other ſenſible qualities of porcelain. We know alſo, that if ſuch porcelain be expoſed to a ſtronger degree of heat, it will then be completely fuſed and entirely vitrified. But the European porcelains tried by Mr Reaumur had this fuſibility; from which he concluded, that their compoſition is founded upon the abovementioned principle.

In the ſecond place a paſte of porcelain may be compoſed of fuſible and vitrifiable matter, mixed with a certain proportion of another matter which is abſolutely unfuſible in the fires of our furnaces. We may eaſily perceive, that if ſuch a mixture be expoſed to a heat ſufficient to melt entirely the vitrifiable ingredient, that this matter will actually melt: but as it is intermixed with another matter which does not melt, and which conſequently preſerves its conſiſtency and opacity, the whole muſt form a compound partly opaque and partly tranſparent, or rather a ſemitranſparent maſs; that is, a ſemivitrified ſubſtance or porcelain, but of a kind very different from the former; for as the fuſible part of this latter has produced all its effect, and as it has been as much fuſed as it can be during the baking of the porcelain, the compound may be expoſed a ſecond time to a more violent fire, without approaching nearer to a complete vitrification, or without departing from its ſtate of porcelain. But as oriental porcelain has preciſely theſe appearances and properties, Mr Reaumur concludes with reaſon, that it is compoſed upon this principle; and he afterwards confirmed his opinion by undeniable facts.

Mr Reaumur examined the pe-tun-tſe and kao-lin of the Chineſe, and having expoſed them ſeparately to a violent fire, he diſcovered that the pe-tun-tſe had fuſed without addition, and that the kao-lin had given no ſign of fuſibility. He afterwards mixed theſe matters, and formed cakes of them, which by baking were converted into porcelain ſimilar to that of China. Mr Reaumur eaſily found, that the pe-tun-tſe of the Chineſe was a hard ſtone of the kind called *vitrifiable*, but much more fuſible than any of thoſe which were known in Europe; and that the kao-lin was a talky matter, reduced to a very fine powder. From that time he hoped to make a porcelain of the ſame kind as the Chineſe with materials found in France. Whether he could not find any materials equal to thoſe of China, particularly that material analogous to the pe-tun-tſe of the Chineſe, or becauſe other occupations prevented the continuance of his reſearches, we do not know; but we find, from his ſecond memoir upon porcelain that he afterwards attempted to make an artificial pe-tun-tſe, by mixing our vitrifiable ſtones with ſalts capable of rendering them fuſible, or even by ſubſtituting for it glaſs ready formed, and by adding to theſe ſuch ſub-

22 Who converted glaſs into a kind of porcelain.

ſtances as he thought might be ſubſtituted for kao-lin. But he probably found he could not execute theſe intentions; for he did not reſume this ſubject from the year 1729 to 1739, when he gave a proceſs for converting common glaſs to a ſingular kind of porcelain, to which he had given his name, and of which an account is given under Chemistry, n° 591—594. See alſo the article *Glass-Porcelain*

23 He is miſtaken in ſome particulars.

Although Mr Reaumur has ſurmounted many difficulties, and has given juſt notions concerning this ſubject, yet he has been miſtaken, or rather miſled, in two important points. His firſt error concerns the Saxon porcelains which he confounds with the other fuſible porcelains made in Europe. Formerly, indeed a porcelain might be made in Saxony, compoſed entirely of fuſible or vitrifiable materials, the vitrification of which was ſtopt in proper time, and which Mr Reaumur had examined. But now we are certainly informed, that all of that country is capable of reſiſting the moſt violent fires without fuſion, as well at leaſt as thoſe of China and Japan. Mr Reaumur might have been miſled by the appearance of the internal texture of this porcelain. For when a piece of it is broken, its internal ſurface does not appear granulous, but compact, uniform, ſmooth, ſhining, and much reſembling white enamel. But this appearance, ſo far from ſhowing that Saxon porcelain is a fuſed or vitrified ſubſtance, proves that it is not entirely compoſed of fuſible matters. All who have conſidered attentively this ſubject know, that the internal ſurface of the moſt fuſible porcelains is alſo the leaſt denſe and leaſt compact; the reaſon of which is, that no vitreous matter can be ſmooth and denſe internally, unleſs it has been completely fuſed. But if the denſity and ſhining appearance of the internal ſurface of the Saxon porcelain were only the effects of the fuſion of a vitreous matter, how could we conceive that veſſels formed of that matter ſhould have ſuſtained the neceſſary fuſion for giving this denſity and ſhining appearance, without having entirely loſt their ſhape? The impoſſibility of this is evident to any perſons who have been converſant in theſe matters and in the fuſion of glaſs.

24 Difference between Saxon and oriental porcelain.

This quality of the Saxon porcelain muſt therefore proceed from another cauſe. Its does indeed contain, as every porcelain does, particularly thoſe of China and Japan, a fuſible ſubſtance, which has been even completely fuſed during the baking. Its denſity alſo, and its internal luſtre, proceed chiefly from this fuſed matter: but we are alſo certain, that it contains a large quantity of a ſubſtance abſolutely unfuſible, from which it receives its admirable whiteneſs, its firmneſs and ſolidity, during the baking; in a word, which ſupplies the place of the oriental kao-lin, and which has the property of contracting its dimenſions conſiderably while it incorporates with the fuſible ſubſtance. If it be ſubjected to the moſt deciſive trial, namely, the action of a violent fire, capable of melting every porcelain compoſed of fuſible matters alone, "I affirm (ſays Mr Macquer), after many experiments, that it cannot be fuſed, unleſs by a fire capable alſo of melting the beſt Japaneſe porcelain." The Saxon porcelain is therefore not to be confounded with thoſe which are vitreous and fuſible; but is in its kind as excellent as that of Japan, and perhaps ſuperior, as we ſhall ſee when we enumerate the qualities which conſtitute the excellence of porcelain. The ſubject of Mr Reaumur's ſecond error, or at leaſt that which he has not ſufficiently explained, is the kao-lin of China. According to him, this matter is a fine talky powder, from the mixture of which with pe-tun-tſe the oriental porcelain is formed. Poſſibly a very finely ground talky ſubſtance mixed with pe-tun-tſe might form a porcelain ſimilar to the oriental; but perſons acquainted with the manufacture of any porcelain muſt perceive the impoſſibility of forming veſſels, unleſs the paſte of which they are made be ſo ductile and tenacious that it may be worked upon a potter's lathe, or at leaſt that it may be moulded. But talks, or any kinds of ſtones, however finely ground, cannot acquire the requiſite tenacity, which clays only, of all known earthy ſubſtances, poſſeſs. The Chineſe porcelain veſſels evidently appear to be turned upon the lathe, ſince they retain the marks of it: hence they muſt have been formed of a very tenacious paſte, and conſequently the kao-lin is not a purely talky matter, but is mixed with clay; or elſe the pe-tun-tſe and kao-lin are not, as Mr Reaumur ſuppoſes, the only ingredients of which Chineſe porcelain is formed, but a ſufficient quantity of ſome binding matter, unknown to Father d'Entrecolles and Mr Reaumur, muſt be alſo added.

Chem. Dict.

25 Manufactories of porcelain in different countries.

Although, ſince Mr Reaumur, no ſcientific perſon has written concerning porcelain, many have attempted to make it. Manufactories have been eſtabliſhed in almoſt all the ſtates of Europe. Beſides that of Saxony, which has been long eſtabliſhed, porcelain is alſo made at Vienna, at Frankendal, and lately in the neighbourhood of Berlin. All theſe German porcelains are ſimilar to the Saxon; and are made of materials of the ſame kind, although they differ ſomewhat from each other. England and Italy alſo have their porcelains, the chief of which are thoſe of Chelſea and of Naples. M. de la Condamine, in his laſt journey into Italy, viſited a manufacture of porcelain eſtabliſhed at Florence by the marquis de la Ginori, then governor of Leghorn. M. de la Condamine obſerved particularly the large ſize of ſome pieces of this porcelain. He ſays he ſaw ſtatues and groups half as large as nature, modelled from ſome of the fineſt antiques. The furnaces in which the porcelain was baked were conſtructed with much art, and lined with bricks made of the porcelain materials. The paſte of this porcelain is very beautiful; and from the grain of broken pieces, it appears to have all the qualities of the beſt Chineſe porcelain. A whiter glazing would be deſirable, which they might probably attain, if the Marquis Ginori was not determined to uſe thoſe materials only which were found in that country.

But in no ſtate of Europe have ſuch attempts been made to diſcover porcelain, or ſo many manufactories of it been eſtabliſhed, as in France. Before even Mr Reaumur had publiſhed on this ſubject, porcelain was made at St Cloud, and in the ſuburb of St Antoine at Paris, which was of the vitreous and fuſible kind, but conſiderably beautiful. Since that time, conſiderable manufactories of it have been eſtabliſhed, at Chantilly, at Villeroi, and at Orleans; the porcelains of which have a diſtiguiſhed merit. But the porcelain produced in the manufacture at Sevres holds at preſent the firſt rank from its ſhining white, its beautiful glazing, and coloured gounds, in which no porcelain has ever equalled it. The magnificence of the gilding, the regularity and elegance of its forms, ſurpaſs every thing of the kind.

26 M. Guettard's diſcoveries.

Mr Guettard has publiſhed an account of his diſcoveries on this ſubject, in the Memoirs of the Academy of Sciences for the year 1765. The kao-lin which he employed was a white argillaceous earth, filled wih mica, which he found in the neighbourhood of Alençon; and his pe-tun-tſe is a hard, quartzoſe, grit ſtone, found abundantly in the ſame country, with which the ſtreets of Alençon are paved. We alſo know that Mr Guettard had begun to make his experiments on porcelain with theſe materials in the year 1751, together with the then Duke of Orleans, to whom he was attached. The Count de Lauraguais, of the Academy of Sciences, engaged in the purſuit of porcelain for ſeveral years with uncommon ardour and conſtancy. He ſpared no trouble nor expence to attain his purpoſe, which was to make porcelain equal in all reſpects to that of China and Japan. He ſhowed ſome pieces made by him in the year 1766 to the members of the Academy of Sciences. The perſons appointed by them to examine it gave their opinion, "that of all the porcelains made in the country, that of the Count de Lauraguais moſt reſembles the porcelain of China and Japan in ſolidity, grain, and unfuſibility." It were to be wiſhed that it poſſeſſed equally the other qualities eſſential to the excellence of porcelain, namely, the whiteneſs and luſtre obſervable in the ancient Japaneſe porcelain.

27 In what the perfection of porcelain conſiſts.

We ſhall now ſhow what thoſe qualities are which conſtitute the perfection of porcelain. We muſt firſt carefully diſtinguiſh the qualities which only contribute to the beauty and external appearance, from the intrinſic and eſſential properties in which the goodneſs and ſolidity of porcelain conſiſt. All perſons who have made experiments in this way have ſoon diſcovered the poſſibility of making compounds very white, beautifully ſemi-tranſparent, and covered with a ſhining glazing; but which cannot be worked for want of tenacity, are not ſufficiently compact, are eſſentially fuſible, are ſubject to break by ſudden application of heat and cold; and, laſtly, the glazing of which cracks, becomes rough, and conſequently loſes its luſtre by uſe, becauſe it is too ſoft.

On the other ſide, we ſhall alſo find it not difficult to compoſe very tenacious paſtes which ſhall be capable of being eaſily worked and well baked; which in the baking ſhall acquire the deſirable hardneſs and denſity; which are unfuſible, and capable of ſuſtaining very well the ſudden change of heat and cold; and, in a word, which ſhall have all the qualities of the moſt excellent porcelain excepting whiteneſs and beauty. We ſhall ſoon ſee that the materials fit for the compoſition of ſuch porcelains may be found abundantly in every country. The only difficulty, then, in this inquiry concerning porcelain, is to unite beauty and goodneſs in one compoſition; and indeed nature ſeems to be very ſparing of materials fit for this purpoſe, and therefore perfect porcelain will always be a dear and valuable commodity.

28 Stone-ware a kind of porcelain.

Thoſe potteries which we call *ſtone-ware* are not of modern invention, and have all the eſſential qualities of the beſt Japaneſe. For if we except whiteneſs, on which alone the ſemi-tranſparency depends, and compare all the properties of Japaneſe porcelain with thoſe of the ſtone-ware, no difference can be found betwixt them. The ſame grain appears internally in both; the ſame ſound is produced by ſtriking them when properly ſuſpended; the ſame denſity, the ſame hardneſs by which they ſtrike fire with ſteel, the ſame faculty of ſuſtaining the heat of boiling liquors without breaking, and the ſame unfuſibility in fire, are obſervable. Laſtly, if the earths of which ſtone-ware is made were free from heterogeneous colouring matters, which prevent their whiteneſs and ſemi-tranſparency; if veſſels were carefully formed; if all the proper attentions were given; and if theſe veſſels were covered over with a fine glazing—they would be as perfect porcelain as that of Japan. The moſt perfect porcelain, therefore, is nothing elſe than a fine white ſtone-ware.

29 Genuine porcelain made in ſome countries of Europe.

Earths of this kind are probably more rare in Europe than in Japan and China. And probably alſo the want of theſe earths was the cauſe that the firſt makers of porcelain in Britain confined themſelves to an external imitation, by employing nothing but vitrifiable matters with fuſible ſalts and a ſmall quantity of white earth, from which fuſible and vitreous porcelains were compoſed, which might be called *falſe porcelains*. But things are much changed ſince theſe firſt attempts. Beſides the diſcoveries of the Count de Lauraguais and of Mr Guettard, genuine white porcelains have been made a long time ago in Germany, eſpecially in Saxony and at Frankendal.

Theſe porcelains are not inferior in any reſpect to the oriental; they are even much ſuperior in beauty and whiteneſs to the modern oriental porcelain, which has much degenerated in theſe reſpects; they ſeem even to excel the oriental in the moſt valuable quality of porcelain, namely, the property of ſuſtaining the ſudden change of heat and cold. We cannot judge of the quality of porcelain by a ſlight trial: for ſo many circumſtances concur to make a piece of porcelain capable or incapable of ſuſtaining the ſudden application of heat and of cold, that if at the ſame time boiling water be poured into two veſſels, one of which is good porcelain and the other bad, the former may poſſibly break and the latter remain entire. The only true method of diſcovering good porcelain in this reſpect is, to examine ſeveral pieces of it which are daily uſed; for inſtance, a ſet of coffee-cups. But it has been obſerved, that in many ſuch pieces of oriental porcelain, which have been long and daily uſed, cracks in the direction of their height may be always perceived, which are never ſeen in the good European porcelains.

30 Excellency of the ancient Japaneſe porcelain.

Every one talks of porcelain, and yet few are connoiſſeurs of it. None can be conſidered as ſuch but thoſe who have long made it an object of their inquiries. That the ancient Japaneſe porcelain is the moſt perfect is a general opinion. This porcelain is indeed very beautiful, and we muſt alſo acknowledge that its quality is excellent. It has been the Britiſh model, and has long been the object of their admiration and emulation; but which they have been never able to equal, and which many perſons believe never can be equalled. Some perſons even decry the Saxon porcelain for a quality which really gives it a ſuperiority to the Japaneſe, namely, the greater ſmoothneſs, luſtre, and leſs granulous appearance of its internal ſurface than the oriental. The reſemblance of this ſurface to that of glaſs has evidently ſuggeſted this notion; and it would be well founded if the denſity and luſtre of this porcelain proceeded only from a fuſible and vitreous quality; but as they do not, and as this porcelain is as fixed and as unfuſible as the Japaneſe, its denſity, ſo far from being a fault, is a valuable quality: for we muſt allow, that of porcelains equal in other reſpects, thoſe are beſt which are moſt firm and compact. Hence the interior ſubſtance of the Japaneſe porcelain is eſteemed for its greater denſity, compactneſs, and luſtre, than the vitreous ſand or fritt porcelains; becauſe theſe qualities indicate greater coheſion, and more intimate incorporation of its parts. For the ſame reaſon alſo the ſuperior denſity of the Saxon porcelain ought to give it the preference to the Japaneſe. Beſides, nothing would be eaſier than to give the Saxon porcelain the granulous texture of the Japaneſe, by mixing with the paſte a certain quantity of ſand. But the perſons who perfected that manufacture were certainly ſenſible that ſuch a conformity to the Japaneſe porcelain would leſſen the merit of theirs: for we know, that in general porcelains are better in proportion as they contain a larger proportion of clay or earth, and leſs of ſand, flints, or other matters of that kind.

What we have ſaid concerning porcelain in general, and the principal kinds of it, ſeem ſufficient to give juſt notions of it, if not to perſons who without conſidering the ſubject are determined to prefer the moſt ancient, to thoſe, at leaſt, who have made experiments on this ſubject, or who, having a ſufficient knowledge of chemiſtry, are capable of ſtudying and examining it thoroughly. We ſhall finiſh this article by giving a ſhort deſcription of the method of manufacturing porcelain as practiſed in Europe.

31 Of making fuſible or vitreous porcelains.

The baſis of the porcelains which we have called *fuſible, vitreous*, or *falſe porcelains*, is called by artiſts a *fritt;* which is nothing elſe than a mixture of ſand or of powdered flints, with ſalts capable of diſpoſing them to fuſion, and of giving them a great whiteneſs by means of a ſufficient heat. This fritt is to be then mixed with as much, and no more, of a white tenacious earth of an argillaceous or marly nature, than is ſufficient to make it capable of being worked upon the wheel. The whole mixture is to be well ground together in a mill, and made into a paſte, which is to be formed, either upon the wheel or in moulds, into pieces of ſuch forms as are required.

Each of theſe pieces, when dry, is to be put into a caſe made of earthen ware (A); which caſes are to be ranged in piles one upon another, in a furnace or kiln, which is to be filled with theſe to the roof. The furnaces are chambers or cavities of various forms and ſizes; and are ſo diſpoſed, that their fire-place is placed on the outſide oppoſite to one or more openings, which communicate within the furnace. The flame of the fuel is drawn within the furnace, the air of which rareſying, determines a current of air from without inwards, as in all furnaces. At firſt a very little fire is made, that the furnace may be heated gradually, and is to be increaſed more and more till the porcelain is baked, that is, till it has acquired its proper hardneſs and tranſparency; which is known by taking out of the furnace from time to time, and examining, ſmall pieces of porcelain, placed for that purpoſe in caſes which have lateral openings. When theſe pieces ſhow that the porcelain is ſufficiently baked, the firſt is no longer to be ſupplied with fuel, the furnace is to be cooled, and the porcelain taken out, which in this ſtate reſembles white marble not having a ſhining ſurface, which is afterwards to be given by covering them with a vitreous compoſition called the *glazing*.

32 Porcelain ſculptures.

The porcelain when baked and not glazed is called *biſcuit*, which is more or leſs beautiful according to the nature of the porcelain. The manufacture of Sévres excels all others in this reſpect, and it is therefore the only one which can produce very fine pieces of ſculpture; that is, in which all the fineneſs of the workmanſhip is preſerved, and which are preferable in ſmoothneſs and whiteneſs to the fineſt marble in Italy.

As no piece of ſculpture of this kind can preſerve all the delicacy of its workmanſhip when covered with a glazing, and as ſculptors avoid poliſhing their marble figures, becauſe the luſtre of the poliſh is diſadvantageous; therefore, in the manufactures of Sévres, all figures or little ſtatues, and even ſome ornamental vaſes, are left in the ſtate of biſcuit. The other pieces of porcelain are to be glazed in the following manner.

33 Method of glazing or colouring porcelain.

A glaſs is firſt to be compoſed ſuited to the nature of the porcelain to which it is to be applied; for every glaſs is not fit for this purpoſe. We frequently find that a glaſs which makes a fine glazing for one porcelain ſhall make a very bad glazing for another porcelain; ſhall crack in many places, ſhall have no luſtre, or ſhall contain bubbles. The glazing, then, muſt be appropriated to each porcelain, that is, to the hardneſs and denſity of the ware, and to the ingredients of its compoſition, &c.

Theſe glazings are prepared by previouſly fuſing together all the ſubſtances of which they conſiſt, ſo as to form vitreous maſſes. Theſe maſſes are to be ground very finely in a mill. This vitreous powder is to be mixed with a ſufficient quantity of water, or other proper liquor, ſo that the mixture ſhall have the conſiſtence of cream of milk. The pieces of porcelain are to be covered with a thin ſtratum of this matter; and when very dry, they are to be again put into the furnace in the ſame manner as before for the forming of the biſcuit, and to be continued there till the glazing be well fuſed. The neceſſary degree of fire for fuſing the glazing is much leſs than that for baking the paſte.

The pieces of porcelain which are intended to remain white are now finiſhed; but thoſe which are to be painted and gilded muſt undergo further operations. The colours to be applied are the ſame as thoſe uſed for enamel painting. They all conſiſt of metallic calces bruiſed and incorporated with a very fuſible glaſs. Crocus

---

(A) The caſes are called by Engliſh potters *ſeggars*. They are generally formed of coarſer clays, but which muſt be alſo capable of ſuſtaining the heat required without fuſion. By means of theſe caſes the contained porcelain is preſerved from the ſmoke of the burning fuel. The whiteneſs of the porcelain depends much on their compactneſs of texture, by which the ſmoke is excluded, and on the purity of the clay of which they are made.

cus of iron furniſhes a red colour; gold * precipitated by tin makes the purple and violet; copper calcined by acids and precipitated by an alkali gives a fine green; zaffre makes the blue; earths ſlightly ferruginous produce a yellow; and, laſtly, brown and black colours are produced by calcined iron, together with a deep blue of zaffre. Theſe colours being ground with gum-water, or with oil of ſpike, are to be employed for the painting of the porcelain with deſigns of flowers and other figures. For gilding, a powder or calx of gold is to be applied in the ſame manner as the coloured enamels. The painted and gilded porcelains are to be then expoſed to a fire capable of fuſing the glaſs, with which the metallic colours are mixed. Thus the colours are made to adhere, and at the ſame time acquire a gloſs equal to that of the glazing. The gold alone has not then a ſhining appearance, which muſt be afterwards given to it by burniſhing with a blood-ſtone.

* See Chemiſtry, n° 227.

34 Preparation of unfuſible porcelain.

The operations for the unfuſible porcelains, and alſo for ſuch as are of the nature of ſtone-ware, are ſomewhat more ſimple. The ſands and ſtones which enter into their compoſition are to be ground in a mill: the earths or clays are to be waſhed: the materials are to be well mixed, and formed into a paſte: the pieces are firſt rudely formed upon a potter's wheel; and when dry, or half dry, they are turned again upon the wheel, and their form is made more perfect: they are then placed in the furnace; not to bake them, but only to apply a ſufficient heat to give them ſuch a ſolidity that they may be handled without breaking, and may receive the glazing. As the pieces of porcelain after this ſlight heat are very dry, they imbibe water readily. This diſpoſition aſſiſts the application of the glazing. The vitrifiable or vitrified matter of this glazing, which has been previouſly ground in a mill, is to be mixed with ſuch a quantity of water, that the liquor ſhall have the conſiſtence of milk. The pieces of porcelain are haſtily dipt in this liquor, the water of which they imbibe, and thus on their ſurface is left an uniform covering of the glazing materials. This covering, which ought to be very thin, will ſoon become ſo dry, that it cannot ſtick to the fingers when the pieces are handled.

The pieces of this porcelain are then put into the furnace to be perfectly baked. The heat is to be raiſed to ſuch a height, that all within the furnace ſhall be white, and the caſes ſhall be undiſtinguiſhable from the flame. When, by taking out ſmall pieces, the porcelain is known to be ſufficiently baked, the fire is diſcontinued, and the furnace cooled. If the baking has been well performed, the pieces of porcelain will be found by this ſingle operation to be rendered compact, ſonorous, cloſe-grained, moderately gloſſy, and covered externally with a fine glazing. The painting and gilding of this porcelain are to be executed in a manner ſimilar to that already deſcribed.

Porcelain-Shell, a ſpecies of Cypræa.

PORCH, in architecture, a kind of veſtibule ſupported by columns; much uſed at the entrance of the ancient temples, halls, churches, &c.

A porch, in the ancient architecture, was a veſtibule, or a diſpoſition of inſulated columns uſually crowned with a pediment, forming a covert place before the principal door of a temple or court of juſtice. Such is that before the door of St Paul's, Covent-Garden, the work of Inigo Jones. When a porch had four columns in front, it was called a *tetraſtyle*; when ſix, *hexaſtyle*; when eight, *octoſtyle*, &c.

Porch, in Greek στοα, a public portico in Athens adorned with the pictures of Polygnotus and other eminent painters. It was in this portico that Zeno the philoſopher taught; and hence his followers were called *Stoics*. See Stoics and Zeno.

PORCUPINE, in zoology. See Hystrix.

Porcupine-Man, the name by which one Edward Lambert, who had a diſtempered ſkin, went in London. We have the following account of him in the Philoſophical Tranſactions for 1755, by Mr Henry Baker, F. R. S. "He is now (ſays he) 40 years of age, and it is 24 years ſince he was firſt ſhown to the ſociety. The ſkin of this man, except on his head and face, the palms of his hands, and the ſoles of his feet, is covered with excreſcences that reſemble an innumerable company of warts, of a brown colour and cylindrical figure; all riſing to an equal height, which is about an inch, and growing as cloſe as poſſible to each other at their baſis; but ſo ſtiff and elaſtic as to make a ruſtling noiſe when the hand is drawn over them. Theſe excreſcences are annually ſhed, and renewed in ſome of the autumn or winter months. The new ones, which are of a paler colour, gradually riſe up from beneath as the old ones fall off; and at this time it has been found neceſſary for him to loſe a little blood, to prevent a ſlight ſickneſs which he had been uſed to ſuffer before this precaution was taken. He has had the ſmallpox, and he has been twice ſalivated, in hopes to get rid of this diſagreeable covering; but though juſt when the puſtules of the ſmallpox had ſcaled off, and immediately after his ſalivations, his ſkin appeared white and ſmooth, yet the excreſcences ſoon returned by a gradual increaſe, and his ſkin became as it was before. His health, during his whole life, has been remarkably good: but there is one particular of this caſe more extraordinary than all the reſt; this man has had ſix children, and all of them had the ſame rugged covering as himſelf, which came on like his own about nine weeks after the birth. Of theſe children only one is now living, a pretty boy, who was ſhewn with his father. It appears, therefore, as Mr Baker remarks, that a race of people might be propagated by this man, as different from other men as an African is from an Engliſhman; and that if this ſhould have happened in any former age, and the accidental original have been forgotten, there would be the ſame objections againſt their being derived from the ſame common ſtock with others: it muſt therefore be admitted poſſible, that the differences now ſubſiſting between one part of mankind and another may have been produced by ſome ſuch accidental cauſe, long after the earth has been peopled by one common progenitor."

PORE, in anatomy, a little interſtice or ſpace between the parts of the ſkin, ſerving for perſpiration.

PORELLA, in botany; a genus of the natural order of muſci, belonging to the cryptogamia claſs of plants. The antheræ are multilocular, full of natural pores, with an operculum; there is no calyptra, nor pedicle; the capſules contain a powder like thoſe of the other moſſes; and their manner of ſhedding this powder is not by ſeparating into two parts, like thoſe of the ſelago and lycopodium, but by opening into ſeveral holes on all ſides.

PORENTRU, is a town of Swiſſerland, in Elſgaw, and capital of the territory of the biſhop of Baſle. It has a good caſtle, where he reſides. It has in it, however, nothing elſe worth taking notice of, except the cathedral. The biſhop is a prince of the empire. It is ſeated on the river Halle, near mount Jura, 22 miles ſouth of Baſle. E. Long. 7. 2. N. Lat. 47. 34.

PORISM, in geometry, is a name given by the ancient geometers to two claſſes of mathematical propoſitions. Euclid gives this name to propoſitions which are involved in others which he is profeſſedly inveſtigating, and which, although not his principal object, are yet obtained along with it, as is expreſſed by their name *poriſmata*, "acquiſitions." Such propoſitions are now called *corollaries*. But he gives the ſame name, by way of eminence, to a particular claſs of propoſitions which he collected in the courſe of his reſearches, and ſelected from among many others on account of their great ſubſerviency to the buſineſs of geometrical inveſtigation in general. Theſe propoſitions were ſo named by him, either from the way in which he diſcovered them, while he was inveſtigating ſomething elſe, by which means they might be conſidered as gains or acquiſitions, or from their utility in acquiring farther knowledge as ſteps in the inveſtigation. In this ſenſe they are poriſmata; for πορίζω ſignifies both to inveſtigate and to acquire by inveſtigation. Theſe propoſitions formed a collection, which was familiarly known to the ancient geometers by the name of Euclid's *poriſms*; and Pappus of Alexandria ſays, that it was a moſt ingenious collection of many things conducive to the analyſis or ſolution of the moſt difficult problems, and which afforded great delight to thoſe who were able to underſtand and to inveſtigate them.

Unfortunately for mathematical ſcience, however, this valuable collection is now loſt, and it ſtill remains a doubtful queſtion in what manner the ancients conducted their reſearches upon this curious ſubject. We have, however, reaſon to believe that their method was excellent both in principle and extent, for their analyſis led them to many profound diſcoveries, and was reſtricted by the ſevereſt logic. The only account we have of this claſs of geometrical propoſitions, is in a fragment of Pappus, in which he attempts a general definition of them as a ſet of mathematical propoſitions diſtinguiſhable in kind from all others; but of this diſtinction nothing remains, except a criticiſm on a definition of them given by ſome geometers, and with which he finds fault, as defining them only by an accidental circumſtance, "*Poriſma eſt quod deficit hypotheſi a theoremate locali.*"

Pappus then proceeds to give an account of Euclid's poriſms; but the enunciations are ſo extremely defective, at the ſame time that they refer to a figure now loſt, that Dr Halley confeſſes the fragment in queſtion to be beyond his comprehenſion.

The high encomiums given by Pappus to theſe propoſitions have excited the curioſity of the greateſt geometers of modern times, who have attempted to diſcover their nature and manner of inveſtigation. M. Fermat, a French mathematician of the laſt century, attaching himſelf to the definition which Pappus criticiſes, publiſhed an introduction (for this is its modeſt title) to this ſubject, which many others tried to elucidate in vain. At length Dr Simſon of Glaſgow, by patient inquiry and ſome lucky thoughts, obtained a reſtoration of the poriſms of Euclid, which has all the appearance of being juſt. It preciſely correſponds to Pappus's deſcription of them. All the lemmas which Pappus has given for the better underſtanding of Euclid's propoſitions are equally applicable to thoſe of Dr Simſon, which are found to differ from local theorems preciſely as Pappus affirms thoſe of Euclid to have done. They require a particular mode of analyſis, and are of immenſe ſervice in geometrical inveſtigation; on which account they may juſtly claim our attention.

While Dr Simſon was employed in this inquiry, he carried on a correſpondence upon the ſubject with the late Dr M. Stewart, profeſſor of mathematics in the univerſity of Edinburgh; who, beſides entering into Dr Simſon's views, and communicating to him many curious poriſms, purſued the ſame ſubject in a new and very different direction. He publiſhed the reſult of his inquiries in 1746, under the title of General Theorems, not caring to give them any other name, leaſt he might appear to anticipate the labours of his friend and former preceptor. The greater part of the propoſitions contained in that work are poriſms, but without demonſtrations; therefore, whoever wiſhes to inveſtigate one of the moſt curious ſubjects in geometry, will there find abundance of materials, and an ample field for diſcuſſion.

Dr Simſon defines a poriſm to be "a propoſition, in which it is propoſed to demonſtrate, that one or more things are given, between which, and every one of innumerable other things not given, but aſſumed according to a given law, a certain relation deſcribed in the propoſition is ſhown to take place."

This definition is not a little obſcure, but will be plainer if expreſſed thus: "A poriſm is a propoſition affirming the poſſibility of finding ſuch conditions as will render a certain problem indeterminate, or capable of innumerable ſolutions." This definition agrees with Pappus's idea of theſe propoſitions, ſo far at leaſt as they can be underſtood from the fragment already mentioned; for the propoſitions here defined, like thoſe which he deſcribes, are, ſtrictly ſpeaking, neither theorems nor problems, but of an intermediate nature between both; for they neither ſimply enunciate a truth to be demonſtrated, nor propoſe a queſtion to be reſolved, but are affirmations of a truth in which the determination of an unknown quantity is involved. In as far, therefore, as they aſſert that a certain problem may become indeterminate, they are of the nature of theorems; and, in as far as they ſeek to diſcover the conditions by which that is brought about, they are of the nature of problems.

We ſhall endeavour to make our readers underſtand this ſubject, diſtinctly, by conſidering them in the way in which it is probable they occurred to the ancient geometers in the courſe of their reſearches: this will at the ſame time ſhow the nature of the analyſis peculiar to them, and their great uſe in the ſolution of problems.

It appears to be certain, that it has been the ſolution of problems which, in all ſtates of the mathematical ſciences, has led to the diſcovery of geometrical truths: the firſt mathematical inquiries, in particular, muſt have occurred in the form of queſtions, where ſomething was given, and ſomething required to be done; and by the reaſoning neceſſary to anſwer theſe queſtions, or to diſcover the relation between the things given and thoſe to be found, many truths were ſuggeſted, which came afterwards to be the ſubject of ſeparate demonſtrations.

The number of theſe was the greater, becauſe the ancient geometers always undertook the ſolution of problems, with a ſcrupulous and minute attention, inſomuch that they would ſcarcely ſuffer any of the collateral truths to eſcape their obſervation.

Now, as this cautious manner of proceeding gave an opportunity of laying hold of every collateral truth connected with the main object of inquiry, theſe geometers ſoon perceived, that there were many problems which in certain caſes would admit of no ſolution whatever, in conſequence of a particular relation taking place among the quantities which were given. Such problems were ſaid to become impoſſible: and it was ſoon perceived, that this always happened when one of the conditions of the problem was inconſiſtent with the reſt. Thus, when it was required to divide a line, ſo that the rectangle contained by its ſegments might be equal to a given ſpace, it is evident that this was poſſible only when the given ſpace was leſs than the ſquare of half the line; for when it was otherwiſe, the two conditions defining, the one the magnitude of the line, and the other the rectangle of its ſegments, were inconſiſtent with each other. Such caſes would occur in the ſolution of the moſt ſimple problems; but if they were more complicated, it muſt have been remarked, that the conſtructions would ſometimes fail, for a reaſon directly contrary to that juſt now aſſigned. Caſes would occur, where the lines, which by their interſection were to determine the thing ſought, inſtead of interſecting each other as they did commonly, or of not meeting at all as in the abovementioned caſe of impoſſiblity, would coincide with one another entirely, and of courſe leave the problem unreſolved. It would appear to geometers upon a little reflection, that ſince, in the caſe of determinate problems, the thing required was determined by the interſection of the two lines already mentioned, that is, by the points common to both; ſo in the caſe of their coincidence, as all their parts were in common, every one of theſe points muſt give a ſolution, or, in other words, the ſolutions muſt be indefinite in number.

Upon inquiry, it would be found that this proceeded from ſome condition of the problem having been involved in another, ſo that, in fact, there was but one, which did not leave a ſufficient number of independent conditions to limit the problem to a ſingle or any determinate number of ſolutions. It would ſoon be perceived, that theſe caſes formed very curious propoſitions of an intermediate nature between problems and theorems; and that they admitted of being enunciated in a manner peculiarly elegant and conciſe. It was to ſuch propoſitions that the ancients gave the name of *poriſms*. This deduction requires to be illuſtrated by an example: ſuppoſe, therefore, that it were required to reſolve the following problem.

Plate CCCCXIII.

A circle ABC (fig. 1.), a ſtraight line DE, and a point F, being given in poſition, to find a point G in the ſtraight line DE ſuch, that GF, the line drawn from it to the given point, ſhall be equal to GB, the line drawn from it touching the given circle.

Suppoſe G to be found, and GB to be drawn touching the given circle ABC in B, let H be its centre, join HB, and let HD be perpendicular to DE. From D draw DL, touching the circle ABC in L, and join HL; alſo from the centre G, with the diſtance GB or GF, deſcribe the circle BKF, meeting HD in the points K and K. Then HD and DL are given in poſition and magnitude; and becauſe GB touches the circle ABC, HBG is a right angle; and ſince G is the centre of the circle BKF, therefore HB touches the circle BKF, and $HB^2 =$ the rectangle K′HK; which rectangle $+ DK^2 = HD^2$, becauſe K′K is biſected in D, therefore $HL^2 + KD^2 = DH^2 = HL^2$ and $= LD^2$; therefore $DK^2 = DL^2$, and $DK = DL$; and ſince DL is given in magnitude, DK is alſo given, and K is a given point: for the ſame reaſon K′ is a given point, and the point F being given by hypotheſis, the circle BKP is given by poſition. The point G, the centre of the circle, is therefore given, which was to be found. Hence the conſtruction:

Having drawn HD perpendicular to DE, and DL touching the circle ABC, make DK and DK′ each equal to DL, and find G the centre of the circle deſcribed through the points K′FK; that is, let FK′ be joined and biſected at right angles by MN, which meets DE in G, G will be the point required; that is, if GB be drawn touching the circle ABC, and GF to the given point, GB is equal to GF.

The ſynthetical demonſtration is eaſily derived from the preceding analyſis; but it muſt be remarked, that in ſome caſes this conſtruction fails. For, firſt, if F fall anywhere in DH, as at F′ the line MN becomes parallel to DE, and the point G is nowhere to be found; or, in other words, it is at an infinite diſtance from D.—This is true in general; but if the given point F coincides with K, then MN evidently coincides with DE; ſo that, agreeable to a remark already made, every point of the line DE may be taken for G, and will ſatisfy the conditions of the problem; that is to ſay, GB will be equal to GK, wherever the point G be taken in the line DE, the ſame is true if F coincide with K. Thus we have an inſtance of a problem, and that too a very ſimple one, which in general, admits of but one ſolution; but which, in one particular caſe, when a certain relation takes place among the things given, becomes indefinite, and admits of innumerable ſolutions. The propoſition which reſults from this caſe of the problem is a poriſm, and may be thus enunciated:

"A circle ABC being given by poſition, and alſo a ſtraight line DE, which does not cut the circle, a point K may be found, ſuch, that if G be any point whatever in DE, the ſtraight line drawn from G to the point K ſhall be equal to the ſtraight line drawn from G touching the given circle ABC."

The problem which follows appears to have led to the diſcovery of many poriſms.

A circle ABC (fig. 2.) and two points D, E, in a diameter of it being given, to find a point F in the circumference of the given circle; from which, if ſtraight lines be drawn to the given points E, D, theſe ſtraight lines ſhall have to one another the given ratio of α to β, which is ſuppoſed to be that of a greater to a leſs.—Suppoſe the problem reſolved, and that F is found, ſo that FE has to FD the given ratio of α to β, produce EF towards B, biſect the angle EFD by FL, and DFB by FM: therefore EL : LD :: EF : FD, that is in a given ratio, and ſince ED is given, each of the ſegments EL, LD, is given, and the point L is alſo given; becauſe DFB is biſected by FM, EM : MD : : EF : FD, that is, in a given ratio, and therefore M is given. Since DFL is half of DFE, and DFM half of DFB, therefore LFM is half of (DFE+DFB), therefore LFM is a right angle; and ſince the points L, M, are given, the point F is in the circumference of a circle deſcribed upon LM as a diameter, and therefore given in poſition. Now the point F is alſo in the circumference of the given circle ABC, therefore it is in the interſection of the two given circumferences, and therefore is found. Hence this conſtruction: Divide ED in L, ſo that EL may be to LD in the given ratio of α to β, and produce ED alſo to M, ſo that EM may be to MD in the ſame given ratio of α to β; biſect LM in N, and from the centre N, with the diſtance NL, deſcribe the ſemicircle LFM; and the point F, in which it interſects the circle ABC, is the point required.

The ſynthetical demonſtration is eaſily derived from the preceding analyſis. It muſt, however, be remarked, that the conſtruction fails when the circle LFM falls either wholly within or wholly without the circle ABC, ſo that the circumferences do not interſect; and in theſe caſes the problem cannot be ſolved. It is alſo obvious that the conſtruction will fail in another caſe, viz. when the two circumferences LFM, ABC, entirely coincide. In this caſe, it is farther evident, that every point in the circumference ABC will anſwer the conditions of the problem, which is therefore capable of numberleſs ſolutions, and may, as in the former inſtances, be converted into a poriſm. We now inquire, therefore, in what circumſtances the point L will coincide with A, and alſo the point M with C, and of conſequence the circumference LFM with ABC. If we ſuppoſe that they coincide EA : AD : : α : β : : EC : CD, and EA : EC : : AD : CD, or by converſion EA : AC : : AD : CD—AD : : AD : 2DO, O being the centre of the circle ABC; therefore, alſo, EA : AO : : AD : DO, and by compoſition EO : AO : : AO : DO, therefore $EO \times OD = AO^2$. Hence, if the given points E and D (fig. 3.) be ſo ſituated, that $EO \times OD = AO^2$, and at the ſame time α : β : : EA : AD : : EC : CD, the problem admits of numberleſs ſolutions; and if either of the points D or E be given, the other point, and alſo the ratio which will render the problem indeterminate, may be found. Hence we have this poriſm:

Plate CCCCXIII

"A circle ABC, and alſo a point D being given, another point E may be found, ſuch that the two lines inflected from theſe points to any point in the circumference ABC, ſhall have to each other a given ratio, which ratio is alſo to be found." Hence alſo we have an example of the derivation of poriſms from one another, for the circle ABC, and the points D and E remaining as before (fig. 3.), if, through D, we draw any line whatever HDB, meeting the circle in B and H; and if the lines EB, EH, be alſo drawn, theſe lines will cut off equal circumferences BF, HG. Let FC be drawn, and it is plain from the foregoing analyſis, that the angles DFC, CFB, are equal; therefore if OG, OB, be drawn, the angles BOC, COG, are alſo equal; and conſequently the angles DOB, DOG. In the ſame manner, by joining AB, the angle DBE being biſected by BA, it is evident that the angle AOF is equal to AOH, and therefore the angle FOB to HOG, that is, the arch FB to the arch HG. This propoſition appears to have been the laſt but one in the third book of Euclid's Poriſms, and the manner of its enunciation in the poriſmatic form is obvious.

The preceding propoſition alſo affords an illuſtration of the remark, that the conditions of a problem are involved in one another in the poriſmatic or indefinite caſe; for here ſeveral independent conditions are laid down, by the help of which the problem is to be reſolved. Two points D and E are given, from which two lines are to be inflected, and a circumference ABC, in which theſe lines are to meet, as alſo a ratio which theſe lines are to have to each other. Now theſe conditions are all independent on one another, ſo that any one may be changed without any change whatever in the reſt. This is true in general; but yet in one caſe, viz. when the points are ſo related to one another that their rectangle under their diſtances from the centre is equal to the ſquare of the radius of the circle; it follows from the preceding analyſis, that the ratio of the inflected lines is no longer a matter of choice, but a neceſſary conſequence of this diſpoſition of the points.

From what has been already ſaid, we may trace the imperfect definition of a poriſm which Pappus aſcribes to the later geometers, viz. that it differs from a local theorem, by wanting the hypotheſis aſſumed in that theorem.—Now, to underſtand this, it muſt be obſerved, that if we take one of the propoſitions called *loci*, and make the conſtruction of the figure a part of the hypotheſis, we get what was called by the ancient geometers a *local theorem*. If, again, in the enunciation of the theorem, that part of the hypotheſis which contains the conſtruction be ſuppreſſed, the propoſition thence ariſing will be a poriſm, for it will enunciate a truth, and will require to the full underſtanding and inveſtigation of that truth, that ſomething ſhould be found, viz. the circumſtances in the conſtruction ſuppoſed to be omitted.

Thus, when we ſay, if from two given points E, D, (fig. 3.) two ſtraight lines EF, FD, are inflected to a third point F, ſo as to be to one another in a given ratio, the point F is in the circumference of a given circle, we have a locus. But when converſely it is ſaid, if a circle ABC, of which the centre is O, be given by poſition, as alſo a point E; and if D be taken in the line EO, ſo that $EO \times OD = AO^2$; and if from E and D the lines EF, DF be inflected to any point of the circumference ABC, the ratio of EF to DF will be given, viz. the ſame with that of EA to AD, we have a local theorem.

Laſtly, when it is ſaid, if a circle ABC be given by poſition, and alſo a point E, a point D may be found, ſuch that if EF, FD be inflected from E and D to any point F in the circumference ABC, theſe lines ſhall have a given ratio to one another, the propoſition becomes a poriſm, and is the ſame that has juſt now been inveſtigated.

Hence it is evident, that the local theorem is changed into a poriſm, by leaving out what relates to the determination of D, and of the given ratio. But though all propoſitions formed in this way from the converſion of loci, are poriſms, yet all poriſms are not formed from the converſion of loci; the firſt, for inſtance, of the preceding cannot by converſion be changed into a locus;

therefore Fermat's idea of poriſms, founded upon this circumſtance, could not fail to be imperfect.

To confirm the truth of the preceding theory, it may be added, that profeſſor Dr Stewart, in a paper read a conſiderable time ago before the Philoſophical Society of Edinburgh, defines a poriſm to be "A propoſition affirming the poſſibility of finding one or more conditions of an indeterminate theorem;" where, by an indeterminate theorem, he meant one which expreſſes a relation between certain quantities that are determinate and certain others that are indeterminate; a definition which evidently agrees with the explanations which have been here given.

If the idea which we have given of theſe propoſitions be juſt, it follows, that they are to be diſcovered by conſidering thoſe caſes in which the conſtruction of a problem fails, in conſequence of the lines which by their interſection, or the points which by their poſition, were to determine the problem required, happening to coincide with one another. A poriſm may therefore be deduced from the problem to which it belongs, juſt as propoſitions concerning the *maxima* and *minima* of quantities are deduced from the problems of which they form limitations; and ſuch is the moſt natural and obvious analyſis of which this claſs of propoſitions admits.

The following poriſm is the firſt of Euclid's, and the firſt alſo which was reſtored. It is given here to exemplify the advantage which, in inveſtigations of this kind, may be derived from employing the *law of continuity* in its utmoſt extent, and purſuing poriſms to thoſe extreme caſes where the indeterminate magnitudes increaſe *ad infinitum*.

Plate CCCCXIII

This poriſm may be conſidered as having occurred in the ſolution of the following problem: Two points A, B, (fig. 4.) and alſo three ſtraight lines DE, FK, KL, being given in poſition, together with two points H and M in two of theſe lines, to inflect from A and B to a point in the third, two lines that ſhall cut off from KF and KL two ſegments, adjacent to the given points H and M, having to one another the given ratio of α to β. Now, to find whether a poriſm be connected with this problem, ſuppoſe that there is, and that the following propoſition is true. Two points A and B, and two ſtraight lines DE, FK, being given in poſition, and alſo a point H in one of them, a line LK may be found, and alſo a point in it M, both given in poſition, ſuch that AE and BE inflected from the points A and B to any point whatever of the line DE, ſhall cut off from the other lines FK and LK ſegments HG and MN adjacent to the given points H and M, having to one another the given ratio of α to β.

Firſt, let AE′, BE′, be inflected to the point E′, ſo that AE′ may be parallel to FK, then ſhall E′B be parallel to KL, the line to be found; for if it be not parallel to KL, the point of their interſection muſt be at a finite diſtance from the point M, and therefore making as β to α; ſo this diſtance to a fourth proportional, the diſtance from H at which AE′ interſects FK, will be equal to that fourth proportional. But AE′ does not interſect FK, for they are parallel by conſtruction; therefore BE′ cannot interſect KL, which is therefore parallel to BE′, a line given in poſition. Again, let AE′, BE″, be inflected to E″, ſo that AE′ may paſs through the given point H; then it is plain that BE″ muſt paſs through the point to be found M; for if not, it may be demonſtrated juſt as above, that AE″ does not paſs through H, contrary to the ſuppoſition. The point to be found is therefore in the line E′B, which is given in poſition. Now if from E there be drawn EP parallel to AE′, and ES parallel to BE′, BS : SE : : BL : $LN=\frac{SE\times BL}{BS}$, and AP : PE : : AF : $FG=\frac{PE\times AF}{AP}$; therefore FG : LN : : $\frac{PE\times AF}{AP} : \frac{SE\times BL}{BS}$: : PE × AF × BS : SE × BL × AP; wherefore the ratio of FG to LN is compounded of the ratios of AF to BL, PE to ES, and BS to AP; but PE : SE : : AE′ : BE′, and BS : AP : : DB : DA for DB : BS : : DE′ : E′E : : DA : AP; therefore the ratio of FG to LN is compounded of the ratios of AF to BL, AE′ to BE′, and DB to DA. In like manner, becauſe E″ is a point in the line DE and AE″, BE″ are inflected to it, the ratio of FH to LM is compounded of the ſame ratios of AF to BL, AE′ to BE′, and DB to DA; therefore FH : LM : : FG : NL (and conſequently) : : HG : MN; but the ratio of HG to MN is given, being the ſame as that of α to β; the ratio of FH to LM is therefore alſo given, and FH being given, LM is given in magnitude. Now LM is parallel to BE′, a line given in poſition; therefore M is in a line QM, parallel to AB, and given in poſition; therefore the point M, and alſo the line KLM, drawn through it parallel to BE′, are given in poſition, which were to be found. Hence this conſtruction: From A draw AE′ parallel to FK, ſo as to meet DE in E′; join BE′, and take in it BQ, ſo that $\alpha : \beta$: : HF : BQ, and through Q draw QM parallel to AB. Let HA be drawn, and produced till it meet DE in E″, and draw BE″, meeting QM in M; through M draw KML parallel to BE′, then is KML the line and M the point which were to be found. There are two lines which will anſwer the conditions of this poriſm; for if in QB, produced on the other ſide of B, there be taken B*q*=BQ, and if *q m* be drawn parallel to AB, cutting MB in *m*; and if *m n* be drawn parallel to BQ, the part *m n*, cut off by EB produced, will be equal to MN, and have to HG the ratio required. It is plain, that whatever be the ratio of α to β, and whatever be the magnitude of FH, if the other things given remain the ſame, the lines found will be all parallel to BE′. But if the ratio of α to β remain the ſame likewiſe, and if only the point H vary, the poſition of KL will remain the ſame, and the point M will vary.

Another general remark which may be made on the analyſis of poriſms is, that it often happens, as in the laſt example, that the magnitude required may all, or a part of them, be found by conſidering the extreme caſes; but for the diſcovery of the relation between them, and the indefinite magnitudes, we muſt have recourſe to the hypotheſis of the poriſm in its moſt general or indefinite form; and muſt endeavour ſo to conduct the reaſoning, that the indefinite magnitudes may at length totally diſappear, and leave a propoſition aſſerting the relation between determinate magnitudes only.

For this purpoſe Dr Simſon frequently employs two ſtatements of the general hypotheſis, which he compares together. As for inſtance, in his analyſis of the laſt poriſm,

riſm, he aſſumes not only E, any point in the line DE, but alſo another point O, any where in the ſame line, to both of which he ſuppoſes lines to be inflected from the points A, B. This double ſtatement, however, cannot be made without rendering the inveſtigation long and complicated; nor is it even neceſſary, for it may be avoided by having recourſe to ſimpler *poriſms*, or to *loci*, or to propoſitions of the *data*. The following poriſm is given as an example where this is done with ſome difficulty, but with conſiderable advantage both with regard to the ſimplicity and ſhortneſs of the demonſtration. It will be proper to premiſe the following lemma.

Plate CCCXIII.

Let AB (fig. 7.) be a ſtraight line, and D, L any two points in it, one of which D is between A and B; let CL be any ſtraight line. $\frac{LB}{CL}\cdot AD^2+\frac{LA}{CL}\cdot BD^2=\frac{LB}{CL}AL^2+\frac{LA}{CL}\cdot BL^2+\frac{AB}{CL}\cdot DL^2$. Place CL perpendicular to AB, and through the points A, C, B, deſcribe a circle; and let CL meet it again in E, and join AE, BE. Draw DG parallel to CE, meeting AE and BE in H and G. Draw EK parallel to AB. $CL : LB :: (LA : LE ::)\ LA^2 : LA\times LE=\frac{LB}{CL}LA^2$

$CL : LA :: (LB : LE ::)\ LB^2 : LB\times LE=\frac{LA}{CL}\cdot BL^2$

Now $CL : LB :: LA : LE :: (EK)\ LD : KH$, and $CL : LA :: LB : LE :: (EK)\ LD : KG$; therefore, (V. 24.) $CL : AB :: (LD : GH ::)\ LD^2 : EK\times GH=\frac{AB}{CL}\cdot LD^2$; therefore $\frac{LB}{CL}\cdot LA^2+\frac{LA}{CL}L+\frac{AB}{CL}\cdot LD^2=AB\times LE+EK\times GH$. Again, $CL : LA :: (LB : LE :: DB : DG ::)\ DB^2 : DB\times DG=\frac{LA}{CL}\cdot DB^2$, and $CL : LB :: (LA : LE :: DA : DH ::)\ DA^2 : DA\times DH=\frac{LB}{CL}\cdot DA^2$; therefore $\frac{LB}{CL}DA^2+\frac{LA}{CL}DB^2=AD\times DH+DB\times DG=AB\times LE+EK\times GH$; wherefore $\frac{LB}{CL}DA^2+\frac{LA}{CL}DB^2=\frac{LB}{CL}LA^2+\frac{LA}{CL}LB^2+\frac{AB}{CL}LD^2$. *Q. E. D.*

Let there be three ſtraight lines AB, AC, CB given in poſition (fig. 5.); and from any point whatever in one of them, as D, let perpendiculars be drawn to the other two, as DF, DE, a point G may be found, ſuch, that if GD be drawn from it to the point D, the ſquare of that line ſhall have a given ratio to the ſum of the ſquares of the perpendiculars DF and DE, which ratio is to be found.

Draw AH, BK perpendicular to BC and AC; and in AB take L, ſo that $AL : LB :: AH^2 : BK^2 :: AC^2 : CB^2$. The point L is therefore given; and if N be taken, ſo as to have to AL the ſame ratio that AB has to AH^2, N will be given in magnitude. Alſo, ſince $AH^2 : BK^2 :: AL : LB$, and $AH^2 : AB^2 :: AL : N$, *ex equo* $BK^2 : AB^2 :: LB : N$. Draw LO, LM perpendicular to AC, CB; LO, LM are therefore given in magnitude. Now, becauſe $AB^2 : BK^2 :: AD^2 : DF^2$, $N : LB :: AD^2 : DF^2$, and $DF^2=\frac{LB}{N}\cdot AD^2$; and for the ſame reaſon $DE^2=\frac{AL}{N}\cdot BD^2$; but, by the preceding lemma, $\frac{LB}{N}\cdot AD^2+\frac{AL}{N}\cdot BD^2=\frac{LB}{N}\cdot AL^2+\frac{AL}{N}\cdot BL^2+\frac{AB}{N}\cdot DL^2$; that is, $DE^2+DF^2=LO^2+LM^2+\frac{AB}{N}\cdot DL^2$. Join LG then by hypotheſis LO^2+LM^2, as to LG^2, the ſame ratio as DF^2+DE^2 has to DG^2; let it be that of R to N, then $LO^2+LM=\frac{R}{N}\cdot LG^2$; and therefore $DE^2+DF^2=\frac{R}{N}\cdot LG^2+\frac{AB}{N}\cdot DL^2$; but $DE^2+DF^2=\frac{R}{N}\cdot DG^2$; therefore, $\frac{R}{N}\cdot LG^2+\frac{BA}{N}\cdot DL^2=\frac{R}{N}\cdot DG^2$, and $\frac{AB}{N}\cdot DL^2=\frac{R}{N}(DG^2-LG^2)$; therefore DG^2-LG^2 has to DL a conſtant ratio, viz. that of AB to R. The angle DLG is therefore a right angle, and the ratio of AB to R that of equality, otherwiſe LD would be given in magnitude, contrary to the ſuppoſition. LG is therefore given in poſition; and ſince $R : N :: AB : N :: LO^2+LM^2 : LG^2$; therefore the ſquare of LG, and conſequently LG, is given in magnitude. The point G is therefore given, and alſo the ratio of DE^2+DF^2 to DG^2, which is the ſame with that of AB to N.

The conſtruction eaſily follows from the analyſis, but it may be rendered more ſimple; for ſince $AH^2 : AB^2 :: AL : N$, and $BK^2 : AB^2 :: BL : N$; therefore $AH^2+BK^2 : AB^2 :: AB : N$. Likewiſe, if AG, BG, be joined, $AB : N :: AH^2 : AG^2$, and $AB : N :: BK^2 : BG^2$; wherefore $AB : N :: AK^2+BK^2 : AG^2+BG^2$ and $AG^2+BG^2=AB^2$; therefore the angle AGB is a right one, and $AL : LG :: LG : LB$. If therefore AB be divided in L, ſo that $AL : LB :: AH^2 : BK^2$; and if LG, a mean proportional between AL and LB be placed perpendicular to AB, G will be the point required.

The ſtep in the analyſis, by which a ſecond introduction of the general hypotheſis is avoided, is that in which the angle GLD is concluded to be a right angle; which follows from DG^2-GL^2, having a given ratio to LD^2, at the ſame time that LD is of no determinate magnitude. For, if poſſible, let GLD be obtuſe (fig. 6,) and let the perpendicular from G to AB meet it in V, therefore V is given: and ſince $GD^2-LG^2=LD^2+2DL\times LV$; therefore, by the ſuppoſition, $LD^2+2DL\times LV$ muſt have a given ratio to LD^2; therefore the ratio of LD^2 to $DL\times VL$, that is, of LD to VL, is given, ſo that VL being given in magnitude, LD is alſo given. But this is contrary to the ſuppoſition; for LD is indefinite by hypotheſis, and therefore GLD cannot be obtuſe, nor any other than a right angle. The concluſion here drawn immediately from the indetermination of LD would be deduced according to Dr Simſon's method, by aſſuming another point D' and how, and from the ſuppoſition that $GD^2-GL^2 : LD^2 :: GD'^2-GL^2 : LD'^2$, it would eaſily appear that GLD muſt be a right angle, and the ratio that of equality.

Theſe poriſms facilitate the ſolution of the general problems from which they are derived. For example, let three ſtraight lines AB, AC, BC (fig. 5.), be given in poſi-

poſition, and alſo a point R, to find a point D in one of the given lines, ſo that DE and DF being drawn perpendicular to BC, AC, and DR, joined; DE^2+DF^2 may have to DR^2 a given ratio. It is plain, that having found G, the problem would be nothing more than to find D, ſuch that the ratio of GD^2 to DR^2, and therefore that of GD to DR, might be given, the point D being in the circumference of a given circle, as is well known to geometers.

The ſame poriſm alſo aſſiſts in the ſolution of another problem. For if it were required to find D ſuch that DE^2+DF^2 might be a given ſpace; having found G, DG^2 would have to DE^2+DF^2 a given ratio, and DG would therefore be given; whence the ſolution is obvious.

The connection of this poriſm with the impoſſible caſe of the problem is evident; the point L being that from which, if perpendiculars be drawn to AC and CB, the ſum of their ſquares is the leaſt poſſible. For ſince $DF^2+DE^2 : DG^2 :: LO^2+LM^2 : LG^2 ::$ and ſince LG is leſs than DG, LO^2+LM^2 muſt be leſs than DF^2+DE^2. It is evident from what has now appeared, that in ſome inſtances at leaſt there is a cloſe connection between thoſe propoſitions and the *maxima* or *minima*, and of conſequence the impoſſible caſes of problems. The nature of this connection requires to be farther inveſtigated, and is the more intereſting becauſe the tranſition from the indefinite to the impoſſible caſe ſeems to be made with wonderful rapidity. Thus in the firſt propoſition, though there be not properly ſpeaking an impoſſible caſe, but only one where the point to be found goes off *ad infinitum*, it may be remarked, that if the given point F be anywhere out of the line HD (fig. 1), the problem of drawing GB equal to GF is always poſſible, and admits of juſt one ſolution; but if F be in DH, the problem admits of no ſolution at all, the point being then at an infinite diſtance, and therefore impoſſible to be aſſigned. There is, however, this exception, that if the given point be at K in this ſame line, DH is determined by making DK equal to DL. Then every point in the line DE gives a ſolution, and may be taken for the point G. Here therefore the caſe of numberleſs ſolutions, and of no ſolution at all, are as it were *conterminal*, and ſo cloſe to one another, that if the given point be at K the problem is indefinite; but if it remove ever ſo little from K, remaining at the ſame time in the line DH, the problem cannot be reſolved. This affinity might have been determined *à priori*: for it is, as we have ſeen, a general principle, that a problem is converted into a poriſm when one or when two of the conditions of it neceſſarily involve in them ſome one of the reſt. Suppoſe, then, that two of the conditions are exactly in that ſtate which determines the third; then while they remain fixed or given, ſhould that third one vary or differ ever ſo little from the ſtate required by the other two, a contradiction will enſue: therefore if, in the hypotheſis of a problem, the conditions be ſo related to one another as to render it indeterminate, a poriſm is produced; but if, of the conditions thus related to one another, ſome one be ſuppoſed to vary, while the others continue the ſame, an abſurdity follows, and the problem becomes impoſſible. Wherever, therefore, any problem admits both of an indeterminate and an impoſſible caſe, it is certain, that theſe caſes are nearly related to one another, and that ſome of the conditions by which they are produced are common to both." It is ſuppoſed above, that *two* of the conditions of a problem involve in them a third; and wherever that happens, the concluſion which has been deduced will invariably take place. But a poriſm may in ſome caſes be ſo ſimple as to ariſe from the mere coincidence of *one* condition with another, though in no caſe whatever any inconſiſtency can take place between them. There are, however, comparatively few poriſms ſo ſimple in their origin, or that ariſe from problems where the conditions are but little complicated; for it uſually happens that a problem which can become indefinite may alſo become impoſſible; and if ſo, the connection already explained never fails to take place.

Plate CCCCXIII

Another ſpecies of impoſſibility may frequently ariſe from the poriſmatic caſe of a problem which will affect in ſome meaſure the application of geometry to aſtronomy, or any of the ſciences depending on experiment or obſervation. For when a problem is to be reſolved by help of data furniſhed by experiment or obſervation, the firſt thing to be conſidered is, whether the data ſo obtained be ſufficient for determining the thing ſought: and in this a very erroneous judgment may be formed, if we reſt ſatisfied with a general view of the ſubject; for tho' the problem may in general be reſolved from the data with which we are provided, yet theſe data may be ſo related to one another in the caſe under conſideration, that the problem will become indeterminate, and inſtead of one ſolution will admit of an indefinite number. This we have already found to be the caſe in the foregoing propoſitions. Such caſes may not indeed occur in any of the practical applications of geometry; but there is one of the ſame kind which has actually occurred in aſtronomy. Sir Iſaac Newton, in his *Principia*, has conſidered a ſmall part of the orbit of a comet as a ſtraight line deſcribed with an uniform motion. From this hypotheſis, by means of four obſervations made at proper intervals of time, the determination of the path of the comet is reduced to this geometrical problem: Four ſtraight lines being given in poſition, it is required to draw a fifth line acroſs them, ſo as to be cut by them into three parts, having given ratios to one another. Now this problem had been conſtructed by Dr Wallis and Sir Chriſtopher Wren, and alſo in three different ways by Sir Iſaac himſelf in different parts of his works; yet none of theſe geometers obſerved that there was a particular ſituation of the lines in which the problem admitted of innumerable ſolutions: and this happens to be the very caſe in which the problem is applicable to the determination of the comet's path, as was firſt diſcovered by the Abbé Boſcovich, who was led to it by finding, that in this way he could never determine the path of a comet with any degree of certainty.

Beſides the geometrical there is alſo an algebraical analyſis belonging to poriſms; which, however, does not belong to this place, becauſe we give this account of them merely as an article of ancient geometry; and the ancients never employed algebra in their inveſtigations. Mr Playfair, profeſſor of mathematics in the univerſity of Edinburgh, has written a paper on the origin and geometrical inveſtigation of poriſms, which is publiſhed in the third volume of the Tranſactions of the Royal Society of Edinburgh, from which this account of the ſubject is taken. He has there promiſed a ſecond part to his paper, in which the algebraical inveſtigation of poriſms is to be conſidered. This will no doubt throw conſiderable light upon the ſubject, as we may readily judge from that gentleman's known abilities, and from the ſpecimen he has already given us in the firſt part.

PORK, the fleſh of ſwine killed for the purpoſes of food. See Sus.

The hog is the only domeſtic animal that we know of no uſe to man when alive, and therefore ſeems properly deſigned for food. Beſides, as loathſome and ugly to every human eye, it is killed without reluctance. The Pythagoreans, whether to preſerve health, or on account of compaſſion, generally forbade the uſe of animal food; and yet it is alleged that Pythagoras reſerved the uſe of hog's fleſh for himſelf. The Jews, the Egyptians, &c. and other inhabitants of warm countries, and all the Mahometans at preſent, reject the uſe of pork. It is difficult to find a ſatisfactory reaſon for this, or for the precept given to the Jews reſpecting it, though unqueſtionably there was ſome good one for it. The Greeks gave great commendations to this food; and Galen, though indeed that is expected to be from a particular fondneſs, is every where full of it. The Romans conſidered it as one of their delicacies; and if ſome of the inhabitants of the northern climates have taken an averſion to it, that probably aroſe from the uncultivated ſtate of their country not being able to rear it. Pork is of a very tender ſtructure; increaſed perhaps from a peculiarity in its œconomy, viz. taking on fat more readily than any other animal. Pork is a white meat even in its adult ſtate, and then gives out a jelly in very great quantity. On account of its little perſpirability and tenderneſs it is very nutritious, and was given for that intention to the *athletæ*. With regard to its alkaleſcency, no proper experiments have yet been made; but as it is of a gelatinous and ſucculent nature, it is probably leſs ſo than many others. Upon the whole, it appears to be a very valuable nutriment; and the reaſon is not very obvious why it was in ſome countries forbidden. It is ſaid that this animal is apt to be diſeaſed; but why were not inconveniences felt on that account in Greece? Again, it has been alleged, that as Paleſtine would not rear theſe animals, and as the Jews had learned the uſe of them in Egypt, it was neceſſary they ſhould have a precept to avoid them. But the Egyptians themſelves did not uſe this meat; and this religious precept, indeed, as well as many others, ſeems to have been borrowed from them. Poſſibly, as pork is not very perſpirable, it might increaſe the leproſy, which was ſaid to be epidemic in Paleſtine; though this is far from being certain.

Cullen's Mat. Med.

PORLOCK, in the county of Somerſet in England, is a ſmall ſea-port town ſix miles weſt from Minehead. This whole pariſh, including hamlets, contains about 110 houſes, and nearly 600 inhabitants. The ſituation of the town is very romantic, being nearly ſurrounded on all ſides, except toward the ſea, by ſteep and lofty hills, interſected by deep vales and hollow glens. Some of the hills are beautifully wooded, and contain numbers of wild deer. The valleys are very deep and pictureſque; the ſides being ſteep, ſcarred with wild rocks, and patched with woods and foreſt ſhrubs. Some of them are well cultivated and ſtudded with villages or ſingle farms and cottages, although agriculture here is very imperfectly underſtood. Moſt of the roads and fields are ſo ſteep, that no carriages of any kind can be uſed; all the crops are therefore carried in with crooks on horſes, and the manure in wooden pots called *doſſels*. Many of the poor are employed in ſpinning yarn for the Dunſter manufactory. W. Long. 3. 32. N. Lat. 51. 14.

PORO. See Calauria.

PORPESSE, in ichthyology. See Delphinus.

PORPHYRIUS, a famous Platonic philoſopher, was born at Tyre in 233, in the reign of Alexander Severus. He was the diſciple of Longinus, and became the ornament of his ſchool at Athens; from thence he went to Rome, and attended Plotinus, with whom he lived ſix years. After Plotinus's death he taught philoſophy at Rome with great applauſe; and became well ſkilled in polite literature, geography, aſtronomy, and muſic. He lived till the end of the third century, and died in the reign of Diocleſian. There are ſtill extant his book on the Categories of Ariſtotle; a Treatiſe on Abſtinence from Fleſh; and ſeveral other pieces in Greek. He alſo compoſed a large treatiſe againſt the Chriſtian religion, which is loſt. That work was anſwered by Methodius biſhop of Tyre, and alſo by Euſebius, Apollinarius, St Auguſtin, St Jerome, St Cyril, and Theodoret. The emperor Theodoſius the Great cauſed Porphyrius's book to be burned in 338. Thoſe of his works that are ſtill extant were printed at Cambridge in 1655, 8vo, with a Latin verſion.

"Porphyrius (ſays Dr Enfield) was, it muſt be owned, a writer of deep erudition; and had his judgement and integrity been equal to his learning, he would have deſerved a diſtinguiſhed place among the ancients. But neither the ſplendor of his diction, nor the variety of his reading, can atone for the credulity or the diſhoneſty which filled the narrative parts of his works with ſo many extravagant tales, or intereſt the judicious reader in the abſtruſe ſubtelties and myſtical flights of his philoſophical writings."

PORPHYRY, a genus of ſtones belonging to the order of ſaxa. It is found of ſeveral different colours, as green, deep-red, purple, black, dark-brown, and grey. Under the name of *porphyry*, Mr Kirwan and M. de Sauſſure include thoſe ſtones which contain either felt-ſpar, ſchoerl, quartz, or mica, with other ſpecies of cryſtallized ſtone on a ſiliceous or calcareous ground. There are a great many different kinds. M. Ferber deſcribes 20 varieties under four ſpecies, but in general it is conſidered with relation to its ground, which is met with of the colours already mentioned. When the ground is of jaſper, the porphyry is commonly very hard; the red generally contains felt-ſpar in ſmall white dots or ſpecks; and frequently, together with theſe, black ſpots of ſchoerl. The green is often magnetic, and is either a jaſper or ſchoerl, with ſpots of quartz. Sometimes a porphyry of one colour contains a fragment of another of a different colour. Thoſe that have chert for their ground are fuſible *per ſe*. The calcareous porphyry conſiſts of quartz, felt-ſpar, and mica, in ſeparate grains, united by a calcareous cement; and, laſtly, the micaceous porphyry conſiſts of a greeniſh grey micaceous ground, in which red felt-ſpar and greeniſh ſoap-rock are inſerted.

The porphyry of the ancients is a moſt elegant maſs of an extremely firm and compact ſtructure, remarkably heavy, and of a fine ſtrong purple, variegated more or

733 k

leſs with pale red and white; its purple is of all degrees, from the claret-colour to that of the violet; and its variegations are rarely diſpoſed in veins, but ſpots, ſometimes very ſmall, and at others running into large blotches. It is leſs fine than many of the ordinary marbles; but it excels them all in hardneſs, and is capable of a moſt elegant poliſh. It is ſtill found in immenſe ſtrata in Egypt. The hard red-lead coloured porphyry, variegated with black, white, and green, is a moſt beautiful and valuable ſubſtance. It has the hardneſs and all the other characters of the oriental porphyry; and even greatly excels it in brightneſs, and in the beauty and variegation of its colours. It is found in great plenty in the iſland of Minorca; and is well worth importing, being greatly ſuperior to all the Italian marbles. The hard, pale-red porphyry, variegated with black, white, and green is of a pale fleſh-colour; often approaching to white. It is variegated in blotches from half an inch to an inch broad. It takes a high poliſh, and emulates all the qualities of the oriental porphyry. It is found in immenſe ſtrata in Arabia Petræa, and in the Upper Egypt; and in ſeparate nodules in Germany, England, and Ireland.

Ficoroni takes notice of two exquiſitely fine columns of black porphyry in a church at Rome. In Egypt there are three celebrated obeliſks or pillars of porphyry, one near Cairo and two at Alexandria. The French call them *aguglias*, and in England they are called *Cleopatra's needles*.

The art of cutting porphyry, practiſed by the ancients, appears now to be loſt. Indeed it is difficult to conceive what tools they uſed for faſhioning thoſe huge columns and other porphyry works in ſome of the ancient buildings in Rome. One of the moſt conſiderable of theſe, ſtill entire, is a tomb of Conſtantia, the emperor Conſtantine's daughter. It is in the church of St Agnes, and is commonly called *the tomb of Bacchus*. In the palace of the Thuilleries there is alſo a buſt of Apollo and of twelve emperors, all in porphyry. Some ancient pieces ſeem to have been wrought with the chiſſel, others with the ſaw, others with wheels, and others gradually ground down with emery. Yet modern tools will ſcarce touch porphyry. Dr Leiſter therefore thinks*, that the ancients had the ſecret of tempering ſteel better than we; and not, as ſome imagine, that they had the art of ſoftening the porphyry; though it is probable that time and air have contributed to increaſe its hardneſs. Mr Addiſon ſays, he ſaw a workman at Rome cutting porphyry; but his advances were extremely ſlow and almoſt inſenſible. The Italian ſculptors work the pieces of old porphyry columns ſtill remaining (for the porphyry quarries are long ſince loſt) with a braſs ſaw without teeth. With this ſaw, emery, and water, they rub and wear the ſtone with infinite patience. Many perſons have endeavoured to retrieve the ancient art, and particularly Leon Baptiſta Alberti; who, ſearching for the neceſſary materials for temper, ſays, he found goats blood the beſt of any: but even this availed not much; for in working with chiſſels tempered with it, ſparks of fire came much more plentifully than pieces of the ſtone. The ſculptors were thus, however, able to make a flat or oval form; but could never attain to any thing like a figure.

In the year 1555, Coſmo de Medicis is ſaid to have diſtilled a water from certain herbs, with which his ſculptor Franceſco Tadda gave his tools ſuch an admirable hardneſs and ſo fine a temper, that he performed ſome very exquiſite works with them; particularly our Saviour's head in demi-relievo, and Coſmo's head and his ducheſs's. The very hair and beard, how difficult ſoever, are here well conducted; and there is nothing of the kind ſuperior to it in all the works of the ancients; but the ſecret appears to have died with him. The French have diſcovered another mode of cutting porphyry, *viz.* with an iron ſaw without teeth, and *grez*, a kind of free ſtone pulverized, and water. The authors of this invention ſay, that they could form the whole contour of a column hereby if they had matter to work on. Others have propoſed to harden tools ſo as to cut porphyry, by ſteeping them in the juice of the plant called *bear's beech* or *brankurſine*. See Birch's *Hiſt.* R. S. vol. i. p. 238. vol. ii. p. 73, &c. Mr Boyle ſays, that he cauſed porphyry to be cut by means of emery, ſteel ſaws, and water; and obſerves, that in his time the Engliſh workmen were ignorant of the manner of working porphyry, and that none of them would undertake to cut or poliſh it. See his Works abr. vol. i. p. 111.

Da Coſta ſuppoſes, and perhaps with reaſon, that the method uſed by the ancients in cutting and engraving porphyry was extremely ſimple, and that it was performed without the aid of any ſcientific means that are now loſt. He imagines, that, by unwearied diligence, and with numbers of common tools at great expence, they rudely hewed or broke the ſtone into the intended figure, and by continued application reduced them into more regular deſigns; and that they completed the work by poliſhing it with great labour, by the aid of particular hard ſands found in Egypt. And he thinks, that in the porphyry quarries there were layers of grit or looſe diſunited particles, analogous to the porphyry, which they carefully ſought for, and uſed for this work. See *Nat. Hiſt. of Foſſils*, p. 285.

PORPHYRY-Shell, a ſpecies of MUREX.

PORPITES, the HAIR-BUTTON-STONE, in natural hiſtory, a name given by authors to a ſmall ſpecies of foſſil coral; which is uſually of a rounded figure conſiderably flatted, and ſtriated from the centre everyway to the circumference. Theſe are of different ſizes and of different colours, as greyiſh, whitiſh, browniſh, or bluiſh, and are uſually found immerſed in ſtone. See Plate CC.

PORRUM, the LEEK; a ſpecies of plants, belonging to the genus of ALLIUM.

PORT, a harbour, river, or haven, formed either by nature or art to receive and ſhelter ſhipping from the ſtorms and waves of the open ſea.

Artificial ports are thoſe which are either formed by throwing a ſtrong mound or rampire acroſs the harbour's mouth to ſome iſland or rock, or erecting two long barriers, which ſtretch from the land on each ſide like arms or the horns of a creſcent, and nearly incloſe the haven; the former of theſe are called *mole-heads* and the latter *piers*.

PORT, is alſo a name given on ſome occaſions to the larboard or left ſide of the ſhip, as in the following inſtances. Thus it is ſaid, "the ſhip heels to port," *i. e.* ſtoops or inclines to the larboard-ſide. "Top the yard to port!" the order to make the larboard extremity of a yard higher than the other. "Port the helm!" the order to put the helm over to the larboard-ſide of the veſſel. In all theſe ſenſes this phraſe appears intended to prevent any miſtakes happening from the ſimilarity of ſounds in the words *ſtarboard* and *larboard*, particularly when they relate to the helm, where a miſapprehenſion might be attended with very dangerous conſequences.

---

* Philoſ. Tranſact. N° 203. or Lowth's Abrid. vol. ii. p. 560.

PORTS, the embraſures or openings in the ſide of a ſhip of war, wherein the artillery is ranged in battery upon the decks above and below.

The ports are formed of a ſufficient extent to point and fire the cannon, without injuring the ſhip's ſide by the recoil; and as it ſerves no end to enlarge them beyond what is neceſſary for that purpoſe, the ſhipwrights have eſtabliſhed certain dimenſions, by which they are cut in proportion to the ſize of the cannon.

The ports are ſhut in at ſea by a ſort of hanging-doors called the *port-lids;* which are faſtened by hinges to their upper edges, ſo as to let down when the cannon are drawn into the ſhip. By this means the water is prevented from entering the lower decks in a turbulent ſea. The lower and upper edges of the ports are always parallel to the deck, ſo that the guns, when levelled in their carriages, are all equally high above the lower extremity of the ports, which is called the *port-cells*.

PORT, is alſo a ſtrong wine brought from Port-a-port, and alſo called *Porto* and *Oporto*.

Port of the Voice, in muſic, the faculty or habit of making the ſhakes, paſſages, and diminutions, in which the beauty of a ſong or piece of muſic conſiſts.

Port-Crayon, a pencil-caſe, which is uſually four or five inches long, and contrived ſo as that the pencil may ſlide up and down. Its inſide is round, and its outſide is ſometimes filed into eight ſides or faces, on which are drawn the ſector-lines; ſometimes it is made round both without-ſide and within, and has its length divided into inches and parts of inches.

Port-Fire, a compoſition for ſetting fire to powder, &c. Port-fires are frequently uſed by artillery people in preference to matches; and they are diſtinguiſhed into wet and dry port-fires. The compoſition of the former is ſaltpetre four, ſulphur one, and mealed powder four. When theſe materials are thoroughly mixed and ſifted, the whole is to be moiſtened with a little linſeed oil, and rubbed between the hands till all the oil is imbibed by the compoſition. The preparation for dry port-fires is ſaltpetre four, ſulphur one, mealed powder two, and antimony one. Theſe compoſitions are driven into ſmall paper caſes, to be uſed whenever neceſſary.

Port-aux-Prune, ſo called by the French, is a country on the coaſt of Africa, to the north of the iſland of Madagaſcar. It is a rich country, and fertile in rice and paſtures; it is inhabited only by the negroes, who are an induſtrious good ſort of people, but very ſuperſtitious. There are no towns, but ſeveral villages, and they have ſome cuſtoms which ſeem to incline to Judaiſm.

Port-Jackſon, in New Holland. See *New Holland*, n° 7, &c.

Port-Royal, a ſea-port town in the iſland of Jamaica. It was once a place of the greateſt riches and importance in the Weſt Indies: but in 1692 it was deſtroyed by an earthquake, in 1702 by fire, in 1722 by an inundation of the ſea, and in 1744 it ſuffered greatly by a hurricane. It is now reduced to three ſtreets, a few lanes, and about 200 houſes. It contains the royal navy-yard for heaving down and refitting the king's ſhips; the navy-hoſpital, and barracks for a regiment of ſoldiers. The fortifications, which are very extenſive, being in excellent order, and having been lately ſtrengthened with many additional works, it may be ſaid to vie in point of ſtrength with any fortreſs in the king's dominions. The harbour is one of the beſt in the world, and 1000 ſhips may ride therein, ſecure from every wind that can blow. It is ſix miles eaſt of Spaniſhtown, and as much by water ſouth-eaſt of Kingſton. W. Long. 76. 40. N. Lat. 18. 0.

Port-Royal, an iſland in North America, on the coaſt of South Carolina, which, with the neighbouring continent, forms one of the moſt commodious harbours in the United States. It is 15 miles in length; and the town on the north ſhore is called *Beaufort*. W. Long. 80. 10. N. Lat. 31. 40.

Port-Royal, the name of two monaſteries of Ciſtertian nuns in the dioceſe of Paris; the one near Chevreuſe, at the diſtance of five leagues from Paris, called *Port-Royal of the Fields;* and the other in Paris, in the ſuburbs of St James.

The nuns of the former of theſe monaſteries proving refractory, were diſperſed; when many eccleſiaſtics, and others, who were of the ſame ſentiments as theſe religious, retired to Port-Royal, took apartments there, and printed many books. Hence the name of *Port-Royaliſts* was given to all their party, and their books were called *books of Port-Royal:* from hence we ſay the writers of Port-Royal, Meſſieurs de Port-Royal, and the tranſlations and grammars of Port-Royal.

PORTA, or *Vena Porta*, in anatomy, a large vein diſtributed through the liver in the manner of an artery. See ANATOMY, n° 96.

Porta-Anguſta (anc. geog.), mentioned only by Ptolemy; a town of the Vaccæi in the Hither Spain; thought by ſome to be *Torre Quemada*, in Old Caſtile; by others *Los Valvaſes*, a village between Burgos and Torre Quemada.

PORTÆ-ROMANÆ (anc. geog.), according to Pliny, Romulus left but three, or at moſt four, gates of Rome: afterwards, on enlarging the Pomœria, or compaſs of the city, they amounted to 37.

PORTAL, in architecture, a little gate where there are two gates of a different bigneſs; alſo a little ſquare corner of a room cut off from the reſt by the wainſcot, and forming a ſhort paſſage into the room. The ſame name is alſo ſometimes given to a kind of arch of joiners work before a door.

PORTATE, or a *Croſs Portate*, in heraldry, a croſs which does not ſtand upright, as croſſes generally do; but lies acroſs the eſcutcheon in bend, as if it were carried on a man's ſhoulder.

PORTCULLICE, in fortification, is an aſſemblage of ſeveral large pieces of wood, joined acroſs one another like a harrow, and each pointed with iron at the bottom. They are ſometimes hung over the gate-way of old fortified towns, ready to let down in caſe of ſurpriſe, when the gates could not be ſhut.

PORTER, a kind of malt-liquor which differs from ale and pale beer, in its being made with high dried malt. See ALE, BEER, and BREWING.

BRITISH MUSEUM

PORT-GLASGOW. See GLASGOW, n° 10.

PORTGREVE, or PORTGRAVE, was anciently the principal magiſtrate in ports and other maritime towns. The word is formed from the Saxon *port*, "a port or other town;" and *geref*, "a governor."—It is ſometimes alſo written *port-reve*.

Camden obſerves, that the chief magiſtrate of London was anciently called *port-greve*: inſtead of whom, Richard I. ordained two bailiffs; and ſoon afterwards King John granted them a mayor for their yearly magiſtrate.

PORTICI, a palace of the king of Naples, ſix miles from that capital. It has a charming ſituation, on the ſea-ſide, near mount Veſuvius. It is enriched with a vaſt number of fine ſtatues, and other remains of antiquity, taken out of the ruins of Herculaneum.

The muſeum conſiſts of 16 rooms, in which the different articles are arranged with very great taſte. The floors are paved with Moſaic, taken from the recovered towns, and the walls of the court are lined with inſcriptions. Beſides buſts, ſtatues, medals, intaglios, lamps, and tripods, there is ſcarcely an article uſed by the ancients of which a ſpecimen may not be ſeen in this muſeum. "But the moſt valuable room is the library, from the numerous manuſcript rolls which it contains. What a field is here for conjecture! what room for hope! Among this ineſtimable collection, how many great works are there, of which even the names are now unknown! how many unbroken volumes, whoſe very fragments, preſerved in the writings of the ancient ſcholiaſts, convey to us moral improvement, information, and delight! perhaps all the dramatic pieces of Menander and Philemon; perhaps, nay, certainly, the loſt Decades of Livy; for it is impoſſible to ſuppoſe, that among ſo many rolls, the moſt admired hiſtory of the people who poſſeſſed them is not to be found: what private library in Britain is without the beſt hiſtories of England? But how I tremble for their ſituation, as Portici is built on the lava that overwhelmed Herculaneum! How I tremble too for the indifference of the king of Naples towards this invaluable treaſure, in which all the moſt enlightened people of Europe are deeply intereſted! When I firſt ſaw them, I had no idea of what they were, as they reſemble wooden truncheons burnt almoſt to charcoal. They are ſo hard and brittle, that the greateſt caution muſt be uſed in removing them, leſt they crumble to duſt; nevertheleſs, an ingenious friar of Genoa, named *Raggio*, undertook to unroll them; and by a moſt curious, though tedious proceſs, ſo far ſucceeded, as to tranſcribe three Greek Treatiſes on Philoſophy and Muſic; but finding (as I hear) no other encouragement than his ſalary, which was but little more than you pay ſome of your ſervants, the work was unhappily diſcontinued. Were theſe manuſcripts in England, they would not long remain a ſecret to the world."

Watkins's Travels through Swiſſerland, Italy, &c.

PORTICO, in architecture, a kind of gallery on the ground; or a piazza encompaſſed with arches ſupported by columns, where people walk under covert. The roof is uſually vaulted, ſometimes flat. The ancients called it *lacunar*. Though the word *portico* be derived from *porta*, "gate, door;" yet it is applied to any diſpoſition of columns which form a gallery, without any immediate relation to doors or gates. The moſt celebrated porticoes of antiquity were, thoſe of Solomon's temple, which formed the atrium or court, and encompaſſed the ſanctuary; that of Athens, built for the people to divert themſelves in, and wherein the philoſophers held their diſputes and converſations, (ſee PORCH); and that of Pompey at Rome, raiſed merely for magnificence, conſiſting of ſeveral rows of columns ſupporting a platform of vaſt extent; a draught whereof, Serlio gives us in his antique buildings. Among the modern porticoes, the moſt celebrated is the piazza of St Peter of the Vatican.—That of Covent-Garden, London, the work of Inigo Jones, is alſo much admired.

PORTII. See POMPEII.

PORTLAND, a peninſula in Dorſetſhire, of great ſtrength both by nature and art, being ſurrounded with inacceſſible rocks, except at the landing-place, where there is a ſtrong caſtle, called *Portland caſtle*, built by king Henry VIII. There is but one church in the iſland: and that ſtands ſo near the ſea, that it is often in danger from it. It is now chiefly noted for the freeſtone which is found there, and which is greatly employed in London, and other parts of England, for building the fineſt ſtructures. St Paul's church, in particular, was built therewith. W. Long. 2. 35. N. Lat. 50. 30.

The following cuſtom at Portland is worthy of notice. "While I was looking over the quarries at Portland (ſays Mr Smeaton), and attentively conſidering the operations, obſerving how ſoon the quarrymen would cut half a ton of ſpawls from an unformed block, and what large pieces flew off at every ſtroke; how ſpeedily their blows followed one another, and how inceſſantly they purſued this labour with a tool of from 18 to 20 pound weight; I was naturally led to view and conſider the figure of the operative agent; and after having obſerved, that by far the greateſt number of the quarrymen were of a very robuſt hardy form, in whoſe hands the tool I have mentioned ſeemed a mere play-thing, I at laſt broke out with ſurpriſe, and inquired of my guide, Mr Roper, where they could poſſibly pick up ſuch a ſet of ſtout fellows to handle the *kevel*, which in their hands ſeemed nothing? for I obſerved, that in the ſpace of 15 minutes, they would knock off as much waſte matter from a maſs of ſtone, as any of that occupation I had ever ſeen before would do in an hour. Says Roper, 'we do not go to fetch thoſe men from a diſtance, they are all born upon the iſland, and many of them have never been farther upon the main land than to Weymouth.' I told him, I thought the air of that iſland muſt be very propitious, to furniſh a breed of men ſo particularly formed for the buſineſs they followed. 'The air (he replied), though very ſharp from our elevated ſituation, is certainly very healthy to working men; yet if you knew how theſe men are produced, you would wonder the leſs; for all our marriages here are productive of children.' On deſiring an explanation how this happened, he proceeded: 'Our people here, as they are bred to hard larbour, are very early in a condition to marry and provide for a family; they intermarry with one another, very rarely going to the main-land to ſeek a wife; and it has been the cuſtom of the iſland, from time immemorial, that they never marry till the woman is pregnant.' But pray (ſaid I) does not this ſubject you to a great number of baſtards? Have not your Portlanders the ſame kind of fickleneſs in their attachments that Engliſhmen are ſubject to? and, in conſequence, does not this produce many inconveniences? 'None at all (replies Roper), for previous to my arrival here, there was but one child on record of the pariſh regiſter that had been born a baſtard in the compaſs of 150 years. The mode of courtſhip here is, that a young woman never admits of the ſerious addreſſes of a young man, but on ſuppoſition of a thorough probation. When ſhe becomes with child, ſhe tells her mother, the mother tells her father, her father tells his father, and he tells his ſon, that it is then proper time to be married.' But ſuppoſe, Mr Roper, ſhe does not prove to be with child, what happens then? Do they live together without marriage? or, if they ſeparate, is not this ſuch an imputation upon her, as to prevent her getting another ſuitor? 'The caſe is thus managed (anſwered my friend), if the woman does not prove with child after a competent time of courtſhip, they conclude they are not deſtined by Providence for each other; they therefore ſeparate; and as it is an eſtabliſhed maxim, which the Portland women obſerve with great ſtrictneſs, never to admit a plurality of lovers at one time, their honour is no way tarniſhed: ſhe juſt as ſoon (after the affair is declared to be broke off) gets another ſuitor, as if ſhe had been left a widow, or that nothing had ever happened, but that ſhe had remained an immaculate virgin.' But pray, Sir, did nothing particular happen upon your men coming down from London? 'Yes (ſays he) our men were much ſtruck, and mightily pleaſed with the facility of the Portland ladies, and it was not long before ſeveral of the women proved with child; but the men being called upon to marry them, this part of the leſſon they were uninſtructed in; and on their refuſal, the Portland women aroſe to ſtone them out of the iſland; inſomuch, that thoſe few who did not chooſe to take their ſweethearts for *better or for worſe*, after ſo fair a trial, were in reality obliged to decamp; and on this occaſion ſome few baſtards were born: but ſince then matters have gone on according to the ancient cuſtom."

PORTLAND VASE, a celebrated funeral vaſe which was long in poſſeſſion of the Baberini family; but which was lately purchaſed for 1000 guineas by the Duke of Portland, from whom it has derived its preſent name. Its height is about ten inches, and its diameter where broadeſt ſix. There are a variety of figures upon it of moſt exquiſite workmanſhip, in bas relief of white opake glaſs, raiſed on a ground of deep blue glaſs, which appears black except when held againſt the light. It appears to have been the work of many years, and there are antiquarians who date its production ſeveral centuries before the Chriſtian era; ſince, as has been ſaid, ſculpture was declining in excellence in the time of Alexander the Great.

Reſpecting the purpoſe of this vaſe, and what the figures on it were meant to repreſent, there have been a variety of conjectures, which it is not our buſineſs to enumerate. We think with Dr Darwin * that it was not made for the aſhes of any particular perſon deceaſed; and therefore that the ſubject of its embelliſhments is not a private hiſtory, but of a general nature. But we are not ſure that he is right in conjecturing it to repreſent a part of the Eleuſinian myſteries; becauſe that conjecture depends on Warburton's explanation of the 6th book of the Æneid, which does not now command that reſpect which it did when it was firſt propoſed. We ſhall therefore give a ſhort account of the ſeveral figures, without noticing any of the theories or conjectures that have been made about them.

In one compartment three exquiſite figures are placed on a ruined column, the capital of which is fallen, and lies at their feet among other disjointed ſtones: they ſit under a tree on looſe piles of ſtone. The middle figure is a female in a reclining and dying attitude, with an inverted torch in her left hand, the elbow of which ſupports her as ſhe ſinks, while the right hand is raiſed and thrown over her drooping head. The figure on her right hand is a man, and that on the left a woman, both ſupporting themſelves on their arms, and apparently thinking intenſely. Their backs are to the dying figure, and their faces are turned to her, but without an attempt to aſſiſt her. On another compartment of the vaſe is a figure coming through a portal, and going down with great timidity into a darker region, where he is received by a beautiful female, who ſtretches forth her hand to help him: between her knees is a large and playful ſerpent. She ſits with her feet towards an aged figure, having one foot ſunk into the earth, and the other raiſed on a column, with his chin reſting on his hand. Above the female figure is a Cupid preceding the firſt figure, and beckoning to him to advance. This firſt figure holds a cloke or garment, which he ſeems anxious to bring with him, but which adheres to the ſide of the portal through which he has paſſed. In this compartment there are two trees, one of which bends over the female figure and the other over the aged one. On the bottom of the vaſe there is another figure on a larger ſcale than the one we have already mentioned, but not ſo well finiſhed nor ſo elevated. This figure points with its finger to its mouth. The dreſs appears to be curious and cumberſome, and above there is the foliage of a tree. On the head of the figure there is a Phrygian cap: it is not eaſy to ſay whether this figure be male or female. On the handles of the vaſe are repreſented two aged heads with the ears of a quadruped, and from the middle of the forehead riſes a kind of tree without leaves: theſe figures are in all probability mere ornaments, and have no connection with the reſt of the figures, or the ſtory repreſented on the vaſe.

PORTLANDIA, in botany: A genus of the monogynia order, belonging to the pentandria claſs of plants; and in the natural method ranking with thoſe of which the order is doubtful. The corolla is elevated and funnel-ſhaped; the antheræ are longitudinal; the capſule pentagonal, and retuſe at top; bilocular, and crowned with a pentaphyllous calyx.

There are two ſpecies, viz. the grandiflora and hexandra; the former of which has been particularly deſcribed by Dr Browne, who has alſo given a good figure of it. It has frequently flowered in the royal garden at Kew, and in Dr Pitcairn's at Iſlington.

The external bark is remarkably rough, furrowed, and thick; it has no taſte. The inner bark is very thin, and of a dark brown colour. Its taſte is bitter and aſtringent, and its virtues are the ſame as thoſe of the Jeſuit's bark. Infuſed in ſpirits or wine with a little orange-peel, it makes an excellent ſtomachic tincture.

PORT-LOUIS, is a ſtrong town of France, in Bretagne,

* Loves of the Plants.

tagne, in the dioceſe of Vannes, with a citadel and a good harbour. It was fortified by Louis XIII. from whom it derived its name. It was a ſtation for part of the royal navy and the Eaſt India ſhips belonging to France. It is ſeated at the mouth of the river Blavet, 27 miles weſt of Vannes. W. Long. 3. 18. N. Lat. 47. 40.

Port-Mahon. See MINORCA.

PORTO. See OPORTO.

Porto-Bello, a town of North America, ſituated in N. Lat. 9. 3. W. Long. 79. 45. cloſe to the ſea, on the declivity of a mountain, which ſurrounds the whole harbour. This harbour is ſo large, deep, and ſafe, that Columbus, who firſt diſcovered it, gave it the name of *Porto-Bello*, or the "Fine Harbour," which is now commonly uſed to denote the town. The number of the houſes is about 130; moſt of them of wood, large and ſpacious, forming one long ſtreet along the ſtrand, with other ſmaller ones croſſing it. The governor of the town is always a gentleman of the army, ſubordinate to the preſident of Panama; but having under him the commandants of the forts that defend the harbour. At the eaſt end of the town, on the road to Panama, is a place called *Guinea*, where all the negroes of both ſexes, whether ſlaves or free, have their habitations. This place is very much crowded when the galleons are here, moſt of the inhabitants of the town quitting their houſes entirely for the ſake of letting them; while others content themſelves with a ſmall part, in order to make money of the reſt. The Mulattoes and other poor families alſo remove either to Guinea, or to cottages already erected near it, or built on the occaſion. Great numbers of artificers likewiſe who flock to Porto-Bello from Panama to work at their reſpective callings during the fair, lodge in Guinea for cheapneſs. Towards the ſea, in a large tract between the town and Gloria caſtle, barracks are erected, in moſt of which the ſhips crews keep ſtalls of ſweetmeats, and other kinds of eatables, brought from Spain; but at the concluſion of the fair, when the ſhips put to ſea, all theſe buildings are taken down, and the town returns to its former tranquillity and emptineſs. In 1739, the harbour was defended by a caſtle and two forts; which were all demoliſhed by admiral Vernon, who, with ſix ſhips only, made himſelf maſter of this port. The country about Porto-Bello is over-run with mountains and impenetrable foreſts, except a few valleys, in which are ſome ſcattered farms. Among the mountains that ſurround the harbour is one diſtinguiſhed by the name of *Capiro*, and by its ſuperior loftineſs is a ſort of barometer to the country, by foretelling every change of weather. Its top is always covered with clouds, of a denſity and darkneſs ſeldom ſeen in thoſe of the atmoſphere. When theſe clouds thicken, increaſe their blackneſs, and ſink below their uſual ſtation, it is a ſure ſign of a tempeſt; while, on the other hand, their clearneſs and aſcent as certainly indicate the approach of fair weather. Theſe changes are very ſudden and frequent here. The ſummit of the mountain is ſcarce ever clear from clouds; and when it happens, it is only, as it were, for an inſtant. Except in the time of the fair, all the inhabitants of Porto-Bello do not amount to 3000; half of whom are Indians, Mulattoes, or Negroes; the Spaniards of any ſubſtance not chooſing to reſide in a place ſo extremely unhealthy and fatal even to the lives of the natives. Ulloa tells us, that the cattle brought hither from Panama or Carthagena, loſe their fleſh ſo faſt in the beſt paſtures, as to become ſcarce eatable: he aſſures us alſo, that neither horſes nor aſſes are bred here. The heat, indeed, is exceſſive; and the torrents of rain are ſo dreadful, ſudden, and impetuous, that one not accuſtomed to them would imagine a ſecond deluge was coming. Theſe torrents are alſo accompanied with frightful tempeſts of thunder and lightning, the awfulneſs of the ſcene being heightened by the repercuſſions from the mountains, and the ſhrieks and howlings of multitudes of monkeys of all kinds which inhabit the ſurrounding woods.

Freſh water pours down in ſtreams from the mountains, ſome running without the town, and others croſſing it. Theſe waters are very light and digeſtive; qualities which in other countries would be very valuable, but are here pernicious, producing dyſenteries, which the patient ſeldom ſurvives. However, theſe rivulets, formed into reſervoirs, ſerve the purpoſes of bathing, which is here found to be very conducive to health.

As the foreſts almoſt border on the houſes of the ſtreets, tygers often make incurſions into the ſtreets during the night, carrying off fowls, dogs, and other domeſtic animals, and ſometimes even children have fallen a prey to them. Beſides the ſnares uſually laid for them, the Negroes and Mulattoes, who fell wood in the foreſts of the mountains, are very dexterous in encountering them; and ſome, for a ſlender reward, even ſeek them in their retreats.

The town of Porto-Bello, which is thinly inhabited by reaſon of its noxious air, the ſcarcity of proviſions, and the barrenneſs of the ſoil, becomes, after the arrival of the galleons, one of the moſt populous towns in the world. He who had ſeen it quite empty, and every place wearing a melancholy aſpect, would be filled with aſtoniſhment to ſee the buſtling multitudes in the time of the fair, when every houſe is crowded, the ſquares and ſtreets encumbered with bales of merchandiſe and cheſts of gold and ſilver, the harbour full of ſhips and veſſels, ſome loaded with proviſions from Carthagena, and others with the goods of Peru, as cocoa, Jeſuit's bark, Vicuna wool, and bezoar ſtones; and this town, at all other times deteſted for its deleterious qualities, becomes the ſtaple of the riches of the Old and New World, and the ſcene of one of the moſt conſiderable branches of trade in the univerſe. Formerly the fair was limited to no particular time; but as a long ſtay in ſuch a ſickly place extremely affected the health of the traders, his Catholic majeſty tranſmitted an order that the fair ſhould not laſt above 40 days; and that, if in that time the merchants could not agree on their rates, thoſe of Spain ſhould be allowed to carry their goods up the country to Peru: and accordingly, the commodore of the galleons has orders to re-embark them, and return to Carthagena; but otherwiſe, by virtue of a compact between the merchants of both kingdoms, and ratified by the king, no Spaniſh trader is to ſend his goods, on his own account, beyond Porto-Bello. The Engliſh were formerly allowed to ſend a ſhip annually to this fair, which turned ed to great account; and, whilſt the aſſiento contract ſubſiſted, either with the Engliſh or the French, one of their principal factories was at Porto-Bello.

Porto-Farina, a port about 12 miles from Cape Carthage, in the bay of Tunis, where formerly the large veſſels belonging to the bey were fitted out, and laid up on their return from a cruize. This harbour is ſafe from the weather, and opens into a large lake, formed by the Mejerdah, which runs through into the ſea.—The north-weſt wind, which blows right upon the ſhore, together with the ſoil brought down by the river, which has the ſame quality as the Nile of overflowing its banks, has formed a bar, ſo that only ſmall veſſels can now enter. It is ſtill the arſenal where the naval ſtores are kept. E. Long. 10. 16. N. Lat. 37. 12.

Porto-Farraio, a handſome town of Italy, in the iſle of Elba, with a good citadel. It is very ſtrong, and ſeated on a long, high, ſteep point of land, to the weſt of the bay of the ſame name, which has two forts. It belongs to the great duke of Tuſcany, who always keeps a good garriſon there. E. Long. 10. 37. N. Lat. 48. 55.

Porto-Longone, a ſmall but very ſtrong town of Italy, and in the iſle of Elba, with a good harbour, and a fortreſs upon a rock almoſt inacceſſible. The king of Naples has a right to put a garriſon therein, though the place belongs to the prnce of Piombino. It is ſeated on the eaſt end of the iſland, eight miles ſouth-weſt of Piombino. E. Long. 10. 10. N. Lat. 42. 52.

Porto-Santo, an iſland of the Atlantic Ocean, on the coaſt of Africa, and the leaſt of thoſe called the *Madeiras*. It is about 15 miles in circumference, and produces but little corn; however, there are oxen and wild hogs, and a vaſt number of rabbits. There are trees which produce the gum or reſin called *dragon's blood*; and there is likewiſe a little honey and wax, which are extremely good. It has no harbour, but good mooring in the road. It belongs to the Portugueſe, and is 300 miles weſt of the coaſt of Africa. W. Long. 16. 20. N. Lat. 32. 58.

Porto-Seguro, a government of South America, on the eaſtern coaſt of Braſil; bounded on the north by the government of Rio-dos-Hilios, on the eaſt by the North Sea, on the ſouth by the government of Spiritu-Santo, and on the weſt by the Tupicks. It is a very fertile country, and the capital town is of the ſame name. It is built on the top of a rock, at the mouth of a river, on the coaſt of the North Sea, and is inhabited by Portugueſe. W. Long. 38. 50. S. Lat. 17. 0.

Porto-Vechio, is a ſea-port town of Corſica, in the Mediterranean Sea, ſeated on a bay on the eaſtern coaſt of the iſland. It is 12 miles from Bonifacio, and 40 north of Sardinia. E. Long. 9. 20. N. Lat. 41. 42.

Porto-Venereo, is a town of Italy, on the coaſt of Genoa, at the entrance of the gulph of Spetia. It is ſeated on the ſide of a hill, at the top of which there is a fort. It has a very good harbour, and is 45 miles ſouth-eaſt of Genoa. E. Long. 9. 38. N. Lat. 44. 5.

PORTRAIT, or Portraiture, in painting, the repreſentation of a perſon, and eſpecially of a face, done from the life. In this ſenſe we uſe the term *portrait-painting*, in contradiſtinction to *hiſtory-painting*, where a reſemblance of perſons is uſually diſregarded. Portraits, when as large as the life, are uſually painted in oil-colours; ſometimes they are painted in miniature with water-colours, crayons, paſtils, &c. See Painting, p. 641.

PORTREE, is a ſmall village, containing a church and a very few houſes, with an excellent bay and a good harbour, in the Iſle of Sky. "The entrance of the bay (Mr Knox tells us) repreſents agreeable landſcapes on both ſides, with excellent paſture.

Knox's Tour.

'The bay of Portree (ſays Mackenzie), off the houſes, is an exceeding good harbour for a few ſhips of any ſize; it is well ſheltered, the ground good, the depth from five to 14 fathoms, and nothing to fear coming in but a rock, about half a cable's length from Airderachig Point, on the ſtarboard as you enter the anchorage, part of which is always above water.' It is the only port or harbour to a very conſiderable diviſion of Sky, on the eaſt ſide. From this opening to the northern extremity, a courſe of 20 miles, the ſhore is one continued line of lofty rocks, where no ſhip can find refuge in the mildeſt weather, and where inevitable danger await the mariners in rough weather.

"James V. of Scotland and ſeveral of his nobility landed here, when they made the tour of the Hebrides in 1535; from which circumſtance, this fine bay has got the honourable name of *Portree*."

Mr Knox tells us, "that the country round this village, though mountainous, is well inhabited; it raiſes much grain, and many cattle. Here the late Sir James Macdonald had marked out the lines of a town; and government, it is ſaid, promiſed to aſſiſt him in the work with 500 l.; but the death of that gentleman put an end to theſe promiſing appearances, and matters remain in *ſtatu quo*."

PORTSMOUTH, a ſea-port town in Hampſhire, with one of the moſt ſecure and capacious harbours in England, being defended by a numerous artillery, both on the ſea and land-ſide, and very good fortifications. A great part of the royal navy is built here; and here are ſome of the fineſt docks, yards, and magazines of naval ſtores, in Europe. It is ſeated in the iſle of Portſey, being ſurrounded by the ſea except on the north ſide, where there is a river which runs from one arm of it to the other. It is much reſorted to on account of the royal navy, whoſe uſual rendezvous is at Spithead, which is at the eaſt end of the iſle of Wight, and oppoſite to Portſmouth. There is a draw-bridge over the river, and it has always a good garriſon. It is governed by a mayor, 12 aldermen, and burgeſſes, and ſends two members to parliament. It has one church, and two chapels, one in the garriſon, and one in the Common, for the uſe of the dock, and others, beſides ſeveral meeting-houſes of the diſſenters. The houſes of Portſmouth amount to about 2000, and the inhabitants to about 12,000. W. Long. 1. 1. N. Lat. 50. 47.

The town is ſuppoſed to receive its name from Port, a famous Saxon chieftain, who, A. D. 501. landed here with his two ſons. It made a conſiderable figure in the time of the Saxons; and from the utility of its ſituation, was highly favoured by all the monarchs of the Norman line. It was incorporated, and became alſo a parliamentary borough. In the reign of Edward III. it was in a very flouriſhing ſtate; but, A. D. 1338, in the very ſame reign, was burned by the French,

when

Cambell's Political Survey.

when that monarch, which was afterwards ratified by king Richard II. forgave the inhabitants a debt, and remitted their fee-farm for 10 years: within which ſpace they ſo recovered themſelves, as to equip a ſquadron, which ſailed into the mouth of the Seine, ſunk two ſhips, and brought away a great booty. The ſingular excellence of its port, and the convenience of fitting out fleets from thence in the time of a French war, induced Edward IV. to think of fortifying it, as he actually, in ſome meaſure, did; which fortifications were farther carried on by Richard III. But king Henry VII. was the firſt who ſettled a garriſon therein; which was increaſed, and the place made ſtill ſtronger, in the reign of Henry VIII. who had a great dock there, wherein was built the Henry Grace de Dieu, which was the largeſt ſhip in the navy of his time. The ſame monarch, remarkably attentive to the ſecurity of all maritime places, built what is now called *South-Sea caſtle*, for the protection of this.—The improvements made here in the reign of Q. Elizabeth were much ſuperior to all theſe. King Charles II. after his reſtoration, directed great alterations, eſtabliſhed new docks and yards, raiſed ſeveral forts, and fortified them after the modern manner; which works were augmented under his brother's reign. Notwithſtanding this, king William directed likewiſe freſh alterations and additions; and ſucceeding princes, following his example, have, at a large expence, extended theſe fortifications, and taken in a vaſt deal of ground: ſo that it is at preſent, as the importance of the place deſerves, the moſt regular fortreſs in Britain; and, as it cannot be effectually attacked by ſea, may be juſtly eſteemed impregnable.

PORTSMOUTH, the largeſt town in the ſtate of New Hampſhire in North America. It ſtands on the ſouth-eaſt ſide of Piſcataqua river, about two miles from the ſea, and contains about 600 houſes, and 4400 inhabitants. The town is handſomely built, and pleaſantly ſituated. Its public buildings are, a court houſe, two churches for Congregationaliſts, one for Epiſcopalians, and one other houſe for public worſhip. Its harbour is one of the fineſt on the continent, having a ſufficient depth of water for veſſels of any burthen. It is defended againſt ſtorms by the adjacent land, in ſuch a manner, as that ſhips may ſecurely ride there in any ſeaſon of the year. Beſides, the harbour is ſo well fortified by nature, that very little art will be neceſſary to render it impregnable. Its vicinity to the ſea renders it very convenient for naval trade. A light-houſe, with a ſingle light, ſtands at the entrance of the harbour.

PORTSOY, is a handſome ſea-port town, ſituated on a ſmall promontory running into the ſea, on the ſouth ſide of the Murray Frith, in Scotland, about ſix miles from Cullen, and ſeven weſt from Banff. It ſends out ſeveral fiſhing veſſels, particularly for the Hebride white fiſhery, and exports a conſiderable quantity of grain. A manufacture of ſtocking and ſewing thread is alſo carried on to a conſiderable amount for the London and Nottingham markets. In the neighbourhood is a ſtratum of marble, of a dark greeniſh colour, in which, it is ſaid, the curious ſubſtance called ASBESTOS, or earth-flax, has been found. From the aſbeſtos a ſort of incombuſtible cloth is made, which is purified by throwing it into the fire. W. Long. 2. 5. N. Lat. 57. 50.

PORTUGAL, the moſt weſterly kingdom of Europe, bounded on the weſt and ſouth by the Atlantic Ocean, and on the eaſt and north by Spain; extending about 310 miles in length, and 150 in breadth.

Portugal.

See Map of Spain and Portugal.

1
Boundaries

By modern writers, we find this country conſtantly ſtyled in Latin *Luſitania;* and it is certain, that anciently a country of Spain went by that name; but it does not by any means appear that the country called by the ancients *Luſitania* had the ſame boundaries with the modern kingdom of Portugal. Before Auguſtus Cæſar, Luſitania ſeems to have been bounded on the north by the ocean, and on the ſouth by the river Tagus; by which means it comprehended all Galicia, and excluded two of the ſix provinces of Portugal. But in the more ſtrict and reſtrained ſenſe of the word, it was bounded on the north by the Durius, now the Douro, and on the ſouth by the river Anas, now the Guadiana; in which ſenſe it was not quite ſo long as modern Portugal, but conſiderably broader.

2
Etymology of the name.

The commonly received opinion with regard to the etymology of the word *Portugal*, is, that a great number of Gauls landed at Porto, or Oporto, whence it received the name of *Portus Gallorum*, or *the Port of the Gauls;* and in proceſs of time that name gradually extended over the whole country, being ſoftened, or rather ſhortened, into *Portugal.* But the time when this event happened, the reaſon why theſe Gauls came thither, and what became of them afterwards, are all particulars which lie buried in oblivion. It is alleged, however, that, upon an eminence which overlooks the mouth of the river Douro, there ſtood an ancient town called *Cale*, ſtrong and well peopled, but ill ſeated for trade; and this occaſioned the conſtruction of a lower town or hamlet, which was called *Portus Cale*, that is, *the haven of Cale;* and, in proceſs of time, *Portucalia.* At length, becoming ſo conſiderable as to merit an epiſcopal chair, the biſhops ſubſcribed themſelves, as the records of ancient councils teſtify, *Portucalenſes*, and the name of the city was transferred to the dioceſe. It is true, that theſe biſhops afterwards changed their title, and ſubſcribed themſelves *Portuenſes*, that is, *biſhops of Porto.* But the facts juſt mentioned are actually recorded in authentic hiſtories; and as the dioceſe of Portucalia contained in a great meaſure that little country in which the ſovereignty originally began, the name extended itſelf, together with the acquiſitions of the ſovereigns, and has remained to the kingdom, though the dioceſe itſelf has changed its name, and poſſibly on that very account.

3
Originally only a ſmall kingdom.

Portugal, though even yet but a ſmall kingdom, was originally much ſmaller. The Spaniſh and Portugueſe hiſtorians agree, that Don Alonſo, king of Leon and Caſtile, and ſon to Don Ferdinand the Great, beſtowed his daughter Donna Thereſa in marriage upon an illuſtrious ſtranger, Don Henry, and gave him with her the frontier province which he had conquered from the Moors, ſmall indeed in extent, but excellently ſituated, and ſo pleaſant and fertile, that it has ſometimes been ſtyled *Medulla Hiſpanica*, or *the marrow of Spain.* To this territory was added the title of *Count;* but authors are much divided about the time that this ſtranger came into Spain, and who he was. However, the authors of the Univerſal Hiſtory make it pretty evident, that he was a grandſon of Robert the firſt duke of Burgundy. The manner in which he obtained the principality above-mentioned is related as follows:

4
Henry of Burgundy the firſt count of Portugal.

The king, Don Alonſo, apprehenſive that his ſucceſs in taking the city of Toledo would bring upon him the whole force of the Moors, ſent to demand aſſiſtance from Philip I. of France, and the duke of Burgundy, whoſe daughter he had married. His requeſt was granted by both princes; and a numerous body of troops was ſpeedily collected for his ſervice, at whoſe head went Raymond count of Burgundy, Henry younger brother of Hugh duke of Burgundy, Raymond count of Tholouſe, and many others. They arrived at the court of Don Alonſo in the year 1087, where they were received and treated with all poſſible marks of eſteem; and having in the courſe of two or three years given great proofs of their courage and conduct, the king reſolved to beſtow his only daughter named *Urraca*, then a mere child, being at moſt in her ninth year, upon Raymond count of Burgundy, and aſſigned them the province of Galicia for the ſupport of their dignity. About four years after, Don Alonſo being very deſirous to expreſs his gratitude to Henry of Burgundy, gave him in marriage a natural daughter of his, born while he remained in exile at Toledo, whoſe name was *Donna Thereſa;* and upon this marriage, he gave up in full property the country which has been already mentioned.

The new ſovereign, with his conſort, fixed their reſidence in the town of Guimaraez, pleaſantly ſituated on the banks of the river Ave. The remains of an ancient palace belonging to their ſucceſſors are ſtill to be ſeen; and on account of its having been anciently the capital, the king, Don Denis, granted the inhabitants an immunity from taxes, which they ſtill enjoy.

5
Differences with Caſtile.

The Portugueſe, now finding themſelves independent, immediately began, like other nations, to attempt the ſubjection of their neighbours. Henry is ſaid to have performed great exploits againſt the Moors; but the accounts of them are ſo indiſtinct, that they cannot be taken notice of here. He died in 1112; and was ſucceeded by his ſon Don Alonſo, then an infant in the third year of his age. In his minority, the kingdom was governed by his mother Donna Thereſa, aſſiſted by two able miniſters. During the firſt nine years of their adminiſtration, nothing remarkable happened; but after that period, ſome differences took place between the queen regent (for ſhe had aſſumed the title of queen after her father's death) and Urraca queen of Caſtile. Thereſa inſiſted, that ſome part of Galicia belonged to her in virtue of her father's will; and therefore ſeized on Tuy, an epiſcopal town, and a place of ſome conſequence. Urraca, having aſſembled a numerous army, went in perſon into Galicia; upon which Thereſa was obliged to abandon Tuy, and take ſhelter in one of her own fortreſſes. The conſequences, in all probability, would have been fatal to the new kingdom, had not the archbiſhop of Compoſtella, without whoſe aſſiſtance Urraca could do nothing, demanded leave to retire with his vaſſals. This offended the queen to ſuch a degree, that ſhe threw him into priſon; which act of violence excited ſuch a commotion among her own ſubjects, that the Portugueſe were ſoon delivered from their apprehenſions. Queen Thereſa fell immediately after into a ſimilar error, by throwing into priſon the archbiſhop of Braga, who had not eſpouſed her cauſe ſo warmly as ſhe had expected. The biſhop, however, was quickly delivered by a bull from the pope, who alſo threatened the kingdom with an interdict; and this was the firſt remarkable offence which Thereſa gave her ſubjects.

Soon after this, Queen Urraca died, and all differences were amicably ſettled at an interview between Thereſa and Don Alonſo Raymond, who ſucceeded to the kingdom of Caſtile. But, in 1126, the king of Caſtile being obliged to march with the whole ſtrength of his dominions againſt his father-in-law the king of Navarre and Arragon, Thereſa took the opportunity of again ſeizing upon Tuy; but the king ſoon returning with a ſuperior army, ſhe was again obliged to abandon her conqueſt. But the greateſt misfortune which befel this princeſs, was a quarrel with her own ſon Don Alonſo Enriquez. It does not appear indeed that Thereſa had given him any juſt cauſe of offence; but it is certain that a civil war enſued, in which the queen's forces were totally defeated, and ſhe herſelf made priſoner, in which ſituation ſhe continued during the remainder of her life.

6
Don Alonſo's wars with the Moors and king of Caſtile.

Enriquez having thus attained to the free and full poſſeſſion of his dominions, made ſeveral attempts upon ſome places in Galicia, but without ſucceſs; ſo that he was at laſt conſtrained to make peace with Alonſo king of Caſtile and Leon, who had aſſumed the title of *Emperor of the Spains;* the more eſpecially as his dominions happened to be at that time invaded by the Moors.—The number of infidels was ſo great, that the count of Portugal had little hopes of ſubduing them; but a plague breaking out in the Mooriſh army, they were obliged to retreat; after which he reduced ſeveral places belonging to that nation. But, in the mean time, the emperor Don Alonſo, breaking into the Portugueſe territories, deſtroyed every thing with fire and ſword. The king of Portugal ſurpriſed and cut off a conſiderable part of his army; which, however, did not hinder the emperor from marching directly towards him.—But, at the interceſſion of the pope's legate, all differences were accommodated, and a peace concluded; all places and priſoners taken on both ſides being delivered up.

7
Victory of Ourique.

In the mean time, the progreſs of the Chriſtian arms in Spain being reported to Abu-Ali Texefien, the miramamolin or chief monarch of the Moors in Barbary, he directed Iſmar, or Iſhmael, his lieutenant in Spain, to aſſemble all the forces in the ſouthern provinces, and drive the Chriſtians beyond the Douro. Iſhmael immediately began to prepare for putting theſe orders in execution; and having added a conſiderable body of troops brought from Barbary to thoſe whom he had raiſed in Spain, the whole army was very numerous. He was met by Don Alonſo of Portugal, in the plains of Ourique, on the banks of the river Tayo; and Iſhmael took all poſſible means to prevent the Chriſtians from paſſing that river, becauſe his own cavalry, in which the ſtrength of his army chiefly conſiſted, had thus more room to act. The Portugueſe forces were very inconſiderable in number in compariſon of the Moors; but Iſhmael, being too confident of victory, divided his army into 12 bodies, and diſpoſed them in ſuch a manner as might beſt prevent the flight, not ſuſtain the attack, of the Chriſtians. The conſequence was, that his army was overthrown with incredible ſlaughter, and a vaſt number of priſoners taken, among whom were 1000 Chriſtians, of the ſect ſtyled *Mozarabians*, whom, at the requeſt of Theotonus, prior of the Holy Croſs, Don Alonſo ſet at liberty with their wives and children, and procured them ſettlements in his own dominions.

8 Don Alonſo aſſumes the title of king.

After this ſignal victory, gained in the year 1139, Don Alonſo was proclaimed king by his ſoldiers, and ever after retained that title, renouncing all kind of ſubjection to the crown of Spain. Being very deſirous, however, of bringing down the power of the emperor, he entered into a league with Raymond count of Barcelona and regent of the kingdom of Arragon againſt that prince. In conſequence of this treaty, he entered Galicia with a conſiderable force on one ſide, while Don Raymond did the ſame on the other. Neither of theſe enterpriſes, however, ſucceeded. The Portugueſe monarch met with a ſevere check in his expedition into Galicia, where he received a dangerous wound, and had ſome of the nobility who attended him taken priſoners. At the ſame time he received intelligence that the Moors had invaded his dominions, ſo that he was obliged to retire; which, however, was not done in ſufficient time to prevent the ſtrong fortreſs of Leyria from falling into their hands. This fortreſs they demoliſhed, and put all the garriſon to the ſword; but the king cauſed it to be rebuilt ſtronger than before, and put a more numerous garriſon into it; however, he undertook nothing farther this campaign. The war continued with various ſucceſs till the year 1145, when the king projected an enterpriſe againſt Santaren, a ſtrong city about 12 miles from Liſbon. In this he luckily ſucceeded: and by that means gained a conſiderable tract of country, and a ſtrong barrier to his dominions.

9 Reduces Liſbon and 12 other cities.

After this ſucceſs Don Alonſo cauſed himſelf with much ceremony to be choſen and crowned king of Portugal before an aſſembly of the ſtates, where he alſo ſolemnly renounced all dependence on the crown of Spain, declaring, that if any of his ſucceſſors ſhould condeſcend to pay tribute or to do homage to that crown, he was unworthy of enjoying the kingdom of Portugal. The next year the king undertook the recovery of Liſbon out of the hands of the Moors; and concerning this expedition there are ſuch numbers of fables, that it is almoſt impoſſible to come at the truth. What can be gathered from theſe accounts is, that he undertook the ſiege with a ſmall army, and was able to make but little progreſs in it, partly from the ſtrength of the place, and partly from the numerous garriſon by which it was defended. At length, fortunately for Don Alonſo, a fleet of adventurers, French, Engliſh, Germans, and Flemings, that were going to the Holy Land, anchored at the mouth of the river Tagus, whoſe aſſiſtance he demanded, as not altogether foreign to their deſign of making war on the infidels. His requeſt was readily granted; and, with their aſſiſtance, Liſbon was ſpeedily reduced; which conqueſt ſo much raiſed the reputation of this monarch, and brought ſuch numbers to recruit his army, that before the end of the year 1147 he had reduced 12 other conſiderable cities.

10 Has his regal dignity confirmed by the pope.

For many years after this, Don Alonſo was ſucceſsful in all his undertakings. He ſettled the internal government of his kingdom, procured a bull from pope Alexander III. confirming his regal dignity, undertook many ſucceſsful expeditions againſt the Moors, and became maſter of four of the ſix provinces which compoſe the preſent kingdom of Portugal. In all his undertakings he was aſſiſted by the councils of his queen Matilda, who was a woman of great capacity, and ſufficient for the government of the kingdom in her huſband's abſence. By her he had a numerous offspring, particularly three daughters; the eldeſt of whom, Donna Mafalda or Mathilda, was married to the king of Arragon; the ſecond, Urraca, to Don Ferdinand king of Leon; and the third, Thereſa, to Philip earl of Flanders.

11 His unſucceſsful war with Don Ferdinand of Spain.

In 1166, however, the king thought proper, from what provocation we know not, to invade the dominions of his ſon-in-law Don Ferdinand; and poſſeſſed himſelf of Limmia and Turon, two cities of Galicia, in which he put ſtrong garriſons. The next year, elated with his ſucceſs, he marched with a numerous army towards Badajos, which he inveſted; on the news of which, Don Ferdinand, who had aſſembled a large army at Ciudad Rodrigo, marched to its relief. Yet before he could come within ſight of it, it had ſurrendered to the king of Portugal; upon which Don Ferdinand came to a reſolution of beſieging his antagoniſt in his newly conquered city; which Don Alonſo perceiving, endeavoured to draw out his forces into the field. Though he was at that time upwards of 70 years of age, he was himſelf on horſeback, and puſhing forwards at the head of his horſe to get out at the gate, he ſtruck his leg againſt one of the bolts with ſuch violence that the bone was ſhattered to pieces. This accident occaſioned ſuch confuſion, that the Portugueſe troops were eaſily beaten, and Don Alonſo was taken priſoner. He was exceedingly mortified by this diſgrace, eſpecially as he had no great reaſon to expect very kind treatment from his ſon in-law. However, the king of Leon behaved towards him with the greateſt reſpect and affection. He deſired him to lay aſide all thoughts of buſineſs, and attend to his cure; but finding him reſtleſs and impatient, he aſſured him that he expected nothing more than to have things put into the ſame condition as before the war, and that they might live in peace and friendſhip for the future: to which the king of Portugal moſt readily aſſented; but returned to his dominions before his cure was perfected, which was the cauſe of his being lame all the reſt of his life. However, this did not abate his military ardour; for, notwithſtanding this inconvenience, his courage tranſported him into the field whenever he was called by the intereſt of his ſubjects. Towards the end of his reign, an opportunity ſeemed to preſent itſelf of obtaining once for all an entire releaſe from the diſagreeable pretenſions of the king of Leon, who, it ſeems, had inſiſted on the king of Portugal's doing homage for his kingdom. The opportunity which now preſented itſelf was a quarrel between the king of Leon and his nephew Don Alonſo king of Caſtile. The latter aſked aſſiſtance from the king of Portugal, which was readily granted. But Don Ferdinand, having received intelligence that the infant Don Sancho (the king's eldeſt ſon) was advancing towards Ciudad Rodrigo, aſſembled his troops on that frontier with ſuch diligence, that he was enabled to attack him unexpectedly, and entirely defeated him. Underſtanding, however, that Don Sancho was recruiting his forces with great diligence, he

12 Don Sancho's ſucceſs againſt the Moors.

he let him know that they might be much better employed againſt the infidels, who remained careleſs and unprepared, expecting the iſſue of the war. Don Sancho made a proper uſe of this advice; and, after making ſome motions to amuſe the enemy, made a ſudden irruption into Andaluſia, penetrating as far as Triana, one of the ſuburbs of Seville. The Moors aſſembled their forces in order to attack him on his retreat; but Don Sancho having firſt fatigued them by the celerity of his march, at length choſe a ſtrong camp, and, having given his troops time to repoſe, drew them out and offered the enemy battle. The Moors accepted the challenge, but were entirely defeated; and Don Sancho returned into Portugal with ſpoils to an immenſe amount. For ſome years after the war was continued without any remarkable event; but, in 1184, Joſeph king of Morocco, having already tranſported multitudes of men from Barbary, at length followed in perſon with a prodigious army, and carried all before him as far as the Tayo. He appeared before the city of Santaren; but having wearied and reduced his army by unſucceſsful aſſaults on that place, he was attacked by the Portugueſe forces aſſiſted by Ferdinand of Leon, entirely defeated, and himſelf killed. By this victory, the Portugueſe were left at liberty to improve the interior part of their country, and fortify their frontiers; and during this interval, the king died in the 76th year of his age, in the year 1185.

13
His wiſe adminiſtration when king.

Don Alonſo was ſucceeded by his ſon Don Sancho I. Of this prince it is remarkable, that, before he aſcended the throne, he was of a reſtleſs and warlike diſpoſition; but no ſooner did he come to the poſſeſſion of the kingdom, than he became a lover of peace, and began with great aſſiduity to repair the cities that had ſuffered moſt by the war, and to repeople the country around them. By his ſteady attention to this, he in a very ſhort time quite altered the appearance of his territories, and procured to himſelf the glorious title of *The reſtorer of cities, and father of his country*. In the year 1189, a fleet, compoſed for the moſt part of Engliſh veſſels, but having on board a great number of adventurers of other nations bound to the Holy Land, entered the river of Liſbon. They were very kindly received, and ſupplied with all kinds of refreſhments by Don Sancho, who took this opportunity of ſoliciting them to aſſiſt him in a deſign he had formed of attacking the city of Silves in Algarve; to which they readily yielded. Having joined a ſquadron of his own galleys, and marched a body of troops by land, the place was reduced, and the Engliſh, according to agreement, rewarded with the plunder. But, in a ſhort time, the Moors from Africa having again invaded Portugal, the town was ſeveral times taken and retaken, till at laſt Don Sancho, being ſenſible of the difficulties that would attend the keeping of it, cauſed it to be demoliſhed. His laſt enterpriſe was the reduction of Elvas; ſoon after which he died with the reputation of the beſt economiſt that ever ſat on the throne of Portugal. With the character of being rather liberal than avaricious, he had amaſſed a treaſure of more than 700,000 crowns in ready money, beſides 1400 merks of ſilver and 100 of gold plate, which he diſpoſed of ſome time before his death. He was interred by his own command with much leſs pomp than his father, in the cathedral of Coimbra; and when his body was taken up 400 years after by order of the king Don Emanuel that it might be laid in a new tomb, it was found uncorrupted.

14
Differences with Caſtile.

The hiſtory of Portugal affords ſcarce any event of importance till the year 1289; when, in the reign of Don Denis, a difference commenced with Caſtile, which ſubſiſted for a long time. Frequent reconciliation took place; but theſe were either of very ſhort duration, or never ſincere. At length, in the reign of John I. Don Juan of Caſtile, who had alſo pretenſions to the crown of Portugal, invaded that kingdom at the head of the whole force of his dominions, and with the flower of the Caſtilian nobility entered the province of Alentego. According to the Portugueſe hiſtorians, he beſieged the city of Elvas without effect; which diſappointment enraged him to ſuch a degree, that he determined next year to invade Portugal a ſecond time, and ruin all the country before him. Accordingly, having collected an army of 30,000 men, he invaded Portugal, took and ruined ſeveral places, while king John lay inactive, with a ſmall army, waiting for ſome Engliſh ſuccours which he expected. At laſt he ventured an engagement with the forces which he had; and, notwithſtanding the great ſuperiority of the enemy, obtained a complete victory; after which he made an irruption into Caſtile, and had the good fortune to gain another battle, which fixed him firmly on the throne of Portugal. The Caſtilians were obliged to conſent to a truce of three years, which was ſoon after improved into a laſting peace.

15
The Caſtilians entirely defeated.

16
The city of Ceuta taken from the Moors.

In 1414, King John undertook an expedition againſt the Moors in Barbary, where he commanded in perſon; but before he ſet out, his queen (Philippa the daughter of John duke of Lancaſter) died of grief at the thoughts of his abſence. The expedition, however, proved ſucceſsful, and the city of Ceuta was taken from the Moors almoſt at the firſt aſſault: but ſcarce had the king left that country, when the princes of Barbary formed a league for the recovery of it; and though they were defeated by the young princes of Portugal, whom John again ſent into Barbary, yet the trouble of keeping it was ſo great, that ſome of the king's council were of opinion that the town ſhould be demoliſhed. But John, having conſidered the arguments on both ſides, determined to keep the city; and therefore enlarged and ſtrengthened the fortifications, augmenting his forces there to 6000 foot and 2500 horſe, which he hoped would be ſufficient for keeping off the attacks of the Moors.

King John died in 1428, and was ſucceeded by his eldeſt ſon Edward. He undertook an expedition againſt Tangier in Barbary: but the event proved very unfortunate; the Portugueſe being ſo ſhut up by the Moors, that they were obliged to offer Ceuta back again, in order to obtain leave to return to Portugal. The king's ſon, Don Ferdinand, was left as an hoſtage for the delivery of Ceuto; but was, with the utmoſt cruelty and injuſtice, left in the hands of the infidels, by the king and council of Portugal, who conſtantly refuſed to deliver up the place. Many preparations indeed were made for recovering the prince by force; but before any thing could be accompliſhed the king died in 1430, which put an end to all theſe deſigns. See PEDRO (Don).

17
Paſſage to the Eaſt Indies diſcovered.

The war with Barbary continued at intervals, but with little ſucceſs on the part of the Portugueſe; and till the year 1497, there is no event of any conſequence recorded in the hiſtory of Portugal. This year was remarkable for the diſcovery of the paſſage to the Eaſt Indies by the Cape of Good Hope. The enterpriſing ſpirit of the Portugueſe had prompted them to undertake voyages along the coaſt of Africa for a conſiderable time before; but when they undertook their firſt voyage of diſcovery, it is probable that they had nothing farther in view than to explore thoſe parts of the coaſt of Africa which lay neareſt to their own country. But a ſpirit of enterpriſe, when rouſed and put in motion, is always progreſſive; and that of the Portugueſe, though ſlow and timid in its firſt operations, gradually acquired vigour, and prompted them to advance along the weſtern ſhore of the African continent, far beyond the utmoſt boundary of ancient navigation in that direction. Encouraged by ſucceſs, it became more adventurous, deſpiſed dangers which formerly appalled it, and ſurmounted difficulties which it once deemed inſuperable. When the Portugueſe found in the torrid zone, which the ancients had pronounced to be uninhabitable, fertile countries, occupied by numerous nations; and perceived that the continent of Africa, inſtead of extending in breadth towards the weſt, according to the opinion of Ptolemy, appeared to contract itſelf, and to bend eaſtwards, more extenſive proſpects opened to their view, and inſpired them with hopes of reaching India, by continuing to hold the ſame courſe which they had ſo long purſued.

Robertſon's India.

18 Circumſtances which facilitated the diſcovery.

After ſeveral unſucceſsful attempts to accompliſh what they had in view, a ſmall ſquadron ſailed from the Tagus under the command of Vaſco de Gama, an officer of rank, whoſe abilities and courage fitted him to conduct the moſt difficult and arduous enterpriſes. From unacquaintance, however, with the proper ſeaſon and route of navigation in that vaſt ocean through which he had to ſteer his courſe, his voyage was long and dangerous. At length he doubled that promontory, which, for ſeveral years had been the object of terror and of hope to his countrymen. From that, after a proſperous navigation along the ſouth-eaſt of Africa, he arrived at the city of Melinda, and had the ſatisfaction of diſcovering there, as well as at other places where he touched, people of a race very different from the rude inhabitants of the weſtern ſhore of that continent, which alone the Portugueſe had hitherto viſited. Theſe he found to be ſo far advanced in civilization and acquaintance with the various arts of life, that they carried on an active commerce, not only with the nations on their own coaſt, but with remote countries of Aſia. Conducted by their pilots, who held a courſe with which experience had rendered them well acquainted, he ſailed acroſs the Indian ocean, and landed at Calecut, on the coaſt of Malabar, on the 22d of May 1498, ten months and two days after his departure from the port of Liſbon.

19 The king of the country jealous of his new viſitors.

The ſamorin, or monarch of the country, aſtoniſhed, at this unexpected viſit of an unknown people, whoſe aſpect, and arms, and manners, bore no reſemblance to any of the nations accuſtomed to frequent his harbours, and who arrived in his dominions by a route hitherto deemed impracticable, received them at firſt with that fond admiration which is often excited by novelty; but in a ſhort time, from whatever motives, he formed various ſchemes to cut off Gama and his followers. The Portugueſe admiral, however, was not to be over-reached by ſuch politics as his. From every danger to which he was expoſed, either by the open attacks or ſecret machinations of the Indians, he extricated himſelf with ſingular prudence and dexterity, and at laſt ſailed from Calecut with his ſhips, loaded not only with the commodities peculiar to that coaſt, but with many rich productions of the eaſtern parts of India. He returned to Portugal in two years after his ſailing from the Tagus, but with a great loſs of men; for out of 148 perſons whom he took out with him, only 55 returned. The king received him with all poſſible teſtimonies of reſpect and kindneſs; created him count of Videgueira; and not only declared him admiral of the Indies, but made that office hereditary in his family.

20 The Venetians dread the ruin of their commerce.

On the firſt intelligence of Gama's ſucceſsful voyage, the Venetians, with the quick-ſighted diſcernment of merchants, foreſaw the immediate conſequence of it to be the ruin of that lucrative branch of commerce which had contributed ſo greatly to enrich and aggrandize their country; and they obſerved this with more poignant concern, as they were apprehenſive that they did not poſſeſs any effectual means of preventing, or even retarding, its operation.

21 Account of the ſettlement of the Portugueſe in India.

The hopes and fears of both were well-founded. The Portugueſe entered upon the new career opened to them with activity and ardour, and made exertions, both commercial and military, far beyond what could have been expected from a kingdom of ſuch inconſiderable extent. All theſe were directed by an intelligent monarch, capable of forming plans of the greateſt magnitude with calm ſyſtematic wiſdom, and of proſecuting them with unremitting perſeverance. The prudence and vigour of his meaſures, however, would have availed little without proper inſtruments to carry them into execution. Happily for Portugal, the diſcerning eye of Emanuel ſelected a ſucceſſion of officers to take the ſupreme command in India, who, by their enterpriſing valour, military ſkill, and political ſagacity, accompanied with diſintereſted integrity, public ſpirit, and love of their country, have a title to be ranked with the perſons moſt eminent for virtue and abilities in any age or nation. Greater things perhaps were atchieved by them than were ever accompliſhed in ſo ſhort a time. Within 24 years only after the voyage of Gama, the Portugueſe had rendered themſelves maſters of the city of Malacca, in which the great ſtaple of trade carried on among the inhabitants of all thoſe regions in Aſia, which Europeans have diſtinguiſhed by the general name of the *Eaſt Indies*, was then eſtabliſhed. This conqueſt ſecured to them great influence over the interior commerce of India, while, at the ſame time, by their ſettlements at Goa and Diu, they were enabled to engroſs the trade of the Malabar coaſt, and to obſtruct greatly the long eſtabliſhed intercourſe of Egypt with India by the Red Sea. In every part of the eaſt they were received with reſpect; in many they had acquired the abſolute command. They carried on trade there without rival or controul; they preſcribed to the natives the terms of their mutual intercourſe; they often ſet what price they pleaſed on the goods which they purchaſed; and were thus enabled to import from Indoſtan and the regions beyond it, whatever is uſeful, rare, or agreeable, in greater abundance, and of more various kinds, than had been known formerly in Europe.

Not ſatisfied with this aſcendant which they had acquired in India, the Portugueſe early formed a ſcheme no leſs bold than intereſted, of excluding all other nations from participating of the advantages of commerce with the eaſt; and they accompliſhed one half of what their ambition had planned.

22
Oppoſition made by the Venetians.

In conſequence of this, the Venetians ſoon began to feel that decreaſe of their own Indian trade which they had foreſeen and dreaded. In order to prevent the farther progreſs of this evil, they incited the Soldan of the Mameluks to fit out a fleet in the Red Sea, and to attack thoſe unexpected invaders of a gainful monopoly, of which he and his predeceſſors had long enjoyed undiſturbed poſſeſſion. The Portugueſe, however, encountered his formidable ſquadron with undaunted courage, entirely defeated it, and remained maſters of the Indian ocean. They continued their progreſs in the eaſt almoſt without obſtruction, until they eſtabliſhed there a commercial empire; to which, whether we conſider its extent, its opulence, the ſlender power by which it was formed, or the ſplendor with which the government of it was conducted, there had hitherto been nothing comparable in the hiſtory of nations. Emanuel, who laid the foundation of this ſtupendous fabric, had the ſatisfaction to ſee it almoſt completed. Every part of Europe was ſupplied by the Portugueſe with the productions of the eaſt; and if we except ſome inconſiderable quantity of them, which the Venetians ſtill continued to receive by the ancient channel of conveyance, Europe had no longer any commercial intercourſe with India, and the regions of Aſia beyond it, but by the Cape of Good Hope.

23
Inquiſition introduced into Portugal.

In September 1522, King Emanuel died of an epidemical fever, and was ſucceeded by his ſon John III. The moſt remarkable tranſaction of this prince's reign was the introduction of the inquiſition into his dominions. This happened in the year 1525, or, as ſome ſay, in 1535. A famine happening to ceaſe in a ſhort time after it was introduced, the prieſts perſuaded the ignorant multitude that it was a bleſſing from heaven on account of the erecting ſuch an holy tribunal. However, it was not long before the bulk of the nation perceived what kind of a bleſſing the inquiſition was: but their diſcernment came too late; for by that time the inquiſitors had acquired ſuch power, that it became equally dangerous and ineffectual to attempt diſcloſing any of their myſteries.

In the mean time Solyman the Magnificent, the moſt enlightened monarch of the Ottoman race, obſerving the power and the opulence of the Portugueſe riſing, and attributing it to its proper cauſe, and eager to ſupplant them, ſent orders to the baſhaw of Egypt to employ his whole ſtrength againſt the Chriſtians in the Eaſt Indies. The baſhaw, in obedience to theſe orders, ſailed out from the Red Sea with a greater naval force than ever the Mohammedans had employed before; having 4000 Janizaries, and 16,000 other land troops on board. Yet, by the courage and conduct of the Portugueſe officers and ſoldiers, all this mighty armament was defeated, and their Eaſt India poſſeſſions ſaved from the danger which threatened them. In Africa likewiſe the king of Fez was baffled before the town of Safi, and freſh quarrels breaking out among the princes gave great relief to the Chriſtians, who had long been obliged to carry on a defenſive war, and had more than once been on the very brink of ruin. For a long time indeed their ſafety had been derived only from the quarrels of the Moors among themſelves; for ſuch was the envy and jealouſy which reigned among the Portugueſe, that they could never unite heartily in oppoſing the common enemy; and therefore, had their enemies united againſt them, they muſt certainly have been cut off. But whenever the cheriffs quarrelled with each other, one party was ſure to have recourſe to the Portugueſe; who, by ſending them a ſmall ſupply, ſecured quiet to themſelves, and had the pleaſure of ſeeing their enemies deſtroy one another. Yet in the end even this had bad conſequences; for, on one hand, it kept up a martial ſpirit among the Moors, and on the other it made them acquainted with the Portugueſe diſcipline; ſo that after every ſhort interval of repoſe they not only found them as much enemies as before, but much more formidable than ever. The conſequence of all this was, that King John began to apprehend that the conqueſt of Barbary was impoſſible, and therefore to limit his deſires to the keeping of thoſe few fortreſſes which he had already; which, though a neceſſary and prudent meaſure, diſpleaſed the generality of his ſubjects.

24
Bad ſtate of affairs in Barbary.

King John exerted himſelf much in the ſettlement of Brazil in South America, which he brought into a very good ſtate, cauſed ſeveral ſtrong towns to be erected there, and took all poſſible methods to encourage the converſion of the natives to Chriſtianity. He alſo made many regulations for the welfare and happineſs of his ſubjects. The diſputes of the nobility about precedency were frequently attended with very diſagreeable conſequences, which made the king reſolve once for all to ſettle them by eſtabliſhed rules; and the rules eſtabliſhed by him on this occaſion have ſubſiſted ever ſince, and in a great meaſure prevent theſe altercations. He had other great deſigns in his mind, particularly with regard to the reformation, which he had puſhed very far with reſpect to religious perſons of both ſexes; but, on a cloſe examination of his affairs, he found his ſubjects in general to have been ſo much injured by his leaving their concerns to the inſpection of his council, that he was thrown by the grief of it into a kind of apoplexy, from which he never recovered. His death happened in June 1557; and he was ſucceeded by his ſon Don Sebaſtian III. an infant of three years of age.

After the death of King John, the adminiſtration remained in the hands of the queen, grandmother to Sebaſtian, who behaved with great prudence and circumſpection. The Moors, however, ſuppoſing that under a minority they might be able to diſpoſſeſs the Chriſtians of ſuch places as they held in Barbary, laid cloſe ſiege to Maſagnan. But the queen-regent ſent ſuch ſpeedy ſuccours, and promiſed ſuch rewards to thoſe who diſtinguiſhed themſelves, that the Moors, though they brought 80,000 men into the field, were obliged to abandon the enterpriſe. This was at firſt magnified as a high inſtance of the queen's capacity and wiſdom; but in a ſhort time the natural averſion which the Portugueſe had to the government of women, together with the prejudice they had againſt her country, as being a Caſtilian, appeared ſo plainly, and gave her ſo much uneaſineſs, that of her own accord ſhe reſigned her authority into the hands of Cardinal Don Henry

25 Prepoſterous education of the young king Sebaſtian.

the king's brother. By him Don Alexius de Meneſes was appointed the king's governor, and Gonſales de Gomera with two other prieſts his preceptors. By means of thoſe inſtructors the king's education was totally marred. His governor aſſiduouſly inculcated upon him that the chief virtue of a king was courage; that danger was never to be avoided, but always ſurmounted, let the occaſion be what it would. His other tutors, inſtead of inſtructing him in the true religion, only inſpired him with an abhorrence of profeſſed infidels: the conſequence of all which was, that he became raſh, inconſiderate, and obſtinate; all which qualities conſpired to draw upon him the cataſtrophe which ruined both him and the kingdom.

26 He undertakes an expedition againſt Africa.

After the king was grown up to man's eſtate, his deſire was to diſtinguiſh himſelf againſt the infidels. He himſelf choſe an expedition to the Eaſt Indies; but the prime miniſter Alcoçova, who did not chooſe to attend his monarch to ſuch a diſtance, ſubſtituted Africa in its ſtead. This expedition the king entered into in the moſt inconſiderate and abſurd manner. He firſt ſent over Don Antonio prior of Crato, with ſome hundreds of ſoldiers; carried his principal courtiers over with him from a hunting match, and without equipages; he then ſent for the duke of Aveyro, with ſuch troops as he could collect on the ſhort warning he had got; and when all theſe were aſſembled, the king ſpent his time in hunting, and ſlight excurſions againſt the enemy, without doing any thing of conſequence, except expoſing his perſon upon all occaſions. At length he returned to Portugal in ſuch tempeſtuous weather, that his ſubjects had given him up for loſt; when they were agreeably ſurpriſed by his unexpected arrival in the river of Liſbon, which they celebrated with the greateſt rejoicings.

27 Account of his forces.

The little ſucceſs which attended the king in this expedition ſerved only to inflame him more with deſire for another; ſo that from the time he returned, he ſeemed to think on nothing elſe. He was highly delighted alſo with an accident which at this time furniſhed him with a pretence for war, though of that he ſtood in no great need. Muley Hamet, king of Fez and Morocco, had been diſpoſſeſſed of his dominions by his uncle Muley Moloch. At the beginning of this war Don Sebaſtian had offered him his troops in Africa, which offer was rejected with contempt: but now being a fugitive, and having in vain applied for aſſiſtance to Philip of Spain, Muley Hamet applied to the king of Portugal; and, that he might the more eaſily ſucceed, cauſed the fortreſs of Arzila, which his father had recovered, to be reſtored to the Portugueſe. The king was in rapture at this event, and fancied that his glory would exceed that of all his predeceſſors. He was adviſed againſt this expedition, however, by all his friends. King Philip of Spain having done every thing to diſſuade him from it in a perſonal conference, ſent Franciſco Aldana, an old and experienced officer, to Morocco; and at his return ordered him to attend Don Sebaſtian, in order to give him an account of the ſtate of affairs in that country. This he performed with the greateſt fidelity, but without any effect. The queen dowager and cardinal united in their endeavours to divert him from this unfortunate enterpriſe; but he treated them both with ſo little reſpect, that his grandmother broke her heart; and the cardinal, to ſhow his diſtaſte to the meaſure, retired to Evora without coming either to court or council; which example was followed by many of the nobles. Many of theſe, however, ſent very free remonſtrances to the king on the impropriety of his conduct; and King Philip ſent to him the duke de Medina Celi, once more to lay before him the reaſons why he thought his ſcheme impracticable, and to put him in mind that he had no hand in puſhing him upon his deſtruction, or of concealing from him the dangers into which he ſeemed determined to plunge himſelf and his ſubjects. Laſtly, he received a letter on the ſubject from Muley Moloch himſelf, wherein that prince explained to him his own right to the crown of Fez, and ſhowed that he had only diſpoſſeſſed a tyrant and a murderer, who had therefore no right to his friendſhip or aſſiſtance. He next aſſured him that he had no reaſon to fear either the power or neighbourhood of the Portugueſe; as a proof of which, and as a mark of his eſteem, he was content to make him a preſent of ten miles of arable ground round each of the fortreſſes he poſſeſſed in Africa, and which indeed were no more than four, viz. Tangier, Ceuta, Maſagan, and Arzila. At the ſame time he addreſſed himſelf to King Philip of Spain, with whom he was on good terms, deſiring him to interpoſe with his nephew Sebaſtian, that things might be yet adjuſted without the effuſion of human blood. But the king of Portugal was deaf to all ſalutary advice; and therefore paid no regard to this letter, nor to the remonſtrances of his uncle. On the 24th of June 1577, therefore, he ſet ſail from the bar of Liſbon with a fleet of 50 ſhips and five galleys, twelve pieces of cannon, and tranſports and tenders, making up near 1000 ſail. His troops conſiſted of 9000 Portugueſe foot; 3000 Germans; 700 Italians commanded by Sir Thomas Stukeley, an Engliſh exile, but remarkably brave; 2000 Caſtilians and 300 volunteers, commanded by Don Chriſtopher de Tuvara maſter of the horſe, a man of courage, but without either conduct or experience. He touched firſt at Lagos bay in the kingdom of Algarve, where he remained for four days: thence he proceeded to Cadiz; where he was magnificently feaſted for a weak by the duke de Medina Sidonia, who took the opportunity once more, by order of Philip, of diſſuading him from proceeding further in perſon. But this exhortation proved as fruitleſs as the reſt; and the king having ſailed with a ſtrong detachment for Tangier, ordered Don Diego de Souza, his commander in chief, to follow with the remaining part of the army.

The troops landed on the coaſt of Africa without any bad accident, and joined at Arzila. Here the king was met by the cheriff Muley Hamet, on whoſe account he had undertaken the war, who delivered him his ſon Muley, a boy of 12 years of age, as a hoſtage, and brought a reinforcement of 300 Moors. The boy was ſent to Maſagon under a ſtrong guard; but the father remained in the Portugueſe camp. Here it was reſolved in a council of war to reduce the town of Larache, but it was diſputed whether the troops ſhould proceed thither by land or ſea. Don Sebaſtian, who eſpouſed the former opinion, finding himſelf oppoſed by Muley Hamet, gave him ſuch a rude anſwer, that he left his preſence in diſcontent; after which the king's opinion prevailed, and the army began its march on the 29th of July. As they proceeded, the king received a letter from the duke of Alba, requeſting him to attempt nothing beyond the taking of the town of Larache. Along with the letter was ſent an helmet which had been worn by Charles V.

28 Movements and diſpoſition of the armies.

On the other hand Muley Moloch, having intelligence of this formidable invaſion, took the field, though at that time ſo ill of a fever that he could not ſit on horſeback, with 40,000 foot and 60,000 horſe. He conducted every thing, notwithſtanding his diſtreſſed ſituation, with the greateſt prudence. Finding ſome reaſon to ſuſpect that part of his army were deſirous of going over to his rival, he proclaimed that ſuch as inclined to join their old maſter were at liberty to do it. This at once put a ſtop to the defection, and only a very few made uſe of the liberty which was granted them. Standing in doubt likewiſe of the fidelity of a body of 3000 horſe, he ſent them to reconnoitre the enemy, by which act of confidence he ſecured them. Still, however, he feared that his officers might be corrupted by the Portugueſe gold; for which reaſon he changed the diſpoſition of his army entirely, ſo that none of his officers commanded the corps to which they had been accuſtomed; and therefore, having new men to deal with, had none whom they could truſt.

Having taken theſe precautions, he advanced againſt the Portugueſe army with ſuch celerity, that he came in ſight of them on the 3d of Auguſt. On this Don Sebaſtian called a council of war; in which many who out of complaiſance had given their opinions for this march, were now for returning. They were ſeparated from the enemy by a river, and the Moors were maſters of the ford, ſo that it was impoſſible to force them immediately in their poſts; neither was it practicable for them to wait for a more favourable opportunity, becauſe they had no proviſions. The foreign officers, on the contrary were of opinion that fighting was now become neceſſary, and a retreat dangerous. This, however, was violently oppoſed by the cheriff, who ſaw plainly that they ran a great riſk of being defeated and of loſing all, while at the ſame time they were not certain of gaining any thing of conſequence though they ſhould be victorious: whereas, if they drew down towards the ſea, they might entrench themſelves till they were relieved by their fleet; during which interval if Muley Moloch ſhould die, he looked upon it as certain that a great part of the army would deſert to him, which would render him maſter not only of the kingdom, but of the fate of the Chriſtians alſo. When he found that the king was bent on fighting, he only requeſted that the engagement might be delayed till 4 o'clock in the afternoon, that, in caſe of a defeat, they might have ſome chance of eſcaping: but even in this he could not prevail; for the king having diſpoſed of every thing for a battle the next day, was impatient to begin the onſet as ſoon as it was light.

In the mean time Muley Moloch was ſo ſenſible of the advantages of his ſituation, that he was inclined to take the whole Portugueſe army priſoners; but finding his diſeaſe increaſe, ſo that he had no hopes of recovery, he came to the reſolution to fight, that his antagoniſt might not avail himſelf of his death. The diſpoſition of the Chriſtian army was very regular and correct, through the care of ſome old officers in Don Sebaſtian's ſervice: the infantry were diſpoſed in three lines; the battalion of volunteers made the vanguard; the Germans commanded by colonel Amberg, and the Italians by Sir Thomas Stuckeley, were on the right; the Caſtilian battalions on the left; the Portugueſe in the centre and rear; the cavalry, conſiſting of about 1500 men, partly on the right under the command of the duke d'Avegro, to whom the cheriff joined himſelf with his horſe: on the left was the royal ſtandard, with the reſt of the cavalry, under the command of the duke of Barcelos eldeſt ſon to the duke of Braganza, Don Antonio prior of Crato, and ſeveral other perſons of great rank. The king took poſt at firſt with the volunteers. Muley Moloch diſpoſed alſo his troops in three lines: the firſt conſiſted of the Andaluſian Moors, commanded by three officers who had diſtinguiſhed themſelves in the wars of Granada; the ſecond of renegadoes; and the third of the natives of Africa. They moved in a half moon, with 10,000 horſe on each wing, and the reſt in the rear, with orders to extend themſelves in ſuch a manner as to encompaſs the Chriſtian army. Muley Moloch, though extremely weak, was taken out of his litter and ſet on horſeback, that he might ſee how his commands had been obeyed; and being perfectly ſatisfied with the ſituation of his troops, he directed the ſignal of battle to be given.

29 The Portuguese army entirely feated.

The Chriſtians advanced with the greateſt reſolution; broke the firſt line of the Mooriſh infantry, and diſordered the ſecond. On this Muley Moloch drew his ſword, and would have advanced to encourage his troops, but that his guards prevented him; on which his emotion of mind was ſo great, that he fell from his horſe. One of his guards caught him in his arms, and conveyed him to his litter; where he immediately expired, having only time to lay his finger on his lips by way of enjoining them to conceal his death. But by this time the Mooriſh cavalry had wheeled quite round, and attacked the Chriſtian army in the rear: upon which the cavalry in the left wing made ſuch a vigorous effort that they broke the Portugueſe or the right; and at this time the cheriff, in paſſing a rivulet, was drowned. In this emergency, the Germans, Italians, and Caſtilians, did wonders; but the Portugueſe, according to their own hiſtorians, behaved indifferently. Attacked on all ſides, however, they were unable to reſiſt; and the whole army, except about 50 men, were killed or taken priſoners. The fate of the king is variouſly related. According to ſome, he had two horſes killed under him, and then mounted a third. His braveſt officers were killed in his defence; after which the Moors ſurrounded him, ſeized his perſon, ſtripped him of his ſword and arms, and ſecured him. They immediately began to quarrel about whoſe priſoner he was; upon which one of the generals rode in among them, crying, "What, you dogs, when God has given you ſo glorious a victory, would you cut one anothers throats about a priſoner?" at the ſame time diſcharging a blow at Sebaſtian, he brought him to the ground, when the reſt of the Moors ſoon diſpatched him. Others affirm, that one Lewis de Brito meeting the king with his ſtandard wrapped round him, Sebaſtian cried out, "Hold it faſt, let us die upon it!" upon which charging the Moors, he was ſeized, reſcued by Brito, who was himſelf taken with the ſtandard, and carried to Fez. He affirmed, that after he was taken, he ſaw the king at a diſtance, and unpurſued. Don Lewis de Lima met him afterwards making towards the river; and this is the laſt account we have of his being ſeen alive.

Muley Hamet, the brother of Muley Moloch, was proclaimed king by the Moors immediately after the battle. Next day, having ordered all the priſoners to be brought before him, the new ſovereign gave orders to ſearch for the body of Don Sebaſtian. The king's valet-de-chambre brought back a body, which he ſaid was that of his maſter, but ſo disfigured with wounds, that it could not well be known; ſo that notwithſtanding the moſt diligent ſearch, this monarch's death could never be properly authenticated. This body, however, was preſerved by Muley Hamet, who delivered it up as the body of Don Sebaſtian to King Philip of Spain. By him it was ſent to Ceuta, from whence it was tranſported to Portugal, and buried among his anceſtors in the monaſtery at Belem, with all poſſible ſolemnity.

30
Portugal conquered by Philip of Spain.

By this terrible diſaſter, the kingdom of Portugal, from being the moſt eminent, ſunk at once into the loweſt rank of the European ſtates. All the young nobility were cut off, or carried into ſlavery: the kingdom was exhauſted of men, money, and reputation; ſo that Don Henry, who aſſumed the government after the death of his brother Don Sebaſtian, found himſelf in a very diſagreeable ſituation. The tranſactions of his reign were quite trifling and unimportant; but after his death a great revolution took place. The crown of Portugal was claimed by three different competitors; viz. the prince of Parma, the dutcheſs of Braganza, and Philip of Spain. Whatever might have been the merits of their reſpective claims, the power of Philip quickly decided the conteſt in his favour. He found his ſchemes facilitated by the treachery of the regents, who took the moſt ſcandalous methods of putting the kingdom into his hands. Under pretence of inſpecting the magazines, they took out ſome of the powder, and mixed the reſt with ſand: they appointed an agent to go to France for ſuccours, from whence they knew that they could not arrive in time; they diſſolved the ſtates as ſoon as they diſcovered that they were bent on maintaining the freedom of the nation; and, under a ſhow of confidence, ſent off to diſtant places ſuch of the nobility as they ſuſpected.

King Philip, finding every thing in his favour, commanded the duke of Alva to invade Portugal, at the head of 20,000 men. The people, perceiving that they were betrayed, exclaimed againſt the governors, and placed on the throne Don Antonio prior of Crato. But his forces being inexperienced, and he himſelf behaving in a very improper manner, he was quickly defeated by the duke of Alva, and forced to fly out of the kingdom, which he effected with great difficulty. On his flight the whole kingdom ſubmitted, together with the garriſons in Barbary, the ſettlements on the weſtern coaſt of Africa, of Brazil, and in the Eaſt Indies. All the Madeiras, however, except the iſle of St Michael, held out for Don Antonio until they were reduced, and the French navy, who came to their aſſiſtance, entirely defeated and deſtroyed.

31
Terms granted by him to his new ſubjects,

Philip made his entry into Liſbon as ſoon as the kingdom was totally reduced, and endeavoured to conciliate the affections of the people by confirming the terms which he had before offered to the ſtates. Theſe terms were, that he would take a ſolemn oath to maintain the privileges and liberties of the people: that the ſtates ſhould be aſſembled within the realm, and nothing propoſed in any other ſtates that related to Portugal: that the viceroy or chief governor ſhould be a native, unleſs the king ſhould give that charge to one of the royal family: that the houſehold ſhould be kept on the ſame footing: that the poſt of firſt preſident, and of all offices, civil, military, and judicial, ſhould be filled with Portugueſe; all dignities in the church and in the orders of knighthood confined to the ſame; the commerce of Ethiopia, Africa, and the Indies, reſerved alſo to them, and to be carried on only by their merchants and veſſels: that he would remit all impoſts on eccleſiaſtical revenues: that he would make no grant of any city, town, or juriſdiction royal, to any but Portugueſe: that eſtates reſulting from forfeitures ſhould not be united to the domain, but go to the relations of the laſt poſſeſſor, or be given to other Portugueſe for recompenſe of ſervices: that when the king came to Portugal, where he ſhould reſide as much as poſſible, he ſhould not take the houſes of private perſons for his officers' lodging, but keep to the cuſtom of Portugal: that wherever his majeſty reſided, he ſhould have an eccleſiaſtic, a treaſurer, a chancellor, two maſters of requeſts, with under officers, all of them Portugueſe, who ſhould diſpatch every thing relating to the kingdom: that Portugal ſhould ever continue a diſtinct kingdom, and its revenue be conſumed within itſelf: that all matters of juſtice ſhould be decided within the realm: that the Portugueſe ſhould be admitted to charges in the houſeholds of the king and queen of Spain: that all duties on the frontiers ſhould be taken away: and, laſtly, that Philip ſhould give 300,000 ducats to redeem priſoners, repair cities, and relieve the miſeries which the plague and other calamities had brought upon the people. All theſe conditions, formerly offered and rejected by the Portugueſe, the king now confirmed: but whereas the duke of Oſſuna, by way of ſecurity for theſe conditions, had promiſed them a law, that if the king did not adhere to them, the ſtates ſhould be freed from their obedience, and might defend their right by the ſword, without incurring the reproach of perjury, or the guilt of treaſon; this he abſolutely refuſed to ratify.

32
Cannot conciliate their affections.

All theſe conceſſions, however, did not anſwer the purpoſe; nay, though Philip was to the laſt degree laviſh of honours and employments, the Portugueſe were ſtill diſſatiſfied. This had alſo an effect which was not foreſeen: it weakened the power, and abſorbed the revenues, of the crown; and, by putting it out of the power of any of his ſucceſſors to be liberal in the ſame proportion, it raiſed only a ſhort-lived gratitude in a few, and left a number of malecontents, to which time was continually adding.

33
Is diſturbed by Don Antonio.

Thus Philip, with all his policy, and endeavours to pleaſe, found his new ſubjects ſtill more and more diſguſted with his government, eſpecially when they found their king treating with the utmoſt ſeverity all thoſe who had ſupported Don Antonio. The exiled prince, however, ſtill ſtyled himſelf *king of Portugal*. At firſt he retired to France, and there demanded ſuccours for the recovery of his dominions. Here he found ſo much countenance, that with a fleet of near 60 ſail, and a good body of troops on board, he made an attempt upon the Terceras, where his fleet was beat by the Spaniards; and a great number of priſoners being taken,

ken, all the officers and gentlemen were beheaded, and a great number of meaner people hanged. Don Antonio, notwithſtanding, kept poſſeſſion of ſome places, coined money, and performed many other acts of regal power; but was at length conſtrained to retire, and it was with ſome difficulty that he did ſo, and returned into France. He paſſed from thence into England, where he was well received; and many fitted out privateers to cruiſe againſt the Spaniards under his commiſſion. But after king Philip had ruined the naval power of Portugal as well as Spain, by equipping the armada, Queen Elizabeth made no difficulty of owning and aſſiſting Don Antonio, and even of ſending Sir John Norris and Sir Francis Drake with a ſtrong fleet and a great army to reſtore him. Upon this occaſion Don Antonio ſent his ſon Don Chriſtopher a hoſtage to Muley Hamet king of Fez and Morocco, who was to lend him 200,000 ducats. But king Philip prevented this by ſurrendering Arzila: and this diſappointment, the unſeaſonable enterpriſe upon Corunna, and the diſputes that aroſe between Norris and Drake, rendered that expedition abortive; ſo that, except carrying the plague into England, it was attended with no conſequences worthy of notice. He remained ſome time after in England: but finding himſelf little regarded, he withdrew once more into France, where he fell into great poverty and diſtreſs; and at length dying in the 64th year of his age, his body was buried in the church of the nuns of Ave Maria, with an inſcription on his tomb, in which he is ſtyled *king*. He left ſeveral children behind him, who, on account of his being a knight of Malta, and having made a vow of virginity at his entrance into the order, were looked upon as illegitimate. He preſerved, even to the day of his death, a great intereſt in Portugal; and had drawn from thence, in the courſe of his life, immenſe ſums of money; which had been ſquandered in many fruitleſs negociations and attempts to diſturb the poſſeſſions of king Philip in almoſt all parts of his dominions, and particularly in the Indies, where the Portugueſe were rather more averſe to the Caſtilian yoke, or at leaſt teſtified their averſion more openly, than in Europe.

34 Impoſtors pretending to be Don Sebaſtian.

But Don Antonio was not the only pretender to the crown of Portugal: for the people, partly through the love of their prince, and partly from their hatred to the Caſtilians, were continually feeding themſelves with the hopes that Don Sebaſtian would appear and deliver them; and in this reſpect ſuch a ſpirit of credulity reigned, that it was ſaid proverbially, they would have taken a negro for Don Sebaſtian. This humour put the ſon of a tiler at Alcobaza, who had led a profligate life, and at length turned hermit, to give himſelf out for that prince; and having with him two companions, one of them ſtyled himſelf *Don Chriſtopher de Tavora*, and the other the *biſhop of Guarda*, they began to collect money, and were in a fair way of creating much diſturbance, if the cardinal arch-duke had not cauſed him to be apprehended; and after leading him ignominiouſly through the ſtreets of Liſbon, he who took the name of *Sebaſtian* was ſent to the galleys for life, and the pretended biſhop was hanged. Not long after, Gonſalo Alvarez, the ſon of a maſon, gave himſelf out for the ſame king; and having promiſed marriage to the daughter of Pedro Alonſo, a rich yeoman, whom he created Earl of Torres Novas, he aſſembled a body of about 800 men, and ſome blood was ſpilt before he was apprehended: at length, being clearly proved to be an impoſtor, himſelf and his intended father-in-law were publicly hanged and quartered at Liſbon; which, inſtead of extinguiſhing this humour, farther increaſed it.

35 Account of a remarkable one.

There was, however, a perſon who appeared about 20 years after the fatal defeat of Sebaſtian, at Venice, who created much more trouble. He aſſumed the name of *Don Sebaſtian*, and gave a very diſtinct account of the manner in which he had paſſed his time from that defeat. He affirmed, that he had preſerved his life and liberty by hiding himſelf amongſt the ſlain: that, after wandering in diſguiſe for ſome time in Africa, he returned with two of his friends into the kingdom of Algarve: that he gave notice of this to the king Don Henry: that finding his life ſought, and being unwilling to diſturb the peace of the kingdom, he returned again among the Moors, and paſſed freely from one place to another in Barbary, in the habit of a penitent: that after this he became a hermit in Sicily; but at length reſolved to go to Rome, and diſcover himſelf to the pope. On the road he was robbed by his domeſtics, and came almoſt naked to Venice, where he was known, and acknowledged by ſome Portugueſe. Complaint being made to the ſenate, he was obliged to retire to Padua. But the governor of that city ordering him alſo to depart, he, not knowing what to do, returned again to Venice; where, at the requeſt of the Spaniſh ambaſſador, who charged him not only with being an impoſtor, but alſo with many black and atrocious crimes, he was ſeized, and thrown into priſon. He underwent 28 examinations before a committee of noble and impartial perſons; in which he not only acquitted himſelf clearly of all the crimes that had been laid to his charge, but entered alſo into ſo minute a detail of the tranſactions that had paſſed between himſelf and the republic, that the commiſſioners were perfectly aſtoniſhed, and ſhowed no diſpoſition to declare him an impoſtor; moved more eſpecially by the firmneſs of his behaviour, his ſingular modeſty, the ſobriety of his life, his exemplary piety, and his admirable patience under his afflictions. The noiſe of this was diffuſed throughout Europe, and the enemies of Spain endeavoured every where to give it credit.

The ſtate, however, refuſed to diſcuſs the great point, whether he was or was not an impoſtor, unleſs they were requeſted ſo to do by ſome prince or ſtate in alliance with them. Upon this the prince of Orange ſent Don Chriſtopher, the ſon of the late Don Antonio, to make that demand; and at his requeſt an examination was made with great ſolemnity: but no deciſion followed; only the ſenate ſet him at liberty, and ordered him to depart their dominions in three days. He went therefore, by the advice of his friends, to Padua, but in the diſguiſe of a monk, and from thence to Florence; where he was arreſted by the command of the grand duke, who delivered him to the viceroy of Naples. The count de Lemos, then in poſſeſſion of that dignity, died ſoon after; before whom he was firſt brought; this man aſſerted, he muſt know him to be Don Sebaſtian, ſince he had been twice ſent to him from the king of Spain. He remained priſoner ſeveral years in the caſtle Del Ovo, where he endured incredible hardſhips. At length he was brought out, led with infamy through the ſtreets of the city, and declared to be an impoſtor, who aſſumed the name of *Sebaſtian:* at which words, when proclaimed before him, he ſaid gravely, *And ſo I am.* In the ſame proclamation it was affirmed, that he was in truth a Calabrian; which as ſoon as he heard, he ſaid, *It is falſe.* He was next ſhipped on board a galley as a ſlave; then carried to St Lucar, where he was ſome time confined; from thence he was transferred to a caſtle in the heart of Caſtile, and never heard of more. Some perſons were executed at Liſbon for their endeavours to raiſe an inſurrection on his behalf: but it was thought ſtrange policy, or rather a ſtrange want of policy, in the Spaniards, to make this affair ſo public without proofs; and the attempt to ſilence this objection, by affirming him to be a magician, was juſtly looked upon as ridiculous.

36
Bad conſequences of the Spaniſh adminiſtration.

The adminiſtration of affairs in Portugal, during the reign of Philip, was certainly detrimental to the nation; and yet it does not appear that this flowed ſo much from any ill intention in that monarch, as from errors in judgment. His prodigious preparations for the invaſion of England impoveriſhed all his European dominions; but it abſolutely exhauſted Portugal. The pretenſions of Don Antonio, and the hopes of deſpoiling their Indian fleets, expoſed the Portugueſe to the reſentment of the Engliſh; from which the king having granted away all his domains, wanted power to defend them. Their clamours were not at all the leſs loud for their being in ſome meaſure without cauſe. The king, to pacify them, borrowed money from the nobility upon the cuſtoms, which were the only ſure remedy he had ſtill left; and this was attended with fatal conſequences. The branches, thus mortgaged, became, and continue to this hour, fixed and hereditary; ſo that the merchant was oppreſſed, and the king received nothing. This expedient failing, a tax of three *per cent.* was impoſed, in the nature of ſhip-money, for the defence of the coaſts and the commerce, which for ſome years was properly applied; but it then became a part of the ordinary revenue, and went into the king's exchequer without account. This made way for diverting other appropriated branches; as for inſtance, that for the repair of fortifications, the money being ſtrictly levied, and the works ſuffered to decay and tumble down; and for the maintenance of the conqueſt in Africa, by which the garriſons mouldered away, and the places were loſt. Upon the whole, in the ſpace of 18 years, the nation was viſibly impoveriſhed: and yet the government of Philip was incomparably better than that of his ſucceſſors; ſo that his death was juſtly regretted; and the Portugueſe were taught by experience to confeſs, that of bad maſters he was the beſt.

His ſon Philip, the ſecond of Portugal and the third of Spain, ſat 20 years upon the throne before he made a viſit to Portugal, where the people put themſelves to a moſt enormous expence to receive him; for which they received little more than the compliment, that before his entry into Liſbon, he knew not how great a king he was. He held an aſſembly of the ſtates, in which his ſon was ſworn ſucceſſor. Having done all that he wanted for himſelf, he acquired a falſe idea of the riches of the nation from an immoderate and fooliſh diſplay of them during his ſhort ſtay at Liſbon; and having ſhown himſelf little, and done leſs, he returned into Spain; where he acted the part of a good king upon his death-bed, in deploring bitterly that he never thought of acting it before. The reign of Philip III. and IV. was a ſeries of worſe meaſures, and worſe fortune: all his dominions ſuffered greatly; Portugal moſt of all. The loſs of Ormus in the Eaſt, of Brazil in the Weſt Indies, together with the ſhipwreck of a fleet ſent to eſcort that from Goa, brought the nation incredibly low, and encouraged the conde duke to hope they might be entirely cruſhed. Theſe are the heads only of the tranſactions for 40 years: to enter in any degree into the particulars, is, in other words, to point out the breaches made by the Spaniſh miniſters on the conditions granted by king Philip; which, with reſpect to them, was the original contract, and unalterable conſtitution of Portugal while ſubject to the monarchs of Caſtile; and which, notwithſtanding, they ſo often and ſo flagrantly violated, that one would have imagined they had ſtudied to provoke the wrath of heaven, and inſult the patience of men, inſtead of availing themſelves, as they might have done, of the riches, power, and martial ſpirit of the Portugueſe people.

37
Great loſſes in Aſia and America.

38
The Portugueſe oppreſſed by the Spaniards.

It was the very baſis and foundation of their privileges, that the kingdom ſhould remain ſeparate and independent, and conſequently that Liſbon ſhould continue as much its capital as ever, the ſeveral ſupreme councils and courts reſiding; ſo that the natives of this realm might not be obliged to travel in ſearch of juſtice. So little, or at leaſt ſo ſhort a time, was this obſerved, that neither promotion nor juſtice was to be obtained without journeys, and Madrid was not more the capital of Caſtile than of Portugal. The general aſſembly of eſtates was to be held frequently, and they were held thrice in the ſpace of 60 years; and of theſe twice within the firſt three. The king was to reſide in this realm, as often and as long as poſſible; in compliance with which, Philip I. was there but once, Philip II. but four months, and Philip III. was never there at all. The houſehold eſtabliſhment was ſuppreſſed through all their reigns. The viceroy was to be a native of Portugal, or a prince or princeſs of the blood; yet when any of the royal family bore the title, the power was in reality in the hands of a Spaniard. Thus, when the princeſs of Mantua was vice-queen, the marquis de la Puebla was to aſſiſt in council, and in all diſpatches; and ſhe was to do nothing without his advice. The council of Portugal, which was to be compoſed entirely of natives, was filled with Caſtilians, as the garriſons alſo were, though the contrary had been promiſed. The preſidents of provinces, or corregidors, were to be natives; but by keeping thoſe offices in his own hands, the king eluded this article. No city, town, or diſtrict, was to be given but to Portuguſe: yet the duke of Lerma had Beja, Serpa, and other parts of the demeſnes of the crown, which were formerly appendages of the princes of the blood. None but natives were capable of offices of juſtice, in the revenue, in the fleet, or of any poſt civil or military; yet theſe were given promiſcuouſly to foreigners, or ſold to the higheſt bidder; not excepting the governments of caſtles, cities, and provinces. The natives were ſo far from having an equal chance in ſuch caſes, that no poſts in the preſidials were ever given to them, and ſcarce any in garriſons; and whenever it happened, in the caſe of a perſon of extraordinary merit, whoſe pretenſions could not be rejected, he was either removed, or not allowed to exerciſe his charge;

as fell out to the marquis of Marialva and others. The forms of proceeding, the juriſdiction, the miniſters, the ſecretaries, were all changed, in the council of Portugal; being reduced from five to three, then two, and at laſt to a ſingle perſon.

39
A revolution in favour of the duke of Braganza.

By reaſon of theſe and many other grievances too tedious to be mentioned here, the deteſtation of the Spaniſh government became univerſal; and in 1640 a revolution took place, in which John duke of Braganza was declared king, by the title of John IV. This revolution, as being determined by the almoſt unanimous voice of the nation, was attended with very little effuſion of blood; neither were all the efforts of the king of Spain able to regain his authority. Several attempts indeed were made for this purpoſe. The firſt battle was fought in the year 1644, between a Portugueſe army of 6000 foot and 1100 horſe, and a Spaniſh army of nearly the ſame number. The latter were entirely defeated; which contributed greatly to eſtabliſh the affairs of Portugal on a firm baſis. The king carried on a defenſive war during the remainder of his life; but after his death, which happened in 1655, the war was renewed with great vigour.

40
Perilous ſtate of Portugal on his death.

This was what the Spaniards did not expect; for they expreſſed a very indecent kind of joy at his death, hoping that it would be followed by a diſſolution of the government. It is not indeed eaſy to conceive a kingdom left in more perilous circumſtances than Portugal was at this time:—The king Don Alonzo Enriquez, a child not more than 13 years of age, reputed of no very ſound conſtitution either in body or mind; the regency in a woman, and that woman a Caſtilian; the nation involved in a war, and this reſpecting the title to the crown; the nobility, ſome of them ſecretly diſaffected to the reigning family, and almoſt all of them embarked in feuds and contentions with each other; ſo that the queen ſcarce knew who to truſt or how ſhe ſhould be obeyed. She acted, however, with great vigour and prudence. By marrying her only daughter the princeſs Catharine to Charles II. King of Great Britain, ſhe procured to Portugal the protection of the Engliſh fleets, with reinforcements of ſome thouſands of horſe and foot; and at laſt, in 1665, terminated the war by the glorious victory of Monteſclaros. This deciſive action broke the power of the Spaniards, and fixed the fate of the kingdom, though not of the king, of Portugal. Alonzo was a prince whoſe education had been neglected in his youth, who was devoted to vulgar amuſements and mean company, and whom the queen for theſe reaſons wiſhed to deprive of the crown, that ſhe might place it on the head of his younger brother Don Pedro. To accompliſh this purpoſe, ſhe attempted every method of ſtern authority and ſecret artifice; but ſhe attempted them all in vain. The Portugueſe would not conſent to ſet aſide the rights of primogeniture, and involve the kingdom in all the miſeries attending a diſputed ſucceſſion. After the death, however, of the queen-mother, the infant entered into cabals againſt the king of a much more dangerous nature than any that ſhe had carried on. Alonzo had married the princeſs of Nemours; but being, as was ſaid, impotent, and likewiſe leſs handſome than his brother, that lady transferred her affection to Don Pedro, to whom ſhe lent her aſſiſtance to hurl the king from the throne. Alonzo was compelled to ſign a reſignation of the kingdom; and his brother, after governing a few months without any legal authority, was in a meeting of the ſtates unanimouſly proclaimed regent, and veſted with all the powers of royalty. Soon after this revolution, for ſuch it may be called, the marriage of the king and queen was declared null by the chapter of Liſbon; and the regent, by a papal diſpenſation, and with the conſent of the ſtates, immediately eſpouſed the lady who had been wife to his brother. He governed, under the appellation of *regent*, 15 years, when, upon the death of the king, he mounted the throne by the title of Don Pedro II. and after a long reign, during which he conducted the affairs of the kingdom with great prudence and vigour, he died on the 19th of December 1706.

41
Don Alonzo obliged to reſign the throne.

42
Don John V. a wiſe and reſolute prince,

Don John V. ſucceeded his father; and though he was then little more than 17 years of age, he acted with ſuch wiſdom and reſolution, adhered ſo ſteadily to the grand alliance formed againſt France and Spain, and ſhowed ſuch reſources in his own mind, that though he ſuffered great loſſes during the war, he obtained ſuch terms of peace at Utrecht, that Portugal was in all reſpects a gainer by the treaty. The two crowns of Spain and Portugal were not, however, reconciled thoroughly till the year 1737; and from this period they became every day more united, which gave much ſatisfaction to ſome courts, and no umbrage to any. In this ſituation of things, a treaty was made in 1750 with the court of Madrid, by which Nova Colonia, on the river of Plata, was yielded to his Catholic majeſty, to the great regret of the Portugueſe, as well on account of the value of that ſettlement, as becauſe they apprehended their poſſeſſion of the Braſils would by this action be rendered precarious. On the laſt of July the ſame year, this monarch, worn out by infirmities, deceaſed, in the 61ſt year of his age, and in the 44th of his reign.

43
Don Joſeph's excellent adminiſtration.

Don Joſeph, prince of Braſil, ſucceeded him, to the univerſal ſatisfaction of his ſubjects, and with as great expectations as ever any monarch that mounted the throne. It was generally believed that he would make conſiderable alterations, in which he did not diſappoint the hopes of the public; and yet they were done ſo ſlowly, with ſuch moderation, and with ſo many circumſtances of prudence, as hindered all grounds of complaint. Amongſt other new regulations, the power of the inquiſition ſuffered ſome reſtriction; the king directing, that none of their ſentences ſhould be put in execution till reviewed and approved by his privy-council. But as in the reign of his father he had conſented to the treaty with Spain, he ratified it after his acceſſion, and ſince carried it into execution upon this noble principle, that no conſiderations of intereſt ought ever to induce a monarch to break his word.

44
Dreadful calamities during his reign.

However, within the ſpace of the few years of this king's reign, the calamities of Portugal in general, and thoſe of the city of Liſbon in particular, cannot, in a great degree, be paralleled in all hiſtory. An earthquake, a fire, a famine, an aſſaſſination-plot againſt their prince, executions upon executions, the ſcaffolds and wheels for torture reeking with the nobleſt blood; imprisonment after impriſonment of the greateſt and moſt diſtinguiſhed perſonages; the expulſion of a chief order of eccleſiaſtics; the invaſion of their kingdom by a powerful, ſtronger, and exaſperated nation; the numerous troops of the enemy laying waſte their territory, bringing fire and ſword with them, and rolling like diſtant thunder towards the gates of their capital; their prince ready almoſt to ſave himſelf by flight! The Spaniſh miniſtry had already decreed the doom of Portugal, and nothing was to be heard at the Eſcurial but *Delenda eſt Carthago.* Carthaginian, perhaps, or Jewiſh ſtory, may poſſibly afford a ſcene ſomething like this, but for the ſhortneſs of the period not ſo big with events, though in their final deſtruction ſuperior. From that indeed, under the hand of Providence, the national humanity and generoſity of Great Britain has preſerved the Portugueſe; and it remains now to be ſeen, in future treaties, how that people will expreſs their gratitude (ſee BRITAIN, n° 450). 45 These calamities fooliſhly accounted for. Thoſe who are able to ſearch deeper into human affairs, may aſſign the cauſes of ſuch a wonderful chain of events; but no wiſe man will aſcribe all this to ſo ſingular a cauſe as that which a Spaniard has done, in a famous pamphlet, printed in the year 1762 at Madrid. It is intitled, *A Spaniſh Prophecy;* and endeavours to ſhow, that all theſe calamities have befallen the Portugueſe, ſolely on account of their connection with the heretic Engliſh. The great Ruler and Governor of the world undoubtedly acts by univerſal laws, regarding the whole ſyſtem, and cannot, without blaſphemy, be conſidered in the light of a partizan. The reſt of the pamphlet tends to ſhow, that his Catholic majeſty carried his arms into Portugal, ſolely to give them liberty, and ſet them free from Engliſh tyranny.

Joſeph dying without male iſſue, the ſucceſſion devolved to Mary, his daughter, now queen of Portugal. She was married ſome time before he died, with the pope's diſpenſation, to his brother Don Pedro.

46 Air, climate, &c. The air of Portugal, in the ſouthern provinces, would be exceſſively hot, if it were not refreſhed by the ſea-breezes; but in the northern, it is much cooler, and the weather more ſubject to rains. The ſpring is extremely delightful here; and the air, in general, more temperate than in Spain. Liſbon has been much reſorted to of late by valetudinarians and conſumptive perſons from Great Britain, on account of its air. The ſoil is very fruitful in wine, oil, lemons, oranges, pomegranates, figs, raiſins, almonds, cheſnuts, and other fine fruits; but there is a want of corn, owing, it is ſaid, in a great meaſure to the neglect of agriculture. There is plenty of excellent honey here; and alſo of ſea and river fiſh, and ſea-ſalt. The horſes in Portugal are briſk lively animals, as they are in Spain, but of a ſlight make: but mules being ſurer-footed, are more uſed for carriage and draught. By reaſon of the ſcarcity of paſture, there are not many herds of cattle or flocks of ſheep; and what they have are ſmall and lean, though the fleſh is tolerably good: their beſt meat is ſaid to be that of hogs and kids. The country in many parts is mountainous: but the mountains contain all kinds of ores; particularly of ſilver, copper, tin, and iron, with a variety of gems, beautifully variegated marble, millſtones, and many curious foſſils. Not far from Liſbon is a mine of ſaltpetre; but none of the metal mines are here worked, the inhabitants being ſupplied with metals of all kinds from their foreign ſettlements. The principal rivers are the Minho, in Latin *Minius;* the Limia, anciently the famed Lethe; the Cavado; the Douro; the Guadiana, anciently Anas; and the Tajo, or Tagus, which is the largeſt river in the kingdom, carrying ſome gold in its ſands, and falling into the ſea a little below Liſbon. There are ſeveral mineral ſprings in the kingdom, both hot and cold, which are much frequented.

47 Religion. The only religion tolerated in Portugal is that of the church of Rome; yet there are many concealed Jews, and thoſe too even among the nobility, biſhops, prebends, monks, and nuns, and the very inquiſitors themſelves. If a Jew pretends to be a Chriſtian and a Roman Catholic, while he is really a Jew, by going to maſs, confeſſion, &c. or if after being converted, or pretending to be converted and pardoned, he relapſes into Judaiſm and is diſcovered, the inquiſition lays hold of him. In the firſt caſe, if he renounce Judaiſm, he is only condemned to ſome corporal puniſhment or public ſhame, and then ordered to be inſtructed in the Chriſtian religion. In the ſecond, he is condemned to the flames without mercy. Beſides Jews and heretics, who broach or maintain any doctrines contrary to the religion of the country, the inquiſition puniſhes all ſodomites, pretenders to ſorcery and the black art, apoſtates, blaſphemers, perjured perſons, impoſters, and hypocrites. The burning of thoſe condemned by the inquiſition, is called an *auto da fe*, or "act of faith." There are ſeveral tribunals of the inquiſition, one of which is at Goa in the Eaſt Indies; but there are none in Braſil. The number of convents in Portugal is ſaid to be 900. The order of Jeſuits hath been ſuppreſſed in this country, as they have been in others. Here is a patriarch, ſeveral archbiſhops and biſhops: the patriarch is always a cardinal, and of the royal family. The archbiſhops rank with marquiſſes, and the biſhops with counts. The Portugueſe have archbiſhops and biſhops in the other quarters of the world as well as in Europe. The ſums raiſed by the popes here, by virtue of their prerogatives, are thought to exceed the revenues of the crown, and the nuncios never fail of acquiring vaſt fortunes in a ſhort time. Though there are two univerſities and ſeveral academies, yet while the papal power, and that of the eccleſiaſtics, continues at ſuch a height, true learning is like to make but a ſmall progreſs. The language of the Portugueſe does not differ much from that of Spain: Latin is the groundwork of both; but the former is more remote from it, and harſher to the ear than the latter. The Portugueſe tongue is ſpoken on all the coaſt of Africa and Aſia as far as China, but mixed with the languages of the ſeveral nations in thoſe diſtant regions.

48 Manufactures. With regard to manufactures, there are very few in Portugal, and thoſe chiefly coarſe ſilks, woollen cloths, and ſome linen; but their foreign trade is very conſiderable, eſpecially with England, which takes a great deal of their wine, ſalt, foreign commodities, and fruits, in return for its woollen manufactures, with which the Portugueſe furniſh their colonies and ſubjects in Aſia, Africa and America. Their plantations in Braſil are very valuable, yielding gold, diamonds, indigo, copper, tobacco, ſugar, ginger, cotton, hides, gums, drugs, dying woods, &c. From their plantations in Africa, they bring gold and ivory, and ſlaves to cultivate their ſugar and tobacco plantations in Braſil. They have ſtill ſeveral ſettlements in the Eaſt Indies, but far leſs conſiderable than formerly. The Azores or Weſtern Iſles, Madeira, and the Cape de Verde iſlands, alſo belong to

them; but a great part of the riches and merchandize brought from theſe diſtant countries becomes the property of foreigners, for the goods they furniſh the Portugueſe with to carry thither. The king's fiſth of the gold brought from Braſil amounts commonly to about 300,000 l. Sterling; ſo that the whole annual produce of gold in Braſil may be eſtimated at near 2,000,000 Sterling. Liſbon is the greateſt port in Europe next to London and Amſterdam.

49 Conſtitution and government.

As to the conſtitution of Portugal, it is an abſolute hereditary monarchy. Both here and in Spain there were anciently cortes, ſtates, or parliaments; but they have long ſince entirely loſt their ſhare in the legiſlature. For the adminiſtration of the civil government, there is a council of ſtate, and ſeveral ſecretaries; for military affairs, a council of war; for the finances, a treaſury court; and for the diſtribution of juſtice ſeveral high tribunals, with others ſubordinate to them, in the ſeveral diſtricts into which the kingdom is divided. The cities have their particular magiſtracy. The proceedings of the courts are regulated by the Roman law, the royal edicts, the canon law, and the pope's mandates. Like the Spaniards, they tranſact moſt of their buſineſs in the mornings and evenings, and ſleep at noon. The nobility are very numerous, and many of them are deſcended from natural ſons of the royal family. They are divided into high and low. The high conſiſts of the dukes, marquiſſes, counts, viſcounts, and barons, who are alſo grandees, but of different claſſes, being ſuffered to be covered in the king's preſence, and having the title of *Dons*, with a penſion from the royal treaſury, to enable them the better to ſupport their dignity: the king ſtyles them *Illuſtrious* in his letters, and treats them as princes. A duke's ſons are alſo grandees, and his daughters rank as marchioneſſes. The inferior nobility or gentry are termed *Hidalgos*, i. e. gentlemen: they cannot aſſume the title of *Don* without the king's licence.

50 Revenues of the king.

The revenues of the crown, ſince the diſcovery of the Braſil mines, are very conſiderable; but the real amount can only be gueſſed at. Some have ſaid that it amounts, clear of all ſalaries and penſions, to upwards of 3,000,000 Sterling; others make it a great deal leſs. Thus much is certain, that the cuſtoms and other taxes run exceſſively high. Beſides the royal demeſnes, the hereditary eſtates of the houſe of Braganza, the monopoly of Braſil ſnuff, the coinage, the money ariſing from the ſale of indulgences granted by the pope, the fiſth of the gold brought from Braſil, the farm of the Braſil diamonds, the maſterſhips of the orders of knighthood, and other ſources, yield very large ſums. The forces, notwithſtanding, of this nation, both by ſea and land, are very inconſiderable; their land-forces being the worſt militia in Europe, and their navy of little importance. They would be an eaſy conqueſt to the Spaniards if they were not under the protection of Britain.

51 Orders of knighthood.

There are ſeveral orders of knighthood here, *viz.* the order of Chriſt, the badge of which is a red croſs within a white one, and the number of the commanderies 454. 2. The order of St James, the badge of which is a red ſword in the ſhape of a croſs. A great number of towns and commanderies belong to this order. 3. The order of Aviz, whoſe badge is a green croſs in form of a lily, and the number of its commanderies 49. Though theſe three ordere are religious, yet the knights are at liberty to marry. 4. The order of St John, which has alſo ſeveral commanderies.

The king's titles are, *King of Portugal and the Algarves, on this ſide and the other ſide the ſea of Africa; Lord of Guinea, and of the navigation, conqueſts, and commerce, in Ethiopia, Arabia, Perſia India*, &c. The king's eldeſt ſon is ſtyled *Prince of Braſil*. In the year 1749, pope Benedict XIV. dignified the king with the title of *His moſt faithful majeſty*.

52 Character of the people.

The Portugueſe are repreſented as inferior to the Spaniards both in perſon and genius: as extremely haughty, treacherous, and crafty in their dealings; much given to avarice and uſury; and vindictive, malicious, and cruel. The meaner ſort are ſaid to be extremely addicted to thieving: notwithſtanding, it muſt be owned, that they have ſhown themſelves on many occaſions a brave and warlike people. They are juſtly famed for their ſkill in navigation; and for the many diſcoveries they have made, both in the Eaſt and Weſt Indies. The women here, and in other countries of the ſame degree of heat, are not ſo prolific as in the colder climates; but they are ſaid to be very beautiful whilſt young, though their complexion is ſomewhat upon the olive. Their eyes are very black and ſparkling, and retain their brilliancy after all their other charms are gone. It is the faſhion here, at preſent, as in moſt other countries, for the ladies to ſpoil and disfigure their ſkins and complexions with paints and waſhes: but, though lively and witty, they are ſaid to have a nice ſenſe of female honour. Both men and women make great uſe of ſpectacles; often not ſo much to aid their ſight, as to denote their wiſdom and gravity. Their dreſs, like that of the Spaniards, never uſed to vary, eſpecially among the men; but of late years, both men and women have given much into the French modes. The women, when they go abroad on foot, are wont to uſe long veils, which cover their heads, but leave their faces bare.

PORTUGALLICA TERRA, earth of Portugal; the name of a fine aſtringent bole, dug in great plenty in the northern part of Portugal.

PORTULACA, PURSLANE: A genus of the monogynia order, belonging to the dodecandria claſs of plants; and in the natural method ranking under the 13th order, *Succulentæ*. The corolla is pentapetalous; the calyx bifid; the capſule unilocular, and cut round. There are ſeveral ſpecies, but the two following are the moſt remarkable. 1. The oleracea, annual, or common culinary purſlane, riſes with herbaceous, low, ſucculent, branchy ſtalks, ſix or eight inches high, garniſhed with wedge-ſhaped, thick, ſucculent leaves, and ſmall cloſe-ſetting flowers. There are two varieties; one with deep green leaves, the other with yellow leaves; both of which riſe from the ſame ſeed. 2. The anacampſeros, perennial, or ſhrubby cape purſlane, riſes with a ſhrubby branchy ſtalk, about ſix inches high, with oval, gibbous, ſucculent leaves, and the ſtalks terminated by ſmall cluſters of red flowers. Both theſe plants are of a ſucculent nature: the firſt is an herbaceous annual, for culinary uſes; and the ſecond a ſhrubby perennial, raiſed by the curious for variety. They are both exotics of a tender quality, of the temperature of greenhouſe or ſtove plants. The common culinary purſlane is raiſed annually from ſeed for ſummer uſe, and is an excellent ingredient in ſummer ſalads, but improper for winter on account of its cold moiſt nature. The plant being tender, muſt be raiſed either on a hot-bed or in a warm border; in which laſt it will not ſucceed before April or May. The ſhrubby ſort muſt be kept in the hot-houſe, in pots of a dry ſoil.

PORTUMNA, a town of Ireland, in the county of Galway and province of Connaught, is 74 miles from Dublin. The caſtle of Portumna, the ſeat of the Earl of Clanricarde, is at this place, and near it are the ruins of an ancient caſtle. There is alſo a garriſon for a troop of horſe and two companies of foot. The town is ſeated on the river Shannon, where it falls into Lough Dreg. The monks of the Ciſtertian abbey of Dunbrody, in the county of Wexford, had for a long time a chapel here, dedicated to St Peter and St Paul; but having at length forſaken it, O'Madden, dynaſt of the country, gave it to the Dominican friars, who, with the approbation of the monks of Dunbrody, erected a friary here and a church, which they dedicated to the bleſſed Virgin and the original patron ſaints; at the ſame time they built a ſteeple, and all other neceſſary offices. Pope Martin V. granted a bull to confirm their poſſeſſions, dated the 8th October 1426; and on the 23d of November following he granted indulgencies to all who had contributed to the building. The walls are ſtill nearly entire, and ſhow that the monaſtery of Portumna was by no means an ignoble ſtructure. The ancient choir is now the pariſh-church.

POSE, in heraldry, denotes a lion, horſe, or other beaſt, ſtanding ſtill, with all his four feet on the ground. See Hollingſhead's *Deſcription of Britain*, chap. xvi.

POSITIVE, a term of relation oppoſed to negative. It is alſo uſed in oppoſition to relative or abitrary: thus we ſay, Beauty is no poſitive thing, but depends on the different taſtes of people.

Positive Degree, in grammar, is the adjective in its ſimple ſignification, without any compariſon.

Positive Electricity. In the Franklinian ſyſtem all bodies ſuppoſed to contain more than their natural quantity of electric matter are ſaid to be *poſitively* electrified; and thoſe from whom ſome part of the electricity is ſuppoſed to be taken away are ſaid to be electrified *negatively*. Theſe two electricities being firſt produced, one from glaſs, the other from amber or roſin, the former was called *vitreous*, the other *reſinous*, electricity.

POSPOLITE, in the military eſtabliſhment of Poland, is the name given to a kind of militia. It is the moſt numerous and the moſt uſeleſs of the Poliſh armies. It conſiſts of the gentry at large, who, in caſe of invaſion, are aſſembled by a regular ſummons from the king, with conſent of the diet. Every palatinate is divided into diſtricts, over each of which proper officers are appointed; and every perſon poſſeſſing free and noble tenures is bound to military ſervice, either ſingly or at the head of a certain number of his retainers, according to the extent and nature of his poſſeſſions. The troops thus aſſembled are obliged only to ſerve for a limited time, and are not under the neceſſity of marching beyond the limits of their country. They ſubmit to no diſcipline but ſuch as they like themſelves; and are very apt to mutiny if detained more than a fortnight in the place appointed them to meet in, without marching. The mode of levying and maintaining this army is exactly ſimilar to that practiſed under the feudal ſyſtem. At preſent, though it is almoſt totally unfit for the purpoſes of repelling a foreign enemy, it is yet a powerful inſtrument in the hands of domeſtic faction: for the expedition with which it is raiſed under the feudal regulations facilitates the formation of thoſe dangerous confederacies which ſuddenly ſtart up on the conteſted election of a ſovereign, or whenever, the nobles are at variance with each other.

Coxe's Travels.

POSSE COMITATUS, in Engliſh law, ſignifies the power of the county, or the aid and aſſiſtance of all the knights, gentlemen, yeomen, labourers, ſervants, apprentices, &c. and all others within the county that are above the age of 15, except women, eccleſiaſtical perſons, and ſuch as are decript and infirm.

This poſſe comitatus is to be raiſed where a riot is committed, a poſſeſſion kept upon a forcible entry, or any force of reſcue uſed contrary to the king's writ, or in oppoſition to the execution of juſtice; and it is the duty of all ſheriffs to aſſiſt juſtices of the peace in the ſuppreſſion of riots, &c. and to raiſe the poſſe comitatus, or to charge any number of men for that purpoſe.

POSSESSION, in law, is either actual, where a perſon actually enters into lands or tenements deſcended or conveyed to him; or where lands are deſcended to a perſon, and he has not yet entered into them. A long poſſeſſion is much favoured by the law as an argument of right, even though no deed can be ſhown, and it is more regarded than an ancient deed without poſſeſſion.

If he that is out of poſſeſſion of land brings an action, he muſt prove an undeniable title to it; and when a perſon would recover any thing of another, it is not ſufficient to deſtroy the title of the perſon, in poſſeſſion without he can prove that his own right is better than his.

In order to make poſſeſſion lawful upon an entry, the former poſſeſſor and his ſervants are to be removed from off the premiſſes entered on: but a perſon by leaſe and releaſe is in poſſeſſion without making any entry upon the lands.

POSSESION, in Scots law. See LAW, Part III. Nº clxii. 11, &c.

Dæmoniacal POSSESSION. (See DÆMON and DÆMONIACS.) In the third volume of the Mancheſter Tranſactions, there is a paper on *popular illuſions* or medical demonology by Dr Ferriar. He informs us in a note, that, on the 13th of June 1788, George Lukins of Yatton in Somerſetſhire was exorciſed in the temple church at Briſtol, and delivered from the poſſeſſion of ſeven devils by the efforts of ſeven clergymen. An account of his deliverance was publiſhed in ſeveral of the public papers, authenticated by the Reverend Mr Eaſterbrook, vicar of the temple church in Briſtol.—Dr Ferriar gives us the following particulars, extracted from this account, which we ſhall here inſert.

"Lukins was firſt attacked by a kind of epileptic fit, when he was going about acting Chriſtmas plays, or mummeries: this he aſcribed to a blow given by an inviſible hand. He was afterwards ſeized by fits; during which he declared, with a roaring voice, that he was the devil, and ſung different ſongs in a variety of keys. The fits always began and ended with a ſtrong agitation of the right hand. He frequently uttered dreadful execrations during the fits. The whole duration of his diſorder was eighteen years.

"At length, viz. in June 1788, he declared that he was poſſeſſed by ſeven devils, and could only be freed by the prayers *(in faith)* of ſeven clergymen. Accordingly the requiſite force was ſummoned, and the patient ſung, ſwore, laughed, and barked, and treated the company with a ludicrous parody on the *Te Deum.* Theſe aſtoniſhing ſymptoms reſiſted both hymns and prayers, till a *ſmall, faint, voice* admoniſhed the miniſters to adjure. The ſpirits, after ſome murmuring, yielded to the adjuration, and the happy patient returned thanks for his wonderful cure. It is remarkable that during this ſolemn mockery, the fiend ſwore 'by his infernal den,' that he would not quit his patient; an oath, I believe, no where to be found but in the Pilgrim's progreſs, from which Lukins probably got it.

"Very ſoon after the firſt relation of this ſtory was publiſhed, a perſon, well acquainted with Lukins, took the trouble of undeceiving the public with regard to his pretended diſorder, in a plain, ſenſible narrative of his conduct. He aſſerts, that Lukins's firſt ſeizure was nothing elſe than a fit of drunkenneſs; that he always foretold his fits, and remained ſenſible during their continuance; that he frequently ſaw Lukins in his fits, 'in every one of which, except in ſinging, he performed not more than moſt active young people can eaſily do; that he was detected in an impoſture with reſpect to the clenching of his hands; that after money had been collected for him, he got very ſuddenly well; that he never had any fits while he was at St George's Hoſpital in London; nor when viſitors were excluded from his lodgings, by deſire of the author of the Narrative; and that he was particularly careful never to hurt himſelf by his exertions during the paroxyſm.

"Is it for the credit of this philoſophical age, that ſo bungling an impoſture ſhould deceive ſeven clergymen into a public act of exorciſm? This would not have paſſed even on the authors of the *Malleus Maleficarum*; for they required ſigns of ſupernatural agency, ſuch as the ſuſpenſion of the poſſeſſed in the air, without any viſible ſupport, or the uſe of different languages, unknown to the demoniac in his natural ſtate."

POSSESSIVE, in grammar, a term applied to pronouns which denote the enjoyment or poſſeſſion of any thing either in particular or in common: as *meus*, "mine;" and *tuus*, "thine."

POSSESSORY ACTION, in Scots Law. See LAW, nº clxxxiii. 18.

POSSIBILITY, in law, is defined to be any thing that is altogether uncertain, or what may or may not be.

POSSIBILITY, alſo denotes a non-repugnance to exiſting, in any thing that does not any way exiſt.

POSSIBLE, is ſometimes oppoſed to real exiſtence, and is underſtood of a thing, which, though it actually does not exiſt, yet may exiſt; as a new ſtar.

POSSIDONIA, (anc. geog.) See POESTUM.

POST, a word derived from the Latin *poſitus*, "ſet or placed." It is uſed in ſeveral different meanings, but all of them referring either immediately or remotely to this primitive ſenſe of *poſition*. Thus the word Poſt ſignifies, 1. A ſtake or piece of timber ſet upright; 2. A ſtation, particularly a military ſtation; 3. An office or employment; 4. An operation in book-keeping; 5. A conveyance for letters or diſpatches; 6. A particular mode of travelling.

POST, a ſtake or piece of timber ſet upright. Poſts are uſed both in building and in fencing ground. In brick-buildings much of the ſtrength of the fabric depends on the nature of the poſts; as it is through them that the ſeveral parts are ſuſtained and held together. The *corner poſts* are called the *principal poſts*; thoſe formed into breſſummers between principal poſts for ſtrengthening the carcaſe of the houſe are called the *prick-poſts*. Poſts which are to be ſet in the ground ought to be well ſeaſoned and coated to preſerve them from rotting; burning the downward end has been recommended as an excellent preſervative, but a coating of pitch or tar, particularly the late invented coal-tar, can be moſt ſafely relied upon. For the various uſes to which poſts may be applied, and the form and ſpecies of them fitteſt to be employed in each caſe, ſee the articles ARCHITECTURE, JOINING, GARDENING, HOUSE, FENCE, &c. In architecture and ſculpture POSTS is a term uſed to denote certain ornaments formed after the manner of rolls or wreathings.

POST, a ſtation, particularly a military ſtation.—Any place where perſons are ſet or placed upon particular occaſions may be termed a *poſt*; but the word in this view is now chiefly reſtricted to military operations, and means any place or ſituation where ſoldiers are ſtationed. Thus the detachments eſtabliſhed in front of the army are termed the *out-poſts*, the ſtations on the wings of the army are ſaid to be the *poſts of honour*, as being the moſt conſpicuous and moſt expoſed. But in the operations of a campaign, a poſt properly ſignifies any ſpot of ground capable of lodging ſoldiers, or any ſituation, whether fortified or not, where a body of men may make a ſtand and engage the enemy to advantage. The great advantages of good poſts, in carrying on war, as well as the mode of ſecuring them, are only learned by experience. Barbarous nations diſdain the choice of poſts, or at leaſt are contented with ſuch as immediately fall in their way; they truſt ſolely or chiefly to ſtrength and courage: and hence the fate of a kingdom may be decided by the event of a battle. But enlightened and experienced officers make the choice of poſts a principal object of attention. The uſe of them is chiefly felt in a defenſive war againſt an invading enemy; as by carrying on a war of poſts in a country where this can be done to advantage, the moſt formidable army may be ſo haraſſed and reduced, that all its enterpriſes may be rendered abortive. Indeed in modern times this is ſo well underſtood, that pitched battles have become much more rare than formerly, manœuvring and ſecuring of poſts being conſidered as the moſt eſſential objects in the conduct of a campaign; a change in the art of war much to the advantage of humanity; ſkill, conduct, and prudence, having thus obtained the aſcendency over brutal courage and mere bodily ſtrength. In the choice of a poſt, the general rules to be attended to are, that it be convenient for ſending out parties to reconnoitre, ſurpriſe, or intercept the enemy; that if poſſible it have ſome natural defence, as a wood, a river, or a moraſs, in front or flank, or at leaſt that it be difficult of acceſs and ſuſceptible of ſpeedy fortification; that it be ſo ſituate as to preſerve a communication with the main army, and have covered places in the rear to favour a retreat; that it command a view of all the approaches to it, ſo that the enemy cannot advance unperceived and reſt concealed, while the detachment ſtationed in the poſt are forced to remain under arms; that it be not commanded by any neighbouring heights; and that it be proportioned in extent to the number of men who are to occupy and defend it. It is not to be expected that all theſe advantages will often be found united; but thoſe poſts ought to be ſelected which offer the greateſt number of them. See War, *Index*.

Post, an office or employment. This uſe of the word is probably derived immediately from the idea of a military ſtation; a poſt being uſed to expreſs ſuch offices or employments as are ſuppoſed either to expoſe the holder to attack and oppoſition, or to require abilities and exertion to fill them. Hence the term is uſed only for *public* offices, and employments under the government; and were ſtrict propriety of ſpeech always attended to, *poſts* would denote thoſe ſtations only in which duty muſt be performed. In common language, however, every *public* office or appointment, even though nominal and ſinecure, goes under the name of a *poſt*.

Post, an operation in book-keeping. Poſting in book-keeping means ſimply the transferring an article to the place in which it ſhould be put, and arranging each under its proper head. It is upon this that the whole theory of book-keeping is founded. The Waſte-book, which is the groundwork of all ſubſequent operations, records every tranſaction exactly in the order in which it occurs. From this the ſeveral articles are poſted, or transferred into the Journal, which in fact is but a kind of ſupplementary book to the Waſte-book. From the Journal they are poſted anew into the Ledger; in which a ſeparate place is appropriated for each perſon with whom tranſactions are carried on, and frequently for every ſeparate article about which the buſineſs is concerned. The particular mode according to which ſuch transferences are made, may vary according to the nature of the trade carried on; the object is the ſame in all, to place every article ſo as that its operations on the general ſtate of the buſineſs may be certainly known and diſtinctly traced. For a full account of the way in which this is done, ſee *Book-Keeping*.

Post, a conveyance for letters or diſpatches.

In the early periods of ſociety, communication between the different parts of a country is rare and difficult, individuals at a diſtance having little inclination or opportunity for mutual intercourſe: when ſuch communication is at any time found neceſſary, a ſpecial meſſenger muſt be employed. As order and civilization advance, occaſions of correſpondence multiply. In particular, the government finds it requiſite frequently to tranſmit orders and laws to every part of the country; and for doing ſo he makes uſe of couriers or meſſengers, to whom he commits the charge of forwarding his diſpatches. But without ſtations in the way, where theſe couriers can be certain of finding refreſhment for themſelves and ſupplies of what may be neceſſary for carrying them forward, the journey, however urgent and important, muſt always be retarded, and in many caſes altogether ſtopped. Experience, therefore, ſoon pointed out the neceſſity of enſuring ſuch accommodations, by erecting upon all the great roads houſes or ſtations at convenient intervals, where the meſſengers might ſtop, as occaſion required, and where too, for the greater convenience, relays of freſh horſes ſhould always be in readineſs, to enable them to purſue their journey with uninterrupted diſpatch. Theſe houſes or ſtations were with great propriety termed *poſts*, and the meſſenger who made uſe of them a *poſt*. Though at firſt, it is probable, the inſtitution was intended ſolely for the government and the neceſſities of the ſtate; yet by degrees individuals, ſeeing the benefit reſulting from it, made uſe of the opportunity to carry on their own correſpondence; for which they were willing to pay an allowance to the government. Thus a poſt-office, of ſome kind or other, gradually came to be eſtabliſhed in every civilized country. Without taking notice of the different means of carrying on correſpondence ſaid to have been attempted by pigeons, dogs, and other animals, we can at leaſt trace with certainty the invention of ſomething like regular poſts as far back as the ancient Perſians. Xenophon aſſures us, that they were invented by Cyrus on his Scythian expedition, about 500 years before Chriſt; that the houſes at the ſeveral ſtations were ſumptuouſly built, and large enough to contain a number of men and horſes; and that every courier on his arrival was obliged to communicate his diſpatches to the poſtmaſter, by whom they were immediately forwarded. From the ſhore of the Egean ſea to Suſa the capital, there were, according to Herodotus, 111 ſtages for poſts, each a day's journey diſtant from the preceding.

In what manner poſts were eſtabliſhed and conducted among the Greeks does not clearly appear; but from the extended commerce carried on, and the frequent communications enjoyed among the different ſtates, there can be no doubt that a regular conveyance, in ſome form or other, was eſtabliſhed.

Though poſts were well known among the Romans, yet it is difficult to trace with certainty the period of their introduction. Some writers carry it back to the times of the republic; poſts and poſt-offices, under the names of *ſtatores* and *ſtationes*, having been then, it is ſaid, eſtabliſhed by the ſenate. Whether this was the caſe or not, Suetonius aſſures us that Auguſtus inſtituted poſts along all the great roads of the empire. At firſt the diſpatches were conveyed from poſt to poſt by young men who run on foot, and delivered the diſpatch to others at the next ſtage. By and by Auguſtus ſubſtituted, in room of theſe, horſes and chariots, both for the conveyance of diſpatches and the convenience of travelling. His ſucceſſors continued the ſame eſtabliſhment; to the maintenance of which every ſubject of the empire was obliged to contribute. Poſt-horſes are mentioned in the Theodorian code *de curſu publico*; but theſe were only the public horſes appointed to be kept there for the uſe of the public meſſengers, who before this inſtitution ſeized any that came in their way. At each poſt-ſtation, according to Procopius, 10 horſes and as many poſtilions were kept, and the uſual rate of their travelling was from five to eight ſtations a-day.

It is to be obſerved, however, that all theſe eſtabliſhments of poſts in ancient times were formed as much, if not more, for travelling ſtations, than for the mere conveyance of letters and diſpatches. This latter object, it is true, was thereby ſecured; but the epiſtolary correſpondence of antiquity was probably at no time ſo extenſive as to require or maintain poſt-offices on the footing of modern poſts, for the mere conveyance of letters. It is in later times only when the extenſion of commerce and diffuſion of literature gave occaſion to frequent communication, that theſe eſtabliſhments are to be looked for.

The earlieſt inſtitution of *poſts* that occurs in modern hiſtory is about the year 807 by the emperor *Charlemagne;* who, having reduced under his dominion Italy, Germany, and a part of Spain, eſtabliſhed three public poſts at the public expence, to carry on the communication with theſe three provinces. The inſtitution of poſts, however, like many other inſtitutions of that emperor, dropped at his death, and for a conſiderable time afterwards no traces of any ſuch eſtabliſhment are to be found. We cannot indeed diſcover them with certainty ſooner than 1464, when that reſtleſs and ſuſpicious prince Louis XI. eſtabliſhed poſts in France, that he might be the ſooner advertiſed of all that paſſed in his own or the neighbouring kingdoms. He employed in this ſervice 230 couriers, who delivered the letters at the different ſtations, and in the various towns through which they paſſed in their courſe. Succeeding monarchs created at different times certain offices for the expreſs purpoſe of ſuperintending the poſts; but the frequent changes to which theſe offices were expoſed, prevented for a long time the eſtabliſhment of any regular ſyſtem of poſts in that kingdom; inſomuch that in 1619 the author of the life of the duke d'Epernon ſays the packet or letter-office was not yet ſet up in France. Former eſtabliſhments, it is probable, were ſolely for the uſe of the court, not for the general good of the nation. From France, the inſtitution gradually ſpread through ſeveral other parts of Europe. In Germany, Lewis Hornig aſſures us they were firſt introduced by Count Taxis, who ſettled them at his own expence; in acknowledgment for which the Emperor Matthias in 1616 gave as a fief the office of poſtmaſter to him and his deſcendants.

In England, the eſtabliſhment of poſts in ſome form or other appears as early as the reign of Edward III. but the notices concerning them are ſo vague, that no account can be given of them. In the reign of Edward VI. however, ſome ſpecies of poſts muſt have been ſet up, as an act of parliament paſſed in 1548, fixing the rate of poſt-horſes at one penny *per* mile: The poſt-horſes here referred to were, it is probable, chiefly for travelling, and the carriage of letters or packets only an occaſional ſervice. In 1581, we find in Cambden's Annals mention made of a chief poſtmaſter for England being appointed.—How this office was managed, does not clearly appear; the limited ſtate of the correſpondence of the country, probably rendered it of trifling conſequence. King James I. originally erected a poſt-office, under the controul of one Matthew de Queſter or de l'Equeſter, for the conveyance of letters to and from foreign parts; which office was afterwards claimed by Lord Stanhope; but was confirmed and continued to William Frizel and Tho. Witherings, by king Charles I. in 1632. Previous to this time, it would appear that private perſons were in uſe to convey letters to and from foreign parts; all ſuch interference with the poſtmaſter's office is therefore expreſsly prohibited. King Charles, in 1635, erected a letter-office for England and Scotland, under the direction of the above Thomas Witherings. The rates of poſtage then eſtabliſhed were, two-pence for every ſingle letter for a diſtance under 80 miles; four-pence from 80 to 140 miles; ſix-pence above 140 miles. The allowance to the poſtmaſters on the road for horſes employed in theſe poſts was fixed at two-pence halfpenny *per* mile for every ſingle horſe. All private inland poſts were diſcharged at this time; and in 1637 all private foreign poſts were in like manner prohibited. The poſts thus eſtabliſhed, however, extended only to a few of the principal roads; and the times of tranſmiſſion were not in every caſe ſo certain as they ought to have been.

Witherings was ſuperſeded for abuſes in the execution of his offices in 1640, and they were ſequeſtrated into the hands of Philip Burlamachy, to be exerciſed under the care and overſight of the king's principal ſecretary of ſtate. On the breaking out of the civil war, great confuſions and interruptions were neceſſarily occaſioned in the conduct of the letter-office: but it was about that time that the outline of the preſent more extended and regular plan ſeems to have been conceived by Mr Edmond Prideaux, who was afterwards appointed attorney-general to the commonwealth. He was chairman of a committee in 1642 for conſidering the rate of poſtage to be ſet upon inland letters; and ſome time after was appointed poſtmaſter by an ordinance of both houſes of parliament; in the execution of which office he firſt eſtabliſhed a *weekly* conveyance of letters into *all* parts of the nation. In 1653, this revenue was farmed for L. 10,000 for England, Scotland, and Ireland; and after the charge of maintaining poſtmaſters, to the amount of L. 7000 *per annum*, was ſaved to the public. Prideaux's emoluments being conſiderable, the common council of London endeavoured to erect another poſt-office in oppoſition to his; but they were checked by a reſolution of the houſe of commons declaring that the office of poſtmaſter is, and ought to be, in the ſole power and diſpoſal of the parliament. This office was farmed by one Maubey in 1654. In 1656 a new and regular general poſt-office was erected by the authority of the protector and his parliament, upon nearly the ſame model that has been ever ſince adopted, with the following rates of poſtage: For 80 miles diſtance, a ſingle letter two-pence; for a greater diſtance, not out of England, three-pence; to Scotland, four pence. By an act of parliament paſſed ſoon after the reſtoration in 1660, the regulations ſettled in 1656 were re-eſtabliſhed, and a general poſt-office ſimilar to the former, but with ſome improvements, was erected. In 1663 the revenue of the poſt-office was found to produce L. 21,500 annually. In 1685 it was made over to the king as a branch of his private income, and was then eſtimated at L. 65,000 *per annum*. The year after the revolution the amount of the poſt-office revenue was L. 90,504 : 10 : 6. At the union the produce of the Engliſh poſt-office was ſtated to be L. 101,101. In 1711 the former eſtabliſhments of ſeparate poſt-offices for England and Scotland were aboliſhed; and by the ſtat. 9 Anne, c. 10. one general poſt-office, and one poſtmaſter-general, were eſtabliſhed for the whole united kingdom; and this poſtmaſter was empowered to erect chief letter-offices at *Edinburgh*, at

Dublin at *New York*, and other proper places in America and the Weſt Indies. The rates of poſtage were alſo increaſed at this time as follows.—In England, for all diſtances under 80 miles 3 d.; above 80 miles 4 d. From London to Edinburgh 6 d. In Scotland, under 50 miles 2 d.; from 50 to 80 miles 3 d.; above 80 miles 4d. In Ireland, under 40 miles 2 d.; above 40 miles 4d.—By the above act all perſons, except thoſe employed by the poſtmaſter, were ſtrictly prohibited from conveying letters. That year the groſs amount of the poſt-office was L 111,561 17s 10d. The nett amount, on a medium, of the three preceding years, was, in the printed report of the commiſſioners, for the equivalent ſtated to be for England, L 62,000, and for Scotland L. 2000. In 1754 the groſs revenue of the poſt-office for Great Britain amounted to L. 210,663, in 1764 to L. 281,535, and in 1774 to L. 345,321.—The privilege of franking letters had been enjoyed by members of parliament from the firſt erection of the poſt-office; the original deſign of this exemption was, that they might correſpond freely with their conſtituents, on the buſineſs of the nation. By degrees the privilege came to be ſhamefully abuſed, and was carried ſo far, that it was not uncommon for the ſervants of members of parliament to procure a number of franks for the purpoſe of ſelling them; an abuſe which was eaſily practiſed, as nothing more was required for a letter's paſſing free than the ſubſcription of a member on the cover. To reſtrain theſe frauds, it was enacted, in 1764, that no letter ſhould paſs free unleſs the whole direction was of the member's writing, and his ſubſcription annexed. Even this was found too great a latitude; and by a new regulation in 1784, no letter was permitted to go free unleſs the date was marked on the cover in the member's own hand-writing, and the letter put into the poſt-office the ſame day. That year the rates of poſtage were raiſed in the following proportions: an addition of 1 d. for a ſingle ſtage; 1 d. from London to Edinburgh; 1 d. for any diſtance under, and 2 d. for any diſtance above, 150 miles. An addition to the revenue of L. 120,000 was eſtimated to ariſe from theſe regulations and additional rates. In all the ſtatements of duties upon poſtage of letters given in this account, the rates mentioned are thoſe upon ſingle letters, double letters pay double, treble letters treble, an ounce weight quadruple poſtage; all above are charged by the weight in the ſame proportion.

About the year 1784, a great improvement was made in the mode of conveying the mails, upon a plan firſt ſuggeſted in 1782 by Mr John Palmer. Diligences and ſtage coaches, he obſerved, were eſtabliſhed to every town of note in the kingdom; and he propoſed that government, inſtead of ſending the mails in the old mode, by a boy on horſeback, ſhould contract with the maſters of theſe diligences to carry the mail, along with a guard for its protection. This plan, he ſhowed, could not fail to enſure much more expeditious conveyance, the rate of travelling in diligences being far quicker than the rate of the poſt; and it was eaſy to carry it into execution with little additional expence, as the coach owners would have a ſtrong inducement to contract at a cheap rate for conveying the mail, on account of the additional recommendation to paſſengers their carriages would thereby acquire in point of ſecurity, regularity, and diſpatch.

Tho' government heartily approved of this plan, and the public at large were ſatisfied of its utility; yet, like all new ſchemes, however beneficial, it met with a ſtrong oppoſition: it was repreſented by a number of the oldeſt and ableſt officers in the poſt-office, not only as impracticable, but dangerous to commerce and the revenue. Notwithſtanding of this oppoſition, however, it was at laſt eſtabliſhed, and gradually extended to many different parts of the kingdom; and, upon a fair compariſon, it appeared that the revenue was improved, and the plan itſelf executed for L. 20,000 *per annum* leſs than the ſum firſt eſtimated by Mr Palmer.

The preſent eſtabliſhment of the general poſt office for Great Britain, conſiſts of two poſtmaſters-general, a ſecretary, ſurveyor, comptrolier-general, and upwards of 150 aſſiſtants and clerks for the head letter office in London; the number of deputy poſtmaſters and other officers through the kingdom is very conſiderable, but not eaſy to aſcertain with accuracy, as it muſt frequently vary with the changes made in the eſtabliſhment of country poſts. The total expence of this branch of the revenue in 1788 was L. 149,029, 17 s. 2 d. the groſs produce may now be reckoned at L. 650,000.

The firſt accounts we have of the eſtabliſhment of a poſt-office in Scotland reach no farther back than 1635, when Charles I. erected one both for Scotland and England. The poſt to Scotland by that appointment was to run night and day, to go from London to Edinburgh and to return in *ſix* days, taking with it all letters intended for any poſt-town in or near the road; the rate of poſtage from London to Edinburgh was 8 d. for a ſingle letter. The expedition with which the poſt went from London to Edinburgh at this time, is indeed ſurpriſing, conſidering the nature of the roads; perhaps, however, though the king made the regulation that it ſhould go and return in ſix days, the journey was not always performed in the ſpecified time. During the government of Cromwell, the public poſt conveyed letters to Scotland as well as England; the poſtage from London to Scotland was only 4 d. After the Reſtoration, when the poſt-office was erected for England, mention is made in the act of parliament of the conveyance of letters to Scotland; and the poſtage to Berwick is fixed at 3d. For ſome time after, however, we find no eſtabliſhment by act of parliament of an internal poſt in Scotland. In 1662, a poſt between Ireland and Scotland was firſt eſtabliſhed; and the privy council gave Robert Main, who was then poſtmaſter-general for Scotland, an allowance of L. 200 Sterling to build a packet-boat for conveying the mail between Portpatrick and Donaghade: the poſtage to Ireland was 6d. In 1669, a poſt was eſtabliſhed to go between Edinburgh and Aberdeen twice a-week, and between Edinburgh and Inverneſs once a-week: the rate of poſtage was fixed, for 40 Scots miles 2d. and for every 20 miles farther an additional penny. Theſe appear to have been the only *public* poſts in Scotland at that time; but as they could not ſuffice for the correſpondence of the country, there muſt have been more, either under the direction of the poſtmaſter, or in the hands of private perſons; probably there might be of both kinds. In 1690, an act for the ſecurity of the common poſt was paſſed, ſubjecting robbers of the mail to capital puniſhment. It was not till 1695 that the eſtabliſhment of the poſt-office in Scotland received the ſanction of parliament: poſts were then appointed for all parts of Scotland; the rates of poſtage were fixed, for any place within 50 miles of Edinburgh 2 d. between 50 and 100 miles 3 d. all places above 100 miles 4 d. By the ſame act, a weekly packet to Ireland was eſtabliſhed, and L. 60 Sterling annually allowed for that ſervice. Though poſts were eſtabliſhed in conſequence of this act, yet ſuch was their mode of travelling, that they hardly deſerved the name. Thus, for inſtance, the perſon who ſet out to carry the mail from Edinburgh to Aberdeen, in place of ſtopping at the firſt intermediate ſtage from Edinburgh, and delivering over the mail to another, to be carried forward, went on with it himſelf the whole journey, reſting two nights by the way, firſt at Dundee, and next at Montroſe.

In this manner the mail was conveyed thrice a-week from Edinburgh to Aberdeen; but between moſt parts of Scotland the poſt went only twice, and between ſome only once a-week. The poſt-boy generally travelled on foot. Horſes were but little uſed in the ſervice of the poſt-office.

At the Union, the Scots poſt office was farmed for L. 1194: in 1710, the nett amount for Scotland was reckoned to be L. 2000. The epiſtolary correſpondence of Scotland muſt have been ſmall indeed, when even the rates of poſtage then eſtabliſhed proved ſo very unproductive. This may perhaps, however, be in part accounted for, by conjecturing, that as private poſts had probably prevailed pretty much before 1695, it was long before theſe were entirely ſuppreſſed, the people ſtill adhering to their old conveyances, and difficulties occurring in ſtrictly enforcing the law; the amount of the poſt-office revenue, therefore, at the two periods abovementioned probably exhibits a view of only a part of the correſpondence of Scotland.

In 1711, it has been already mentioned, one general poſt-office was eſtabliſhed for the whole united kingdom; but the poſtmaſter-general was authoriſed to erect at Edinburgh a chief letter office for Scotland.— This was accordingly done, and a poſtmaſter-general for North Britain, with other neceſſary officers, appointed. All the deputy poſtmaſters in Scotland are under his immediate direction, but he himſelf is under the controul of the poſtmaſter-general for Great Britain. From this head letter office poſts were eſtabliſhed to the different parts of Scotland.

For many years the poſt-boys generally travelled on foot, or if on horſeback, without a change of horſes. It was not till about 1750 that the mail began to be conveyed from ſtage to ſtage by different poſt-boys and freſh horſes to the principal places in Scotland, and by foot runners to the reſt. The communication between London and Edinburgh was at firſt but thrice a-week, and ſo ſlow, that the mail from London to Edinburgh was upon the road 85 hours, and from Edinburgh to London 131 hours. In 1757, upon a repreſentation from the royal boroughs, regulations were fallen upon, by which the time was ſhortened to 82 hours in the one caſe, and 85 in the other. By the extenſion of Mr Palmer's plan to Scotland, the time has been ſtill farther ſhortened to about 60 hours in each caſe.

The eſtabliſhment of the Scots poſt-office, which has been gradually enlarged as the ſtate of the country required, conſiſts at preſent of a poſtmaſter-general, ſecretary, ſolicitor, and accountant, with a number of other clerks and aſſiſtants for the head office at Edinburgh; under its management are about 180 deputy-poſtmaſters for the different poſt-towns through Scotland.

The nett produce of the poſt-office for Scotland in 1733 was L.5399, in 1754 L.8927, in 1757 L.10,623, in 1760 L.11,942, in 1776 L.31,103. In 1788 the groſs produce was L.55,836, the expence L.22,636, 13 s. 6 d.: in 1793 the groſs amount was about L.64,000, the nett produce about L.40,000.

Penny-Post, a poſt eſtabliſhed for the benefit of London and other parts adjacent, whereby any letter or parcel under 16 ounces weight, or L.10 value, is ſpeedily and ſafely conveyed to and from all places within the bills of mortality, or within 10 miles of the city. It is managed by particular officers, and receiving houſes are eſtabliſhed in moſt of the principal ſtreets, for the more convenient tranſmiſſion of the letters. Some other large towns have inſtituted ſimilar eſtabliſhments.

About 20 years ago a penny-poſt was ſet up in Edinburgh by an individual, unconnected with the general poſt-office. It met with but indifferent encouragement for ſome years, doubts being entertained as to its punctuality in delivering the letters; by degrees, however, it ſeemed to be advancing in eſtimation, and was more frequently employed. About a year ago, the general poſt-office, in virtue of the act of parliament prohibiting the conveyance of letters by any but thoſe employed under the poſtmaſter-general, took the penny-poſt entirely into its own hands; and at preſent letters are tranſmitted from the general poſt-office to the different quarters of Edinburgh and the ſuburbs, three or four times a-day.

Post, a particular mode of travelling. A perſon is ſaid to *travel poſt*, in contradiſtinction to common journey travelling, when, in place of going on during his whole journey in the ſame vehicle, and with the ſame horſes, he ſtops at different ſtages, to provide freſh horſes or carriages for the ſake of greater convenience and expedition. As he thus uſes the ſame mode of travelling that is employed for the common poſt, he is ſaid to travel poſt, or in poſt, *i. e.* in the manner of a poſt.

In tracing the origin of poſts, it has been already remarked, that the more ancient eſtabliſhments of this kind were fully as much for *travelling ſtations* as the conveyance of letters. The relays of horſes provided at theſe public ſtations for the meſſengers of the prince, were occaſionally, by ſpecial licence, allowed to be uſed by other travellers who had ſufficient intereſt at court. Frequent demands of this nature would ſuggeſt the expedient of having in readineſs ſupplies of freſh horſes or carriages over and above what the *public* ſervice required, to be hired out to other travellers on payment of an adequate price. We find, therefore, that in former times the poſtmaſters alone were in uſe to let out horſes for riding poſt, the rates of which were fixed in 1548 by a ſtatute of Edward VI. at one penny *per* mile. In what ſituation the ſtate of the kingdom was with regard to travelling poſt for more than a century after this period, we cannot now certainly diſcover; but in the ſtatute re-eſtabliſhing the poſt-office in 1660, it is enacted, that none but the poſtmaſter, his deputies, or aſſigns, ſhall furniſh poſt-horſes for travellers; with a proviſo, however, that if he has them not ready in half an hour after being demanded, the traveller ſhall be at liberty to provide himſelf elſewhere.

The ſame prohibition is contained in the act eſtabliſhing the Scots poſt-office in 1695, as well as in the ſubſequent act of Queen Anne, erecting the general office for the united kingdom. It is doubtful, however, whether it ever was ſtrictly enforced. By an explanatory act of 26 Geo. II. the prohibition is confined to poſt *horſes* only, and every perſon declared to be at liberty to furniſh *carriages* of every kind for riding poſt. This regulation has, in fact, done away the prohibition, as hardly any perſon now thinks of travelling poſt except in a carriage.

The rate fixed by the act 1695, in Scotland, for a horſe riding poſt, was three-pence *per* Scotch mile. By the act 9 Anne, c. 10. three-pence a-mile without, and four-pence a-mile with, a guide, was the ſum fixed for each horſe riding poſt. The increaſe of commerce, and neceſſity for a ſpeedy communication between different parts of the kingdom, have brought the mode of travelling poſt ſo much into uſe, that upon every great road in the kingdom poſt-chaiſes are now in readineſs at proper diſtances; and the convenience of poſting is enjoyed in Britain to a degree far ſuperior to what is to be met with in any other country whatever.

Poſting at laſt appeared to the legiſlature a proper object of taxation. In 1779 the firſt act was paſſed, impoſing duties on horſes hired either by themſelves or to run in carriages travelling poſt: the duties were, one penny *per* mile on each horſe if hired by the mile or ſtage, and one ſhilling *per* day if hired by the day. Every perſon letting out ſuch horſes was alſo obliged to take out a licence at five ſhillings *per annum*. Theſe duties were next year repealed, and new duties impoſed, of one penny *per* mile on each horſe hired by the mile or ſtage, and 1s. 6d. on each if hired by the day. A number of additional regulations were at the ſame time enacted for ſecuring theſe duties. An addition of one halfpenny *per* mile, or three-pence *per* day, for each horſe riding poſt, was impoſed in 1785, by Stat. 25 Geo. III. c. 51. The duty is ſecured, by obliging every letter of horſes to deliver to the perſon hiring them a ticket, expreſſing the number of horſes hired, and either the diſtance in miles to be travelled, or that the horſes are hired by the day, as the caſe happens to be. Theſe tickets muſt be delivered to the bar-keeper at the firſt turnpike through which the traveller paſſes; and the turnpike-keeper gives, if demanded, what is termed an *exchange* ticket, to be produced at the next turnpike. The ſtamp-office iſſues to the perſon licenſed to let poſt horſes ſuch a number of theſe tickets as is required, and theſe muſt be regularly accounted for by the perſon to whom they are iſſued. As an effectual check upon his account, the turnpike-keeper is obliged to return back to the ſtamp-office all the tickets he takes up from travellers. Evaſions are by theſe means rendered difficult to be practiſed without running a great riſk of detection. In 1787, for the more effectually levying the poſt-horſe duties, a law was paſſed, authoriſing the commiſſioners of the ſtamp-office to let them to farm by public auction, for a ſum not leſs than the produce in the year ending 1ſt Auguſt 1786.

In the advertiſement publiſhed by the commiſſioners in conſequence of this law, previous to the receiving propoſals for farming them, the total amount of the duty for Great Britain is ſtated to have been at the period above referred to, L 119,873. The ſum for which that duty was farmed in 1794 amounted in all to L 140,030, of which the diſtrict of North Britain was L. 6000.

Soon after the tax was impoſed, conſiderable difficulties were raiſed about the meaning of the term *poſting*, and what mode of journeying ſhould ſubject travellers to duty. The old law, Stat. 9 Anne, c. 10. explained poſting to be "travelling ſeveral ſtages, and changing horſes;" but the acts impoſing the poſting duties expreſsly declare, that "every horſe hired by the mile or ſtage ſhall be deemed to be hired to travel poſt, although the perſon hiring the ſame doth not go ſeveral ſtages upon a poſt road, or change horſes;" and that "every horſe hired for a day or leſs period of time, is chargeable with the duty of three halfpence *per* mile, if the diſtance be then aſcertained; and if the diſtance be not then aſcertained, with 1s. 6d. each horſe." Horſes hired for any leſs time than two days are by theſe acts to be deemed to be hired for a day. An action was brought in 1788, in the court of exchequer at Edinburgh, to determine whether ſeveral diſputed caſes fell under the meaning of the act, and were liable to duty; when the following deciſions were given:

Saddle-horſes both hired and paid by the mile, and ſaddle horſes hired originally for an excurſion, but afterwards paid by the mile, were found liable to duty according to the number of miles paid for; carriage-horſes, where the carriage is hired and paid for only at the uſual rate of *outgoing* carriages, and no more, whether the perſon hiring it does or does not return in it, were found liable to duty only for the number of miles *out*; but if the carriage be hired and paid for, or actually paid for though not originally hired, at the uſual rate of carriages employed both to carry out and bring back the ſame company, the duty was found to be exigible according to the number of miles both out and home taken together. Hackney-coaches in Edinburgh, hired and paid for leſs than two miles, were found liable to duty for one mile.

No duty was found to be exigible on ſaddle-horſes hired for a mere excurſion, and paid for accordingly, where the diſtance neither is nor can be aſcertained, on hackney-coaches employed in the ſtreets for leſs than a mile, or for an excurſion or round of viſits merely; and on horſes or carriages hired for a journey of three days or more, and paid for accordingly, or paid for at the rate of three days, though the journey ſhould actually be performed in two full travelling days. The general rule of theſe deciſions was, that in every caſe, except unaſcertainable diſtance, or journeys exceeding two days, the mode of travelling fell under the legal definition of poſting. The only point that may ſeem doubtful in the judgments here ſtated, is that where the duty is found chargeable by the number of miles both going and returning. Yet as the law expreſsly declares, that horſes hired by the mile or ſtage are to be deemed *poſting*, and as the number of miles for which they are hired can only be aſcertained by the number paid for, it is clear, that where an addition to the outgoing charge is made on account of bringing back the perſon hiring the carriage, the carriage in that caſe is actually hired and paid for according to the number of miles both out and home, and the duty muſt fall to be rated accordingly. The doubtful points being now ſettled by the above deciſions, the mode of levying the duty in Scotland has been regulated agreeably to them ever ſince the matter was thus determined.

POSTERIOR, a term of relation, implying ſomething behind, or that comes after, another. In which ſenſe it is uſed in oppoſition to *prior* and *anterior*.

The back and hips are the poſterior parts of man. Ariſtotle has given prior and poſterior analytics. A date is poſterior to another, when it is later or freſher.

POSTERN, in fortification, a ſmall gate, uſually made in the angle of the flank of a baſtion, or in that of the curtain, or near the orillon, deſcending into the ditch; whereby the garriſon can march in and out, unperceived by the enemy, either to relieve the works, or to make private ſallies, &c.

The word is alſo uſed in the general for any private or back-door.

POSTHUMOUS a child born after the death of his father, or taken out of the body of a dead mother; from whence it is frequently applied to the works of an author not publiſhed till after his deceaſe.

POSTIL, a name anciently given to a note in the margin of the Bible, and afterwards to one in any other book poſterior to the text.

POSTING, among merchants, the putting an account forward from one book to another, particularly from the journal or waſte-book to the ledger. See POST and BOOK-KEEPING.

POSTLIMINIUM, among the Romans, the return of one who had gone to ſojourn elſewhere, or had been baniſhed, or taken by an enemy, to his own country or ſtate.

POSTPONING, putting any thing after or behind another with regard to time.

POSTSCRIPT, an article added to a letter or memoir, containing ſomething learnt or recollected after the piece was written.

POSTULATE, in mathematics, &c. is deſcribed to be ſuch an eaſy and ſelf-evident ſuppoſition, as needs no explication or illuſtration to render it intelligible; as that a right line may be drawn from one point to another.

POSTURE, in painting and ſculpture, the ſituation of a figure with regard to the eye, and of the ſeveral principal members thereof with regard to one another, whereby its action is expreſſed. A conſiderable part of the art of a painter conſiſts in adjuſting the poſtures, in giving the moſt agreeable ones to his figures, in accommodating them to the characters of the reſpective figures, and the part each has in the action, and in conducting and in purſuing them throughout.

Poſtures are either natural or artificial.

Natural poſtures are ſuch as nature ſeems to have had a view to in the mechaniſm of the body, or rather ſuch as the ordinary actions and occaſions of life lead us to exhibit while young, and while the joints, muſcles, ligaments, &c. are flexible.

Artificial poſtures, are thoſe which ſome extraordinary views or ſtudies occaſion us to learn; as thoſe of dancing, fencing, &c. Such alſo are thoſe of our balance, and poſture maſters.

A painter would be ſtrangely puzzled with the figure of Clark (a late famous poſture-maſter in London) in a hiſtory-piece. This man, we are told in the Phil. Tranſ. had ſuch an abſolute command of his muſcles, &c. that he could disjoint almoſt his whole body; ſo that he impoſed on the great ſurgeon Mullens, who looked upon him as in ſuch a miſerable condition, he would not undertake his cure. Though a well-made man, he would appear with all the deformities imaginable; hunch-backed, pot-bellied, ſharp-breaſted, &c. He disjointed his arms, ſhoulders, legs, and thighs; and rendered himſelf ſuch an object of pity, that he has frequently extorted money, in quality of a cripple, from the ſame company in which he had the minute before been in quality of a comrade. He would make his hips ſtand a conſiderable way out from his loins, and ſo high as to invade the place of his back. Yet his face was the moſt changeable part about him, and ſhowed more poſtures than all the reſt.

POTAMOGETON, POND-WEED: A genus of the tetragynia order, belonging to the tetrandria claſs of plants; and in the natural method ranking under the 15th order, *Inundatæ*. There is no calyx; but four petals; no ſtyle, and four ſeeds. There are 12 ſpecies, all of them floating vegetables on the ſurfaces of ſtagnant waters, affording an agreeable ſhade to fiſh, and food to cattle.

POTAMON or POTAMO, was a philoſopher of Alexandria. He kept a middle courſe between the ſcepticiſm of the Pyrrhonians and the preſumption of the dogmatiſts; but attached himſelf to none of the ſchools of philoſophy of his time. He was the firſt projector of the Eclectic ſect; for though that mode of philoſophiſing had been pretty common before, he was the firſt that attempted to inſtitute a new ſect on this principle. "Diogenes Laertius relates, that not long before he wrote his Lives of the Philoſophers, an Eclectic ſect, ἐκλεκτική τις αἵρεσις, had been introduced by Potamo of Alexandria, who ſelected tenets from every former ſect. He then proceeds to quote a few particulars of his ſyſtem from his Eclectic inſtitutes, reſpecting the principles of reaſoning, and certain general topics of philoſophical inquiry; from which nothing further can be learned, than that Potamo endeavoured to reconcile the precepts of Plato with thoſe of other maſters. As nothing remains concerning this philoſopher beſides the brief account juſt referred to in Laertius, an obſcure paſſage in Suidas, and another ſtill more obſcure in Porphyry; it is probable that his attempt to inſtitute a ſchool upon the Eclectic plan proved unſucceſsful. The time when Potamo flouriſhed is uncertain. Suidas places him under Auguſtus; but it is more probable, from the account of Laertius, that he began his undertaking about the cloſe of the ſecond century."

Enfield's Hiſtory of Philoſophy.

POTASH, the lixivious aſhes of certain vegetables, uſed in making of glaſs, ſoap, &c. See GLASS, SOAP, &c.

1
Dr Shaw's method of making potaſh.

The method of making potaſh is directed by Dr Shaw as follows. Burn a quantity of billet-wood to grey aſhes; and taking ſeveral pounds of theſe aſhes, boil them in water, ſo as to make a very ſtrong lixivium, or ley. Let this ley be ſtrained through a coarſe linen cloth, to keep out any black parts of the half-burnt wood that might happen to remain in the aſhes; then evaporate this ſtrained lye in an iron-pan over a quick fire almoſt to dryneſs: then taking out the matter remaining at the bottom, and putting it into an iron crucible, ſet it in a ſtrong fire till the matter is melted, and then immediately pour it out upon an iron plate, where it ſoon cools, and appears in the form of a ſolid lump of pot-aſh *. Much after this manner is pot-aſh made in the large way of buſineſs, for the ſervice of the ſoap-boiler, glaſs-maker, fuller, &c. but according to the difference of the wood, or combuſtible matter employed, with the manner of turning it, and conducting the proceſs, different kinds of potaſh are prepared. There are certain ſaline plants that yield this potaſh to great advantage, as particularly the plant kali; there are others that afford it in leſs plenty, and of an inferior quality, as bean-ſtalks, &c. but in general, all vegetable ſubjects afford it of one kind or other, and may moſt of them be made to yield it tolerably perfect after the manner of the proceſs already laid down, even the loppings, roots, and refuſe parts of ordinary trees, vine clippings, &c. The fixed ſalts of all vegetables excepting the kali and marine plants, when reduced to abſolute purity, or entirely ſeparated from the other principles, appear to be one and the ſame thing: whence it ſhould ſeem, ſays Dr Shaw, that by a ſuitable management, good ſaleable potaſh might be made in all places where vegetable matters abound. For if by examining Ruſſia (A) potaſh, for example, we find that its ſuperior excellence depends upon its being clear of earth, or upon its containing a large proportion of oil, or refined ſalt, theſe advantages may, by properly regulating the operation, be given to Engliſh potaſhes, ſo as perhaps to render the latter as good as the former: but where the potaſh of any remarkable ſaline vegetable is to be imitated, that of the kali, for example, the Doctor recommends a prudent ſprinkling of the ſubject with ſalt, or ſea-water, in the burning; and by theſe ways, properly diverſified, any principle that is naturally wanting might be artificially introduced ſo as to perfect the art of potaſh.

2
Account of Mr Stephens's manufacture.

About 40 years ago, or upwards, Mr Stephens, encouraged by the Society of Arts, &c. and by a parliamentary grant of 3000 l. eſtabliſhed a manufacture of potaſh in North America, which produced ſuch as was ſo perfectly good as to anſwer in bleaching and other uſes the purpoſes of *pearl-aſh;* and which at the ſame time afforded a very large produce. But the very great heat which his proceſs required, occaſioned the deſtruction of a very extenſive apparatus; and other circumſtances concurred to diſappoint the hopes and check the ſpirit of the proprietors. The manufacture was, however, afterwards undertaken and proſecuted by others. Mr Stephens's apparatus was as follows: Fig. 1. A is the bed of the kiln, which flies off about four feet by two from the grate, more or leſs according to the ſize; C is the aſh-hole, 2½ or 3 feet deep. Fig. 2. B repreſents quadrangular bars of iron, with their oppoſite angles placed upwards and downwards, not above an inch aſunder. Fig. 3. A, B, and C, are three ſteepers five feet deep, and of any width from four to eight feet ſquare, of the beſt white pine or cyprus plank, with ſquare joints and ſtrong oak framer, placed each over a receiver, with a cock to let off the lye, and a vent juſt beneath the ſurface of the grating. E repreſents three receivers, ſtanding each under, and projecting out, from its ſteeper. They muſt be made of the beſt ſtuff, carefully put together, and laid in tough clay well rammed within the ground, their tops being level with the ſurface: they need not be ſo large as the ſteepers by ſix, eight, or twelve inches. Fig. 4. E repreſents a falſe bottom or lattice of boards, eight inches deep and five ſquare, with a hole in the under edge of every partition for the lye to paſs into the ſteeper. Fig. 5. A is the veſſel over the furnace in which the lye and aſhes are mixed; B is a hole or funnel a few inches from the back of the furnace, with an iron ſocket to let the pipe through the hinder part of the arch, to reach down within two inches of the floor of the furnace. C is a caſt iron cauldron for boiling the lye to dryneſs when pearl-aſh is made. D is a veſſel whence the liquor is let into the cauldron as it evaporates. The mortar for building the furnace ſhould be made of loam; the arch ſhould be 18 inches thick, and the floor ſhould be laid with tiles on a layer of ſand an inch thick, with neat joints.

Plate CCCCXV.

3
Of his apparatus.

4
Proceſs without uſing a kiln.

Mr Stephens's proceſs, both with and without the kiln, was as follows. Cut timber, felled at any ſeaſon, into lengths of about eight feet; lay from three to ten of them lengthwiſe in a heap upon dry ground, and fill the vacancies between with ſmaller wood: the ſooner it is burnt after felling, the better. Set fire to it by laying embers on the bottom logs at each end; and for burning the bruſh and lappings, with other ſmaller woods, lay them lengthwiſe on the ground, top to top, lapping over a little, with the butt ends outwards, and as cloſe as a faggot; laying the large woods on top till the heap is full four feet high; the length of the bruſh ſet againſt each other making the breadth of the heap. As to the choice of the timber, old hollow trees, if not dead, are beſt: pine, cyprus, and cedar, are to be totally rejected.

As ſoon as the pile is burnt down, rake ſuch aſhes as lie round the outſide a little in towards the middle; add no freſh fuel, nor throw on any brands. Let the aſhes lie without ſtirring till you can juſt bear your hand in them; then carry them to a houſe, or under a ſhed, on a plank floor raiſed a little from the earth and well jointed;

(A) According to Sir Peter Warren, the beſt woods for making Ruſſia potaſh are, oak, aſh, poplar, hiccory, elm, hazle, and beech. They muſt be cut in November, December, January, and February, ſplit and ſtacked to dry. After 12 months in warm open weather, it muſt be burnt on a brick hearth by a ſlow fire in a kiln, or cloſe place; the aſhes muſt be ſifted through two ſieves, one finer than the other, and then put up in brick troughs or wooden backs, covered with rain or river water, and muſt remain well marſhed and incorporated five months. Brick furnaces ſhaped like bakers ovens muſt be heated with a ſtrong fire of oak or aſh, burning night and day; the prepared aſhes muſt be gradually thrown on the fire, when they will run into metal like lead: the fire muſt not go out till the furnace is nigh filled with potaſhes. The aſhes muſt then be broken to be taken out, but the larger the pieces the better; they muſt be preſerved from the air in tight caſks, the large pieces by themſelves, and the duſt by itſelf.

jointed; there wet them till brought nearly to the conſiſtence of mortar in the firſt mixture of lime and ſand, and ram them in a heap, in which they muſt lie full 20 days, or ſome months if you pleaſe; obſerving to be more ſparing of water in winter, and ramming them cloſer, and ſometimes wetting the top that it may never grow quite dry.

5 And with it. Plate CCCCXV.

Wood may alſo be burnt in a kiln, as fig. 1 and 2; and then it muſt be cut into ſuch lengths as may be moſt convenient for carriage, and beſt ſuit the ſize of the kiln. The mouth of the aſh-hole muſt be cloſe ſtopped by daubing the joints of the lid with loam, or throwing a bank of ſand or earth againſt it: keep the bed of the kiln filled with wood up to the ſurface, but not above it, and let it burn inceſſantly till the aſhes riſe within ſix or eight inches of the grate. Draw them out whilſt red-hot, and in that ſtate ſprinkle them with lye, from four to ſix caracts weight; weigh a ſmall vial which holds about four ounces very exactly; then fill it with water and weigh that alſo: divide the weight of water into equal parts till you come to $\frac{1}{128}$ of the whole, which is called a *caract*, $\frac{1}{64}$ two caracts, &c. until you have a weight equal to $\frac{1}{4}$ of the whole water, which is called 32 caracts: all which ſmall weights, together with one equal to the phial filled with water, are to be kept for weighing the lye in the ſaid phial till they are made damp; then ram them as before in a heap, but ſeparate from the aſhes made as above. N. B. By kiln-burning a ſtronger lye may be more certainly procured than by the other way, where rain may chance to fall on the aſhes before they can be removed.

The aſhes thus prepared are to be put in vats or ſteepers fig. 3, with a falſe latticed bottom as fig. 4; firſt putting coarſe wheat or rye ſtraw about a foot thick on the lattice or grating; on which put aſhes to within four or five inches of the top, ramming them all the way up, eſpecially at the ſides, with a ſmall light rammer, as tight as you can, without burſting the vat. Form on the top of the ſteeper a hollow baſon in the aſhes four or five inches deep, leaving the aſhes four or five inches thick on the ſides, by raiſing a ſmall bank round the ſides, ſo that the liquor may not overflow the edges of the aſhes at top: keep this baſon conſtantly filled with ſoft water in the ſteeper A, until the aſhes will imbibe no more, which will be in 24 hours or more, according as it is rammed; then turn the cock, and let off what ſhall be ſoaked through into the receiver or lower chamber of the ſteeper, and no more; for if the ſeveral runnings are not kept ſeparate, the lye will not be brought to its due ſtrength. Follow that ſteeper with freſh water on the ſame aſhes for ſeveral other runnings, which will each come off in a few days, till the liquor has neither ſmell nor taſte; then heave out the aſhes, and charge the ſteeper afreſh.

Upon drawing off the firſt running from the ſteeper A, fig. 3. fill the ſteeper B with aſhes as before, and put into its hollow at the top the lye ſo firſt run off, and the ſmaller or half lyes alſo, till full, and draw off as directed for the ſteeper A: if this weighs 18 caracts or more, pump it into the cyſtern F as fit for uſe; if it be ſhort of that, paſs it off as half lye to the ſteeper C, and through freſh aſhes till ſtrong enough. With kiln-aſhes only, from water paſſing through the firſt ſteeper, it will be ſtrong enough for the ciſtern, if the aſhes are well prepared. If your water be hard, let it ſtand two or three days expoſed to the air and ſun in a ſhallow back, and it will be ſoft. When you uſe kiln-aſhes with others, lay them at bottom.

The lye muſt be conveyed from the ciſtern F, as it is wanted to the veſſel A fig. 5; where with every gallon of proof lye mix three ounces of fine, light, wood aſhes; and to the lye that is $\frac{1}{4}$ over-proof put ſix ounces of aſhes; and if $\frac{2}{5}$ over-proof 12 ounces, increaſing or leſſening according to the ſtrength of the lye.

For evaporating the lye and melting the ſalt, heat a furnace till you bring it very near a white heat, of which the ſide-doors being red-hot is a mark. This will take 48 hours or more, if the furnace be quite cold; when thoroughly hot, a little fuel keeps it ſo. Then, through the cock of the veſſel A, paſs the mixture by the funnel B into the furnace, not ſo as to reach much beyond the middle of the floor, before it changes from dark to bright red, letting the heat prevail towards front or back as you ſee neceſſary. When the maſs begins to gather about the flues or in heaps, run in no more till the furnace is cleared by driving the fire backward. You muſt have two funnels, one ſoon choaking: in an hour or leſs will iſſue out a red hot ſtream of melted ſalt, which is potaſh, to be broken to pieces as ſoon as cold, and packed in tight cloſe caſks, being in no reſpect inferior to the beſt foreign aſh whatever.

6 Spaniſh potaſh the beſt.

The beſt potaſh is made from barilla, and comes from Spain. The plants from which it is procured are found in great plenty about Carthagena, where they are indigenous, and may be collected in a ſwamp called *Almojar* eaſt of that place; the *Sayones* barilla is the beſt. They are found, beſides all along that coaſt, on the borders of the Mediterranean for 60 leagues in length and 8 in breadth. About 150,000 quintals of it are annually exported from Spain. It produces a revenue of 25,500l. a year; each quintal paying a duty of 17 reals: yet Don Bernardo de Ulloa, A. D. 1740, ſays it was farmed at L. 1822, 4s. 3 d. M. Macdonnell has brought the manufacture of potaſh to its preſent perfection in Spain; but its exportation is materially injured hy the heavy tax on it. See Townſhend's *Travels*, vol. iii. p. 131. See alſo BARILLA, KELP, and FUCUS.

7 Dr Percival's account of making potaſh.

In the 70th volume of the Philoſophical Tranſactions we have an account of a method of procuring this ſalt from the putrid water which runs from dunghills. The proceſs is very eaſy, conſiſting only in ſimple evaporation of the fluid, and calcining the impure ſalt till moſt of the foulneſs is burnt out. From 24 wine-pipes full of this muck-water were obtained 9 cwt. 1 q. 12 lb. of ſaleable potaſh, valued at 42 s. *per* cwt; the expence of manufacturing them being only valued at 4 l. 9 s.

The potaſh thus made is of a greyiſh white appearance; deliqueſces a little in moiſt air; but if kept in a dry room, near the fire, acquires a powdery ſurface. It is hard and of a ſpongy texture when broken, with many ſmall cryſtals in its ſubſtance. The colour of its internal parts is duſky and variegated. To the taſte it is acrid, ſaline, and ſulphureous. It emits no ſmell of volatile alkali, either in a ſolid form, diſſolved, or when added to lime-water; neither does it communicate the ſapphire-colour to a ſolution of blue vitriol. Silver is quickly tinged black by it; a proof that it contains much phlogiſton. Ten grains of this potaſh required 11 drops of the weak ſpirit of vitriol to ſeparate it.

The like quantity of ſalt of tartar required 24 drops: a ſtrong efferveſcence occurred in both mixtures; and a ſulphureous vapour exhaled from the former. A tea ſpoonful of the ſyrup of violets diluted with an ounce of water was changed into a bright green colour by five grains of the ſalt of tartar; but ten grains of this potaſh were neceſſary to produce the ſame hue in a ſimilar mixture. Half an ounce of the ſalt diſſolved entirely in half a pint of hot water; but when the liquor was cold, a large purple ſediment ſubſided to the bottom; and it was found that this ſediment amounted to about two-thirds of the whole quantity of aſhes uſed.

Dr Percival, the author of this paper, concludes with obſerving, that this potaſh is a true fixed vegetable alkali, produced by putrefaction; that the quantity of alkali contained in it may be eſtimated at one-third of its weight, whereas the white Muſcovy aſhes are ſaid to yield only one-eighth part; that no quicklime appears to be contained in this potaſh, for a ſolution of it poured from its ſediment remained clear though long expoſed to the air: that it would be worth trying, whether the large purple ſediment, which ſubſides when this potaſh is lixiviated, might not be applied to the manufacture of Pruſſian blue, or uſed in the manner recommended by Macquer for dyeing wool and ſilks; and that this manufacture will furniſh the farmer for top-dreſſing for his garden and land, of great fertilizing powers. See *Phil. Tranſ.* Vol. LXX. p. 345.

8
Other attempts.

Theſe are the proceſſes moſt eſſentially different from one another which have appeared concerning the manufacture of this uſeful ſalt. Some indeed have attempted to compoſe it on the ſuppoſition that alkali conſiſted of an earth combined in a peculiar manner with a certain acid. But the little ſucceſs of all theſe attempts ſhow that they have been built on a falſe principle. The only method of producing alkaline ſalts originally is from the aſhes of vegetables; and the vegetable ſubſtances which yield the largeſt quantity of them are tartar and marine plants. From the former the pureſt and ſtrongeſt vegetable alkali is obtained, and from the latter the mineral alkali. From other vegetables, as fern, broom, bean-ſtalks, &c. an alkaline ſalt is produced, but ſo impure, and in ſuch ſmall quantity, that no manufacture of it can be eſtabliſhed with any reaſonable expectations of profit.

9
On extracting its alkaline part from rock-ſalt.

Dr Watſon (the preſent biſhop of Landaff) ſuggeſts, that the inveſtigation of a method of extracting its alkaline part from rock-ſalt would be a moſt ſerviceable diſcovery. We have inexhauſtible mines of rock ſalt in this country, which (he obſerves) the proprietors can afford at ten ſhillings a ton. A ton of rock ſalt contains about half a ton of mineral alkali, which is for moſt purpoſes far preferable to potaſh. To thoſe who have leiſure to attempt ſuch a diſcovery he gives the following hint: whether the alkaline part of rock-ſalt may not be obtained by calcining it in conjunction with charcoal in open fires? His reaſon for this conjecture is founded upon the following experiment: upon burning ſea-wreck to a black coal and ſtopping the proceſs at that point, he has obtained great plenty of common ſalt, but no mineral alkali from the black aſhes: though we are certain, that when the black aſhes are thoroughly calcined, or reduced to white aſhes, mineral alkali may be obtained from them. This makes it probable, that the common ſalt contained in the black aſhes of ſea-wreck is decompoſed, and changed into a mineral alkali, during the burning of the black aſhes. There are reaſons to ſuppoſe, that the cinder of pit-coal would anſwer the purpoſe better than charcoal. *Chem. Eſſ.* vol. i. p. 136, &c.

10
Dr Home's experiments on the potaſhes of different countries.

The potaſhes of different countries vary much in quality; and the experiments of Dr Home, in his treatiſe on Bleaching, ſeem to ſet forth their different properties in the cleareſt point of view. The different kinds tried by him were,

Blue pearl-aſhes. Theſe appear to be a pure alkaline ſalt, mixed with a ſmall quantity of vitriolated tartar and earth. Half a pound of this, filtered and evaporated, yielded 5½ ounces of pure ſalt.—Here, however, we muſt obſerve, that though the quantity was ſo far diminiſhed by this operation, yet we are not to imagine that the whole of this diminution was owing to impurities; for all ſalts are deſtroyed in ſome meaſure by ſolution in water and exſiccation.

2. *White pearl-aſhes* are nearly of the ſame quality with the former; half a pound of them giving five ounces and ſeven drams of pure ſalt, with ſome vitriolated tartar and earth.

3. *Ruſſia* or *Muſcovy aſhes* have very much the appearance of ſlacked lime, and are, like it, friable betwixt the fingers. They adhere to the tongue; and their alkaline taſte ſoon goes away, leaving in the mouth a ſtrong taſte of lime. Some ſmall bits of charcoal are obſervable in their compoſition, and they never turn moiſt in the air. Half a pound of the ſalt lixiviated with water and evaporated, gave only 10 drams 15 grains of very cauſtic ſalt. Theſe conſiſt therefore of a ſmall quantity of alkaline ſalt united with a large quantity of lime.

4. *Caſhub-aſhes* are of the colour of iron ſtone, and extremely hard, with many ſhining particles of charcoal in them. They have a ſaline taſte, with a conſiderable degree of pungency; feel gritty in the mouth when broke in pieces by the teeth; and will diſſolve in water. To extract the pure ſalt, half a pound of the aſhes were boiled in a pint of water; then that water poured off, and half a pint put on the aſhes again; and ſo on, till the aſhes taſted no more ſalt. This boiling took 24 hours, and the laſt water that came off had a ſtrong taſte of ſulphur, and was blackiſh. A piece of ſilver put in the decoction was in a few minutes turned almoſt black; but though the decoction was evaporated conſiderably, it did not turn ſilver black more ſpeedily than before. The whole, when totally evaporated, yielded only 10 drams of a brown ſalt having a ſtrong cauſtic alkaline taſte. Some Caſhub-aſhes powdered, and often waſhed in water ſo that the ſalts were all carried off, were infuſed in water. After ſtanding ſome time, there was a weak lime-water, with ſomething of a ſaline taſte, but no pellicle. Some of this reſiduum was put into a reverberatory furnace for two hours; after which it afforded good lime-water. Caſhub-aſhes then appear to contain an earth half vitrified, ſome lime, alkaline ſalts, and a quantity of ſulphur.

5 *Marcoſt-aſhes*, are of a paler colour than the former, with ſome ſmall pieces of charcoal in their compoſition. They have a ſtrong ſaline taſte; and ſo great pungency, that they cannot be held long in the mouth. Half a pound diſſolved in water, filtered and evaporated, yielded 11 drams one ſcruple and two grains of al-

kaline reſiduum. The decoction blackened ſilver, but not ſo ſtrongly as the former; and by evaporation it quickly loſt that quality.

11 On manufacturing them in Britain.

Our author next proceeds to conſider the probability of manufacturing theſe aſhes in Britain. On which ſubject he has the following obſervations.—— "The blue and white pearl aſhes we have diſcovered to be pure alkaline ſalts, without any conſiderable mixture of heterogeneous, bodies. Their purity ſhows the lixive to have been ſtrained through ſome cloſe ſubſtance, ſuch as linen or flannel. The blue aſhes ſhow by their colour that they have ſuſtained the moſt fire. But both of them are ſo much alike, that the one may be ſubſtituted for the other; and therefore we ſhall conſider them in one view.

"Every one knows that alkaline ſalts, ſuch as theſe, are got from all plants except the alkaleſcent, and from all trees except the moſt reſinous, which afford them in very ſmall quantity. Theſe plants or trees, when found, are pulled or felled in the ſpring, dried, and burnt to aſhes. By the affuſion of warm water the ſalts are diſſolved, and, by ſtraining, ſeparated from the earth along with the water. This ſaline liquor, which is called a *lixive*, is evaporated over a fire; and what remains is an alkaline ſalt of the ſame kind with the pearl-aſhes.

"I was informed by a ſkilful bleacher in Ireland, that he practiſed a more expeditious way of extracting the ſalts. He bought the aſhes of different vegetables from the commonalty for 9 s. a buſhel. From theſe a very ſtrong lye was made, into which dry ſtraw was dipped until it ſucked up all the lye. This ſtraw was afterwards dried and burnt, and gave him ſalts which he ſhowed me, almoſt as good and pure as the pearl-aſhes. This method I have ſeveral times tried; but could never burn the ſtraw to white aſhes, the ſalts diminiſhing the inflammability of the ſtraw. It is a very expeditious method if it can be practiſed. But I can ſee no occaſion for bringing the lye into a ſolid form, as the ſalts muſt again be diſſolved in water before they can be uſed. The ſtrength of the lye can eaſily be determined by the hydroſtatical balance.

"Though I make no queſtion, that the quantity of ſalt, in plants of the ſame ſpecies, will vary in different ſoils and climates; yet it would be of advantage to have the proportion aſcertained in general. Some trials of this kind I have made.

"Two pounds of fern which had been pulled Auguſt 16. were dried, and burnt to white aſhes. Theſe weighed 7 dr. and taſted very ſalt. When lixiviated, ſtrained, and evaporated, they gave me 49 gr. of ſalt, about the eighth part of the aſhes. If the fern had been pulled in April, it would have afforded more ſalt. Why then ſhould we not prepare ſalts from this vegetable? There is more of it growing on our hills than would ſerve all our bleachfields. The Iriſh make great uſe of it.

"From 11 oz. of tobacco-aſhes I had 1 oz. of ſalt. Two ounces of peat-aſhes afforded half a drachm of ſalt. Nettles, I am informed, afford much ſalt. Furz and broom, natives of this country, are very fit for this purpoſe.

"But the kelp, as it grows in ſuch plenty along our ſhore, and contains more ſalt than any other vegetable I know, would be the moſt proper, were it not for a mixture of ſome ſubſtance that renders it unfit for bleaching, at leaſt of fine cloths, after they have obtained a tolerable degree of whiteneſs. It is obſerved by bleachers, that, in theſe circumſtances, it leaves a great yellowneſs in the linen. As theſe aſhes are much uſed in Ireland, and as it is not uncommon to bleach coarſe cloths with them in Scotland, a diſquiſition into their nature, and ſome attempts to purify them, may not be improper. There are no aſhes ſold ſo cheap as theſe; for the beſt gives but 2 l. the 2000 weight (B). They may, therefore, allow of more labour to be expended on them, and come cheaper at long-run than the foreign ſalts.

"I dried ſome ſea-ware, and burnt it, though I found that laſt operation very difficult. When I had kept it fuſed in the fire for two hours, it weighed 3½ oz. I poured on the aſhes an Engliſh pint and a half of cold water, that I might have as little of the ſulphur as poſſible. This lye, after it had ſtood for ſome hours, was poured off clear, and had but a ſlight tendency to a green colour. I made a ſecond infuſion with milk-warm water, and poured it off from the ſediment. This had a darker colour than the former; was kept ſeparated from it, and evaporated by itſelf. There was a third infuſion made; but having no ſalt taſte, it was thrown away. The ſecond infuſion ſeemed to contain more ſulphur than the firſt; and a piece of white linen kept in it half an hour, while it was boiling, was tinged yellow, and could not be waſhed white again. The earthy part remaining, weighed, when well dried, 1 oz. 2 dr. The ſaline decoction evaporated by degrees, and ſet at different times in a cellar to cryſtallize, afforded me 5 dr. 46 gr. The liquor, when entirely evaporated, left 4½ dr. of a yellow ſalt, which appeared to be a ſtrong alkaline. The ſalts which cryſtallized ſeemed to be moſtly ſea-ſalt, with a conſiderable quantity of ſulphur, and ſome alkaline ſalt. There appeared no ſigns of the bittern in theſe ſalts, as their ſolution did not turn turbid with the oil of tartar. Nor is any of the bittern to be expected in kelp aſhes, although it probably is to be found in the recent vegetable; becauſe the alkaline ſalts formed by the fire muſt have changed it into a neutral. The lye made warm with water, being evaporated, left 4 dr. of a black bitter ſalt, which, from its quantity of ſulphur, appeared unfit for bleaching. Theſe aſhes, then, ſeem to be a compoſition of ſomewhat leſs than the fourth of ſulphur, the ſame quantity of ſea-ſalt, about a fourth of alkaline ſalt, and ſomewhat more than a fourth of earth. The alkaline ſalt contained in kelp-aſhes amounts to one penny a pound. This cheapneſs makes it worth our pains to beſtow ſome labour on them.

"If the bad effects in bleaching with kelp-aſhes ariſe from

(B) "Since this treatiſe was written, however, the price of kelp has been advanced to 7 l. or upwards the 2000 weight; ſo that thoſe who would now attempt any thing of this kind, muſt alſo manufacture the kelp themſelves."

from the ſea-ſalt, as ſome of the moſt knowing bleachers think, they can be freed from it in an eaſy manner. Let a lixive of kelp-aſhes be made with cold water, for that does not extract ſo much of the ſulphur; it muſt ſtand but for a ſhort time, for theſe ſalts diſſolve eaſily; decant it, and evaporate the lye. As the boiling continues, the ſea-ſalt will cryſtallize. When that is all ſeparated, the remaining lye will contain alkaline ſalt with ſome ſulphur. This operation every maſter of a bleachfield may learn and overſee, without taking up much of his time. A ſimilar proceſs is carried on by common ſervants in the alum-works who have by practice learned it from others.

"I had ſome hopes that the ſulphur might be carried off by long roaſting, ſuch as theſe ſalts undergo before they are fuſed in order to be turned into glaſs; becauſe I had obſerved, that the longer time they were kept in the fire, the freer were they from this ſulphureous part.

"I ordered a quantity of kelp aſhes to be kept in the furnace of a glaſshouſe, where the heat was juſt below the vitrifying point, for 24 hours. During this time they had loſt almoſt four-fifths of their weight. They were now much freer from their ſulphur, and were of a light colour; but much of the alkaline ſalt had been driven off with the oils. If a lye is much impregnated with this ſulphureous matter, it appears to be carried off in a great meaſure by long boiling.

"We come now to explain the method of manufacturing the white Muſcovy aſhes. We have ſhown, by undoubted experiments, that the greateſt part of theſe aſhes conſiſts of lime; and yet we have ſeveral acts of parliament which forbid the uſe of that material under ſevere penalties. The parliament were in the right to diſcharge its uſe, upon the diſadvantageous reports which were made to them. We ſhall immediately ſee how dangerous a material it is when uſed improperly, or without the mixture of alkaline ſalts, which render it ſafe, and more ſoluble in water. But I will venture to ſay, that experiment will not ſupport the prejudice entertained with regard to it, if carried any further.

"Since bleaching, then, cannot be carried on without it (for thoſe aſhes which contain it are quite neceſſary in that operation), and ſince we import them from foreign countries, let theſe prejudices againſt it ceaſe, and let us only conſider how we may render our own lime as ſafe as the foreign. If we can do that, the wiſdom of the legiſlature will be as ready to abrogate theſe acts as they were to make them.

"By my experiments on the white Muſcovy aſhes, I got about the eighth part of alkaline ſalts from them. This made me expect, that, by mixing in the ſame proportion quicklime and alkaline ſalts, I ſhould be able to produce Muſcovy aſhes.

"To an ounce of quicklime and a drachm of white pearl aſhes, I added about a gill of water, and boiled them together till the water was all evaporated. The taſte of this ſubſtance was little different from lime. To recover the ſalts again from the lime, I diſſolved it in water ſtrained off the liquor, and evaporated it. Inſtead of the drachm of ſalts, I had but 2 gr. of a ſubſtance which was more earthy than ſaline.

"To 3dr. of quicklime and as much potaſhes, I added a pint of water, and kept it boiling for two hours till it was evaporated. I diſſolved it again in water, which being filtered and evaporated, gave me 1½ dr. of a cauſtic ſalt, that liquefied in the air when it had been but four minutes from the fire. It appears, then, that the alkaline ſalts are deſtroyed by lime, and that a great part of them can never be again recovered. From the remaining lime, after the ſalts were extracted, I got ſtrong lime-water, but without a pellicle. This ſhows, that a quantity of alkaline ſalts, equal to the lime, boiled with it for two hours, are not able to fix all the ſoluble part of the lime.

"From theſe experiments we may draw ſome corollaries with regard to the preſent ſubject. *1ſt*, That evaporating the water from the lime and ſalts by boiling, is a moſt unfrugal way of preparing theſe white aſhes. *2dly*, That theſe aſhes ought to be kept cloſe ſhut up in caſks; for if expoſed to the open air, though in a room, the alternate moiſture and drought muſt fix their moſt uſeful parts. This I have found to be fact: for the ſalts that I made became leſs pungent by keeping; and I have obſerved, that the ſurface of the Muſcovy aſhes loſt all pungency by being expoſed to the air, while their internal parts ſtill retained it. *3dly*, That all boiling is prejudicial to theſe Muſcovy aſhes, as it fixes, and that quickly, their moſt ſubtile and probably their moſt ſerviceable parts.

"Let us now proceed to another method of making theſe white aſhes. I imagined, that if the ſalts were diſſolved in water, and the quicklime ſlacked with that, the maſs would ſoon dry without the aſſiſtance of fire. In this way I added equal parts of both; but the compoſition was ſo ſtrong, that it bliſtered my tongue if it but touched it. When the fourth part was alkaline ſalt, it bliſtered my tongue when kept to it a few ſeconds. I could taſte the ſalts plainly in the compoſition, when they made but the thirty-ſecond part of the whole.

"I thought, when compoſed with the eighteenth part of ſalt, it had, when freſh made, juſt the taſte and look of the Muſcovy aſhes; nor could any perſon have diſtinguiſhed them. This I once imagined was the proportion; but when I found that the ſaline pungency ſoon turned weaker by keeping, and that this compoſition would not afford the ſame quantity of ſalts that the Muſcovy aſhes did, I ſaw that a much greater quantity of ſalts was neceſſary. The proportion appears to be one of ſalt to four of lime, prepared in this laſt way. Three drachms of aſhes prepared in this way, and kept for a fortnight, gave me but 15 grains of ſalt; which is but the half of what the Muſcovy would have afforded. I find, if the quicklime is firſt quenched, it does not fix the ſalts ſo much; and therefore is better and cheaper. One drachm of potaſhes diſſolved in a little water, and added to 3 drachms of quenched lime, gave me 44 grains of a very cauſtic ſalt. I prefer this method as the beſt.

"The manufacturers of this ſalt probably pour the lixive upon the lime, as they can know by its ſpecific gravity what quantity of ſalts is in the water, and ſo ſave themſelves the expence of procuring the ſalts in a dry form.

"The manufacture of the Marcoſt and Caſhub aſhes remains yet to be explained. We have diſcovered that both of them contain ſulphur, earth alkaline ſalts, and lime; and differ in nothing but in the Caſhub's having more ſulphur than the Marcoſt aſhes. We ſhall therefore conſider them together.

Whether theſe two ſpecies of aſhes are of any uſe in bleaching, may be, and has already been, diſputed. I find they contain no other principles, the ſulphureous part excepted, then the former aſhes combined together. Why then ſhould we expect any other effects from the ſame ingredients in the Marcoſt and Caſhub aſhes, than what we have from either of the pearl and Muſcovy aſhes mixed together? The ſulphureous principle in the former muſt have very bad effects; as I find by experiment, that it leaves a yellowneſs on cloth that is very hard to be waſhed out. It is owing to this ſulphureous principle that linen, after it has been waſhed with ſoap, and is pretty well advanced in whiteneſs, is apt to be diſcoloured by lye which is brought to boil: for, by boiling, the ſulphureous part is extracted from theſe aſhes, and the lye becomes of a deep brown colour. Daily practice, then, ſhows the diſadvantage of this ſulphureous principle. Beſides, as ſulphur unites itſelf quickly and firmly with alkaline ſalts, it muſt weaken or altogether deſtroy a great quantity of theſe in the Marcoſt and Caſhub aſhes, and ſo render them of no effect in bleaching. Theſe two reaſons ſeem to me ſufficient to exclude them from the bleachfield; eſpecially as, by increaſing the other materials, we can attain perhaps more ſpeedily the ſame end.

"However, as cuſtom has introduced them into general practice, we ſhall conſider how they are to be manufactured. Dr Mitchel, has, in a very ingenious and uſeful paper, contained in the Philoſophical Tranſactions for the year 1748, delivered an account tranſmitted to him by Dr Linnæus of the method of making potaſhes in Sweden. This account was contained in an academical diſſertation of one Lundmark upon this ſubject at Aboe in Sweden. The ſubſtance of this account is, 'That birch or alder is burnt by a ſlow fire to aſhes, and made into a paſte with water. This paſte is plaſtered over a row of green pine or fir logs. Above that is laid tranſverſely another row of the ſame; and that likewiſe is plaſtered over. In this way they continue building and plaſtering till the pile be of a conſiderble height. This pile is ſet on fire; and whenever the aſhes begin to run, it is overturned, and the melted aſhes are beat with flexible ſticks, ſo that the aſhes incruſt the logs of wood, and become as hard as ſtone.' This, in the Doctor's opinion, is the method of making the potaſhes that come from Sweden, Ruſſia, and Dantzic: and that there is no other difference betwixt the aſhes made in thoſe different countries, but that the Ruſſian, containing more ſalt, muſt be made into a paſte with a ſtrong lye.

"There would appear, by my experiments, a greater difference than this betwixt the Swediſh aſhes, if that is the true proceſs, and thoſe I have examined. I had diſcovered the greateſt part of the Muſcovy aſhes to be lime. I ſuſpected it might enter into the compoſition of the Marcoſt and Caſhub; and have accordingly diſcovered it there. Without the ſame grounds, none would ever have ſearched for it. Whence then comes this lime? It muſt either enter into its compoſition, or ariſe from the materials managed according as the proceſs directs.

"I have tried the birch aſhes made into paſte with water. I have tried common charcoal made into a paſte with a third part of potaſhes, and kept them in a ſtrong reverberatory heat for ſome hours, and yet no ſuch cauſtic ſubſtance appeared. I have kept earth and ſalts of kelp-aſhes fuſed together for 24 hours in the furnace of a glaſshouſe, where the heat was juſt below the degree of vitrification; and yet no remarkable cauſticity appeared afterwards in the concreted maſs. But ſuppoſing that there did, will ever this account for the generation of lime? Theſe chemiſts do not aſſert that it is a calcareous cauſticity. The earth of vegetables kept in fuſion with their ſalts, is ſo far from turning into a quicklime, that the maſs takes the oppoſite courſe, and becomes glaſs. Bodies that, by the laws of nature, are vitreſcible, can never, ſo far as we know, become calcareous. In one or other of theſe two ſubſtances all bodies terminate that are changeable by fire; and vegetables are of the former kind. Here it may be aſked, Why then, ſince they endure ſuch a fire, are they not vitrified? the objection would be juſt, did they contain nothing elſe but what was found in vegetables. But if we once allow that lime is one of the materials, the difficulty is eaſily ſolved: for lime, we know, in proportion as it is mixed, hinders the vitrification of all bodies. In effect, the earthy part in theſe aſhes is almoſt vitrified: and I think that I have carried the vitrification yet farther in that part; but I never was able, with the utmoſt heat of a reverberatory furnace, continued for ſix hours, to produce any thing like a thorough vitrification in theſe aſhes. The heat of the fire uſed in the proceſs would ſeem to be very great; and muſt, if it were not very difficult, reduce them to glaſs. The invitreſcible nature of theſe ſalts, ſo far from being an objection, becomes a ſtrong proof of my opinion.

"Theſe ſalts have a remarkable pungency. This we have already ſeen is the natural effect of quicklime on ſalts.

"Theſe ſalts are found to be the fitteſt for making ſoap, and to incorporate ſooneſt and beſt with oils. Salts, we know, of themſelves do not readily unite with oil; but when once mixed with quicklime, they have a greater tendency to union.

"Again, I find that theſe aſhes are more eaſily fluxed than charcoal made into a paſte with the third part ſalt; which is much more than the aſhes contain. Now, it is obſerved that quicklime increaſes the fluxing power of alkaline ſalts; for the common cauſtic made of quicklime and alkaline ſalts is ſooner fuſed than the latter alone.

"From theſe reaſons, and the experiments that diſcover lime in theſe aſhes, I am led to think, that it is not generated by the proceſs, but mixed with the aſhes when they are made into a paſte. The following experiment is a convincing proof of what I have been endeavouring to make out.

"I boiled ſome peaſe-ſtraw in a ſtrong lye of pearl-aſhes burnt into a black coal, and made it into a paſte with water. Another quantity of ſtraw was boiled in a lye made of one part of quicklime and four parts of pearl ſalts, the lye being poured off turbid from the lime. This ſtraw was likewiſe burnt when dry, and made into a paſte. Theſe two ſubſtances were put into ſeparate crucibles, and fluxed in a reverberatory furnace. The latter appeared to reſemble the Marcoſt and Caſhub aſhes more than the former, which ſeemed to want their pungency."

12 Potaſhes and pearl-aſhes obtained from neutral ſalts.

Though the only method of preparing the alkaline ſalt originally is by the combuſtion of vegetables, yet there are ſome neutral ſalts from which if it were poſſible to expel the acid, we ſhould have it in our power to procure the fineſt pearl-aſhes in vaſt quantity. Theſe are vitriolated tartar, nitre, but eſpecially ſea-ſalt, on account of the inexhauſtible quantities of it to be met with in the waters of the ocean. Unhappily, however, there are ſome objections to every one of thoſe. The vitriolated tartar, or any other ſalt in which the vitriolic acid enters, cannot be decompoſed without converting the acid into ſulphur by charcoal-duſt; in which caſe it is as difficult to get free of the ſulphur as of the acid; and if we attempt it by frequent ſolutions in water, we deſtroy the phlogiſton of the ſulphur, and have only vitriolated tartar again inſtead of alkali. See CHEMISTRY, nº 716, &c.

With reſpect to nitre, though its acid may be expelled by fire, yet it is too high-priced, and too much uſed in other manufactures, to be thought of for this purpoſe. A potaſh manufacture from ſea-ſalt has indeed been lately erected in England. The principle on which this was eſtabliſhed is, that the acid of ſea-ſalt may be extracted by means of lime; and accordingly we find that the ſaline effloreſcence, which frequently appears on walls, conſiſts chiefly of the marine alkali deprived of its acid. But this, though delivered on the credit of a very eminent chemiſt, we can affirm from our own obſervation to be a miſtake. Of the many caſes in which we have examined this efflorescence only one was found to be alkaline; the others uniformly appeared to be true Glauber's ſalt compoſed of the vitriolic acid and foſſil alkali. Neither did this appear to be formed by any decompoſition of ſalt originally in the plaſter, but to be a real generation of both acid and alkali where none of them exiſted before. See EFFLORESCENCE.

POTATO, in botany. See SOLANUM.

1 How potatoes were introduced into Britain.

Potatoes, it is generally thought, came originally from North America, where they were not reckoned good for food. They were firſt (we are told) introduced into Ireland in the year 1565, and from thence into England by a veſſel wrecked on the weſtern coaſt, called *North Meols*, in Lancaſhire, a place and ſoil even now famous for producing this vegetable in great perfection. It was 40 years after their introduction, however, before they were much cultivated about London; and then they were conſidered as rarities, without any conception of the utility that might ariſe from bringing them into common uſe. At this time they were diſtinguiſhed from the Spaniſh by the name of *Virginia potatoes*, or *battatas*, which is the Indian name of the Spaniſh * ſort. At a meeting of the Royal Society, March 18th, 1662 3, a letter was read from Mr Buckland, a Somerſet gentleman, recommending the planting of potatoes in all parts of the kingdom to prevent famine. This was referred to a committee; and, in conſequence of their report, Mr Buckland had the thanks of the ſociety, ſuch members as had lands were intreated to plant them, and Mr Evelyn was deſired to mention the propoſals at the cloſe of his Sylva.

2 Their late introduction into Sweden.

In Sweden, notwithſtanding the indefatigable induſtry of Linnæus, the culture of potatoes was only introduced in 1764, when a royal edict was publiſhed to encourage their general cultivation. They were known there, however, at an earlier period; for in *the Memoirs of the Royal Academy of Sciences in Sweden*, 1747, M. Charles Skytſe propoſed to diſtil brandy from them, in order to ſave corn, which in that country is very dear. He found by experience, that an acre of land ſet with potatoes will yield a much greater quantity of brandy than when ſown with barley.

3 Their great utility.

The utility of potatoes to the common people is well known, and this utility has brought them into general uſe, and has extended them over every part of this country. To promote this utility, and to make their cultivation more eaſy, a variety of experiments and inquiries have been made. Some of theſe we ſhall now lay before our readers, without repeating, however, what has been ſaid on the ſame ſubject in the article [illegible]GRICULTURE, nº 158—167.

4 Remarks and experiments on their culture.

By many people the Iriſh purple potato is thought to be the ſweeteſt and beſt; and of theſe the bright and middle-ſized are directed to be ſet whole, in February, March, and April, in a fine deep tilth, in any ſoil. During the froſt, the firſt ſetting ſhould be covered with litter or fern. They ſhould be ſet ſix inches deep, and a yard diſtant from each other every way, in a kind of hillocks like a mole-caſt; and they muſt be moulded every month or fortnight, as high as poſſible. By July or Auguſt, under each hillock there will be nearly a buſhel of potatoes. The white kidney potato runs all into ſtringy roots in looſe ground, while the pink-coloured will do extremely well in the way we have now directed; and the ſmalleſt of them, though often given to hogs, unleſs they be otherwiſe improper or unhealthy, will be very good feed.

The following experiments concerning the culture of potatoes are related in the Georgical Eſſays.

5 Of the Howard potato.

"By all the experiments that have been made, the Howard or large Bedfordſhire potato is found to produce the largeſt crop. On that account they are chiefly uſed in feeding of cattle. In two beds, four feet wide, and 200 feet long, I planted in a common field a ſufficient number of ſets of this kind of potato, and managed them by a horſe-hoe. The produce was 64 buſhels, each buſhel up-heaped, weighing about 70 lb. My cattle eat them boiled with as much eagerneſs as the beſt ſorts, and came on as well with them. I have built a boiling-houſe, &c. on Mr Young's plan, and during this whole winter have boiled potatoes for my cattle. For the fattening ones, I mix ground oats with them; and for the milk-cows, malt-duſt; and dare venture to affirm, that they are much more profitable than either turnips or cabbages. Once, when my potatoes grew low. I deſiſted giving them to the milking-cows. Immediately, though fed with the beſt hay, they fell off amazingly in their milk. I therefore began again; and in a week's time they gave better than one-third more butter. I own this accidental diſcovery gave me much ſatisfaction, as it confirmed my opinion, that potatoes boiled are an excellent winter food for cattle. Their culture is not ſo difficult, at leaſt not ſo precarious, as either turnips or cabbages. Their value is ſuperior, and there is no riſk of their giving a diſagreeable taſte either to butter or milk. Add to this the vaſt increaſe of the Howard potato, and its equality with the beſt ſorts when uſed for cattle.

---

* See Convolvulus, nº 5.

6 Of the increaſe of potatoes.

"My gardner cut a large potato into nine pieces, which he planted with dung, in a drill, in the garden. By earthing up and laying the ſhoots, he produced 575 (A) ſizeable potatoes, which weighed eight ſtone eight pound. Another of my ſervants produced, in the field, ſeven ſtone of good potatoes from the ſame number of ſets. Though this experiment cannot always be executed in its full force in an extenſive ſcale, it ought, notwithſtanding, to be imitated as nearly as circumſtances will allow. It ſhows, in the moſt diſtinguiſhing manner, the uſe of clean and careful huſbandry.

"On the 14th of April, I cut a large white potato into 17 ſets, which were planted in as many hillocks, at the diſtance of four feet. In the courſe of growing, the plants were earthed up, and on the 14th of October the crop was taken up: The produce, 10 pecks of ſizeable potatoes. At the time that this experiment was made, I had ſeveral hillocks, in which I put three and four ſets of the ſame kind of potato. But, upon the moſt careful examination, I could not obſerve that theſe hillocks produced a greater crop than the others planted with a ſingle ſet. Hence it is obvious, that the potato ſpreads its root moſt kindly when leaſt crowded."

While ſpeaking of the increaſe of potatoes, we cannot help taking notice of a memoir by John Howard, Eſq; of Cardington, in Bedfordſhire, on a new kind of potato remarkable for its prolificacy. "In the year 1765 (ſays he) being at Cliſton, near Briſtol, I was informed a perſon had brought from America a new ſort of potato, and with ſome trouble I procured half a dozen roots of it, as the greateſt part of thoſe brought over were already planted. That autumn I planted three of them, and in the following ſpring the other three, in my garden at Cardington in Bedfordſhire; ſetting them in hillocks about ſix feet aſunder. The ſtrength of the ſtems, and largeneſs of the bloſſom and apples, gave the pleaſing proſpect of great increaſe: and accordingly, when I took them up in the autumn 1766, I found they had increaſed far beyond any of the common ſort, which for ſome years I had encouraged our cottagers to cultivate. The produce from each cutting was in weight from 26 to 27 pounds and a half. I ſent for two of the Bedford gardeners, who ſerve the market, to ſee them taken up, and they were ſurpriſed at the great increaſe. I gave ſome of them to theſe gardeners, and others to almoſt all our own cottagers. The increaſe continued to appear the ſame in the ſucceeding year, viz. 1767, as in the laſt: only, as many of the ſingle potatoes had been then found to weigh four or five pounds each, I had now planted moſt of them in drills three feet aſunder, in order to procure a greater number, and a leſs ſize. Their produce was now from 22 to 30 pounds from each cutting; and the potatoes were more ſizeable for common uſe. The vegetation was not ſo luxuriant as in thoſe I before planted in hillocks; but the increaſe of theſe was, allowing the cuttings to weigh one ounce, full 400-fold. Having laſt year upwards of a waggon-load of theſe potatoes, I with pleaſure ordered it to be made publicly known, that every perſon who choſe to cultivate them were welcome to have a quantity for planting. In conſequence of this, numbers applied in our own and the adjacent counties. In my plantations, as well as thoſe of other perſons, the increaſe has been ſtill greater this year: for the ſeaſon having proved very favourable, I have had from ſome hillocks 42 pounds and a half, allowing for dirt."

We now continue our extracts from the Georgical Eſſays.

7 Of raiſing ſeedling potatoes.

"Take a bunch of the apples of any ſort of potato. Hang it up in a warm room during the winter, and in February ſeparate the ſeeds from the pulp, by waſhing the apples in water, and preſſing them with the fingers. Then dry the ſeeds upon paper. In the month of April, ſow theſe ſeeds, in drills, in a bed of earth well dug, and manured with rotten dung. When the plants are about an inch high, draw a little earth up to them with a hoe, in order to lengthen their main roots. When they are about three inches high, dig them up with a ſpade, and ſeparate them carefully from each other, in order for planting out in the following manner. Prepare a piece of freſh ground by trenching it well. Dig up the ſeedling plants as before directed; and plant them out in the ground, thus prepared, in ſuch a manner that there ſhall be 16 inches between each plant. As they advance in growth, let them receive one or two earthings up, in order to lengthen the main root, and encourage the ſhoots under ground. By this management, the potatoes will, in the courſe of one ſeaſon, arrive at the ſize of hen's eggs, and the haulm will be as vigorous as if ſets had been planted. But what proves the luxuriancy in the moſt convincing manner, is, that flowers and apples are produced.

"In Lancaſhire, where the gardeners raiſe potatoes from ſeed, they are always two, and ſometimes three, years in bringing them to full ſize. By the above method of tranſplanting, with wide diſtances, many of the potatoes nearly attain their full ſize in one ſeaſon. It is obſervable, that theſe ſeedlings produce potatoes of all the different kinds; and ſometimes new ſorts are procured. We do not find any difference whether the apple comes from one kind or another. It is not ſo when we uſe the ſet, which invariably produces the ſame kind. Potatoes, when propagated from ſets, after a number of years, are found to decreaſe in bearing; for which reaſon they ſhould be brought back every 14 years to their original. From a want of attention to this circumſtance, I have known potatoes ſo run out, that they hardly returned treble ſeed. The farmer complains that his land is tired of them; but the true cauſe

---

(A) Inſtances of the amazing increaſe of potatoes are very numerous, and are almoſt every year detailed in the public papers. In the Gentleman's Magazine for 1757, p. 480, we are told, that from one ſlice of a potato, ſet in the ſpring of the ſame year by Mr Simon M'Hoy, a farmer at Park near Tuam in Ireland, there proceeded no leſs than 84 ſtalks, which produced 965 potatoes.

auſe is the age of the ſets. The increaſe of potatoes raiſed from ſeed is aſtoniſhing. They continue in vigour for about 14 years; after which the produce gradually declines.

8 On raiſing early potatoes. "As the culture of potatoes, and particularly of the early ſorts for the table, has of late become an object of very general attention, I hope the following account of a new method of obtaining theſe (without the help of hot-beds) will be acceptable to the public.

"On the 2d of January 1772, I made a hot-bed for the forward ſort of potatoes, and on the 7th put in the ſets, placing a glaſs and frame over them, and taking every precaution to defend them from the froſt. Of theſe ſmall potatoes, or ſets, there remained about 40 in a baſket, which was accidentally hung up in a warm kitchen, and there remained unnoticed till about the 25th of April. I then accidentally obſerved the baſket, and perceiving ſomething green on the edge of it, took it down, and, to my great ſurpriſe, found that the potatoes had ſprouted half a yard in length, and that there were a great number of very ſmall potatoes formed on the fibrous roots which had grown out. I took them into my garden, and planted them in a rich ſandy ſoil, without any manure. The roots I put into the ground three inches deep, and laid down the ſtems that had ſprouted, horizontally, and covered them with two inches of ſoil, but left the tops uncovered. Without further attention they grew ſurpriſingly.

"On the 26th of May, I took up the roots planted in the hot-bed on the 7th of January. They by no means anſwered my expectations, or paid for the trouble of their culture: but, at the ſame time, I was aſtoniſhed to find the others, which were put into the ground ſo late, to have produced larger potatoes than the roots in the hot-bed. I took up all the roots, and picked off the large potatoes from them, which amounted to from 4 to 12 on each root, and then ſet the roots again in the ſame ground. This, indeed, I have ſucceſsfully practiſed for many years, ſometimes even twice, and have had a third good crop at Michaelmas. When this method is tried, the roots muſt be watered on the evenings of hot days.

"In January 1773, in order to make a ſecond trial of this experiment with a large quantity, I placed a great many potatoes of the early ſorts on a thick layer of gravelly ſoil, cloſe to each other, over an oven, ſlated over, but open to the ſouth-weſt, and covered them two inches deep with the ſame earth. At the end of April I took them up, and found the ſtems about a foot long or more. For fear of injuring the fine and delicate fibres of the roots, I took great care in taking them up, and planting them in the ſoil. This I now manured, but in all other reſpects treated them in the manner above deſcribed, many of the fibrous roots having then potatoes formed upon them nearly as large as walnuts. For a week, the plants came on ſurpriſingly, when, by one ſharp night's uncommon froſt, they were nearly deſtroyed. However, notwithſtanding this, freſh ſtems grew up in a few days, and I actually gathered from them, on the 3d of June following, finer potatoes than were ſold at that time, at Mancheſter, from 1 s. to 1 s. 6 d. per pound, being the produce of hot-beds. After taking off the larger potatoes, I again planted the roots for a ſecond crop, and in September obtained a very large produce. I weighed the increaſe of many ſeparate roots, which amounted from four pound eight ounces to 14 pound 12 ounces, the potatoes being the largeſt of the forward kinds I ever ſaw.

9 On raiſing them in winter. "Make a compoſt of earth, ſand, and coal-aſhes. With this mixture fill a tub about 16 inches deep. Plant this artificial ſoil with ſome ſets of the early round potato, and place the tub in a ſtable oppoſite to a window, taking care to water the earth now and then. In all ſeaſons the ſets will ſprout, and give a tolerable increaſe of potatoes. Laſt November I planted ſome ſets in the above manner; and in February following I took up a conſiderable number of young potatoes, clean ſkinned and well flavoured.

10 On tranſplanting potato-tops. "On the 18th of May 1772, finding ſome beds I had ſown very early with onions to be a miſſing crop, I was induced to make the following experiment. The year before, I had ſet ſome potatoes in another part of my garden in the common way; and as it is impoſſible but ſome will remain in the ground all winter, ſo I found a number of ſprouts about three inches high, which I nipped off cloſe to the ground, and tranſplanted them into the onion-beds, without any further preparation, about a foot and a half aſunder, in the ſame manner that cabbages and cauliflowers are planted. As the ſeaſon became immediately very dry, I was obliged to give my plants a little water for four or five ſucceſſive nights; after which they began to flouriſh, and had the appearance of a promiſing crop during all the ſummer. At the uſual time, in October, I ordered them to be taken up; and for ſize, quantity, and quality, they exceeded all I ever had in the common way. Had the ground been freſh, properly manured and prepared, and the plants put down at a proper diſtance from each other, I am of opinion that the ſucceſs would have been ſtill greater.

11 On feeding hogs, &c. with potatoes. "From an accurate experiment made laſt year, I dare venture to recommend baked potatoes as an excellent food for hogs. The pork produced by this food was equal to that from barley and beans: but at preſent I cannot exactly aſcertain the comparative experiment with regard to expence; however, I am of opinion, that roaſted potatoes, conſidering the improvement of the hogs, is as cheap a food, if not cheaper, than can be given them. I roaſted my potatoes upon a kiln, ſimilar to what is uſed by oatmeal ſhellers for drying their oats. The difference in expence between boiling and roaſting the potatoes is prodigious, both with regard to the labour and fuel. A kiln that will coſt 3 l. will roaſt potatoes ſufficient for the maintainance of more than 20 hogs; and one man will beſtow all the neceſſary attendance upon them, and do other work beſides. The action of the fire, by diſſipating the crude juices that are contained in raw potatoes, reduces them into a ſtate highly wholeſome and nutritious. Boiling does this in part, but not ſo effectually. A potato roaſted in the manner above deſcribed, partakes much of the nature of a cheſnut, and perhaps is not greatly inferior to it."

Potatoes are found to be uſeful food for moſt other animals. See Agriculture, n° 45.

To theſe experiments we ſhall add ſome important obſervations of Dr Anderſon of Cotefield near Leith, 12 Remarks on the ſeeds moſt proper to be planted.

who has paid a very particular attention to this as well as other branches of agriculture. Our readers will find the Doctor's remarks and experiments at large in the *Bath Papers*, volume fourth. He firſt conſiders the nature of the ſeeds moſt proper to be planted; and from his experiments he thinks it appears that the produce is not materially affected, by planting for ſeed, either whole potatoes or cuttings, or large or ſmall potatoes as ſuch; for it is only incidentally that theſe things can affect the crop. In the fifth volume of the *Bath Papers*, Mr Wimpey relates an experiment, by which it would appear that there is an advantage in planting cut potatoes. His concluſion is as follows. "The meaſure of all the ground planted, ſays he, was 325 poles; the whole produce 378 buſhels. The meaſure of the ground planted with cut potatoes was 265 poles; the produce 312 buſhels The ground planted with whole or uncut ſets was 60 poles, and the produce of the ſame 66 buſhels. Now, if 48 buſhels, the whole quantity of ſets uſed, produced 378 buſhels, then 34 buſhels, the quantity cut, ſhould produce 267 buſhels; but they produced 312, which is 45 buſhels more than the proportion. Again, if 48 buſhels produced 378 buſhels, then 14 buſhels ſhould have produced 110 buſhels; but 14 buſhels of uncut produced only 66 buſhels, which is 44 buſhels leſs than the proportion. A preference of 40 *per cent.* in favour of cut potatoes, in compariſon with whole ſets." Mr Wimpey corroborates the fact in the ſixth volume of the ſame work, and informs us, moreover, that he uſed to ſupply many of his neighbours with potatoes for planting; ſome of whom deſired to have them all ſmall as they had found them equally productive with the larger, and ſaved much trouble in cutting. "Others (continues he) preferred the largeſt, who carried their economy much further: they, it ſeems, uſed to pare them, eat the fleſhy part, and plant the rinds only. Upon inquiry, I found it was not an unuſual practice among the cottagers; and I have been credibly informed they get as large crops and as good potatoes in that method of planting as in any other whatever. If this be a fact, it ſeems to appear that the fleſhy part of the bulb is of no uſe in ſupplying nouriſhment to the young fruit after the fibrous roots have put forth and laid hold of the ground. Perhaps an experiment of this ſort may be thought worth making. "The weight of the crop, however, Dr Anderſon aſſerts (and Mr Wimpey agrees with him, ſee Bath Papers, vol. v. p. 34.), is always in ſome meaſure influenced by the weight of the ſeeds planted; but the weight of produce is not augmented in the *ſame proportion* with the weight of the ſeed planted; the ſmalleſt ſeed yielding the greateſt returns in proportion to the ſeed, but the ſmalleſt in proportion to the extent of ground. It is in no caſe profitable, however, the Doctor thinks to plant ſmall potatoes (B), or ſmall cuttings, unleſs where it is meant to increaſe as faſt as poſſible a favourite kind; in which caſe it may be ſometimes eligible to plant pieces very ſmall, as in that way the kind will be moſt quickly multiplied. We may alſo remark here, that ſuch as wiſh for a large increaſe ſhould never plant the worſt of the crop; it is, we know, extremely common, and may indeed be an immediate ſaving; but it is unqueſtionably a loſs upon the whole; and perhaps it is one cauſe of the *curl diſeaſe*, which is the ſure indication of a poor dwindling crop, and of which we ſhall ſpeak more at large immediately.

Our author further remarks, that there ſeems to be no reaſon to ſuſpect that eyes taken from any particular part of the bulb are poſſeſſed of a degree of prolificacy greater than thoſe taken from any other part of it, independent of the ſize of the fleſhy part that adheres to the eye. It is however highly probable that a difference in the crop, either with reſpect to the number and ſize, or general weight of the whole, would reſult from planting large cuttings of equal weight, taken from the big end of large potatoes, or from the point, as many eyes would be in the laſt in compariſon of the firſt. This is therefore one of the many preparatory experiments that require to be made. It is poſſible too that even the apples may be an object of value, and may indicate a thriving crop or otherwiſe; but of this there is no certainty, as no ſpecific experiments have yet been made on this ſubject.

13 On cutting the ſtems of potatoes while growing.

With reſpect to the effects of cutting the ſtems of potatoes while growing, the Doctor ſeems to be doubtful. The ſtems of potatoes, if cut while growing, and uſed green, are found to be a wholeſome food for cattle, and horſes. But though ſome farmers maintain that the produce in potatoes it not leſſened by having the ſtems cut off while they are in ſtate of vigorous vegetation; others as poſitively inſiſt that the crop is eſſentially injured by that operation. It is proper that this point ſhould be aſcertained. Probably the crop is hurt if the ſtems are cut over before they have attained a certain point of maturity, though it is poſſible they may be afterwards cut without doing any eſſential injury to it.

14 On extracting ardent ſpirits from potatoes.

We have already mentioned that an experiment was made a good while ago in Sweden, to extract ardent ſpirits from potatoes. Other experiments have been made in this country of a later date, but with little effect. This, however, appears to have proceeded either from ignorance or a want of proper attention to the fermentation and after-diſtillation; as appears from Dr Anderſon's experiment, which ſucceeded extremely well by attending to theſe proceſſes. What he made he aſſerts to have been the fineſt and moſt agreeable vinous ſpirit he ever ſaw, reſembling in taſte very fine brandy, but more mild, and having a certain coolneſs on the ſtomach peculiar to itſelf.

Much may be done in bringing potatoes to pefection

(B) In oppoſition to this, it is the opinion of even practical men, that the ſmall potatoes are to be preferred. "I have been informed (ſays Mr Hollins) by a native of America, that what we call the long red American potato, grows in that rich and newly cleared ſoil to a very large ſize; but that the potatoes proceeding from the roots were never uſed as ſeed; for there ſprung from the ſtalk, very near the ſurface of the ground, ſmall potatoes as they called them; but, he ſaid, they were about the ſize of thoſe raiſed in England, and thoſe were always planted. I hope the Society will forgive my mentioning this, as it confirms what I have already ſaid, 'that ſmall potatoes are beſt for ſeed." *London Society of Arts*, vol. xi. p. 82.

tion by attending to their ſeveral varieties. For this purpoſe ſome particular potato muſt be fixed upon as a ſtandard; and when this is done, the inquiry muſt be carried on by attending, *firſt*, to their appearances below ground, as, 1. the general form and ſize of the bulbs; 2. their colour; 3. the ſmoothneſs or roughneſs of the ſkin; 4. the conſiſtence, that is, the mealineſs or viſcoſity and taſte of the bulb; 5. the colour, length, thickneſs, &c. of the umbilical cord; 6. their tendency to grow deep, or to riſe near the ſurface; to ramble wide, or to adhere cloſe to the ſtem; 7. the time when the bulbs knot and ſet; marking, not by the kalendar only, but alſo compared with the advance of the plant above ground; 8. the time when they attain perfect maturity with reſpect to ſize, and alſo that period of their growth at which they loſe the herbaceous, and attain the farinaceous, taſte; 9. their general prolificacy; 10. how long they may be kept, at what ſeaſon they are in greateſt perfection for eating, &c. We muſt *next* attend to the particulars obſervable above-ground; as, 1. the general height, colour, and form of the ſtem; 2. their tendency to puſh out many or few ſtems from a root; 3. whether they carry bloſſom or not; 4. the form, dimenſions, and colour of the leaves; 5. the form, colour, and general habitude of the bloſſom where there is any; 6. the time at which the bloſſom appears; 7. the tendency they have to produce few or many apples; 8. the tendency they have to produce thoſe excreſcences on the ſtalks that reſemble potatoes below ground, which may be called air potatoes; 9. the comparative hardneſs or tenderneſs of the leaves, in reſpect of froſt or other variations of weather that affect them. And, *laſtly*, we muſt attend to the particulars that concern the whole plant; as, 1. the ſoil which ſeems beſt to ſuit each kind; 2. the mode of culture that beſt agrees with them; 3. the accidents which are moſt liable to affect them; and in general every particular that could indicate any difference between one kind and another.

15 On attending to the ſeveral varieties of potatoes.

16 Opinions on raiſing ſeedling potatoes.

Our author next conſiders the circumſtance of raiſing ſeedling potatoes. His mode of raiſing them was ſimilar to that recommended in the *Georgical Eſſays* quoted above; but he differs with reſpect to the utility or ſucceſs of that mode. It has been alleged, he ſays, that potatoes, which have been long propagated by means of bulbs, loſe in time their generative quality, ſo as to become much leſs prolific than at firſt; and it is aſſerted that thoſe bulbs which have been lately obtained from ſeeds are much more prolific, and conſequently much more profitable for being employed as plants than others: but this opinion appears to have been adopted without ſufficient examination: for there appears not the ſmalleſt indication of ſuperior prolificacy in thoſe raiſed from ſeeds, but rather the reverſe. That potatoes do not degenerate in point of prolificacy in conſequence of being long propagated in the uſual way, ſeems to be confirmed by the general experience of all Europe. It is now about a hundred years ſince the potato was pretty generally cultivated in Ireland, and it has been very univerſally cultivated in Britain for 50 years paſt; and all that have been reared in it ſince their firſt introduction two hundred years ago, a very few of late only excepted, have been propagated from bulbs only; ſo that if they have declined in point of prolificacy, the degeneracy ſhould in this time have been very apparent. Nothing of that kind however was ever remarked, nor any inſinuation of that ſort thrown out, till the diſcovery of rearing potatoes from ſeed was made, when it was for the firſt time heard of. There are many perſons now living who have been in the conſtant practice of rearing potatoes for 30 or 40 years; and notwithſtanding the general tendency that mankind have to diſpraiſe the preſent, when compared to paſt times, yet none of them have given the ſmalleſt hint of degeneracy in this reſpect. And perhaps it will be found that this is merely a groundleſs notion, that has originated from the partial fondneſs of thoſe who firſt propagated this plant from ſeed, in favour of their new diſcovery. It has been further ſaid, that by raiſing potatoes from ſeed, many new and valuable kinds may be obtained; and it is alſo aſſerted in the *Georgical Eſſays*. Indeed an opinion of obtaining new varieties of plants by propagating them from ſeed univerſally prevails among naturaliſts. But Dr Anderſon, in his firſt paper, doubts whether this be fact, and whether, when any of theſe occur, they have not been the effect of accidental poſition or other cauſes. We may certainly (ſays he) aſſert on the whole, that if the practice of rearing potatoes from ſeeds ſhall ever be productive of any advantages to ſociety, they have not yet been diſcovered. Since he wrote that treatiſe which appears in the Bath Papers, vol. iv. (and of which we are now giving a ſhort account), however, he has had occaſion to alter his opinion, which he does with great candour in vol. v. The experiment which induced him to alter his opinion, and which appears to be deciſive, was made with the ſeed of a potato procured from Ireland of a very peculiar kind. Its colour was a dirty dark purple, its ſhape a round irregular bulb, and its ſtem tall and upright. The ſeeds procured from this potato were ſown by themſelves, and the ſeedlings when of a proper ſize were tranſplanted. From the appearance of the ſtems he ſoon diſcovered that they were not all of one ſort, and on taking them up the variety was almoſt infinite; and ſuch as could not be accounted for on the principles of a mongrel adulteration. The diverſities reſpected colour, ſhape, &c. ſome of which he enumerates. See *Bath Papers*, vol. v. p. 127.; ſee alſo p. 35. where Mr Wimpey controverts the Doctor's former opinion.

17 On the curled diſeaſe.

Reſpecting the cauſes and prevention of the *curled diſeaſe* in potatoes there has been a great variety of opinions, which we have detailed at ſome length under the article Agriculture, p. 267 to 270. Dr Anderſon confeſſes that he can ſay but little *poſitive* as to the cauſe of this diſorder, but he thinks a good deal may be ſaid on the *negative* ſide of the queſtion. It was little known till lately (c), and in the northern parts of Britain it was abſolutely unknown but a very few years ago: and even now in the more remote corners it is ſtill leſs frequent than in the more ſouthern and more commercial diſtricts of the iſland. It has been ſuppoſed that nature, ſated as it were by having long produced this plant in a climate not deemed congenial to it, had become ſo far exhauſted as to occaſion this diſeaſe. But in this caſe, the more northern parts, where the climate is moſt unfavourable, ſhould have been ſooneſt affected. It has been alſo thought that potatoes, whoſe bulbs are froſt-bitten before they are houſed, occaſion this diſeaſe in the plants they produce. But the fact is, that they are leaſt liable to the diſeaſe in thoſe diſtricts where they are moſt expoſed to froſt. A potato can never indeed be benefited by froſt; but it is not at all probable that the being touched by it occaſions the curl. The taking up potatoes before they arrive at maturity has been thought to occaſion the diſeaſe; but in places where they muſt be taken up ſo, the diſeaſe is ſcarcely known. It has alſo been thought that potatoes obtained from *ſeed* are entirely free from it. But Dr Anderſon gives a proof of the contrary; for one half of the plants of a large field planted from potatoes the third year from the ſeed were curled; while another field adjoining raiſed from potatoes that never were, that he knows, produced from ſeed in Britain, had ſcarcely one curled plant in the whole. The diſeaſe has been ſuppoſed by others to ariſe from the ſoil or ſeaſon. But that this is not the caſe, appears from the circumſtance of a ſingle field which Dr Anderſon planted with potatoes of the very ſame ſort, but obtained from different perſons. The ridges were intermixed, and the one was very much curled, and the other perfectly free. The diſeaſe, therefore, appears to ariſe from infected ſeed: it is however poſſible that it may be communicated by juxtapoſition; and if ſo, the diſeaſe might be in a great meaſure if not entirely avoided, by pulling out thoſe that ſhowed the leaſt ſymptom of it, on their firſt appearing above ground.

(c) In the eighth volume of the Tranſactions of the London Society for Encouragement of Arts, &c. p. 43. we are told that the curl firſt appeared in 1764, in the very diſtrict in Lancaſhire where they were firſt cultivated.

In the Tranſactions of the London Society for encouragement of arts, &c. we find a good deal about the curl diſeaſe. Many of the writers agree in opinion with Dr Anderſon in many particulars; and particularly, that though the diſeaſe may be prevented, we do not yet know enough of its nature to be able to cure it. See their vol. viii. p. 18, &c. ix. p. 52, &c. and x. p. 75. In this laſt volume we are told that the principal cauſes of the curl are three: 1. From their being forced by cultivation to overgrow their power for vegetation; 2. From their vegetative power being dried up in ebb ſoil by the ſcorching heat of the ſun; and, 3. From their being expoſed too long after they are cut in ſets before they are planted.

18
On the ſoil and ſeaſon moſt proper for potatoes.

It is generally and very naturally believed that a dry ſoil or a dry ſeaſon neceſſarily produces the drieſt potatoes. But there is good reaſon to doubt the truth of the opinion. The year 1775 was the drieſt and warmeſt ſeaſon that has been known in Scotland within the memory of man, yet the potatoes of that year's crop were watery almoſt to a proverb: on the other hand, the potatoes of crop 1777, although it was a remarkably rainy ſeaſon, were as dry and mealy at leaſt as is common, and much more ſo than in the year 1775. It deſerves alſo to be remarked, that the crop of 1775 was almoſt double in quantity to that of 1777. Hence a dry ſeaſon would ſeem to augment the produce, though it does not for certain in all caſes improve the quality, of this crop: nor does a dry ſoil neceſſarily inſure meally potatoes; for our author ſays he has often ſeen potatoes of the ſame kind, and of the ſame year's produce, reared in two different places; the one of them in a naturally damp ſoil, which turned out to be much freer and more mealy than the others which were reared on a drier and ſharper ſoil. He confeſſes, that he has alſo often ſeen it turn out in fact, that potatoes raiſed in thoſe diſtricts where the ſoil is hot and ſandy, are uſually more free and tender than thoſe raiſed in countries where the ſoil is cold and damp. Our author tries to account for theſe contradictory phenomena by conjecturing the probable cauſe of the waterineſs or dryneſs of a crop. He aſks, Whether in this reſpect the crop is anywiſe affected by the degree of ripeneſs that the plants employed for ſeed may have attained in the preceding ſeaſon? That this is the caſe he thinks highly probable. Potatoes which, on account of the richneſs or other peculiarity of the ſoil, continue in a ſtate of vegetation highly luxuriant till they are nipped by froſt, or checked in their growth by other inclemencies of the ſeaſon, have much leſs chance of being dry and mealy than others of the ſame ſort which have attained their full growth before the coldneſs or inclemency of the weather checked them. But our author's queſtion does not relate to this, but to the effect theſe unripe potatoes, uſed as ſeed, would have on the ſucceeding crop; a circumſtance which experience alone can determine. "But even if it ſhould be found (continues our author) that the maturity of the ſeeds affected the quality of the potatoes, it would not follow invariably that the ſeeds produced on early dry ſoils would be better than thoſe from later ſoils; becauſe it might ſometimes happen from local poſition, and other accidental circumſtances, that the growth of the potatoes in the dry early ſoil might be checked by froſts many weeks before thoſe on the other ſoil were affected, in conſequence of which the plants in the cold ſoil might attain to more perfect maturity than thoſe on the drier one. I mention this peculiarity merely to ſhow how cautious the farmer ought to be in adopting general concluſions without carefully attending to all the collateral circumſtances that may affect his experiment. I ſhall only farther add on this head, that I had occaſion to know well a dry warm ſpot of ground on which the ſtems of the potatoes of crop 1776 were froſt-bitten at leaſt *ſix weeks* before thoſe on another ſpot at ſome miles diſtance from it, where the ſoil was naturally more cold and damp, were in the ſmalleſt degree affected by it. It likewiſe ſo happened, that the potatoes raiſed on the firſt-mentioned ſpot in the year 1777 (their own froſt-bitten (D) ſeed was employed) had ſuch a peculiar acrid and bitteriſh taſte as to be hardly at all eatable, while thoſe in the colder place of that crop had nothing of that unuſual

---

(D) Obſerve, the term *froſt bitten* is here applied to the ſtems only, and not to the bulbs. The ſtems were ſo much hurt by the froſt as to turn black and decay, but the bulbs were taken up before the froſt had been ſufficiently intenſe to hurt them.

uſual taſte. Whether this diverſity was occaſioned by the circumſtance here alluded to, I do not take it on me to ſay. In matters of ſuch nice diſquiſition as the preſent, many facts obtained by very accurate obſervation are neceſſary before any concluſion can be relied on."

Potatoes, when planted in water, ſhoot out a great number of fine white roots like threads into the water; but on none of them is there to be found the leaſt appearance of a bulb; while on the other hand the potatoes in that caſe always grow on the top. Potatoes are found to be extremely uſeful in bringing exhauſted land into heart again. See AGRICULTURE, n° 35 and 186, p. 309, col. 1. The biſhop of Killalue in Ireland directs the uſe of them for this purpoſe in a letter in the *Bath Papers*, vol. 4. p. 232, and confirms its utility in this reſpect by experiments of his own. In the 10th vol. of the *Tranſactions of the London Society for Encouragement of Arts*, &c. p. 34, there is alſo a moſt deciſive proof of this utility.

We have been induced, from the extenſive utility of this root, to extend our obſervations on the ſubject to a greater length than we ſhould otherwiſe have done. Such of our readers as wiſh for further information, will of courſe conſult the books from which we have made up the preſent article, as well as other books on Agriculture; in which they will find the obſervations and experiments which we have mentioned at much greater length than we could poſſibly give them. In the ſixth volume of the *Bath Society Papers* there is an excellent paper on the culture of potatoes and feeding hogs with them during ſeven years by John Billingſley Eſq; of which our limits do not permit us to take particular notice. There are alſo a variety of other papers in the ſeveral volumes of that work, as well as in the Tranſactions of the London Society, which we have already ſeveral times mentioned; which will deſerve the particular attention of ſuch as wiſh well to the poor, or have a deſire ſtill farther to extend the utility of this moſt valuable root. We have already mentioned a cheap preparation by means of potatoes for the poor, ſee AGRICULTURE, n° 161; and we ſhall finiſh the preſent article with a receipt to make a potato herrico, which may be equally uſeful to thoſe whoſe circumſtances are not ſuch as to make them regardleſs of economy. We take it from the Gentleman's Magazine, and give it in the words of a perſon who had tried the experiment.

Scrape the ſkin clean off four pounds of good raw potatoes, then waſh them clean in fair water: take two pounds of beef, one of mutton, and one of pork; or as you like beſt, four pounds of any of theſe meats; cut them into pieces of three or four ounces each, ſeaſon them very well with pepper and ſalt and a good onion chopped very ſmall: have ready a ſtrong wide-mouthed ſtone-jar, ſuch as hares are uſually jugged in; ſlice thin a layer of the potatoes into the jar, then a layer of the ſeaſoned meat over them, and ſo alternately layers of potatoes and meat; let your uppermoſt layer be potatoes, ſo that your jar be about three quarters full, but put no water into your jar; then cloſe or ſtop the mouth of it with a large well-fitted piece of cork, covering the ſame with a ſtrong piece of canvas, and tyeing it down with pack-thread, ſo as only a little of the ſteam may eſcape in the ſtewing; for a little ſhould conſtantly evaporate from the ſide of the cork to ſave the jar from burſting. Then place your jar upright in a kettle of cold water on the fire, ſo as the mouth of the jar may be always two inches above the water in the kettle when boiling. The herrico in the jar will begin to boil ſome minutes ſooner than the water in the kettle, and that for obvious reaſons. In about an hour after the water in the kettle begins to boil, your herrico will be fully ſtewed. Then take out and open the jar, pour out the herrico into a deep diſh, and ſerve it up.

This excellent, wholeſome, and economical diſh ſupplies an agreeable dinner twice a week to a family conſiſting of three grown people, and three children under fourteen years of age, where neither health nor good ſtomachs are wanting, thanks to God: and, in point of economy we muſt obſerve, that here is the whole article of butter ſaved, as alſo the whole article of bread, or nearly ſo; nor does there require ſo large or ſo continued a fire, nor ſo much time or trouble as is neceſſary for the dreſſing of many other diſhes that by no means deſerve the preference of this excellent herrico.

We have alſo (by way of change) made it with powdered beef, ſometimes with powdered pork, ſometimes with half freſh beef or mutton and half pickled pork, and found it good in all theſe ways, particularly with three pounds of freſh beef and one of pickled pork. We have left off ſending pies and ſtews to the bakers. We ſometimes (in a larger kettle) boil a ſmall piece of powdered beef along-ſide of the jar, by continuing the boiling an hour and an half longer, and this ſerves us to eat cold the next day, with hot garden-ſtuff or a pudding.

POTATO-Bread. See *BREAD of Potatoes.*

Spaniſh POTATO. See CONVOLVULUS, n° 5.

POTENT, or **POTENCE**, in heraldry, a term for a kind of croſs, whoſe ends all terminate like the head of a crutch. It is otherwiſe called the *Jeruſalem croſs*, and is repreſented Plate CCXXIX, fig. 12, 12.

POTENTIA (POWER), that whereby a thing is capable either of acting or being acted upon.

POTENTIAL, in the ſchools, is uſed to denote and diſtinguiſh a kind of qualities, which are ſuppoſed to exiſt in the body *in potentia* only; by which they are capable in ſome meaſure of affecting and impreſſing on us the ideas of ſuch qualities, though not actually inherent in themſelves; in which ſenſe we ſay, potential heat, potential cold, &c.

POTENTIAL Cautery, in medicine, denotes the conſuming, or reducing to an eſchar, any part of the human body by a cauſtic alkaline or metallic ſalt, &c. inſtead of a red-hot iron, which laſt is called the *actual cautery*.

POTENTIAL, in grammar, an epithet applied to one of the moods of verbs. The potential is the ſame in form with the ſubjunctive, and is, according to Ruddiman, implied in that mood, for which reaſon that grammarian rejects it; but others will have it to differ from the ſubjunctive in this, that it always implies in it either *poſſum*, *volo*, or *debeo*. It is ſometimes called the *permiſſive mood*, becauſe it often implies a permiſſion or conceſſion to do a thing. See GRAMMAR.

POTENTILLA, SILVER-WEED, *wild tanſey*, or *cinquefoil*: A genus of the pentagynia order, belonging to the icoſandria claſs of plants; and in the natural method ranking under the 35th order, *Senticoſæ*. The calyx is decemfid; there are five petals; the ſeeds roundiſh, naked, and affixed to a ſmall dry receptacle. The ſpecies are, 1. The fruticoſa, or ſhrubby potentilla, commonly

monly called *ſhrub-cinquefoil.* This riſes with a ſhort ſhrubby ſtem, dividing into a branchy full head, three or four feet high; cloſely garniſhed with pinnated leaves of five oblong, narrow, acute-pointed, folioles, pale green above, and whitiſh underneath; and the branches terminated by cluſters of large ſpreading, yellow flowers. This is a beautiful deciduous flowering ſhrub, worthy a place in every curious collection. It grows wild in Yorkſhire and other northern parts of England, &c. but has been long cultivated in gardens as an ornamental ſhrub. 2. The reptans, or creeping common five-leaved potentilla, or five-leaved graſs, hath a thick fibry root, ſlender, trailing, repent ſtalks, digitated, five-lobed, petiolated leaves, and yellow flowers ſingly. 3. The rupeſtris, or mountain upright cinquefoil, hath upright ſtalks, eight or nine inches high; pinnated five and three lobed alternate leaves, having oval crenated lobes, and the ſtalks terminated by ſmall white flowers. 4. The recta, or erect ſeven-lobed yellow cinquefoil, hath erect ſtalks, ſeven-lobed leaves; having three lobes ſpear-ſhaped and ſerrated, green and hairy on both ſides, and the ſtalks terminated by corymboſe cluſters of yellow flowers. 5. The fragaroides, or ſtrawberry-like trailing potentilla, hath a ſomewhat tuberous root, furniſhed with many long fibres, long trailing ſhoots, rooting at the joints; pinnated, moſtly three-lobed leaves, having oval lobes, with the extreme lobe the largeſt, and cluſters of ſmall white flowers. This ſpecies bears a great reſemblance to the ſmall ſterile ſtrawberry plants. 6. The argentea, ſilvery upright potentilla, hath upright ſtalks, branching a foot high; and five-lobed leaves, having the lobes wedge-ſhaped, cut on the edges, hoary and white underneath, and the branches terminated by ſmall yellow flowers.

All theſe plants flower in June and July; the flowers are compoſed each of five roundiſh petals, and about 20 ſtamina. They are all very hardy, and may be employed in the different compartments of the pleaſure ground. Their propagation is very eaſy. The ſhrubby potentilla may be propagated abundantly by ſuckers, layers, and cuttings; all of which will readily grow, and make plants in one year, which after having two or three years gowth in the nurſery will be fit for any of the ſhrubbery compartments. All the herbaceous kinds may be propagated by parting the roots in autumn or ſpring, or by ſeed in any of thoſe ſeaſons.

POTERIUM, GARDEN BURNET: A genus of the polyandria order, belonging to the monœcia claſs of plants and in the natural method ranking under the 54th order, *Miſcellaneæ*. The male calyx is tetraphyllous; the corolla quadripartite; and there are from 30 to 40 ſtamina. The female calyx is tetraphyllous; the corolla quadripartite; there are two piſtils; the berry is formed of the indurated tube of the corolla. The ſpecies are, 1. The ſanguiſorba, or common garden burnet, hath fibry perennial roots, crowned by a large tuft of pinnated leaves, or ſix or ſeven pair of ſawed lobes, terminated by an odd one; upright angular ſtalks, dividing, and branching a foot and a half high, terminated by oblong ſpikes of purpliſh red flowers. This ſpecies grows wild in England, in chalky ſoils; but has been long cultivated as a choice ſalad-herb for winter and ſpring uſe, it being of a warm nature; the young leaves are the uſeful parts. It is perennial in root, and retains its radical leaves all the year, but the ſtalks are annual. 2. The hybridum, hybrid agrimony-leaved Montpelier burnet, riſes with upright, taper, cloſely gathered ſtalks two feet high; pinnated odoriferous leaves of three or four pair of ſawed lobes, terminated by an odd one; and the ſtalks terminated by long footſtalks dividing into ſmaller, each ſupporting a ſmall roundiſh ſpike of flowers. This ſpecies often proves biennial; but by cutting down ſome of the ſtalks before they flower, it will cauſe it to multiply at bottom, and become abiding. 3. Poterium ſpinoſum, ſhrubby ſpinous burnet of Crete, hath a ſhrubby ſtem and branches, riſing a yard high, armed with ſpines; ſmall pinnated evergreen leaves, of ſix or ſeven pair of lobes, terminated by an odd one, and the branches terminated by ſmall heads of greeniſh flowers.

All theſe ſpecies flower in June and July, ſucceeded by ripe ſeeds in Autumn. They are all naturally perennial; but the two herbaceous ones are abiding in root only; the other in root, ſtem, and branches: the two former are hardy, and the third requires ſhelter in winter. The firſt ſort merits culture in every kitchen-garden for winter and ſpring ſalads. Some plants, both of the firſt and ſecond ſorts, may be introduced in the herbaceous collection in the pleaſure-garden for variety. The third ſort muſt be kept always in pots to have ſhelter in winter. They are all eaſily propagated, the firſt ſort by ſeed and by parting the roots. The ſecond ſort may alſo be increaſed by ſeeds and ſlips of the root, as for the former ſort. And the propagation of the third is by ſlips or cuttings of the branches in ſpring and ſummer, planted in pots, and placed under glaſſes, giving ſhade and water; or might be forwarded more by plunging them in a hot-bed.

Burnet is of a heating, drying nature, cordial and alexipharmac; in ſummer, the leaves are uſed for cool tankards, to give the wine an agreeable flavour. The powder of the root of the firſt ſpecies is commended againſt ſpitting of blood, bleeding at the noſe, dyſenteries, and diſeaſes attended with violent ſecretions. In winter and ſpring, the young tender leaves are uſed in ſalads. For its uſes as food for cattle, ſee AGRICULTURE, nº 184

POTHOS, in botany; a genus of the polyandria order, belonging to the gynandria claſs of plants. The ſpatha or ſheath is a ſimple ſpadix covered; there is no calyx but four petals, and as many ſtamina; the berries diſpermous.

POTION, a liquid medicine, conſiſting of as much as can be drunk at one draught.

POTIPHAR, or PUTIPHAR, an officer of the court of Pharaoh king of Egypt, and general of his troops, according to our tranſlation, Le Clerc, and the verſion of the vulgate; but according to the Hebrew and Septuagint, the chief of his butchers or cooks. The Hebrew text, the Septuagint, and vulgate, call him Eunuch. But it is probable it in this place means only an officer of the king's court, for he was certainly married and had children. We have no other accounts of him but what appear in ſcripture; and that account is too generally known to require to be enlarged on in this place. See Geneſis xxxviii. xxxix. &c.

POTOSI, a city of Peru in South America, ſituated at the bottom of a mountain of that name, in which is the richeſt ſilver mine ever diſcovered. To give an idea of its richneſs, we ſhall mention its produce at different times. Excluſive of what was not regiſtered, ſays Abbé Raynal, and was ſmuggled away, the fiſth part belonging to the government, from 1545 to 1564, amounted to 36,450,000 livres * *per annum*. But this abundance of metals ſoon decreaſed. From 1564 to 1585, the annual fifth part amounted to no more than 15,187,489 livres four ſols §. From 1585 to 1624, it amounted to 12,149,994 livres 12 ſols †. From 1624 to 1633, to 6,074,997 livres ſix ſols ‡. From this laſt period, the produce of theſe mines hath ſo evidently decreaſed, that in 1763 the fiſth part, belonging to the king, did not exceed 1,364,682 livres 12 ſols ||. Situated in W. Long. 67. S. Lat. 22. See the article Peru, p. 220, col. 2.

POTSDAM, or **Postdam**, a town of Germany, in the circle of Upper Saxony, with a palace, belonging to the king of Pruſſia. It is ſeated in an iſland ten miles in circumference, formed by the rivers Sprae and Havel. The palace is very curious, and finely built upon a delightful ſpot 12 miles weſt of Berlin. E. Long. 13. 42. N. Lat. 52. 34. Reiſbeck in his travels informs us, that the houſes in Potſdam are ſtill finer than thoſe of Berlin; but like them they are inhabited only by perſons of the lower and middling ranks.

POTT (Percival), was born in London in 1713. He received the firſt rudiments of his education at a private ſchool at Darne in Kent; and became an apprentice to Mr Nourſe, one of the ſurgeons of St Bartholomew's hoſpital; of which hoſpital, in 1744-5, he was elected an aſſiſtant ſurgeon, and in 1749 appointed one of the principal ſurgeons. In 1746, he married the daughter of Robert Cruttenden, Eſq. His firſt publication is ſaid to have been planned in 1756, during his confinement in conſequence of a compound fracture of the leg: from that time, his pen was ſeldom long unemployed. His practice and his reputation were now rapidly increaſing: in 1764, he was elected a fellow of the Royal Society; and afterward was complimented with honorary diplomas from the Royal Colleges of Surgeons at Edinburgh and in Ireland. In 1787, he reſigned the office of ſurgeon to St Bartholomew's hoſpital, "after having ſerved it (as he uſed to ſay), man and boy, half a century; and on the 22d of December 1788, after an illneſs of eight days, he expired.

"The labours of the greateſt part of his life (ſays Mr Earle, who publiſhed his Chirurgical works), were without relaxation: an increaſing family required his utmoſt exertion: of late years he had a villa at Neaſden; and in the autumn uſually paſſed a month at Bath, or at the ſea-ſide. Thus, though he gathered, as he expreſſed it, ſome of the fruit of the garden which he had planted as he went along, and always lived in a generous and hoſpitable manner, at the ſame time beſtowing on four ſons and four daughters a liberal and neceſſarily expenſive education, and applying large ſums to their eſtabliſhment during his lifetime, he left an ample proviſion for them at his deceaſe. Among his papers was found, what he had often mentioned, a ſmall box, containing a few pieces of money, being the whole which he ever received from the wreck of his father's fortune. With this was depoſited an exact account of every individual fee which a long life of buſineſs had produced—abundant evidence of well ſpent time, and the induſtrious application of abilities, to which the *res anguſta domi*, at the commencement probably acted more powerfully as an incentive than as an obſtacle."

POTTER (Chriſtopher), a learned Engliſh divine, was born in 1591, and bred at Oxford. In 1633, he publiſhed his "Anſwer to a late Popiſh Plot," intitled *Charity miſtaken*, which he wrote by ſpecial order of King Charles I. whoſe chaplain he was. In 1634, he was promoted to the deanery of Worceſter; and, in 1640, was conſtituted vice-chancellor of the univerſity of Oxford, in the execution of which office he met with ſome trouble from the members of the long parliament. Upon breaking out of the civil wars, he ſent all his plate to the king, declaring, "that he would rather, like Diogenes, drink in the hollow of his hand, than that his majeſty ſhould want;" and he afterwards ſuffered much for the royal cauſe. In conſideration of this he was nominated to the deanery of Durham in 1646, but was prevented from being inſtalled by his death, which happened about two months after. He was a perſon learned and religious, exemplary in his converſation, courteous in his carriage, of a ſweet and obliging nature, and of a comely preſence. He was remarkable in his charity to the poor.

Potter (Dr John), archbiſhop of Canterbury, was the ſon of a linen-draper at Wakefield in Yorkſhire, where he was born about the year 1674. He ſtudied at Univerſity college, Oxford; and at 19 publiſhed *Variantes lectiones & notæ ad Plutarchi librum de audiendis poetis; & ad Baſilii magni orationem ad juvenes, quomodo cum fructu legere poſſint Græcorum libros*, 8vo, 1693. In 1697, came out his edition of *Lycophron*, in folio; which is reckoned the beſt of that obſcure writer: ſoon after, he publiſhed his *Antiquities of Greece*, 2 vols. 8vo. Theſe works eſtabliſhed his literary reputation, and engaged him in a correſpondence with Grævius and other learned foreigners. In 1706, he was made chaplain to the queen; in 1715, biſhop of Oxford; and in 1737, he ſucceeded archbiſhop Wake in the ſee of Canterbury; which high ſtation he ſupported with much dignity until his death in 1747. He was a learned and exemplary churchman; but not of an amiable diſpoſition, being but too ſtrongly tinctured with the pride of office; nor is it to his credit that he diſinherited his eldeſt ſon for marrying below his rank in life. His "Theological works, containing ſermons, charges, diſcourſes on church-government, and divinity lectures," were printed at Oxford, in 3 vols, 8vo, 1753.

POTTERY, the manufacture of earthen-ware, or the art of making earthen veſſels. See *Delft-Ware*, *Stone-Ware*, and Porcelain, &c.

The wheel and lathe are the chief and almoſt the only inſtruments in pottery: the firſt for large works, and the laſt for ſmall. The potter's wheel conſiſts principally in the nut, which is a beam or axis, whoſe foot or pivot plays perpendicularly on a free-ſtone ſole or bottom. From the four corners of this beam, which does not exceed two feet in height, ariſe four iron bars, called the *ſpokes of the wheel;* which forming diagonal lines with the beam, deſcend, and are faſtened at bottom to the edges of a ſtrong wooden circle, four feet in diameter, perfectly like the felloes of a coach-wheel, except that it has neither axis nor radii, and is only joined to the beam, which ſerves it as an axis by the iron-bars. The top of the nut is flat, of a circular

§ 632,812 l. 1 s.

† 506,249 l. 15 s. 6d.

‡ 253,124 l. 17s. 9d.

|| 56,861 l. 15s. 9d.

cular figure, and a foot in diameter; and on this is laid the clay which is to be turned and faſhioned. The wheel thus diſpoſed is encompaſſed with four ſides of four different pieces of wood faſtened on a wooden frame; the hind-piece, which is that on which the workman ſits, is made a little inclining towards the wheel; on the fore-piece are placed the prepared earth; on the ſide-pieces he reſts his feet, and theſe are made inclining to give him more or leſs room. Having prepared the earth, the potter lays a round piece of it on the circular head of the nut, and ſitting down turns the wheel with his feet till it has got the proper velocity; then, wetting his hands with water, he preſſes his fiſt or his finger-ends into the middle of the lump, and thus forms the cavity of the veſſel, continuing to widen it from the middle; and thus turning the inſide into form with one hand, while he proportions the outſide with the other, the wheel conſtantly turning all the while, and he wetting his hands from time to time. When the veſſel is too thick, he uſes a flat piece of iron, ſomewhat ſharp on the edge, to pare off what is redundant; and when it is finiſhed, it is taken off from the circular head by a wire paſſed under the veſſel.

The potter's lathe is alſo a kind of wheel, but more ſimple and ſlight than the former: its three chief members are an iron beam or axis three feet and a half high, and two feet and a half diameter, placed horizontally at the top of the beam, and ſerving to form the veſſel upon: and another large wooden wheel, all of a piece, three inches thick, and two or three feet broad, faſtened to the ſame beam at the bottom, and parallel to the horizon. The beam or axis turns by a pivot at the bottom in an iron ſtand. The workman gives the motion to the lathe with his feet, by puſhing the great wheel alternately with each foot, ſtill giving it a greater or leſſer degree of motion as his work requires. They work with the lathe with the ſame inſtruments, and after the ſame manner, as with the wheel. The mouldings are formed by holding a piece of wood or iron cut in the form of the moulding to the veſſel, while the wheel is turning round; but the feet and handles are made by themſelves and ſet on with the hand; and if there be any ſculpture in the work, it is uſually done in wooden moulds, and ſtuck on piece by piece on the outſide of the veſſel. For the glazing of the work, ſee GLAZING.

POTTLE, an Engliſh meaſure containing two quarts.

POVERTY ſignifies indigence or want of riches, and has been the lot of a large portion of men in every age. Whether, on the whole, it has been productive of good or bad conſequences, has been diſputed. In a moral view, perhaps it has been, on the whole, uſeful, as adverſity is in general more conducive to virtue than proſperity, which too often leads to luxury and vice.—Sometimes, however, poverty has had a baneful effect upon the mind, and has prompted men to commit very inhuman actions; but this in civilized communities very ſeldom occurs. In a political view, poverty is thought by ſome to be hurtful: Raynal thinks it is a check to population, (ſee his Hiſtory, vol vi. p. 471.); and Dr Smith ſo far agrees with him; for though he aſſerts, and indeed proves, that poverty is no check to the production of children, he allows it to be very unfavourable to raiſing them. See *Smith's Wealth of Nations*, vol. i. p. 119, &c. See alſo POOR.

POULADUFF, two remarkable great holes in the ground, about a mile weſt of Roſs, in the county of Cork, and province of Munſter, in Ireland, 80 yards deep, in which the ſea flows by ſubterraneous paſſages. They are called Eaſt and Weſt *Pouladuff*; one is on the lands of Downeen, and the other on Tralong.

POULTICE, a ſort of medicine, called alſo a *cataplaſm*. See CATAPLASMA.

POULTRY, all kind of domeſtic birds brought up in yards, as cocks, hens, capons, ducks, turkeys, &c.

Almoſt all the domeſtic birds of the poultry kind that we maintain in our yards are of foreign extraction: but there are others to be ranked in this claſs that are as yet in a ſtate of nature, and perhaps only wait till they become ſufficiently ſcarce to be taken under the care of man to multiply their propagation. It will appear remarkable enough, if we conſider how much the tame poultry which we have imported from diſtant climates has increaſed, and how much thoſe wild birds of the poultry kind that have never yet been taken into keeping have been diminiſhed and deſtroyed. They are all thinned; and many of the ſpecies, eſpecially in the more cultivated and populous parts of the country are utterly unſeen.

Under birds of the poultry kind may be ranked all thoſe that have white fleſh, and, comparatively to their heads and limbs, have bulky bodies. They are furniſhed with ſhort ſtrong bills for picking up grain, which is their chief and often their only ſuſtenance. Their wings are ſhort and concave; for which reaſon they are not able to fly far. They lay a great many eggs; and as they lead their young abroad, the very day they are hatched, in queſt of food, which they are ſhown by the mother, and which they pick up for themſelves, they generally make their neſts on the ground. The toes of all theſe are united by a membrane as far as the firſt articulation, and are then divided.

Under this claſs we may therefore render the common cock, the peacock, the turkey, the pintada or Guinea hen, the pheaſant, the buſtard, the grous, the partridge, and the quail. They all bear a ſtrong ſimilitude to each other, being equally granivorous, fleſhy, and delicate to the palate. They are among birds what beaſts of paſture are among quadrupeds, peaceable tenants of the field, and ſhunning the thicker parts of the foreſt, that abound with numerous animals who carry on unceaſing hoſtilities againſt them.

As nature has formed the rapacious claſs for war, ſo ſhe ſeems equally to have fitted theſe for peace, reſt, and ſociety. Their wings are but ſhort, ſo that they are ill formed for wandering from one region to another; their bills are alſo ſhort, and incapable of annoying their oppoſers: their legs are ſtrong indeed; but their toes are made for ſcratching up their food, and not for holding or tearing it. Theſe are ſufficient indications of their harmleſs nature; while their bodies, which are fat and fleſhy, render them unwieldy travellers, and incapable of ſtraying far from each other.

Accordingly, we find them chiefly in ſociety: they live together; and though they may have their diſputes, like all other animals, upon ſome occaſions; yet, when kept in the ſame diſtrict, or fed in the ſame yard, they learn the arts of ſubordination; and, in proportion as each knows his ſtrength, he ſeldom tries a ſecond time the combat where he has once been worſted.

In this manner, all of this kind ſeem to lead an indolent voluptuous life. As they are furniſhed internally with a very ſtrong ſtomach, commonly called a *gizzard*, ſo their voraciouſneſs ſcarce knows any bounds. If kept in cloſe captivity, and ſeparated from all their former companions, they have ſtill the pleaſure of eating left; and they ſoon grow fat and unwieldy in their priſon. To ſay this more ſimply, many of the wilder ſpecies of birds, when cooped or caged, pine away, grow gloomy, and ſome refuſe all ſuſtenance whatever; none except thoſe of the poultry kind grow fat, who ſeem to loſe all remembrance of their former liberty, ſatisfied with indolence and plenty.

POUNCE, gum ſandarach pounded and ſifted very fine, to rub on paper in order to preſerve it from drinking, and to make it more fit to write upon.

Pounce, is alſo a little heap of charcoal duſt, incloſed in a piece of muſlin or ſome other open ſtuff, to be paſſed over holes pricked in a work, in order to mark the lines or deſigns thereof on paper, ſilk, &c. placed underneath; which are to be afterwards finiſhed with a pen and ink, a needle, or the like. This kind of pounce is much uſed by embroiderers, to transfer their patterns upon ſtuffs; by lace-makers, and ſometimes alſo by engravers.

Pounces, in falconry, the talons or claws of a bird of prey.

POUND, a ſtandard-weight; for the proportion and ſubdiviſions of which, ſee the article Weight.

Pound alſo denotes a money of account; ſo called, becauſe that ancient pound of ſilver weighed a pound one penny troy.

Pound, among lawyers, denotes a place of ſtrength, in which to keep cattle that are diſtrained, or put in for treſpaſs, until they are replevied or redeemed.

POUNDAGE, in England a ſubſidy of 12d. in the pound, granted to the crown on all goods and merchandizes exported or imported; and if by aliens, more.

POURPRESTURE, in law, is a wrongful incloſure, or incroachment upon another perſon's property.

POURSUIVANT, or Pursuivant, in heraldry, the loweſt order of officers at arms.—They are properly attendants on the heralds when they marſhal public ceremonies. Of theſe in England there were formerly many; but at preſent there are only four, viz. blue-mantle, rouge-croſs, rouge-dragon, and port cullice. In Scotland there is only one king at arms, who is ſtyled *Lyon*; and has under him no leſs than ſix heralds, as many purſuivants, and a great many meſſengers at arms. See Lyon.

POURVEYANCE, or Purveyance, in Engliſh law, the providing corn, fuel, victuals, &c. for the king's houſehold; and hence the officer who did ſo was termed *pourveyor*. As ſeveral offences were committed by theſe officers, it was enacted by ſtat. 12. Car. II. that no perſon, under colour of pourveyance, ſhall take any timber, cattle, corn, &c. from any ſubject without his free conſent, or without a juſt appraiſement and paying for the ſame.

POUSSIN (Nicholas), an eminent French painter, born in 1594, at Andel, a little city in Normandy, where his father was of noble extraction, but born to a ſmall eſtate. He was inſtructed for a few months by one Ferdinand Elle, a portrait-painter, and afterwards ſpent a month with L'Allemant; but finding theſe artiſts not likely to improve him ſuitably to his deſires, he firſt ſtudied the paintings of the beſt maſters, and then haſtened to finiſh a few pieces he was engaged in, and travelled to Italy. Here he devoted almoſt his whole attention to the ſtudy of antique ſtatutes and bas reliefs; which was probably the cauſe of his want of knowledge in, and taſte for, the art of colouring. Being invited back to Paris by Louis XIII. who aſſigned him a penſion with lodgings in the Thuilleries, he painted for prince Juſtiniani an hiſtorical picture repreſenting Herod's cruelty; an admirable compoſition, in which he gave ſuch expreſſion to every character, as could not fail to ſtrike the beholder with terror and pity: he then laboured for ſeveral years on the celebrated pictures of the ſeven ſacraments of the Romiſh church. But none of Pouſſin's deſigns have been more generally admired than that of the death of Germanicus; which would have gained him immortal honour if he had never painted another picture. He began the labours of Hercules in the gallery of the Louvre; but the faction of Vouet's ſchool railing at him and his performances, put him ſo out of humour with his own country, that he returned to Rome, where he died in 1665. He never went beyond eaſel-pieces, for which he had a perpetual demand; and his method was to fix the price he expected on the back of the canvas, which was readily paid.

Poussin (Gaſpar). This painter, whoſe real name was *Dughet*, was born at Paris in 1600; and was induced to travel to Rome, not only from a love to the art of painting, but alſo to viſit his ſiſter, who was married to Nicholas Pouſſin. Sandrart ſays that Gaſpar was employed at firſt only to prepare the pallet, pencils, and colours, for Nicholas; but by the precepts and example of that excellent maſter, gradually roſe to the higheſt reputation, and is undoubtedly one of the beſt landſcape painters that ever appeared. It is generally thought that no painter ever ſtudied nature to better purpoſe, or repreſented the effects of land-ſtorms more happily, than Gaſpar; all his trees ſhow a natural degree of agitation, every leaf being in motion; his ſcenes are all beautifully choſen, as are the ſites of his buildings. He deſigned human figures but very indifferently; for which reaſon he frequently prevailed on Nicholas to paint them for him; and they were always introduced with the utmoſt propriety. While he continued at Rome he dropped his own name, and aſſumed that of his brother-in-law and benefactor, by which only he is at preſent known. He died in 1662.

POWDER, in pharmacy, a dry medicine well broken, either in a mortar by grinding or by ſome chemical operation.

Gun-Powder. See Gunpowder. See alſo Obſervations on Gunpowder in the Iriſh Tranſactions 1788, p. 97. claſs *Science*, by Mr Napier.

Powder-Cheſts, certain ſmall boxes charged with powder and a quantity of old nails or ſplinters of iron, and faſtened occaſionally on the deck and ſides of a ſhip, in order to be diſcharged on an enemy who attempts to ſeize her by boarding. Theſe caſes are uſually from 12 to 18 inches in length, and about eight or ten in breadth, having their outer or upper part terminating in an edge. They are nailed to ſeveral places of the quarter-deck and bulk-head of the waiſt, having a train of powder, which communicates with the inner apartments of the ſhip, ſo as to be fired at pleaſure to annoy the enemy. They are particularly uſed in merchant-ſhips which are furniſhed with cloſe-quarters to oppoſe the boarders.

Powder Magazine, a bomb-proof arched building, to contain powder in fortified places.

Powder for the Hair. The beſt ſort is ſtarch well pounded and ſifted, and generally prepared with ſome perfume.

James's Powder. See *James's Powder*. In the Philoſophical Tranſactions for 1791, p. 317. there is a paper by Dr Pearſon, containing experiments and obſervations on James's powder. Dr Pearſon ſays, it was originally a patent medicine; but it is well known that it cannot be prepared by following the directions of the ſpecification in the court of chancery. His obſervations and experiments, therefore, he thinks, may explain the nature and manner of preparing this medicine, and perhaps may extend the hiſtory of antimony. The reſult of the whole, in Dr Pearſon's own words, is as follows:

1. James's powder conſiſts of phoſphoric acid, lime, and antimonial calx; with a minute quantity of calx of iron, which is conſidered to be an accidental ſubſtance. 2. Either theſe three eſſential ingredients are united with each other, forming a triple compound, or phoſphorated lime is combined with the antimonial calx, compoſing a double compound in the proportion of about 57 parts of calx and 43 parts of phoſphorated lime. 3. This antimonial calx is different from any other known calx of antimony in ſeveral of its chemical qualities. About three-fourths of it are ſoluble in marine acid, and afford Algaroth powder; and the remainder is not ſoluble in this menſtrum, and is apparently vitrified. It alſo appears, that by calcining together bone-aſhes, that is, phoſphorated lime and antimony in a certain proportion, and afterwards expoſing the mixture to a white heat, a compound was formed, conſiſting of antimonial calx and phoſphorated lime in the ſame proportion, and poſſeſſing the ſame kind of chemical properties as James's powder.

POWDIKE, in the fens of Norfolk and Ely. By ſtat. 22 Hen. VIII. c. 11. perverſely to cut down and deſtroy the powdike in the fens of Norfolk and Ely is felony. See *Blackſtone's Commentaries* vol. iv. p. 243.

POWER, has been defined the faculty of doing or ſuffering any thing. Power, therefore, is two-fold, viz. conſidered as able to make, or able to receive, any change; the former whereof may be called *active*, and the latter *paſſive, power*: but this diſtinction is improper. See Metaphysics, n° 116.

Power, in mechanics, denotes any force, whether of a man a horſe, a ſpring, the wind, water &c. which being applied to a machine, tends to produce motion.

Power, in law, ſignifies in general a particular authority granted by any perſon to another to repreſent him, or to act in his ſtead.

POWERS in arithmetic and algebra, are nothing but the products ariſing from the continual multiplications of a number or quantity into itſelf. See Algebra and Arithmetic.

POX, *French-Pox*, or *Lues Venerea*. See Medicine, n° 350

Small-Pox See Inoculation, and Medicine, n° 222—226.

POYNING's law, an act of parliament made in Ireland under Henry VII. whereby all the ſtatues of force in England were made of force in Ireland; which before that time they were not.—Nor are any now in force there made in England ſince that time.

The law took its name from Sir Edward Poyning, lord-lieutenant of that kingdom at the time of its making. See Ireland, n° 46.

POZZOLANA, See Puzzolana.

PRACTICE, in arithmetic. See there, n° 16. &c.

Gun-Practice, in Engliſh military education. In the ſpring, as ſoon as the weather permits, the exerciſe of the great guns begins, with an intention to ſhow the gentlemen cadets at the royal military academy at Woolwich, and private men, the manner of laying, loading, pointing, and firing the guns. Sometimes inſtruments are uſed to find the centre line, or two points, one at the breech, the other at the muzzle, which are marked with chalk, and whereby the piece is directed to the target: then a quadrant is put into the mouth to give the gun the required elevation, which at firſt is gueſſed at, according to the diſtance the target is from the piece. When the piece has been fired, it is ſponged to clear it from any duſt or ſparks of fire that might remain in the bore, and loaded: then the centre line is found as before; and if the ſhot went too high or too low, to the right or to the left, the elevation and trail are altered accordingly, This practice continues morning and evening for about ſix weeks, more or leſs according as there are a greater or leſs number of recruits. In the mean time others are ſhown the motions of quick-firing with field-pieces.

Mortar-Practice, generally thus. A line of 1500, or 2000 yards is meaſured in an open ſpot of ground from the place where the mortars ſtand, and a flag fixed at about 300 or 500 yards: this being done, the ground where the mortars are to be placed is prepared and levelled with ſand, ſo that they may lie at an elevation of 45 degrees; then they are loaded with a ſmall quantity of powder at firſt, which is increaſed afterwards by an ounce every time, till they are loaded with a full charge; the times of the flights of the ſhells are obſerved, to determine the length of the fuzes. The intention of this practice is, when a mortar battery is raiſed in a ſiege, to know what quantity of powder is required to throw the ſhells into the works at a given diſtance, and to cut the fuzes of a juſt length, that the ſhell may burſt as ſoon as it touches the ground.

PRÆMUNIRE, in Engliſh law, is taken either for a writ ſo called, or for the offence whereon the writ is granted; the one may be underſtood by the other.—The church of Rome, under pretence of her ſupremacy and the dignity of St Peter's chair, took on her to beſtow moſt of the eccleſiaſtical livings of any worth in England, by mandates, before they were void; pretending therein great care to ſee the church provided of a ſucceſſor before it needed. Whence theſe mandates or bulls were called *gratiæ expectativæ, or proviſiones*; whereof ſee a learned diſcourſe in *Duarenus de beneficiis*, Blackſt. Comment.

beneficiis, lib. 3. cap. 1. Theſe proviſions were ſo common, that at laſt Edward I. not digeſting ſo intolerable an encroachment, in the 35th year of his reign made a ſtatute againſt papal proviſions, which, according to Sir Edward Coke, is the foundation of all the ſubſequent ſtatutes of præmunire: which is ranked as an offence immediately againſt the king, becauſe every encouragement of the papal power is a diminution of the authority of the crown.

In the weak reign of Edward II. the pope again endeavoured to encroach, but the parliament manfully withſtood him; and it was one of the articles charged againſt that unhappy prince, that he had given allowance to the bulls of the ſee of Rome. But Edw. III. was of a temper extremely different; and, to remedy theſe inconveniences, firſt by gentle means, he and his nobility wrote an expoſtulation to the pope: but receiving a menacing and contemptuous anſwer, withal acquainting him, that the emperor (who a few years before at the diet of Nuremberg, A. D. 1323, had eſtabliſhed a law againſt proviſions), and alſo the king of France, had lately ſubmitted to the holy ſee; the king replied, that if both the emperor and the French king ſhould take the pope's part, he was ready to give battle to them both, in defence of the liberties of the crown. Hereupon more ſharp and penal laws were deviſed againſt proviſors, which enact ſeverally, that the court of Rome ſhall preſent or collate to no biſhopric or living in England; and that whoever diſturbs any patron in the preſentation to a living by virtue of a papal proviſion, ſuch proviſor ſhall pay fine and ranſom to the king at his will, and be impriſoned till he renounces ſuch proviſion; and the ſame puniſhment is inflicted on ſuch as cite the king, or any of his ſubjects, to anſwer in the court of Rome. And when the holy ſee reſented theſe proceedings, and pope Urban V. attempted to revive the vaſſalage and annualrent to which king John had ſubjected his kingdom, it was unanimouſly agreed by all the eſtates of the realm in parliament aſſembled, 40 Edw. III. that king John's donation was null and void, being without the concurrence of parliament, and contrary to his coronation-oath; and all the temporary nobility and commons engaged, that if the pope ſhould endeavour by proceſs or otherwiſe to maintain theſe uſurpations, they would reſiſt and withſtand him with all their power.

In the reign of Richard II. it was found neceſſary to ſharpen and ſtrengthen theſe laws, and therefore it was enacted by ſtatutes 3 Ric. II. c. 3. and 7. Ric. II. c. 12. firſt, that no alien ſhall be capable of letting his benefice to farm; in order to compel ſuch as had crept in, at leaſt to reſide on their preferments: and afterwards, that no alien ſhould be capable to be preſented to any eccleſiaſtical preferment, under the penalty of the ſtatutes of proviſors. By the ſtatute 12 Rich. II. c. 15. all liegemen of the king accepting of a living by any foreign proviſion, are put out of the king's protection, and the benefice made void. To which the ſtatute 13 Rich. II. ſt. 2. c. 2. adds baniſhment and forfeiture of land and goods: and by c. 3. of the ſame ſtatute, any perſon bringing over any citation or excommunication from beyond ſea, on account of the execution of the foregoing ſtatutes of proviſors, ſhall be impriſoned; forfeit his goods and lands, and moreover ſuffer pain of life and member.

In the writ for the execution of all theſe ſtatutes, the words *præmunire facias* being uſed to command a citation of the party, have denominated in common ſpeech, not only the writ, but the offence itſelf of maintaining the papal power, by the name of *præmunire*. And, accordingly, the next ſtatute we ſhall mention, which is generally referred to by all ſubſequent ſtatutes, is uſually called the *ſtatute of præmunire*. It is the ſtatute 16 Richard II. c. 5. which enacts, that whoever procures at Rome, or elſewhere, any tranſlations, proceſſes, excommunications, bulls, inſtruments, or other things which touch the king, againſt him, his crown, and realm, and all perſons aiding and aſſiſting therein, ſhall be put out of the king's protection, their lands and goods forfeited to the king's uſe, and they ſhall be attached by their bodies to anſwer to the king and his council; or proceſs of *præmunire facias* ſhall be made out againſt them as in other caſes of proviſors.

By the ſtatute 2 Henry IV. c. 3. all perſons who accept any proviſion from the pope, to be exempt from canonical obedience to their proper ordinary, are alſo ſubjected to the penalties of præmunire. And this is the laſt of the ancient ſtatutes touching this offence: the uſurped civil power of the biſhop of Rome being pretty well broken down by theſe ſtatutes, as his uſurped religious power was in about a century afterwards: the ſpirit of the nation being ſo much raiſed againſt foreigners, that about this time, in the reign of Hen. V. the alien priories, or abbeys for foreign monks, were ſuppreſſed, and their lands given to the crown. And no farther attempts were afterwards made in ſupport of theſe foreign juriſdictions.

This, then, is the original meaning of the offence which we call *præmunire*; viz. introducing a foreign power into the land, and creating *imperium in imperio*, by paying that obedience to papal proceſs which conſtitutionally belonged to the king alone, long before the Reformation in the reign of Henry VIII. at which time the penalties of præmunire were indeed extended to more papal abuſes than before; as the kingdom then entirely renounced the authority of the ſee of Rome, though not at all the corrupted doctrines of the Roman church. And therefore, by the ſeveral ſtatutes of 24 Hen. VIII. c. 12. and 25 Hen. VIII. c. 19. & 21. to appeal to Rome from any of the king's courts, which (though illegal before) had at times been connived at; to ſue to Rome for any licence or diſpenſation, or to obey any proceſs from thence, are made liable to the pains of præmunire. And, in order to reſtore to the king in effect the nomination of vacant biſhoprics, and yet keep up the eſtabliſhed forms, it is enacted by ſtatute 25 Hen. VIII. c. 20. that if the dean and chapter refuſe to elect the perſon named by the king, or any archbiſhop or biſhop to confirm or conſecrate him, they ſhall fall within the penalties of the ſtatutes of præmunire. Alſo by ſtatute 5 Eliz. c. 1. to refuſe the oath of ſupremacy will incur the pains of præmunire; and to defend the pope's juriſdiction in Britain, is a præmunire for the firſt offence, and high treaſon for the ſecond. So, too, by ſtatute 13 Eliz. c. 2. to import any *agnus Dei*, croſſes, beads, or other ſuperſtitious things pretended to be hallowed by the biſhop of Rome, and tender the ſame to be uſed; or to receive the ſame with ſuch intent, and not diſcover the offender; or if a juſtice of the peace, knowing thereof, ſhall not within

14 days declare it to a privy-counſellor, they all incur a præmunire. But importing or ſelling maſs-books, or other Popiſh books, is by ſtat. 3. Jac. I. c. 5. § 25. only liable to a penalty of 40 s. Laſtly, to contribute to the maintenance of a Jeſuit's college, or any Popiſh ſeminary whatever beyond ſea, or any perſon in the ſame, or to contribute to the maintenance of any Jeſuit or Popiſh prieſt in England, is by ſtatute 27 Eliz. c. 2. made liable to the penalties of præmunire.

Thus far the penalties of præmunire ſeem to have kept within the proper bounds of their original inſtitution, the depreſſing the power of the pope: but they being pains of no conſiderable conſequence, it has been thought fit to apply the ſame to other heinous offences; ſome of which bear more, and ſome leſs, relation to this original offence, and ſome no relation at all.

Thus, 1. By the ſtatute 1 & 2 Ph. and Mar. c. 8. to moleſt the poſſeſſors of abbey-lands granted by parliament to Henry VIII. and Edward VI. is a præmunire. 2. So likewiſe is the offence of acting as a broker or agent in any uſurious contract where above 10 *per cent.* intereſt is taken, by ſtatute 13 Eliz. c. 10. 3. To obtain any ſtay of proceedings, other than by arreſt of judgment or writ of error, in any ſuit for a monopoly, is likewiſe a præmunire, by ſtat. 21. Jac. I. c. 3. 4. To obtain an excluſive patent for the ſole making or importation of gunpowder or arms, or to hinder others from importing them, is alſo a præmunire by two ſtatutes; the one 16 Car. I. c. 21. the other 1 Jac. II. c. 8. 5. On the abolition, by ſtat. 12. Car. II. c. 24. of purveyance, and the prerogative of pre-emption, or taking any victual, beaſt, or goods for the king's uſe, at a ſtated price, without conſent of the proprietor, the exertion of any ſuch power for the future was declared to incur the penalties of præmunire. 6. To aſſert, maliciouſly and adviſedly, by ſpeaking or writing, that both or either houſe of parliament have a legiſlative authority without the king, is declared a præmunire by ſtatute 13 Car. II. c. 1. 7. By the *habeas corpus* act alſo, 31 Car. II. c. 2. it is a præmunire, and incapable of the king's pardon, beſides other heavy penalties, to ſend any ſubject of the realm a priſoner into parts beyond the ſeas. 8. By the ſtatute 1 W. & M. ſt. 1. c. 8. perſons of 18 years of age refuſing to take the new oaths of allegiance as well as ſupremacy, upon tender by the proper magiſtrate, are ſubject to the penalties of a præmunire; and by ſtatutes 7 & 8 W. III. c. 24. ſerjeants, counſellors, proctors, attorneys, and all officers of courts, practiſing without having taken the oaths of allegiance and ſupremacy, and ſubſcribed the declaration againſt popery, are guilty of a præmunire whether the oaths be tendered or not. 9. By the ſtatute 6 Ann. c. 7. to aſſert maliciouſly and directly, by preaching, teaching, or adviſed ſpeaking, that the then pretended prince of Wales, or any perſon other than according to the acts of ſettlement and union, hath any right to the throne of theſe kingdoms, or that the king and parliament cannot make laws to limit the deſcent of the crown; ſuch preaching, teaching, or adviſed ſpeaking, is a præmunire: as writing, printing, or publiſhing the ſame doctrines amounted, we may remember, to high treaſon. 10. By ſtatute 6 Ann. c 23. if the aſſembly of peers of Scotland, convened to elect their 16 repreſentatives in the Britiſh parliament, ſhall preſume to treat of any other matter ſave only the election, they incur the penalties of a præmunire. 11. The ſtat. 6 Geo. I. c. 18. (enacted in the year after the infamous South Sea project had beggared half the nation) makes all unwarrantable undertakings by unlawful ſubſcriptions, then commonly known by the name of *bubbles*, ſubject to the penalties of a præmunire. 12. The ſtat. 12. Geo. III. c. 11. ſubjects to the penalties of the ſtatute of præmunire all ſuch as knowingly and wilfully ſolemnize, aſſiſt, or are preſent at, any forbidden marriage of ſuch of the deſcendants of the body of king Geo. II. as are by that act prohibited to contract matrimony without the conſent of the crown.

Having thus enquired into the nature and ſeveral ſpecies of præmunire, its puniſhment may be gathered from the foregoing ſtatutes, which are thus ſhortly ſummed up by Sir Edward Coke: "That, from the conviction, the defendant ſhall be out of the king's protection, and his lands and tenements, goods and chattels, forfeited to the king; and that his body ſhall remain in priſon at the king's pleaſure, or (as other authorities have it) during life; both which amount to the ſame thing, as the king by his prerogative may at any time remit the whole, or any part of the puniſhment, except in the caſe of tranſgreſſing the ſtatute of *habeas corpus*. Theſe forfeitures here inflicted do not (by the way) bring this offence within our former definition of FELONY; being inflicted by particular ſtatutes, and not by the common law." But ſo odious, Sir Edward Coke adds, was this offence of præmunire, that a man that was attainted of the ſame, might have been ſlain by any other man without danger of law; becauſe it was provided by law, that any man might do to him as to the king's enemy; and any man may lawfully kill an enemy. However, the poſition itſelf, that it is at any time lawful to kill an enemy, is by no means tenable: it is only lawful, by the law of nature and nations, to kill him in the heat of battle, or for neceſſary ſelf-defence. And to obviate ſuch ſavage and miſtaken notions, the ſtatute 5 Eliz. c. 1. provides, that it ſhall not be lawful to kill any perſon attainted in a præmunire, any law, ſtatute, opinion, or expoſition of law to the contrary notwithſtanding. But ſtill ſuch delinquent, though protected as a part of the public from public wrongs, can bring no action for any private injury, how atrocious ſoever; being ſo far out of the protection of the law, that it will not guard his civil rights, nor remedy any grievance which he as an individual may ſuffer. And no man, knowing him to be guilty, can with ſafety give him comfort, aid, or relief.

PRÆNESTE (anc. geog.), a town of Latium, to the ſouth-eaſt of Rome, towards the territory of the Æqui; a place of great ſtrength. Famous for the temple and oracle of Fortune, called *Sortes Præneſtinæ* (Strabo); which Tiberius wanted to deſtroy, but was deterred by the awful majeſty of the place. From a colony it was raiſed to a municipium by Tiberius (Inſcriptions, Florus, A. Gellius), on the conſideration of his recovery from a dangerous illneſs near this place. Thither the Roman emperors uſually retired, on account of the agreeableneſs of the ſituation (Suetonius). It was a very ancient city, with a territory of large extent (Livy). The temple of Fortune was built in the moſt ſumptuous manner by Sylla, and the pavement was Moſaic work (Pliny). Concerning the Sortes, there is a remarkable paſſage in Cicero; who ſays, that it was all a mere contrivance, in order to deceive, either for the purpoſes of gain or ſuperſtition. The town that has ſucceeded it ſtands low in a valley, and is called *Paleſtrina*, in the Campania of Rome. E. Long. 13. 30. N. Lat. 42. 0.

PRÆSIDIUM (Notitia), a town of the Cornavii in Britain. Now thought to be Warwick (Camden).—Another of Corſica (Antonine), 30 miles to the ſouth of Aleria.—A third *Præſidium* ſurnamed *Julium*, in Bætica (Pliny).

PRÆTORIA AUGUSTA (Ptolemy), a town of Dacia. Now called *Braſſow* by the natives, and *Cronſtadt* by the Germans (Baudrand): a town in Tranſylvania. E. Long. 25°. N. Lat. 47°.—Another of the Salaſſii, near the two gates or defiles of the Alps, the Grajæ and Pinninæ (Pliny); a Roman colony, ſettled by Auguſtus after the defeat of the Salaſſii by Terentius Varro, on the ſpot where he encamped (Strabo, Dio Caſſius, Ptolemy), ſituated on the river Duria Major. The town is now called *Aoſta* or *Aouſt*, in Piedmont. E. Long. 7. 14. N. Lat. 45. 19.

PRÆTORIUM (Antonine, Notitia Imperii), a town of the Brigantes. Now *Paterington* (Camden), near the mouth of the Humber in Yorkſhire. *Coventry* (Talbot).

PRAGMATIC SANCTION, in the civil law, is defined by Hottoman to be a reſcript or anſwer of the ſovereign, delivered by advice of his council, to ſome college, order, or body of people, upon conſulting him on ſome caſe of their community. The like anſwer given to any particular perſon is called ſimply *reſcript*.

The term *pragmatic ſanction* is chiefly applied to a ſettlement of Charles VI. emperor of Germany, who, in the year 1722, having no ſons, ſettled his hereditary dominions on his eldeſt daughter the archducheſs Maria Thereſa, which was confirmed by the diet of the empire, and guaranteed by Great Britain, France, the States-General, and moſt of the powers in Europe. The word *pragmatic* is derived from the Greek πραγμα, *negotium*, "buſineſs."—It is ſometimes alſo called abſolutely *pragmatic*, το πραγματικον.

PRAGUE, a city of Bohemia, and capital of the whole kingdom, is ſituated 14° 40′ of longitude, and 50° 5′ of latitude. It ſtands on both ſides the Moldau, over which there is a bridge 700 feet long, built of large freeſtone. The river, though of great breadth here, is nevertheleſs ſhallow, and not navigable. On both ſides the bridge are ſeveral ſtatues, and among others that of St John of Nepomuch, whom king Wenſel cauſed to be thrown from the bridge into the river, for venturing to reprove him upon ſome occaſion; but in 1720 he was canonized as a ſaint, and is at preſent held in ſuch veneration in Bohemia, that all other ſaints ſeem on his account to be forgotten. Near the bridge, which ſtands at the upper part of the city, the number of people is very great, but the further you go from thence the more deſolate you find every place. The city is about three miles long and two broad; the number of its Chriſtian inhabitants is ſaid to be 70,000, and of Jews about 12,000. The principal branch of its trade conſiſts in brewing of beer. It is divided into the Old and the New Towns, and that called the *Small ſide*; the former lying on the eaſt ſide of the Moldau, and the latter on the weſt. The whole is about 12 miles in circumference. The fortifications are not of great importance, as it may be flanked and raked on all ſides. However, the king of Pruſſia was not able to make himſelf maſter of it in the late war, though he almoſt deſtroyed it with his bombs, &c. See PRUSSIA, n° 24, &c.—It hath ſuffered greatly by ſieges, and hath been often taken and plundered. The univerſity was founded by Charles IV. in the year 1347. In 1409, when John Huſs was rector of the univerſity, there were no leſs than 44,000 ſtudents; and when the emperor Charles V. would have retrenched their privileges, 24,000 are ſaid to have left it in one week, and 16,000 in a ſhort time after. The Jews have the trade of this city almoſt entirely in their own hands. They deal in all ſorts of commodities, eſpecially the precious ſtones found in the Bohemian mines, and, by receiving all old-faſhioned things in payment, quite ruin the Chriſtian handicraftſmen. In 1744 they narrowly eſcaped being expelled the kingdom, having been ſuſpected of correſponding with the Pruſſians, when they made themſelves maſters of the city. The grand prior of the order of Malta, for Bohemia, Moravia, and Sileſia, reſides here; and the church and hoſpital of the Holy Ghoſt is the ſeat of the general and grandmaſters of the holy order of knights of the croſs with the red ſtar, reſiding in the abovementioned countries, and in Poland and Hungary. The houſes of this city are all built of ſtone, and generally conſiſt of three ſtories; but there are very few good buildings in it, and almoſt every thing looks dirty. The cathedral, which is dedicated to St Veit, is an old building, in which there are ſome pieces of excellent architecture and many magnificent tombs of great men. There are 100 churches and chapels, and about 40 cloiſters in the place. On Ratſchin-hill, in Upper Prague, moſt of the nobility have houſes, and the emperor a very magnificent palace, and a ſummer-houſe commanding one of the fineſt proſpects in the world. Here the tribunals of the regency meet; and the halls, galleries, and other apartments, are adorned with a multitude of noble pictures. The great hall, where the coronation feaſt is kept, is ſaid to be the largeſt of the kind in Europe next to that of Weſtminſter. The caſtle ſtands on the abovementioned mountain, called *Ratſchin* or the *White Mountain*, and is very ſtrong. From a window of this caſtle the emperor's counſellors were thrown in 1618; but though they fell from a great height, yet they were not killed, nor indeed much hurt. On the ſame mountain ſtands alſo the archiepiſcopal palace. In the New Town is an arſenal, and a religious foundation for ladies, called the *Free Temporal Engliſh Foundation*, over which an abbeſs preſides. In the Leſſer Side or Town, the counts Colloredo and Wallenſtein have very magnificent palaces and gardens. The ſtables of the latter are very grand; the racks being of ſteel and the mangers of marble, and a marble pillar betwixt each horſe; over each horſe alſo is placed his picture as big as life. Though the inhabitants of Prague in general are poor, and their ſhops but meanly furniſhed, yet, it is ſaid, there are few cities where the nobility and gentry are more wealthy, and live in greater ſtate. Here is much gaming, maſquerading, feaſting, and very ſplendid public balls, with an Italian opera, and aſſemblies in the houſes of the quality every night. On the White Mountain, near the town, was fought the battle in which the Proteſtants, with the elector Palatine Frederic their king, were defeated.

The luſtres and drinking-glaſſes made here of Bohemian cryſtal are much eſteemed, and vended all over Europe. Theſe cryſtals are alſo poliſhed by the Jews, and ſet in rings, ear-pendants, and ſhirt-buttons. The chief tribunal conſiſts of twelve ſtadtholders, at the head of whom is the great burgrave, governor of the kingdom and city, immediately under the emperor, and the chancery of Bohemia. Though the city of Prague is very ill-built, it is pleaſantly ſituated, and ſome of the proſpects are beautiful, and the gardens and pleaſure-houſes are excellent. The people, Rieſbeck informs us, enjoy ſenſual pleaſures more than thoſe of Vienna, becauſe they know better how to connect mental enjoyments with them. The numerous garriſon kept in the place (9000 men) contributes much to its gaiety and livelineſs.

PRAM, or PRAME, a kind of lighter uſed in Holland and the ports of the Baltic Sea, to carry the cargo of a merchant-ſhip *along-ſide*, in order to lade or to bring it to ſhore to be lodged in the ſtorehouſes after being diſcharged out of the veſſel.

PRAME, in military affairs, a kind of floating battery, being a flat-bottomed veſſel, which draws little water, mounts ſeveral guns, and is very uſeful in covering the diſembarkation of troops. They are generally made uſe of in tranſporting troops over the lakes in America.

PRAMNION, in natural hiſtory, the name of a ſemipellucid gem. This is a very ſingular ſtone, and of a very great concealed beauty. The lapidaries, when they meet with it, call it by the name of the *black agate*. It is of an extremely cloſe, compact, and firm texture, of a ſmooth and equal ſurface, and in ſhape very irregular, being ſometimes round, ſometimes oblong, and often flat; in ſize it ſeldom exceeds two inches. It appears, on a common inſpection, to be of a fine deep black; but held up againſt the ſun or the light of a candle, it is an elegant red, clouded by a quantity of ſubtile black earth. It is brought from the Eaſt Indies.

PRASIUM, in botany: A genus of the gymnoſpermia order, belonging to the didynamia claſs of plants; and in the natural method ranking under the 42d order, *Verticillatæ*. There are four monoſpermous berries.

PRATINAS, a Greek poet contemporary with Æſchylus, born at Phlius. He was the firſt among the Greeks who compoſed ſatires, which were repreſented as farces. Of theſe 32 were acted, as alſo 18 of his tragedies, one of which only obtained the poetical prize. Some of his verſes are extant, quoted by Athenæus.

PRATIQUE, or PRATTIC, in commerce, a negociation or communication of commerce which a merchant-veſſel obtains in the port it arrives in and the countries it diſcovers: hence to obtain a pratique, is to obtain liberty to frequent a port, to go aſhore, to buy and ſell, &c.

PRATT (Charles), earl of Camden, was the third ſon of Sir John Pratt, knight, chief-juſtice of the court of king's-bench under George I. by his ſecond wife Elizabeth, daughter of the Reverend Hugh Wilſon canon of Bangor and was born in 1713, the year before his father was called to the honour of the bench. He received the firſt rudiments of his education at Eton, and afterwards removed to king's college Cambridge. Of his early life at both places there is little known, other than that at college he was found to be remarkably diligent and ſtudious, and particularly ſo in the hiſtory and conſtitution of his country. By ſome he was thought to be a little too tenacious of the rights and privileges of the college he belonged to: but perhaps it was to this early tendency that we are indebted for thoſe noble ſtruggles in defence of liberty, which, whether in or out of office, he diſplayed through the whole courſe of his political life. After ſtaying out the uſual time at college, and taking his maſter's degree, in 1739 he entered himſelf a ſtudent of the Inner Temple, and was in due time admitted by that honourable ſociety as a barriſter at law. And here a circumſtance developes itſelf in the hiſtory of this great man, which ſhows how much chance governs in the affairs of this world, and that the moſt conſiderable talents and indiſputable integrity will ſometimes require the introduction of this miſtreſs of the ceremonies, in order to obtain that which they ought to poſſeſs from their own intrinſic qualifications.

Mr Pratt, after his being called to the bar, notwithſtanding his family introduction, and his own perſonal character, was very near nine years in the profeſſion, without ever getting in any degree forward. Whether this aroſe from a natural timidity of conſtitution, ill-luck, or perhaps a mixture of deſpondence growing out of the two circumſtances, it is now difficult to tell; but the fact was ſo: and he was ſo diſpirited by it, that he had ſome thoughts of relinquiſhing the profeſſion of the law, and retiring to his college, where, in rotation, he might be ſure of a church living, that would give him a ſmall but honourable independence. With theſe melancholy ideas he went as uſual the weſtern circuit, to make one more experiment, and then to take his final determination. Mr Henly, afterwards Lord Northington and chancellor of England, was in the ſame circuit: he was Mr Pratt's moſt intimate friend; and he now availed himſelf of that friendſhip, and told him his ſituation, and his intentions of retiring to the univerſity and going into the church. He oppoſed his intention with ſtrong raillery, and got him engaged in a cauſe along with himſelf; and Mr Henley being ill, Mr Pratt took the lead, and diſplayed a profeſſional knowledge and elocution that excited the admiration of his brother barriſters as much as that of the whole court. He gained his cauſe; and beſides, he acquired the reputation of an eloquent, profound, and conſtitutional lawyer. It was this circumſtance, together with the continued good offices of his friend Henley, which led to his future greatneſs; for with all his abilities and all his knowledge, he might otherwiſe in all probability have paſſed his life in obſcurity unnoticed and unknown.

He became now one of the moſt ſucceſsful pleaders at the bar, and honours and emoluments flowed thick upon him. He was choſen to repreſent the borough of Downton, Wilts, after the general election in 1759; recorder of Bath 1759; and the ſame year was appointed attorney-general; in January 1762 he was called to the degree of ſerjeant at law, appointed chief-juſtice of the common pleas, and knighted. His lordſhip preſided in that court with a dignity, weight and impartiality, never exceeded by any of his predeceſſors; and when John Wilkes, Eſq; was ſeized and committed to the Tower on an illegal general warrant, his Lordſhip with the intrepidity of a Britiſh magiſtrate, and the becoming fortitude of an Engliſhman, granted him an *habeas corpus;* and on his being brought before the court of common pleas, diſcharged him from his confinement in the Tower, May 6. 1763, in a ſpeech which did him honour. His wiſe and ſpirited behaviour on this remarkable occaſion, ſo intereſting to every true-born Briton, and in the conſequent judicial proceedings between the printers of The North Briton and the meſſengers and others, was ſo acceptable to the nation, that the city of London preſented him with the freedom of their corporation in a gold box, and deſired his picture, which was put up in Guildhall, with this inſcription:

HANC ICONEM
CAROLI PRATT, EQ.
SUMMI JUDICIS C. B.
IN HONOREM TANTI VIRI,
ANGLICÆ LIBERTATIS LEGE
ASSERTORIS,
S. P. Q. L.
IN CURIA MUNICIPALI
PONI JVSSERVNT
NONO KAL. MART. A. D. MDCCLXIV.
GULIELMO BRIDGEN, AR. PRÆ. VRB.

This portrait, painted by Reynolds, was engraved by Baſire. The corporations of Dublin, Bath, Exeter, and Norwich, paid him the like compliment; and in a petition entered in the journals of the city of Dublin, it was declared, that no man appeared to have acquitted himſelf in his high ſtation with ſuch becoming zeal for the honour and dignity of the crown, and the fulfilling his majeſty's moſt gracious intentions for preſerving the freedom and happineſs of his ſubjects, and ſuch invincible fortitude in adminiſtering juſtice and law, as the Right Honourable Sir Charles Pratt, knight, the preſent lord-chief-juſtice of his majeſty's court of common pleas in England, has ſhown in ſome late judicial determinations which muſt be remembered to his lordſhip's honour while and wherever Britiſh liberties are held ſacred.

Higher honours, however, than the breath of popular applauſe awaited Sir Charles Pratt. On the 16th of July 1765 he was created a peer of Great Britain, by the ſtyle and title of Lord Camden, Baron Camden, in the county of Kent; and July 30. 1766, on the reſignation of Robert earl of Northington, he was appointed lord high-chancellor of Great Britain; in which capacity he, in a ſpeech of two hours, declared, upon the firſt deciſion of the ſuit againſt the meſſengers who arreſted Mr Wilkes, that "it was the unanimous opinion of the whole court, that general warrants, except in caſes of high treaſon, were illegal, oppreſſive, and unwarrantable. He conducted himſelf in this high office ſo as to obtain the love and eſteem of all parties; but when the taxation of America was in agitation, he declared himſelf againſt it, and ſtrongly oppoſing it, was removed from his ſtation in 1770.

Upon the fall of Lord North he was again taken into the adminiſtration, and on the 27th of March 1782 appointed preſident of the council; an office which he reſigned in March 1783. On the 13th of May 1786, he was created Viſcount Bayham of Bayham abbey Kent, and Earl Camden.

Whether we conſider Earl Camden as a *ſtateſman*, called to that high ſituation by his talents; as a *lawyer*, defending, ſupporting, and enlarging the conſtitution; or as a *man* ſuſtaining both by his firmneſs and unſhaken integrity—in all he excites our general praiſe; and when we contemplate his high and exalted virtue, we muſt allow him to have been an honour to his country. He died on the 18th of April 1794 at his houſe in Hill-ſtreet, Berkeley-ſquare, being at that time preſident of his majeſty's moſt honourable privy-council, a governor of the charter-houſe, recorder of the city of Bath, and F. R. S.

He married Elizabeth, daughter and coheir of Nicholas Jafferys, Eſq; ſon and heir of Sir Jeffery Jafferys of Brecknock priory, knight, who died in December 1779, and by whom he had iſſue John Jafferys Pratt (now Lord Camden), born 1759, M. P. for Bath, commiſſioner of the admiralty, 1782, reſigned and re-appointed 1783; and four daughters, Frances, married, 1775, Robert Stewart, Eſq; of Mount Stewart, county of Down, 1779, and M. P. for that county; Elizabeth, ſingle; Sarah, married Nicholas Saintfield, Eſq; county of Down, 1779; Jane, married 1780 William Head James, Eſq; ſon and heir of Sir F. Head of Langley, county of Bucks. His ſeat at Camden place, Chiſelhurſt, was the reſidence of the great William Camden; on whoſe death it came by ſeveral intermediate owners to Weſton, Spencer, and Pratt, and was much improved by his Lordſhip. His remains were interred in the family burying-place at Seal, in Kent.

PRAXAGORAS, a native of Athens, at 19 years of age compoſed the Hiſtory of the Kings of Athens, in two books; and at 22 the Life of Conſtantine the Great, in which, though a pagan, he ſpeaks very advantageouſly of that prince. He alſo wrote the Hiſtory of Alexander the Great. He lived under Conſtantius about the year 345.

PRAXITELES, a very famous Greek ſculptor, who lived 330 years before Chriſt, at the time of the reign of Alexander the Great. All the ancient writers mention his ſtatues with a high commendation, eſpecially a Venus executed by him for the city of Cnidos, which was ſo admirable a piece, that king Nicomedes offered to releaſe the inhabitants from their tribute as the purchaſe of it; but they refuſed to part with it. The inhabitants of the iſle of Cos requeſted of Praxiteles a ſtatue of Venus; and in conſequence of this application the artiſt gave them their choice of two; one of which repreſented the goddeſs entirely naked, and the other covered with drapery. Both of theſe were of exquiſite workmanſhip; although the former was eſteemed the moſt beautiful, nevertheleſs the inhabitants of Cos had the wiſdom to give the preference to the latter, from a conviction that no motive whatever could juſtify their introducing into their city any indecent ſtatues or paintings, which are ſo likely to inflame the paſſions of young people, and lead them to immorality and vice. What a reproach will this be to many Chriſtians!—He was one of the gallants of Phryne the celebrated courteſan.

PRAYER, a ſolemn addreſs to God, which, when it is of any conſiderable length, conſiſts of *adoration, confeſſion, ſupplication, interceſſion,* and *thankſgiving.*

By *adoration* we expreſs our ſenſe of God's infinite perfections, his power, wiſdom, goodneſs, and mercy; and acknowledge that our conſtant dependence is upon Him by whom the univerſe was created and has been hitherto preſerved. By *confeſſion* is meant our acknowledgment of our manifold tranſgreſſions of the divine laws, and our conſequent unworthineſs of all the good things which we enjoy at preſent or expect to be conferred upon us hereafter. In *ſupplication* we intreat our omnipotent Creator and merciful Judge, not to deal with us after our iniquities, but to pardon our tranſgreſſions, and by his grace to enable us to live henceforth righteouſly, ſoberly, and godly, in this preſent world; and by Chriſtians this intreaty is always made in the name and through the mediation of Jeſus Chriſt, becauſe to them it is known that there is none other name under heaven given unto men whereby they may be ſaved. To theſe ſupplications for mercy we may likewiſe add our prayers for the neceſſaries of life; becauſe if we ſeek *firſt* the kingdom of God and his righteouſneſs, we are aſſured that ſuch things ſhall be added unto us. *Interceſſion* ſignifies thoſe petitions which we offer up for others, for friends, for enemies, for all men, eſpecially for our lawful governors, whether ſupreme or ſubordinate. And *thankſgiving* is the expreſſion of our gratitude to God, the giver of every good and perfect gift, for all the benefits enjoyed by us and others, for the means of grace, and for the hope of glory. Such are the component parts of a regular and ſolemn prayer, adapted either for the church or for the cloſet. But an ejaculation to God, conceived on any emergency, is likewiſe a prayer, whether it be uttered by the voice or ſuffered to remain a mere affection of the mind; becauſe the Being to whom it is addreſſed diſcerneth the thoughts of the heart.

That prayer is a duty which all men ought to perform with humility and reverence, has been generally acknowledged as well by the untaught barbarian as by the enlightened Chriſtian; and yet to this duty objections have been made by which the underſtanding has been bewildered in ſophiſtry and affronted with jargon. "If God be independent, omnipotent, and poſſeſſed of every other perfection, what pleaſure, it has been aſked, can he take in our acknowledgment of theſe perfections? If he knows all things paſt, preſent, and future, where is the propriety of our confeſſing our ſins unto him? If he is a benevolent and merciful Being, he will pardon our ſins, and grant us what is needful for us without our ſupplications and intreaties; and if he be likewiſe poſſeſſed of infinite wiſdom, it is certain that no importunities of ours will prevail upon him to grant us what is improper, or for our ſakes to change the equal and ſteady laws by which the world is governed.

"Shall burning Ætna, if a ſage requires,
"Forget to thunder, and recal her fires?
"On air or ſea new motions be impreſt,
"Oh blameleſs Bethel! to relieve thy breaſt?
"When the looſe mountain trembles from on high,
"Shall gravitation ceaſe, if you go by?
"Or ſome old temple, nodding to its fall,
"For Chartres' head reſerve the hanging wall*?"

Such are the moſt plauſible objections which are uſually made to the practice of prayer; and though they have been ſet off with all the art of the metaphyſical wrangler, and embelliſhed with all the graces of the poetry of Pope, they appear to us ſuch groſs ſophiſms as can operate only on a very unthinking head, or on a very corrupt heart. For if God certainly exiſts, and there is not a mathematical theorem capable of more rigid demonſtration, it is obvious that no man can think of ſuch a being without having his mind ſtrongly impreſſed with the conviction of his own conſtant dependence upon him; nor can he "contemplate the heavens, the work of God's hands, the moon, and the ſtars which he has ordained," without forming the moſt ſublime conceptions that he can of the Divine power, wiſdom, and goodneſs, &c But ſuch conviction, and ſuch conceptions, whether clothed in words or not, are to all intents and purpoſes what is meant by adoration; and are as well known to the Deity while they remain the ſilent affections of the heart, as after they are ſpoken in the beginning of a prayer. Our adoration, therefore, is not expreſſed for the purpoſe of giving information to God, who underſtandeth our thoughts afar off; but merely, when the prayer is private, becauſe we cannot think any more than ſpeak without words, and becauſe the very *ſound* of words that are well choſen affects the heart, and helps to fix our attention: and as the Being who ſees at once the paſt, preſent, and to come, and to whom a thouſand years are but as one day, ſtands not in need of our information; ſo neither was it ever ſuppoſed by a man of rational piety, that he takes pleaſure on his *own* account in hearing his perfections enumerated by creatures of yeſterday; for being independent, he has no paſſions to be gratified, and being ſelf-ſufficient, he was as happy when exiſting alone as at that moment "when the morning ſtars ſang together, and all the ſons of God ſhouted for joy." Adoration is therefore proper only as it tends to preſerve in our minds juſt notions of the Creator and Governor of the world, and of our own conſtant dependence upon him; and if ſuch notions be uſeful to ourſelves, who have a part to act in the ſcale of exiſtence, upon which our happineſs depends (a propoſition which no theiſt will controvert), adoration muſt be acceptable to that benevolent God, who, when creating the world, could have no other end in view than to propogate happineſs. Se METAPHYSICS, n° 312.

By the ſame mode of reaſoning, it will be eaſy to ſhow the duty of *confeſſion* and *ſupplication*. We are not required to confeſs our ſins unto God, becauſe he is ignorant of them; for he is ignorant of nothing. If he were, no reaſon could be aſſigned for our divulging to our judge actions deſerving of puniſhment. Neither are we required to cry for mercy, in order to move him in whom there is no variableneſs, neither ſhadow of turning. The Being that made the world, governs it by laws that are inflexible, becauſe they are the beſt; and to ſuppoſe that he can be induced by prayers, oblations, or ſacrifices, to vary his plan of government, is an impious thought, which degrades the Deity to a level with man. One of theſe inflexible laws is the connection eſtabliſhed between certain diſpoſitions of mind and human happineſs. We are enjoined to purſue a particular courſe of conduct under the denomination of virtue, not becauſe our virtuous actions can in any degree be of advantage to him by whom we were created, but becauſe they neceſſarily generate in our own minds thoſe diſpoſitions which are eſſential to our ultimate happineſs. A man of a malignant, arrogant, or ſenſual diſpoſition, would have no enjoyment in that heaven, where all are actuated by a ſpirit of love and purity; and it is doubtleſs for this reaſon among others, that the Chriſtian religion prohibits malice, arrogance, and ſenſuality, among her votaries, and requires the cultivation of the oppoſite virtues. But a perſon who has deviated far from his duty cannot think of returning, unleſs he be previouſly convinced that he has gone aſtray. Such conviction, whenever he obtains it, will neceſſarily impreſs upon his mind a ſenſe of his own danger, and fill his heart with ſorrow and remorſe for having tranſgreſſed the laws eſtabliſhed by the moſt benevolent of all Beings for the propagation of univerſal felicity. This conviction of error, this ſenſe of danger, and this compunction for having tranſgreſſed, are all perceived by the deity as ſoon as they take place in the mind of the ſinner; and he is required to *confeſs* his ſins, only becauſe the act of confeſſion tends to imprint more deeply on his mind his own unworthineſs, and the neceſſity of returning immediately into the paths of that virtue of which all the ways are pleaſantneſs and all the paths are peace.

---

* Eſſay on Man.

In the objection, it is taken for granted, that if God be a benevolent and merciful Being, he will pardon our ſins, and grant us what is needful for us, whether we ſupplicate him or not: but this is a groſs and palpable miſtake, ariſing from the objector's ignorance of the end of virtue and the nature of man. Until a man be ſenſible of his ſins and his danger, he is for the reaſon already aſſigned incapable of pardon, becauſe his diſpoſition is incompatible with the happineſs of the bleſſed. But whenever he acquires this conviction it is impoſſible for him not to form a *mental wiſh* that he may be pardoned; and this wiſh being perceptible to the all-ſeeing eye of his Judge, forms the ſum and ſubſtance of a ſupplication for mercy. If he clothe it in words, it is only for a reaſon ſimilar to that which makes him adore his Creator and confeſs his ſins in words, that juſt notions may be more deeply imprinted on his own mind. The ſame reaſoning holds good with reſpect to thoſe prayers which we put up for temporal bleſſings, for protection and ſupport in our journey through life. We are told by high authority, that "the Lord is nigh unto all them that call upon him, to all that call upon him in truth." This, however, is not becauſe he is attracted or delighted by their prayers and intreaties, but becauſe thoſe prayers and intreaties fit ſuch as offer them for receiving thoſe benefits which he is at all times ready to pour upon all mankind. In his eſſence God is equally preſent with the righteous and with the wicked, with thoſe who pray, and with thoſe who pray not; for "the eyes of the Lord are in every place beholding the evil and the good." But as the atmoſphere equally ſurrounds every perſon upon this globe, and yet in its ſtate of greateſt purity does not affect the aſthmatic as it affects thoſe who are whole; ſo the Divine preſence, though eſſentially the ſame everywhere, yet does not protect the impious as it protects the devout, becauſe the impious are not in a ſtate capable of the Divine protection. The end for which God requires the exerciſe of prayer as a duty, is not his benefit but ours; becauſe it is a mean to generate in the petitioner ſuch a diſpoſition of mind as muſt render him a ſpecial object of that love and that providential care which extend over the whole creation.

That part of the objection which reſults from the conſideration of the fixed laws of nature, and which the poet has ſo finely illuſtrated, preſents, it muſt be confeſſed, conſiderable difficulties; but none which to us appear inſurmountable. If, indeed, we ſuppoſe that in the original conſtitution of things, when the laws of nature were eſtabliſhed, a determinate duration was given to the top of the mountain and the nodding temple, without any regard to foreſeen conſequences, it would undoubtedly be abſurd and perhaps impious to expect the law of gravitation to be ſuſpended by the prayers of a good man, who ſhould happen to be paſſing at the inſtant decreed for the fall of theſe objects. But of ſuch a conſtitution there is ſo far from being evidence, that it appears not to be conſiſtent with the wiſdom and goodneſs of the Author of nature. This world was undoubtedly formed for the habitation of man and of other animals. If ſo, we muſt neceſſarily ſuppoſe, that in the eſtabliſhing of the laws of Nature, God adjuſted them in ſuch a manner as he ſaw would beſt ſerve the accommodation of thoſe ſentient beings for whoſe accommodation alone they were to be eſtabliſhed. Let it then be admitted, that all the human beings who were ever to exiſt upon this globe, with all their thoughts, words, and actions, were at that important moment preſent to the divine intellect, and it ſurely will not be impoſſible to conceive, that in conſequence of the foreſeen danger and prayers of a good man, the determinate duration of the mountain and the tower might be either lengthened or ſhortened to let him eſcape. This idea of providence, and of the efficacy of prayer, is thus illuſtrated by Mr Wollaſton *. "Suppoſe M (ſome man) certainly to *foreknow*, by ſome means or other, that, when he ſhould come to be upon his death-bed, L would *petition* for ſome *particular legacy*, in a manner ſo earneſt and humble, and with ſuch a good diſpoſition, as would render it proper to grant his requeſt: and upon this, M makes his *laſt-will*, by which he deviſes to L that which was to be aſked, and then locks up the *will*; and all this many years before the death of M, and whilſt L had yet no expectation or thought of any ſuch thing. When the time comes, the *petition* is made and *granted*; not by making any *new* will, but by the old one already made, and without alteration: which legacy had, notwithſtanding that, never been left, had the petition never been preferred. The grant may be called the effect of a future act, and depends as much upon it as if it had been made after the act. So, if it had been foreſeen, that L would not *ſo much as aſk*, and he had been therefore left out of the will, this *præterition* would have been cauſed by his carriage, though much later than the date of the will. In all this nothing is hard to be admitted, if M be allowed to foreknow the caſe. And thus the *prayers* which good men offer to the *all-knowing* God, and the *neglect of prayers* by others, may find fitting effects *already* forecaſted in the courſe of nature."

This ſolution of the difficulty preſents indeed to the mind a prodigious ſcheme, in which all things to come are, as it were, comprehended under one view, and eſtimated and compared together. But when it is conſidered what a maſs of wonders the univerſe is in other reſpects; what an incomprehenſibly great and perfect Being God is; that he cannot be ignorant of any thing, no not of the future wants and deportments of particular men; and that all things which derive their exiſtence from him muſt be conſiſtent with one another—it muſt ſurely be confeſſed that ſuch an adjuſtment of phyſical cauſes to moral volitions is within the compaſs of infinite power and perfect wiſdom.

---

* Religion of Nature delineated.

To that part of a prayer which we have termed interceſſion, it has been objected, that "to intercede for others is to preſume that we poſſeſs an intereſt with the Deity upon which their happineſs and even the proſperity of whole communities depends." In anſwer to this objection, it has been obſerved by an ingenious and uſeful writer †, that "how unequal ſoever our knowledge of the divine economy may be to a complete ſolution of this difficulty, which may require a comprehenſion of the entire plan, and of all the ends of God's moral government, to explain it ſatisfactorily, we can yet underſtand one thing concerning it, that it is, after all, nothing more than the making of one man the inſtrument of happineſs and miſery to another; which is perfectly of a piece with the courſe and order that obtain, and which we muſt believe were intended to obtain in human affairs. Why may we not be aſſiſted by the *prayers* of other men, as well as we are beholden for our *ſupport to their labour?* Why may not our happineſs be made in ſome caſes to depend upon the interceſſion as it certainly does in many upon the good offices of our neighbours? The happineſs and miſery of great numbers we ſee oftentimes at the diſpoſal of one man's choice, or liable to be much affected by his conduct: what greater difficulty is there in ſuppoſing, that the prayers of an individual may avert a calamity from multitudes, or be accepted to the benefit of whole communities."

Theſe obſervations may perhaps be ſufficient to remove the force of the objection, but much more may be ſaid for the practice of mutual interceſſion. If it be one man's duty to intercede for another, it is the duty of that other to intercede for him; and if we ſet aſide the particular relations which ariſe from blood, and from particular ſtations in ſociety, mutual interceſſion muſt be equally the duty of all mankind. But there is nothing (we ſpeak from our own experience, and appeal to the experience of our readers) which has ſo powerful a tendency to generate in the heart of any perſon good-will towards another as the conſtant practice of praying to God for his happineſs. Let a man regularly pray for his enemy with all that ſeriouſneſs which devotion requires, and he will not long harbour reſentment againſt him. Let him pray for his friend with that ardour which friendſhip naturally inſpires, and he will perceive his attachment to grow daily and daily ſtronger. If, then, univerſal benevolence, or charity, be a diſpoſition which we ought to cultivate in ourſelves, mutual interceſſion is undeniably a duty, becauſe nothing contributes ſo effectually to the acquiſition of that ſpirit which an apoſtle terms the end of the commandment.

When it is ſaid, that by interceding for kings, and all in authority, we ſeem to conſider the proſperity of communities as depending upon our intereſt with God, the objector miſtakes the nature and end of theſe interceſſions. In the proſperity of any community conſiſts great part of the happineſs of its individual members; but that proſperity depends much upon the conduct of its governors. When, therefore, individuals intercede for their governors, the ultimate object of their prayers muſt be conceived to be their own good. As it is equally the duty of all the members of the community to pray for their governors, ſuch interceſſions are the prayers of the whole community for itſelf, and of every individual for himſelf. So that in this view of the caſe, the moſt juſt, we apprehend, that can be taken of it, it is not true that ſupplications and interceſſions for kings and all in authority are the prayers of one individual for another, but the prayers of many individuals for that body of which each of them knows himſelf to be a member.

Having evinced the duty of adoration, confeſſion, ſupplication, and interceſſion, we need not ſurely waſte our reader's time with a formal and laboured vindication of thankſgiving. Gratitude for benefits received is ſo univerſally acknowledged to be a virtue, and ingratitude is ſo deteſtable a vice, that no man who lays claim to a moral character will dare to affirm that we ought not to have a juſt ſenſe of the goodneſs of God in preſerving us from the numberleſs dangers to which we are expoſed, and "in giving us rain from heaven, and fruitful ſeaſons, filling our hearts with food and gladneſs." But if we have this ſenſe, whether we expreſs it in words or not, we offer to God thankſgiving; becauſe every movement of the heart is open and expoſed to his all-ſeeing eye.

In this article we have treated of prayer in general, and as the private duty of every individual; but there ought to be *public* as well as *private* prayer, which ſhall be conſidered afterwards. (See WORSHIP.) We have likewiſe obſerved, that the prayers of every Chriſtian ought to be offered in the name and through the mediation of Jeſus Chriſt, for which the reaſon will be ſeen in the article THEOLOGY. We ſhall conclude our reflections on the general duty, with obſerving, that nothing ſo forcibly reſtrains from ill as the remembrance of a recent addreſs to heaven for pretection and aſſiſtance. After having petitioned for power to reſiſt temptation, there is ſo great an incongruity in not continuing the ſtruggle, that we bluſh at the thought, and perſevere leſt we loſe all reverence for ourſelves. After fervently devoting our ſouls to God, we ſtart with horror at immediate apoſtacy: every act of deliberate wickedneſs is then complicated with hypocriſy and ingratitude: it is a mockery of the Father of Mercies, the forfeiture of that peace in which we cloſed our addreſs, and a renunciation of the hope which that addreſs inſpired. But if prayer and immorality be thus incompatible, ſurely the former ſhould not be neglected by thoſe who contend that moral virtue is the ſummit of human perfection.

PREACHING. See DECLAMATION, Art. I.—The word is derived from the Hebrew *paraſch*, *expoſuit*, "he expounded."

PREADAMITE, a denomination given to the inhabitants of the earth, conceived, by ſome people, to have lived before Adam.

Iſaac de la Pereyra, in 1655, publiſhed a book to evince the reality of Preadamites, by which he gained a conſiderable number of proſelytes to the opinion: but the anſwer of Demarets, profeſſor of theology at Groningen, publiſhed the year following, put a ſtop to its progreſs; though Pereyra made a reply.

His ſyſtem was this: The Jews he calls *Adamites*, and ſuppoſes them to have iſſued from Adam; and gives the title *Preadamites* to the Gentiles, whom he ſuppoſes to have been a long time before Adam. But this being expreſsly contrary to the firſt words of Geneſis, Pereyra had recourſe to the fabulous antiquities of the Egyptians and Chaldeans, and to ſome idle rabbins, who imagined there had been another world before that

† Mr Paley.

deſcribed by Moſes. He was apprehended by the inquiſition in Flanders, and very roughly uſed, though in the ſervice of the dauphin. But he appealed from their ſentence to Rome; whither he went in the time of Alexander VII. and where he printed a retraction of his book of Preadamites. See PRE-EXISTENCE.

PREAMBLE, in law, the beginning of an act of a legiſlature, &c. which ſerves to open the intent of the act, and the miſchiefs intended to be remedied by it.

PREBEND, the maintenance a prebendary receives out of the eſtate of a cathedral or collegiate church. Prebends are diſtinguiſhed into ſimple and dignitary: a ſimple prebend has no more than the revenue for its ſupport; but a prebend with dignity has always a juriſdiction annexed to it.

PREBENDARY, an eccleſiaſtic who enjoys a prebend.

The difference between a prebendary and a canon is, that the former receives his prebend in conſideration of his officiating in the church, but the latter merely by his being received into the cathedral or college.

PRECARIUM, in Scots law. See LAW, N° clxxiii. 9.

PRECEDENCE, in Europe, a place of honour to which a perſon is entitled. This is either of courteſy or of right. The former is that which is due to age, eſtate, &c. which is regulated by cuſtom and civility: the latter is ſettled by authority; and when broken in upon gives an action at law.

In Great Britain, the order of precedency is as follows: The king; the princes of the blood; the archbiſhop of Canterbury; the lord high chancellor; the archbiſhop of York; the lord treaſurer of England; the lord preſident of the council; the lord privy ſeal; dukes; the eldeſt ſons of dukes of the blood royal; marquiſſes; dukes eldeſt ſons; earls; marquiſſes eldeſt ſons; dukes younger ſons; viſcounts; earls eldeſt ſons; marquiſſes younger ſons; biſhops; barons; ſpeaker of the houſe of commons; lord commiſſioner of the great ſeal; viſcounts eldeſt ſons; earls younger ſons; barons eldeſt ſons, privy counſellors not peers; chancellor of the exchequer; chancellor of the duchy; knights of the garter not peers; lord chief juſtice of the king's bench; maſter of the rolls; lord chief juſtice of the common pleas; lord chief baron of the exchequer; puiſne judges and barons; knights banneret, if made in the field; maſters in chancery; viſcounts younger ſons; barons younger ſons; baronets; knights banneret; knights of the Bath; knights bachelors; baronets eldeſt ſons; knights eldeſt ſons; baronets younger ſons; knights younger ſons; field and flag officers; doctors graduate; ſerjeants at law; eſquires; gentlemen bearing coat armour; yeomen; tradeſmen; artificers; labourers.—*Note*, The ladies, except thoſe of archbiſhops, biſhops, and judges, take place according to the degree of quality of their huſbands; and unmarried ladies take place according to that of their fathers.

PRECEDENT, in law, a caſe which has been determined, and which ſerves as a rule for all of the ſame nature.

PRECENTOR, a dignity in cathedrals, popularly called the *chantor*, or *maſter of the choir*.

PRECEPT, in law, a command in writing ſent by a chief juſtice or juſtice of the peace, for bringing a perſon, record, or other matter before him.

Precept of Clare Conſtat in Scots law. See LAW, Part III. n° clxxx. 28.

Precept of Seiſin, in Scots law. See LAW, Part III. n° clxix. 16.

PRECEPTIVE, any thing which gives or contains precepts.

Preceptive Poetry. See POETRY n° 146, &c.

1 Diurnal revolution of the ſtarry heavens.

PRECESSION OF THE EQUINOXES. The moſt obvious of all the celeſtial motions is the diurnal revolution of the ſtarry heavens. The whole appears to turn round an imaginary AXIS, which paſſes through two oppoſite points of the heavens, called the *poles*. One of theſe is in our ſight, being very near the ſtar and in the tail of the little bear. The great circle which is equidiſtant from both poles divides the heavens into the northern and ſouthern hemiſpheres, which are equal. It is called the *equator*, and it cuts the horizon in the eaſt and weſt points, and every ſtar in it is 12 ſidereal hours above and as many below the horizon, in each revolution.

2 Obſervations of the Aſiatic ſhepherds.

The ſun's motions determine the length of day and night, and the viciſſitudes of the ſeaſons. By a long ſeries of obſervations, the ſhepherds of Aſia were able to mark out the ſun's path in the heavens; he being always in the oppoſite point to that which comes to the meridian at midnight, with equal but oppoſite declination. Thus they could tell the ſtars among which the ſun then was, although they could not ſee them. They diſcovered that his path was a great circle of the heavens, afterward called the ECLIPTIC; which cuts the Equator in two oppoſite points, dividing it, and being divided by it, into two equal parts. They farther obſerved, that when the ſun was in either of theſe points of interſection, his circle of diurnal revolution coincided with the equator, and therefore the days and nights were equal. Hence the equator came to be called the EQUINOCTIAL LINE, and the points in which it cuts the ecliptic were called the EQUINOCTIAL POINTS, and the ſun was then ſaid to be in the equinoxes. One of theſe was called the VERNAL and the other the AUTUMNAL EQUINOX.

3 To determine the time of the ſun's occupying the equinoctial points.

It was evidently an important problem in practical aſtronomy to determine the exact moment of the ſun's occupying theſe ſtations; for it was natural to compute the courſe of the year from that moment. Accordingly this has been the leading problem in the aſtronomy of all nations. It is ſuſceptible of conſiderable preciſion, without any apparatus of inſtruments. It is only neceſſary to obſerve the ſun's declination on the noon of two or three days before and after the equinoctial day. On two conſecutive days of this number, his declination muſt have changed from north to ſouth, or from ſouth to north. If his declination on one day was obſerved to be 21′ north, and on the next 5′ ſouth, it follows that his declination was nothing, or that he was in the equinoctial point about 23 minutes after 7 in the morning of the ſecond day. Knowing the preciſe moments, and knowing the rate of the ſun's motion in the ecliptic, it is eaſy to aſcertain the preciſe point of the ecliptic in which the equator interſected it.

4 Hipparchus's diſcoveries.

By a ſeries of ſuch obſervations made at Alexandria between the years 161 and 127 before Chriſt, Hipparchus the father of our aſtronomy found that the point of the autumnal equinox was about ſix degrees to the eaſtward of the ſtar called SPICA VIRGINIS. Eager to determine every thing by multiplied obſervations, he ranſacked all the Chaldean, Egyptian, and other records, to which his travels could procure him acceſs, for obſervations of the ſame kind; but he does not mention his having found any. He found, however, ſome obſervations of Ariſtillus and Timochares made about 150 years before. From theſe it appeared evident that the point of the autumnal equinox was then about eight degrees eaſt of the ſame ſtar. He diſcuſſes theſe obſervations with great ſagacity and rigour; and, on their authority, he aſſerts that the equinoctial points are not fixed in the heavens, but move to the weſtward about a degree in 75 years or ſomewhat leſs.

5
Why called the preceſſion of the equinoxes.

This motion is called the PRECESSION OF THE EQUINOXES, becauſe by it the time and place of the ſun's equinoctial ſtation precedes the uſual calculations: it is fully confirmed by all ſubſequent obſervations. In 1750 the autumnal equinox was obſerved to be 20° 21′ weſtward of ſpica virginis. Suppoſing the motion to have been uniform during the period of ages, it follows that the annual preceſſion is about $50''\frac{1}{3}$; that is, if the celeſtial equator cuts the ecliptic in a particular point on any day of this year, it will on the ſame day of the following year cut it in a point $50''\frac{1}{3}$ to the weſt of it, and the ſun will come to the equinox 20′ 23″ before he has completed his round of the heavens. Thus the equinoctial or tropical year, or true year of ſeaſons, is ſo much ſhorter than the revolution of the ſun or the ſidereal year.

6
Importance of the diſcovery.

It is this diſcovery that has chiefly immortalized the name of Hipparchus, though it muſt be acknowledged that all his aſtronomical reſearches have been conducted with the ſame ſagacity and intelligence. It was natural therefore for him to value himſelf highly for the diſcovery. It muſt be acknowledged to be one of the moſt ſingular that has been made, that the revolution of the whole heavens ſhould not be ſtable, but its axis continually changing. For it muſt be obſerved, that ſince the equator changes its poſition, and the equator is only an imaginary circle, equidiſtant from the two poles or extremities of the axis; theſe poles and this axis muſt equally change their poſitions. The equinoctial points make a complete revolution in about 25745, the equator being all the while inclined to the ecliptic in nearly the ſame angle. Therefore the poles of this diurnal revolution muſt deſcribe a circle round the poles of the ecliptic at the diſtance of about $23\frac{1}{2}$ degrees in 25745 years; and in the time of Timochares the north pole of the heavens muſt have been 30 degrees eaſtward of where it now is.

7
Hipparchus has been accuſed of plagiariſm,

Hipparchus has been accuſed of plagiariſm and inſincerity in this matter. It is now very certain that the preceſſion of the equinoxes was known to the aſtronomers of India many ages before the time of Hipparchus. It appears alſo that the Chaldeans had a pretty accurate knowledge of the year of ſeaſons. From their ſaros we deduce their meaſure of this year to be 365 days 5 hours 49 minutes and 11 ſeconds, exceeding the truth only by 26″, and much more exact than the year of Hipparchus. They had alſo a ſidereal year of 365 days 6 hours 11 minutes. Now what could occaſion an attention to two years, if they did not ſuppoſe the equinoxes moveable? The Egyptians alſo had a knowledge of ſomething equivalent to this: for they had diſcovered that the dog-ſtar was no longer the faithful forewarner of the overflowing of the Nile; and they combined him with the ſtar Fomalhaſet* in their myſtical kalendar. This knowledge is alſo involved in the precepts of the Chineſe aſtronomy, of much older date than the time of Hipparchus.

8
But falſely,

But all theſe acknowledged facts are not ſufficient for depriving Hipparchus of the honour of the diſcovery, or fixing on him the charge of plagiariſm. This motion was a thing unknown to the aſtronomers of the Alexandrian ſchool, and it was pointed out to them by Hipparchus in the way in which he aſcertained every other poſition in aſtronomy, namely, as the mathematical reſult of actual obſervations, and not as a thing deducible from any opinions on other ſubjects related to it. We ſee him, on all other occaſions, eager to confirm his own obſervations and his deductions from them, by every thing he could pick up from other aſtronomers; and he even adduced the abovementioned practice of the Egyptians in corroboration of his doctrine. It is more than probable then that he did not know any thing more. Had he known the Indian preceſſion of 54″ annually, he had no temptation whatever to withhold him from uſing it in preference to one which he acknowledges to be inaccurate, becauſe deduced from the very ſhort period of 150 years, and from the obſervations of Timochares, in which he had no great confidence.

9
Heavenly motions accounted for by the Copernican ſyſtem.

This motion of the ſtarry heavens was long a matter of diſcuſſion, as a thing for which no phyſical reaſon could be aſſigned. But the eſtabliſhment of the Copernican ſyſtem reduced it to a very ſimple affair; the motion which was thought to affect all the heavenly bodies, is now acknowledged to be a deception, or a falſe judgment from the appearances. The earth turns round its own axis while it revolves round the ſun, in the ſame manner as we may cauſe a child's top to ſpin on the brim of a mill-ſtone, while the ſtone is turning ſlowly round its axis. If the top ſpin ſteadily, without any wavering, its axis will always point to the zenith of the heavens; but we frequently ſee, that while it ſpins briſkly round its axis, the axis itſelf has a ſlow conical motion round the vertical line, ſo that, if produced, it would ſlowly deſcribe a circle in the heavens round the zenith point. The flat ſurface of the top may repreſent the terreſtrial equator, gradually turning itſelf round on all ſides. If this top were formed like a ball, with an equatorial circle on it, it would repreſent the whole motion very prettily, the only difference being, that the ſpinning motion and this wavering motion are in the ſame direction; whereas the diurnal rotation and the motion of the equinoctial points are in contrary directions. Even this diſſimilarity may be removed, by making the top turn on a cap, like the card of a mariner's compaſs.

10
And the earth's.

It is now a matter fully eſtabliſhed, that while the earth revolves round the ſun from weſt to eaſt, in the plane of the ecliptic, in the courſe of a year it turns round its own axis from weſt to eaſt in 23h 56′ 4″, which axis is inclined to this plane in an angle of nearly 23° 28′; and that this axis turns round a line perpendicular to the ecliptic in 25,745 years from eaſt to weſt, keeping nearly the ſame inclination to the ecliptic.—By this means, its pole in the ſphere of the ſtarry heavens deſcribes a circle round the pole of the ecliptic at the diſtance of 23° 28′ nearly. The conſequence of this muſt be, that the terreſtrial equator, when produced to the ſphere of the ſtarry heavens, will cut the ecliptic in two oppoſite points, through which the ſun muſt paſs when he makes the day and night equal; and that theſe points muſt ſhift to the weſtward, at the rate of 50⅓ ſeconds annually, which is the preceſſion of the equinoxes. Accordingly this has been the received doctrine among aſtronomers for nearly three centuries, and it was thought perfectly conformable to appearances.

---

11
Bradley's attempt to diſcover the parallax of the earth's orbit.

But Dr Bradley, the moſt ſagacious of modern aſtronomers, hoped to diſcover the parallax of the earth's orbit by obſervations of the actual poſition of the pole of the celeſtial revolution. Dr Hooke had attempted this before, but with very imperfect inſtruments. The art of obſerving being now prodigiouſly improved, Dr Bradley reſumed this inveſtigation. It will eaſily appear, that if the earth's axis keeps parallel to itſelf, its extremity muſt deſcribe in the ſphere of the ſtarry heavens a figure equal and parallel to its orbit round the ſun; and if the ſtars be ſo near that this figure is a viſible object, the pole of diurnal revolution will be in different diſtinguiſhable points of this figure. Conſequently, if the axis deſcribes the cone already mentioned, the pole will not deſcribe a circle round the pole of the ecliptic, but will have a looped motion along this circumference, ſimilar to the abſolute motion of one of Jupiter's ſatellites, deſcribing an epicycle whoſe centre deſcribes the circle round the pole of the ecliptic.

12
Difficulties in the attempt obviated by accident.

He accordingly obſerved ſuch an epicyclical motion, and thought that he had now overcome the only difficulty in the Copernican ſyſtem; but, on maturely conſidering his obſervations, he found this epicycle to be quite inconſiſtent with the conſequences of the annual parallax, and it puzzled him exceedingly. One day, while taking the amuſement of ſailing about on the Thames, he obſerved, that every time the boat tacked, the direction of the wind, eſtimated by the direction of the vane, ſeemed to change. This immediately ſuggeſted to him the cauſe of his obſerved epicycle, and he found it an optical illuſion, occaſioned by a combination of the motion of light with the motion of his teleſcope while obſerving the polar ſtars. Thus he unwittingly eſtabliſhed an incontrovertible argument for the truth of the Copernican ſyſtem, and immortalized his name by his diſcovery of the ABERRATION of the ſtars.

13
His further inveſtigation of the ſubject.

He now engaged in a ſeries of obſervations for aſcertaining all the circumſtances of this diſcovery. In the courſe of theſe, which were continued for 28 years, he diſcovered another epicyclical motion of the pole of the heavens, which was equally curious and unexpected. He found that the pole deſcribed an epicycle, whoſe diameter was about 18″, having for its centre that point of the circle round the pole of the ecliptic in which the pole would have been found independent of this new motion. He alſo obſerved, that the period of this epicyclical motion was 18 years and ſeven months. It ſtruck him, that this was preciſely the period of the revolution of the nodes of the moon's orbit. He gave a brief account of theſe reſults to Lord Macclesfield, then preſident of the Royal Society, in 1747. Mr Machin, to whom he alſo communicated the obſervations, gave him in return a very neat mathematical hypotheſis, by which the motion might be calculated.

Plate CCCCXIV

14
Mathematical theory if the poles of the equator be ſuppoſed to deſcribe a circle.

Let E (fig. 1.), be the pole of the ecliptic, and SPQ a circle diſtant from it 23° 28′, repreſenting the circle deſcribed by the pole of the equator during one revolution of the equinoctial points. Let P be the place of this laſt mentioned pole at ſome given time. Round P deſcribe a circle ABCD, whoſe diameter AC is 18″. The real ſituation of the pole will be in the circumference of this circle; and its place, in this circumference, depends on the place of the moon's aſcending node. Draw EPF and GPL perpendicular to it; let GL be the colure of the equinoxes, and EF the colure of the ſolſtices. Dr Bradley's obſervations ſhowed that the pole was in A when the node was in L, the vernal equinox. If the node recede to H, the winter ſolſtice, the pole is in B. When the node is in the autumnal equinox at G, the pole is at C; and when the node is in F, the ſummer ſolſtice, the pole is in D. In all intermediate ſituations of the moon's aſcending node, the pole is in a point of the circumference ABCD, three ſigns or 90° more advanced.

15
More exact if an ellipſe be ſubſtituted for the circle.

Dr Bradley, by comparing together a great number of obſervations, found that the mathematical theory, and the calculation depending on it, would correſpond much better with the obſervations, if an ellipſe were ſubſtituted for the circle ABCD, making the longer axis AC 18″, and the ſhorter, BD, 16″. Mr d'Alembert determined, by the phyſical theory of gravitation, the axes to be 18″, and 13″, 4.

16
Theſe obſervations and this theory are facts in aſtronomy.

Theſe obſervations, and this mathematical theory, muſt be conſidered as ſo many facts in aſtronomy, and we muſt deduce from them the methods of computing the places of all celeſtial phenomena, agreeable to the univerſal practice of determining every point of the heavens by its longitude, latitude, right aſcenſion, and declination.

17
Obliquity of the ecliptic.

It is evident, in the firſt place, that this equation of the pole's motion makes a change in the obliquity of the ecliptic. The inclination of the equator to the ecliptic is meaſured by the arch of a great circle intercepted between their poles. Now, if the pole be in O inſtead of P, it is plain that the obliquity is meaſured by EO inſtead of EP. If EP be conſidered as the mean obliquity of the ecliptic, it is augmented by 9″ when the moon's aſcending node is in the vernal equinox, and conſequently the pole in A. It is, on the contrary, diminiſhed 9″ when the node is in the autumnal equinox, and the pole in C; and it is equal to the mean when the node is in the colure of the ſolſtices. This change of the inclination of the earth's axis to the plane of the ecliptic was called the NUTATION of the axis by Sir Iſaac Newton; who ſhowed, that a change of nearly a ſecond muſt obtain in a year by the action of the ſun on the prominent parts of the terreſtrial ſpheroid. But he did not attend to the change which would be made in this motion by the variation which obtains in the diſturbing force of the MOON, in conſequence of the different obliquity of her action on the equator, ariſing from the motion of her own oblique orbit. It is this change which now goes by the name NUTATION, and we owe its diſcovery entirely to Dr Bradley. The general change of the poſition of the earth's axis has been termed DEVIATION by modern aſtronomers.

18
Quantity of it eaſily aſcertained.

The quantity of this change of obliquity is eaſily aſcertained. It is evident, from what has been already ſaid, that when the pole is in O, the arch ADCO is equal to the node's longitude from the vernal equinox, and that PM is its coſine; and (on account of the ſmallneſs of AP in compariſon of EP) PM may be taken for the change of the obliquity of the ecliptic. This is therefore $= 9'' \times$ coſ. long. node, and is additive to the mean obliquity, while O is in the ſemicircle BAD, that is, while the longitude of the node is from 9 ſigns to 3 ſigns; but ſubtractive while the longitude of the node changes from 3 to 9 ſigns.

19 Change of the equinoctial points.

But the nutation changes alſo the longitudes and right aſcenſions of the ſtars and planets by changing the equinoctial points, and thus occaſioning an equation in the preceſſion of the equinoctial points. It was this circumſtance which made it neceſſary for us to conſider it in this place, while expreſsly treating of this preceſſion. Let us attend to this derangement of the equinoctial points.

20 Situation of the ſolſtitial and equinoctial colures.

The great circle or meridian which paſſes through the poles of the ecliptic and equator is always the ſolſtitial colure, and the equinoctial colure is at right angles to it: therefore when the pole is in P or in O, EP or EO is the ſolſtitial colure. Let S be any fixed ſtar or planet, and let SE be a meridian or circle of longitude; draw the circles of declination PS, OS, and the circles M′EM′, *m*E*m*′, perpendicular to PE, OE.

21 Equation of longitude from nutation of the earth's axis.

If the pole were in its mean place P, the equinoctial points would be in the ecliptic meridian M′EM′, or that meridian would paſs through the interſections of the equator and ecliptic, and the angle MES would meaſure the longitude of the ſtar S. But when the pole is in O, the ecliptic meridian *m*E*m*′ will paſs thro' the equinoctial points. The equinoctial points muſt therefore be to the weſtward of their mean place, and the equation of the preceſſion muſt be additive to that preceſſion; and the longitude of the ſtar S will now be meaſured by the angle *m*ES, which, in the caſe here repreſented, is greater than its mean longitude. The difference, or the equation of longitude, ariſing from the nutation of the earth's axis, is the angle OEP, or $\frac{\text{OM}}{\text{OE}}$. OM is the ſine of the angle CPO, which, by what has been already obſerved, is equal to the longitude of the node: Therefore OM is equal to $9'' \times$ long. node, and $\frac{\text{OM}}{\text{OE}}$ is equal to $\frac{9'' \times \text{ſin. long. node}}{\text{ſin. obliqy. eclip.}}$. This equation is additive to the mean longitude of the ſtar when O is in the ſemicircle CBA, or while the aſcending node is paſſing backwards from the vernal to the autumnal equinox but it is ſubtractive from it while O is in the ſemicircle ADC, or while the node is paſſing backwards from the autumnal to the vernal equinox; or, to expreſs it more briefly, the equation is ſubtractive from the mean longitude of the ſtar, while the aſcending node is in the firſt ſix ſigns, and additive to it while the node is in the laſt ſix ſigns.

This equation of longitude is the ſame for all the ſtars, for their longitude is reckoned on the ecliptic (which is here ſuppoſed invariable); and therefore is affected only by the variation of the point from which the longitude is computed.

22 Right aſcenſion ſuffers a double change.

The right aſcenſion, being computed on the equator, ſuffers a double change. It is computed from, or begins at, a different point of the equator, and it terminates at a different point; becauſe the equator having changed its poſition, the circles of declination alſo change theirs. When the pole is at P, the right aſcenſion of S from the ſolſtitial colure is meaſured by the angle SPE, contained between that colure and the ſtar's circle of declination. But when the pole is at O, the right aſcenſion is meaſured by the angle SOE, and the difference of SPE and SOE is the equation of right aſcenſion. The angle SOE conſiſts of two parts, GOE and GOS; GOE remains the ſame wherever the ſtar S is placed, but GOS varies with the place of the ſtar.—We muſt firſt find the variation by which GPE becomes GOE, which variation is common to all the ſtars. The triangles GPE, GOE, have a conſtant ſide GE, and a conſtant angle G; the variation PO of the ſide GP is extremely ſmall, and therefore the variation of the angles may be computed by Mr Cotes's Fluxionary Theorems. See Simpſon's *Fluxions*, § 253, &c. As the tangent of the ſide EP, oppoſite to the conſtant angle G, is to the ſine of the angle EPG, oppoſite to the conſtant ſide EG, ſo is PO the variation of the ſide GP, adjacent to the conſtant angle, to the variation x of the angle GPO, oppoſite to the conſtant ſide EG. This gives $x = \frac{9' \times \text{ſin. long. node}}{\text{tang. obl. eclip.}}$. This is ſubtractive from the mean right aſcenſion for the firſt ſix ſigns of the node's longitude, and additive for the laſt ſix ſigns. This equation is common to all the ſtars.

23 Other variations, &c.

The variation of the other part SOG of the angle, which depends on the different poſition of the hour circles PS and OS, which cauſes them to cut the equation in different points, where the arches of right aſcenſion terminate, may be diſcovered as follows. The triangles SPG, SOG, have a conſtant ſide SG, and a conſtant angle G. Therefore, by the ſame Coteſian theorem, tan. SP : ſin. SPG $=$ PO : y, and y, or the ſecond part of the nutation in right aſcenſion, $= \frac{9'' \times \text{ſin. diff. R. A. of ſtar and node}}{\text{cotan. declin. ſtar}}$.

24 Nutation affects the declinations of the ſtars.

The nutation alſo affects the declination of the ſtars: For SP, the mean codeclination, is changed into SO.—Suppoſe a circle deſcribed round S, with the diſtance SO cutting SP in f; then it is evident that the equation of declin. is Pf $=$ PO $\times$ coſine OPf $= 9'' \times$ ſign r. aſcen. of ſtar—long. of node.

25 A more exact mode of calculation.

Such are the calculations in conſtant uſe in our aſtronomical reſearches, founded on Machin's Theory. When ſtill greater accuracy is required, the elliptical theory muſt be ſubſtituted, by taking (as is expreſſed by the dotted lines) O in that point of the ellipſe deſcribed on the tranſverſe axis AC, where it is cut by OM, drawn according to Machin's theory. All the change made here is the diminution of OM in the ratio of 18 to 13,4, and a correſponding diminution of the angle CPO. The detail of it may be ſeen in De la Lande's *Aſtronomy*, art. 2874; but is rather foreign to our preſent purpoſe of explaining the preceſſion of the equinoxes. The calculations being in every caſe tedious, and liable to miſtakes, on account of the changes of the ſigns of the different equations, the zealous promoters of aſtronomy have calculated and publiſhed tables of all theſe equations, both on the circular and elliptical hypotheſis. And ſtill more to abridge calculations, which occur in reducing every aſtronomical obſervation, when the place of a phenomenon is deduced from a compariſon with known fixed ſtars, there have been publiſhed tables of nutation and preceſſion, for ſome hundreds of the principal ſtars, for every poſition of the moon's node and of the ſun.

26 Preceſſion of the equinoctial points, &c.

It now remains to conſider the preceſſion of the equinoctial points, with its equations, ariſing from the nutation of the earth's axis as a phyſical phenomenon, and to endeavour to account for it upon thoſe mechanical principles which have ſo happily explained all the other phenomena of the celeſtial motions.

27 Obſervations of Newton and others on this ſubject.

This did not eſcape the penetrating eye of Sir Iſaac Newton; and he quickly found it to be a conſequence, and the moſt beautiful proof, of the univerſal gravitation of all matter to all matter; and there is no part of his immortal work where his ſagacity and fertility of reſource ſhine more conſpicuouſly than in this inveſtigation. It muſt be acknowledged, however, that Newton's inveſtigation is only a ſhrewd gueſs, founded on aſſumptions, of which it would be extremely difficult to demonſtrate either the truth or falſity, and which required the genius of a Newton to pick out in ſuch a complication of abſtruſe circumſtances. The ſubject has occupied the attention of the firſt mathematicians of Europe ſince his time; and is ſtill conſidered as the moſt curious and difficult of all mechanical problems. The moſt elaborate and accurate diſſertations on the preceſſion of the equinoxes are thoſe of Sylvabella and Walmeſly, in the Philoſophical Tranſactions, publiſhed about the year 1754; that of Thomas Simpſon, publiſhed in his Miſcellaneous Tracts; that of Father Friſius, in the Memoirs of the Berlin Academy, and afterwards, with great improvements, in his Coſmographia; that of Euler in the Memoirs of Berlin; that of D'Alembert in a ſeparate diſſertation; and that of De la Grange on the Libration of the Moon, which obtained the prize in the Academy of Paris in 1769. We think the diſſertation of Father Friſius the moſt perſpicuous of them all, being conducted in the method of geometrical analyſis; whereas moſt of the others proceed in the fluxionary and ſymbolic method, which is frequently deficient in diſtinct notions of the quantities under conſideration, and therefore does not give us the ſame perſpicuous conviction of the truth of the reſults. In a work like ours, it is impoſſible to do juſtice to the problem, without entering into a detail which would be thought extremely diſproportioned to the ſubject by the generality of our readers. Yet thoſe who have the neceſſary preparation of mathematical knowledge, and wiſh to underſtand the ſubject fully, will find enough here to give them a very diſtinct notion of it; and in the article Rotation, they will find the fundamental theorems, which will enable them to carry on the inveſtigation. We ſhall firſt give a ſhort ſketch of Newton's inveſtigation, which is of the moſt palpable and popular kind, and is highly valuable, not only for its ingenuity, but alſo becauſe it will give our unlearned readers diſtinct and ſatisfactory conceptions of the chief circumſtances of the whole phenomena.

28 Sketch of Newton's inveſtigation of it. Plate CCCCXIV.

Let S (fig. 2.) be the Sun, E the Earth, and M the Moon, moving in the orbit NMCDn, which cuts the plane of the Ecliptic in the line of the nodes Nn, and has one half raiſed above it, as repreſented in the figure, the other half being hid below the Ecliptic. Suppoſe this orbit folded down; it will coincide with the Ecliptic in the circle N$mcdn$. Let EX repreſent the axis of this orbit, perpendicular to its plane, and therefore inclined to the Ecliptic. Since the Moon gravitates to the Sun in the direction MS, which is all above the Ecliptic, it is plain that this gravitation has a tendency to draw the Moon towards the Ecliptic. Suppoſe this force to be ſuch that it would draw the Moon down from M to i in the time that ſhe would have moved from M to t, in the tangent to her orbit. By the combination of theſe motions, the Moon will deſert her orbit, and deſcribe the line Mr, which makes the diagonal of the parallelogram; and if no farther action of the ſun be ſuppoſed, ſhe will deſcribe another orbit Mdn', lying between the orbit MCDn and the Ecliptic, and ſhe will come to the Ecliptic, and paſs through it in a point n', nearer to M than n is, which was the former place of her deſcending node. By this change of orbit, the line EX will no longer be perpendicular to it; but there will be another line Ex, which will now be perpendicular to the new orbit. Alſo the Moon, moving from M to r, does not move as if ſhe had come from the aſcending node N, but from a point N' lying beyond it; and the line of the nodes of the orbit in this new poſition is N' n'. Alſo the angle MN'm is leſs than the angle MNm.

Thus the nodes ſhift their places in a direction oppoſite to that of her motion, or move to the weſtward; the axis of the orbit changes its poſition, and the orbit itſelf changes its inclination to the ecliptic. Theſe momentary changes are different in different parts of the orbit, according to the poſition of the line of the nodes. Sometimes the inclination of the orbit is increaſed, and ſometimes the nodes move to the eaſtward. But, in general, the inclination increaſes from the time that the nodes are in the line of ſyzigee, till they get into quadrature, after which it diminiſhes till the nodes are again in ſyzigee. The nodes advance only while they are in the octants after the quadratures, and while the moon paſſes from quadrature to the node, and they recede in all other ſituations. Therefore the receſs exceeds the advance in every revolution of the moon round the earth, and, on the whole, they recede.

What has been ſaid of one Moon, would be true of each of a continued ring of Moons ſurrounding the Earth, and they would thus compoſe a flexible ring, which would never be flat, but waved, according to the difference (both in kind and degree) of the diſturbing forces acting on its different parts. But ſuppoſe theſe Moons to cohere, and to form a rigid and flat ring, nothing would remain in this ring but the exceſs of the contrary tendencies of its different parts. Its axis would be perpendicular to its plane, and its poſition in any moment will be the mean poſition of all the axes of the orbits of each part of the flexible ring; therefore the nodes of this rigid ring will continually recede, except when the plane of the ring paſſes through the Sun, that is, when the nodes are in ſyzigee; and (ſays Newton) the motion of theſe nodes will be the ſame with the mean motion of the nodes of the orbit of one Moon. The inclination of this ring to the ecliptic will be equal to the mean inclination of the Moon's orbit during any one revolution which has the ſame ſituation of the nodes. It will therefore be leaſt of all when the nodes are in quadrature, and will increaſe till they are in ſyzigee, and then diminiſh till they are again in quadrature.

Suppoſe this ring to contract in dimenſions, the diſturbing forces will diminiſh in the ſame proportion, and in this proportion will all their effects diminiſh. Suppoſe its motion of revolution to accelerate, or the time of a revolution to diminiſh; the linear effects of the diſturbing forces being as the ſquares of the times of their action, and their angular effects as the times, thoſe errors muſt diminiſh alſo on this account; and we can compute what thoſe errors will be for any diameter of the ring, and for any period of its revolution. We can tell, therefore, what would be the motion of the nodes, the change of inclination, and deviation of the axis, of a ring which would touch the ſurface of the earth, and revolve in 24 hours; nay, we can tell what theſe motions would be, ſhould this ring adhere to the earth. They muſt be much leſs than if the ring were detached; For the diſturbing forces of the ring muſt drag along with it the whole globe of the earth. The quantity of motion which the diſturbing forces would have produced in the ring alone, will now (ſays Newton) be produced in the whole maſs; and therefore the velocity muſt be as much leſs as the quantity of matter is greater: But ſtill all this can be computed.

Now there is ſuch a ring on the earth: for the earth is not a ſphere, but an elliptical ſpheroid. Sir Iſaac Newton therefore engaged in a compoſition of the effects of the diſturbing force, and has exhibited a moſt beautiful example of mathematical inveſtigation. He firſt aſſerts, that the earth *muſt* be an elliptical ſpheroid, whoſe polar axis is to its equatorial diameter as 229 to 230. Then he demonſtrates, that if the ſine of the inclination of the equator be called π, and if t be the number of days (ſidereal) in a year, the annual motion of a detached ring will be $360^\circ \times \frac{3\sqrt{1-\pi^2}}{4t}$. He then ſhows that the effect of the diſturbing force on this ring is to its effect on the matter of the ſame ring, diſtributed in the form of an elliptical ſtratum (but ſtill detached) as 5 to 2; therefore the motion of the nodes will be $360^\circ \times \frac{3\sqrt{1-\pi^2}}{10t}$, or 16′ 16″ 24‴ annually. He then proceeds to ſhow, that the quantity of motion in the ſphere is to that in an equatorial ring revolving in the ſame time, as the matter in the ſphere to the matter in the ring, and as three times the ſquare of a quadrantal arch to two ſquares of a diameter, jointly: Then he ſhows, that the quantity of matter in the terreſtrial ſphere is to that in the protuberant matter of the ſpheroid, as 52900 to 461 (ſuppoſing all homogeneous). From theſe premiſes it follows, that the motion of 16′ 16″ 24‴, muſt be diminiſhed in the ratio of 10717 to 100, which reduces it to 9″ 07‴ annually. And this (he ſays) is the preceſſion of the equinoxes, occaſioned by the action of the ſun; and the reſt of the $50\frac{1}{3}''$, which is the obſerved preceſſion, is owing to the action of the moon, nearly five times greater than that of the ſun. This appeared a great difficulty; for the phenomena of the tides ſhow that it *cannot* much exceed twice the ſun's force.

29 His determination of the form and dimenſions of the earth demonſtrated by M'Laurin.

Nothing can exceed the ingenuity of this proceſs. Juſtly does his celebrated and candid commentator, Daniel Bernoulli, ſay (in his Diſſertation on the Tides, which ſhared the prize of the French Academy with M'Laurin and Euler), that Newton ſaw through a veil what others could hardly diſcover with a microſcope in the light of the meridian ſun. His determination of the form and dimenſions of the earth, which is the foundation of the whole proceſs, is not offered as any thing better than a probable gueſs, *in re difficillima*; and it has been ſince demonſtrated with geometrical rigour by M'Laurin.

His next principle, that the motion of the nodes of the rigid ring is equal to the mean motion of the nodes of the moon, has been moſt critically diſcuſſed by the firſt mathematicians, as a thing which could neither be proved nor refuted. Friſius has at leaſt ſhown it to be a miſtake, and that the motion of the nodes of the ring is double the mean motion of the nodes of a ſingle moon; and that Newton's own principles ſhould have produced a preceſſion of $18\frac{1}{4}$ ſeconds annually, which removes the difficulty formerly mentioned.

His third aſſumption, that the quantity of motion of the ring muſt be ſhared with the included ſphere, was acquieſced in by all his commentators, till D'Alembert and Euler, in 1749, ſhowed that it was not the quantity of motion round an axis of rotation which remained the ſame, but the quantity of momentum or rotatory effort. The quantity of motion is the product of every particle by its velocity; that is, by its diſtance from the axis; while its momentum, or power of producing rotation, is as the ſquare of that diſtance, and is to be had by taking the ſum of each particle multiplied by the ſquare of its diſtance from the axis. Since the earth differs ſo little from a perfect ſphere, this makes no ſenſible difference in the reſult. It will increaſe Newton's preceſſion about three-fourths of a ſecond.

30 Examination of the phenomenon of preceſſion on mechanical principles.

We proceed now to the examination of this phenomenon upon the fundamental principles of mechanics.

Becauſe the mutual gravitation of the particles of matter in the ſolar ſyſtem is in the inverſe ratio of the ſquares of the diſtance, it follows, that the gravitations of the different parts of the earth to the ſun or to the moon are unequal. The nearer particles gravitate more than thoſe that are more remote.

Plate CCCCXIV.

Let PQ*p*E (fig. 3.), be a meridional ſection of the terreſtrial ſphere, and PO*pq* the ſection of the inſcribed ſphere. Let CS be a line in the plane of the ecliptic paſſing through the ſun, ſo that the angle ECS is the ſun's declination. Let NCM be a plane paſſing thro' the centre of the earth at right angles to the plane of the meridian PQ*p*E; NCM will therefore be the plane of illumination.

In conſequence of the unequal gravitation of the matter of the earth to the ſun, every particle, ſuch as B, is acted on by a diſturbing force parallel to CS, and proportional to BD, the diſtance of the particle from the plane of illumination; and this force is to the gravitation of the central particle to the ſun, as three times BD is to CS, the diſtance of the earth from the ſun.

Let AB*a* be a plane paſſing through the particle B, parallel to the plane EQ of the equator. This ſection of the earth will be a circle, of which A*a* is a diameter, and Q*q* will be the diameter of its ſection with the inſcribed ſphere. Theſe will be two concentric circles, and the ring by which the ſection of the ſpheroid exceeds the ſection of the ſphere will have AQ for its breadth; P*p* is the axis of figure.

Let

Let EC be repreſented by the ſymbol	a
OC or PC	b
EO their difference, $=\frac{a^2-b^2}{a+b}$	d
CL	x
QL	$\sqrt{b^2-x^2}$
The periphery of a circle to radius 1	Π
The diſturbing force at the diſtance 1 from the plane NCM	f
The ſine of declination ECS	m
The coſine of ECS	n

It is evident, that with reſpect to the inſcribed ſphere, the diſturbing forces are completely compenſated, for every particle has a correſponding particle in the adjoining quadrant, which is acted on by an equal and oppoſite force. But this is not the caſe with the protuberant matter which makes up the ſpheroid. The ſegments NS sn and MT tm are more acted on than the ſegments NT tn and MS sm; and thus there is produced a tendency to a converſion of the whole earth, round an axis paſſing through the centre C, perpendicular to the plane PQ p E. We ſhall diſtinguiſh this motion from all others to which the ſpheroid may be ſubject, by the name LIBRATION. The axis of this libration is always perpendicular to that diameter of the equator over which the ſun is, or to that meridian in which he is.

PROB. I. To determine the momentum of libration corresponding to any poſition of the earth reſpecting the ſun, that is, to determine the accumulated energy of the diſturbing forces on all the protuberant matter of the ſpheroid.

Let B and b be two particles in the ring formed by the revolution of AQ, and ſo ſituated, that they are at equal diſtances from the plane NM; but on oppoſite ſides of it. Draw BD, bd, perpendicular to NM, and FLG perpendicular to LT.

Then, becauſe the momentum, or power of producing rotation, is as the force and as the diſtance of its line of direction from the axis of rotation, jointly, the combined momentum of the particles B and b will be $f.\,\mathrm{BD.DC}-f.bd.dc$, (for the particles B and b, are urged in contrary directions). But the momentum of B is $f.\,\mathrm{BF.DC}+f.\mathrm{FD.DC}$, and that of b is $f.\,b\mathrm{G}.d\mathrm{C}-f.d\mathrm{G}.d\mathrm{C}$; and the combined momentum is $f.\,\mathrm{BF.D}d-f.\mathrm{FD}.\overline{\mathrm{DC}+d\mathrm{C}},=2f.\mathrm{BF.LF}-2f.\mathrm{LT.TC}$.

Becauſe m and n are the ſine and coſine of the angle ECS or LCT, we have $\mathrm{LT}=m.\mathrm{CL}$, and $\mathrm{CT}=n.\,\mathrm{CL}$, and $\mathrm{LF}=m.\mathrm{BL}$, and $\mathrm{BF}=n.\,\mathrm{BL}$. This gives the momentum $=2fmn\,\overline{\mathrm{BL}^2-\mathrm{CL}^2}$.

The breadth AQ of the protuberant ring being very ſmall we may ſuppoſe, without any ſenſible error, that all the matter of the line AQ is collected in the point Q; and, in like manner, that the matter of the whole ring is collected in the circumference of its inner circle, and that B and b now repreſent, not ſingle particles, but the collected matter of lines ſuch as AQ, which terminate at B and b. The combined momentum of two ſuch lines will therefore be $2\,m\,n\,f.\mathrm{AQ}.\overline{\mathrm{BL}^2-\mathrm{CL}^2}$.

Let the circumference of each parallel of latitude be divided into a great number of indefinitely ſmall and equal parts. The number of ſuch parts in the circumference, of which Q q is the diameter, will be $\Pi\cdot\mathrm{QL}$. To each pair of theſe there belongs a momentum $2\,mnf.\mathrm{AQ}\cdot\overline{\mathrm{BL}^2-\mathrm{CL}^2}$. The ſum of all the ſquares of BL, which can be taken round the circle, is one half of as many ſquares of the radius CL: for BL is the ſine of an arch, and the ſum of its ſquare and the ſquare of its correſponding coſine is equal to the ſquare of the radius. Therefore the ſum of all the ſquares of the ſines, together with the ſum of all the ſquares of the coſines is equal to the ſum of the ſame number of ſquares of the radius; and the ſum of the ſquares of the ſines is equal to the ſum of the ſquares of the correſponding coſines: therefore the ſum of the ſquares of the radius is double of either ſum. Therefore $\int\Pi.\mathrm{QL}\cdot\mathrm{BL}^2=\frac{1}{2}\Pi\cdot\mathrm{QL.QL}^2$. In like manner the ſum of the number $\Pi.\mathrm{QL}$ of CL^2s will be $=\Pi.\mathrm{QL.CL}^2$. Theſe ſums, taken for the ſemicircle, are $\frac{1}{4}\Pi.\mathrm{QL.QL}^2$, and $\frac{1}{2}\Pi\cdot\mathrm{QL.CL}^2$, or $\Pi\cdot\mathrm{QL}\cdot\frac{1}{4}\mathrm{QL}^2$, and $\Pi\cdot\mathrm{QL}\cdot\frac{1}{2}\mathrm{CL}^2$: therefore the momentum of the whole ring will be $2\,m\,n\,f\cdot\mathrm{AQ\,QL}.\Pi\,(\frac{1}{4}\mathrm{QL}^2-\frac{1}{2}\mathrm{CL}^2)$: for the momentum of the ring is the combined momenta of a number of pairs, and this number is $\frac{1}{2}\Pi\cdot\mathrm{QL}$.

By the ellipſe we have $\mathrm{OC}:\mathrm{QL}=\mathrm{EO}:\mathrm{AQ}$, and $\mathrm{AQ}=\mathrm{QL}\frac{\mathrm{EO}}{\mathrm{OC}},=\mathrm{QL}\frac{d}{b}$; therefore the momentum of the ring is $2\,m\,n\,f\frac{d}{b}\mathrm{QL}^2\Pi\,(\frac{1}{4}\mathrm{QL}^2-\frac{1}{2}\mathrm{CL}^2),=m\,n\,f\frac{d}{b}\mathrm{QL}^2\Pi\,(\frac{1}{2}\mathrm{QL}^2-\mathrm{CL}^2)$: but $\mathrm{QL}^2=b^2-x^2$; therefore $\frac{1}{2}\mathrm{QL}^2-\mathrm{CL}^2=\frac{1}{2}b^2-\frac{1}{2}x^2-x^2,=\frac{1}{2}b^2-\frac{3}{2}x^2,=\frac{b^2-3x^2}{2}$; therefore the momentum of the ring is $m\,n\,f\frac{d}{b}\Pi(b^2-x^2)\left(\frac{b^2-3x^2}{2}\right)=m\,n\,f\frac{d}{b}\Pi\left(\frac{b^4-4b^2x^2+3x^4}{2}\right),=m\,n\,f\frac{d}{2b}\Pi\,(b^4-4b^2x^2+3x^4)$. If we now ſuppoſe another parallel extremely near to Aa, as repreſented by the dotted line, the diſtance Ll between them being $\dot{x}$, we ſhall have the fluction of the momentum of the ſpheroid $mnf\frac{d}{2b}\Pi\,(b^4\dot{x}-4b^2x^2\dot{x}+3x^4\dot{x})$, of which the fluent is $m\,n\,f\frac{d}{2b}\Pi\left(b^4x-4b^2\frac{x^3}{3}+\frac{3x^5}{5}\right)$. This expreſſes the momentum of the zone EA aQ, contained between the equator and the parallel of latitude A a. Now let x become $=b$, and we ſhall obtain the momentum of the hemiſpheroid $=m\,n\,f\frac{d}{2b}\Pi\,(b^5-\frac{4}{3}b^5+\frac{3}{5}b^5)$, and that of the ſpheroid $=m\,n\,f\frac{d}{b}\Pi\,(b^5-\frac{4}{3}b^5+\frac{3}{5}b^5)=\frac{4}{15}\,m\,n\,f\,d\,\Pi\,b^4$.

This formula does not expreſs any motion, but only a preſſure tending to produce motion, and particularly tending to produce a libration by its action on the cohering matter of the earth, which is affected as a number of levers. It is ſimilar to the common mechanical formula $w.d$, where w means a weight, and d its diſtance from the fulcrum of the lever.

It is worthy of remark, that the momentum of this protuberant matter is juſt $\frac{2}{5}$ of what it would be if it were all collected at the point O of the equator: for the matter in the ſpheroid is to that in the inſcribed ſphere as a^2 to b^2, and the contents of the inſcribed ſphere is $\frac{2}{3}\,\Pi\,b^3$. Therefore $a^2:a^2-b^2=\frac{2}{3}\Pi b^3:\frac{2}{3}\Pi b^3\frac{a^2-b^2}{a^2}$, which is the quantity of protuberant matter. We may, without ſenſible error, ſuppoſe $\frac{a^2-b^2}{a}=2d$,

$= 2d$; then the protuberant matter will be $\frac{4}{3}\Pi b^2 d$. If all this were placed at O, the momentum would be $\frac{4}{3}\Pi db^2 f \cdot \mathrm{OH} \cdot \mathrm{HC}, = \frac{4}{3} mnfdb^4$, becauſe $\mathrm{OH} \cdot \mathrm{HC} = mnb^2$; now $\frac{4}{3}$ is 5 times $\frac{4}{15}$.

Alſo, becauſe the ſum of all the rectangles OH·HC round the equator is half of as many ſquares of OC, it follows that the momentum of the protuberant matter placed in a ring round the equator of the ſphere or ſpheroid is one half of what it would be if collected in the point O or E; whence it follows that the momentum of the protuberant matter in its natural place is two fifths of what it would be if it were diſpoſed in an equatorial ring. It was in this manner that Sir Iſaac Newton was enabled to compare the effect of the ſun's action on the protuberant matter of the earth, with his effect on a rigid ring of moons. The preceding inveſtigation of the momentum is nearly the ſame with his, and appears to us greatly preferable in point of perſpicuity to the fluxionary-ſolutions given by later authors. Theſe indeed have the appearance of greater accuracy, becauſe they do not ſuppoſe all the protuberant matter to be condenſed on the ſurface of the inſcribed ſphere: nor were we under the neceſſity of doing this, only it would have led to very complicated expreſſions had we ſuppoſed the matter in each line AQ collected in its centre of oſcillation or gyration. We made a compenſation for the error introduced by this, which may amount to $\frac{1}{115}$ of the whole, and ſhould not be neglected, by taking d as equal to $\frac{a^2 - b^2}{2a}$. inſtead of $\frac{a^2 - b^2}{a \times b}$. The conſequence is, that our formula is the ſame with that of the later authors.

Thus far Sir Iſaac Newton proceeded with mathematical rigour; but in the application he made two aſſumptions, or, as he calls them, hypotheſes, which have been found to be unwarranted. The firſt was, that when the ring of protuberant matter is connected with the inſcribed ſphere, and ſubjected to the action of the diſturbing force, the ſame quantity of motion is produced in the whole maſs as in the ring alone. The ſecond was, that the motion of the nodes of a rigid ring of moons is the ſame with the mean motion of the nodes of a ſolitary moon. But we are now able to demonſtrate, that it is not the quantity of motion, but of momentum, which remains the ſame, and that the nodes of a rigid ring move twice as faſt as thoſe of a ſingle particle. We proceed therefore to

31
Effects of the libratory momentum of the earth's protuberant matter.

Prob. 2. To determine the deviation of the axis, and the retrograde motion of the nodes which reſult from this libratory momentum of the earth's protuberant matter.

But here we muſt refer our readers to ſome fundamental propoſitions of rotatory motions which are demonſtrated in the article Rotation.

If a rigid body is turning round an axis A, paſſing through its centre of gravity with the angular velocity a, and receives an impulſe which alone would cauſe it to turn round an axis B, alſo paſſing through its centre of gravity, with the angular velocity b, the body will now turn round a third axis C, paſſing thro' its centre of gravity, and lying in the plane of the axes A and B, and the ſine of the inclination of this third axis to the axis A will be to the ſine of inclination to the axis B as the velocity b to the velocity a.

32 When a rigid body is made to turn round any axis by the action of an external force, the quantity of momentum produced that is, the ſum of the products of every particle by its velocity and by its diſtance from the axis) is equal to the momentum or ſimilar product of the moving force or forces.

33 If an oblate ſpheroid, whoſe equatorial diameter is a and polar diameter b, be made to librate round an equatorial diameter, and the velocity of that point of the equator which is fartheſt from the axis of libration be v, the momentum of the ſpheroid is $\frac{4}{15}\Pi a^2 b^2 v$.

The two laſt are to be found in every elementary book of mechanics.

Plate CCCCXIV.

Let ANan (fig. 4.) be the plane of the earth's equator, cutting the ecliptic CNKn in the line of the nodes or equinoctial points Nn. Let OAS be the ſection of the earth by a meridian paſſing through the ſun, ſo that the line OCS is in the ecliptic, and CA is an arch of an hour-circle or meridian, meaſuring the ſun's declination. The ſun not being in the plane of the equator, there is, by prop. 1. a force tending to produce a libration round an axis ZOz at right angles to the diameter Aa of that meridian in which the ſun is ſituated, and the momentum of all the diſturbing forces is $\frac{4}{15} mnf\Pi db^4$. The product of any force by the moment $\dot{t}$ of its action expreſſes the momentary increment of volocity; therefore the momentary velocity, or the velocity of libration generated in the time $\dot{t}$ is $\frac{4}{15} mnfd\Pi b^4 \dot{t}$. This is the abſolute velocity of a point at the diſtance 1 from the axis, or it is the ſpace which would be uniformly deſcribed in the moment $\dot{t}$, with the velocity which the point has acquired at the end of that moment. It is double the ſpace actually deſcribed by the libration during that moment; becauſe this has been an uniformly accelerated motion, in conſequence of the continued and uniform action of the momentum during this time. This muſt be carefully attended to, and the neglect of it has occaſioned very faulty ſolutions of this problem.

Let v be the velocity produced in the point A, the moſt remote from the axis of libration. The momentum excited or produced in the ſpheroid is $\frac{4}{15}\Pi a^2 b^2 v$ (as above), and this muſt be equal to the momentum of the moving force, or to $\frac{4}{15} mnfd\Pi b^4 \dot{t}$; therefore we obtain $v = \frac{\frac{4}{15} mnfd\Pi b^4 t}{\frac{4}{15}\Pi a^2 b^2}$, that is, $v = mnfd\dot{t}\frac{b^2}{a^2}$ or very nearly $mnfd\dot{t}$, becauſe $\frac{b^2}{a^2} = 1$ very nearly. Alſo, becauſe the product of the velocity and time gives the ſpace uniformly deſcribed in that time, the ſpace deſcribed by A in its libration round Zz is $mnfd\dot{t}^2$, and the angular velocity is $\frac{mnfd\dot{t}}{a}$.

Let $\dot{r}$ be the momentary angle of diurnal rotation. The arch Ar, deſcribed by the point A of the equator in this moment $\dot{t}$ will therefore be $a\dot{r}$, that is, $a \times \dot{r}$, and the velocity of the point A is $\frac{a\dot{r}}{\dot{t}}$. and the angular velocity of rotation is $\frac{\dot{r}}{\dot{t}}$.

Here then is a body (fig. 5.) turning round an axis OP, perpendicular to the plane of the equator zoz, and therefore ſituated in the plane ZPz; and it turns round this axis with the angular velocity $\frac{\dot{r}}{\dot{t}}$. It has received an impulſe, by which alone it would librate round the axis Z*z*, with the angular velocity $\frac{mnfd\dot{t}}{a}$. It will therefore turn round neither axis (n° 31.), but round a third axis OP′, paſſing through O, and lying in the plane ZP*z*, in which the other two are ſituated, and the ſine P′π of its inclination to the axis of libration Z*z* will be to the ſine P′*p* of its inclination to the axis OP of rotation as $\frac{\dot{r}}{\dot{t}}$ to $\frac{mnfd\dot{t}}{a}$

Now A, in fig. 4. is the ſummit of the equator both of libration and rotation; $mnfd\dot{t}^2$ is the ſpace deſcribed by its libration in the time $\dot{t}$; and $a\dot{r}$ is the ſpace or arch A*r* (fig. 4.) deſcribed in the ſame time by its rotation: therefore, taking A*r* to A*c* (perpendicular to the plane of the equator of rotation, and lying in the equator of libration), as $a\dot{r}$ to $mnfd\dot{t}^2$, and completing the parallelogram A*rmc*, A*m* will be the compound motion of A (n° 31.), and $a\dot{r} : mndf\dot{t}^2 = 1 : \frac{mnfd\dot{t}^2}{a\dot{r}}$, which will be the tangent of the angle *m*A*r*, or of the change of poſition of the equator. But the axes of rotation are perpendicular to their equator; and therefore the angle of deviation $\dot{w}$ is equal to this angle *r*A*m*. This appears from fig. 5.; for πP : P′*p*=O*p* : P′*p*,=OP : tan. POP; and it is evident that $a\dot{r} : mnfd\dot{t}^2 = \frac{\dot{r}}{\dot{t}} : mnfd\frac{\dot{t}}{a}$, as is required by the compoſition of rotations.

In conſequence of this change of poſition, the plane of the equator no longer cuts the plane of the ecliptic in the line N*n*. The plane of the new equator cuts the former equator in the line AO, and the part AN of the former equator lies between the ecliptic and the new equator AN′, while the part A*n* of the former equator is above the new one A*n′*; therefore the new node N′, from which the point A was moving, is removed to the weſtward, or farther from A; and the new node *n′*, to which A is approaching, is alſo moved weſtward, or nearer to A; and this happens in every poſition of A. The nodes, therefore, or equinoctial points, continually ſhift to the weſtward, or in a contrary direction to the rotation of the earth; and the axis of rotation always deviates to the eaſt ſide of the meridian which paſſes through the ſun.

This account of the motions is extremely different from what a perſon ſhould naturally expect. If the earth were placed in the ſummer ſolſtice, with reſpect to us who inhabit its northern hemiſphere, and had no rotation round its axis, the equator would begin to approach the ecliptic, and the axis would become more upright; and this would go on with a motion continually accelerating, till the equator coincided with the ecliptic. It would not ſtop here, but go as far on the other ſide, till its motion were extinguiſhed by the oppoſing forces; and it would return to its former poſition, and again begin to approach the ecliptic, playing up and down like the arm of a balance. On this account this motion is very properly termed *libration;* but this very ſlow libration, compounded with the incomparably ſwifter motion of diurnal rotation, produces a third motion extremely different from both. At firſt the north pole of the earth inclines forward toward the ſun; after a long courſe of years it will incline to the left hand, as viewed from the ſun, and be much more inclined to the ecliptic, and the plane of the equator will paſs through the ſun. Then the ſouth pole will come into view, and the north pole will begin to decline from the ſun; and this will go on (the inclination of the equator diminiſhing all the while) till, after a courſe of years, the north pole will be turned quite away from the ſun, and the inclination of the equator will be reſtored to its original quantity. After this the phenomena will have another period ſimilar to the former, but the axis will now deviate to the right hand. And thus, although both the earth and ſun ſhould not move from their places, the inhabitants of the earth would have a complete ſucceſſion of the ſeaſons accompliſhed in a period of many centuries. This would be prettily illuſtrated by an iron ring poiſed very nicely on a cap like the card of a mariner's compaſs, having its centre of gravity coinciding with the point of the cap, ſo that it may whirl round in any poſition. As this is extremely difficult to execute, the cap may be pierced a little deeper, which will cauſe the ring to maintain a horizontal poſition with a very ſmall force. When the ring is whirling very ſteadily, and pretty briſkly, in the direction of the hours of a watch-dial, hold a ſtrong magnet above the middle of the nearer ſemicircle (above the 6 hour point) at the diſtance of three or four inches. We ſhall immediately obſerve the ring riſe from the 9 hour point, and ſink at the 3 hour point, and gradually acquire a motion of preceſſion and nutation, ſuch as has been deſcribed.

If the earth be now put in motion round the ſun, or the ſun round the earth, motions of libration and deviation will ſtill obtain, and the ſucceſſion of their different phaſes, if we may ſo call them, will be perfectly analogous to the above ſtatement. But the quantity of deviation, and change of inclination, will now be prodigiouſly diminiſhed, becauſe the rapid change of the ſun's poſition quickly diminiſhes the diſturbing forces, annihilates them by bringing the ſun into the plane of the equator, and brings oppoſite forces into action.

We ſee in general that the deviation of the axis is always at right angles to the plane paſſing through the ſun, and that the axis, inſtead of being raiſed from the ecliptic, or brought nearer to it, as the libration would occaſion, deviates ſidewiſe; and the equator, inſtead of being raiſed or depreſſed round its eaſt and weſt points, is twiſted ſidewiſe round the north and ſouth points; or at leaſt things have this appearance: but we muſt now attend to this circumſtance more minutely.

The compoſition of rotation ſhows us that this change of the axis of diurnal rotation is by no means a tranſlation of the former axis (which we may ſuppoſe to be the axis of figure) into a new poſition, in which it again becomes the axis of diurnal motion; nor does the equator of figure, that is, the moſt prominent ſection of the terreſtrial ſpheroid, change its poſition, and in this new poſition continue to be the equator of rotation. This was indeed ſuppoſed by Sir Iſaac Newton; and this ſuppoſition naturally reſulted from the train of reaſoning which he adopted. It was ſtrictly true of a ſingle moon, or of the imaginary orbit attached to it; and therefore Newton ſuppoſed that the whole earth did in this manner deviate from its former poſition, ſtill, however, turning round its axis of figure. In this he has been followed by Walmeſly, Simpſon, and moſt of his commentators. D'Alembert was the firſt who entertained any ſuſpicion that this might not be certain; and both he and Euler at laſt ſhowed that the new axis of rotation was really a new line in the body of the earth, and that its axis and equator of figure did not remain the axis and equator of rotation. They aſcertained the poſition of the real axis by means of a moſt intricate analyſis, which obſcured the connection of the different poſitions of the axis with each other, and gave us only a kind of momentary information. Father Friſius turned his thoughts to this problem, and fortunately diſcovered the compoſition of rotations as a general principle of mechanical philoſophy. Few things of this kind have eſcaped the penetrating eye of Sir Iſaac Newton. Even *this* principle had been glanced at by him. He affirms it in expreſs terms with reſpect to a body that is perfectly ſpherical (cor. 22. prop. 66. B. I.) But it was reſerved for Friſius to demonſtrate it to be true of bodies of any figure, and thus to enrich mechanical ſcience with a principle which gives ſimple and elegant ſolutions of the moſt difficult problems.

But here a very formidable objection naturally offers itſelf. If the axis of the diurnal motion of the heavens is not the axis of the earth's ſpheroidal figure, but an imaginary line in it, round which even the axis of figure muſt revolve; and if this axis of diurnal rotation has ſo greatly changed its poſition, that it now points at a ſtar at leaſt 12 degrees diſtant from the pole obſerved by Timochares, how comes it that the equator has the very ſame ſituation on the ſurface of the earth that it had in ancient times? No ſenſible change has been obſerved in the latitudes of places.

The anſwer is very ſimple and ſatisfactory: Suppoſe that in 12 hours the axis of rotation has changed from the poſition PR (fig. 6.) to pr, ſo that the north pole, inſtead of being at P, which we may ſuppoſe to be a particular mountain, is now at p. In this 12 hours the mountain P, by its rotation round pr, has acquired the poſition π. At the end of the next 12 hours, the axis of rotation has got the poſition $\pi\rho$, and the axis of figure has got the poſition pr, and the mountain P is now at p. Thus, on the noon of the following day, the axis of figure PR is in the ſituation which the real axis of rotation occupied at the intervening midnight. This goes on continually, and the axis of figure follows the poſition of the axis of rotation, and is never further removed from it than the deviation of 12 hours, which does not exceed $\frac{1}{700}$th part of one ſecond, a quantity altogether imperceptible. Therefore the axis of figure will always ſenſibly coincide with the axis of rotation, and no change can be procured in the latitudes of places on the ſurface of the earth. Plate CCCCXIV

34 Application of this reaſoning to nutation and preceſſion.

We have hitherto conſidered this problem in the moſt general manner; let us now apply the knowledge we have gotten of the deviation of the axis or of the momentary action of the diſturbing force to the explanation of the phenomena: that is, let us ſee what preceſſion and what nutation will be accumulated after any given time of action.

For this purpoſe we muſt aſcertain the preciſe deviation which the diſturbing forces are competent to produce. This we can do by comparing the momentum of libration with the gravitation of the earth to the ſun, and this with the force which would retain a body on the equator while the earth turns round its axis.

The gravitation of the earth to the ſun is in the proportion of the ſun's quantity of matter M directly, and to the ſquare of the diſtance A inverſely, and may therefore be expreſſed by the ſymbol $\frac{M}{A^2}$. The diſturbing force at the diſtance 1 from the plane of illumination is to the gravitation of the earth's centre to the ſun as 3 to A, (A being meaſured on the ſame ſcale which meaſures the diſtance from the plane of illumination). Therefore $\frac{3M}{A^3}$ will be the diſturbing force f of our formula.

Let p be the centrifugal force of a particle at the diſtance 1 from the axis of rotation; and let t and T be the times of rotation and of annual revolution, viz. ſidereal day and year. Then $p : \frac{M}{A^2} = \frac{1}{t^2} : \frac{A}{T^2}$. Hence we derive $\frac{3M}{A^3} = 3p\frac{t^2}{T^2}$. But ſince $\dot{r}$ was the angular velocity of rotation, and conſequently $1 \times \dot{r}$ the ſpace deſcribed, and $\frac{1 \times \dot{r}}{\dot{t}}$ the velocity; and ſince the centrifugal force is as the ſquare of the velocity divided by the radius, (this being the meaſure of the generated velocity, which is the proper meaſure of any accelerating force), we have $p = \frac{1^2 \times \dot{r}^2}{1^2 \times \dot{t}^2}, = \frac{\dot{r}^2}{\dot{t}^2}$, and $f = \frac{3\dot{r}^2}{\dot{t}^2} \times \frac{\dot{t}^2}{T^2}$. Now the formula $f\,m\,n\,d\frac{\dot{t}^2}{a}$ expreſſed the ſine of the angle. This being extremely ſmall, the ſine may be conſidered as equal to the arc which meaſures the angle. Now, ſubſtitute for it the value now found, viz. $\frac{3\dot{r}^2}{\dot{t}^2} \times \frac{\dot{t}^2}{T^2}$, and we obtain the angle of deviation $\dot{w} = \dot{r}\frac{3t^2}{T^2}mn\frac{d}{a}$, and this is the ſimpleſt form in which it can appear. But it is convenient, for other reaſons, to expreſs it a little differently: d is nearly equal to $\frac{a^2 - b^2}{2a^2}$, therefore $\dot{w} = \dot{r} \times \frac{3}{2}\frac{t^2}{T^2}mn\frac{a^2 - b^2}{a^2}$, and this is the form in which we ſhall now employ it.

The ſmall angle $\dot{r}\frac{3t^2}{2T^2}mn\frac{a^2 - b^2}{a^2}$ is the angle in which the new equator cuts the former one. It is different at different times, as appears from the variable part mn, the product of the ſine and coſine of the ſun's declination. It will be a maximum when the declination is in the ſolſtice, for mn increaſes all the way to 45°, and the declination never exceeds 23½. It increaſes, therefore, from the equinox to the ſolſtice, and then diminiſhes.

Let ESL (fig. 7.) be the ecliptic, EAC the equator, BAD the new poſition which it acquires by the momentary action of the ſun, cutting the former in the angle BAE $= \dot{r}\frac{3}{2}\frac{t^2}{T^2}mn\frac{a^2 - b^2}{a^2}$. Let S be the ſun's place in the ecliptic, and AS the ſun's declination, the meridian AS being perpendicular to the equator. Let $\frac{a^2 - b^2}{a^2}$ be k. The angle BAE is then $= \dot{r}\frac{3t^2}{2T^2}kmn$. In the ſpherical triangle BAE we have ſin. B : ſin. AE = ſin. A : ſin. BE, or = A : BE, becauſe very ſmall angles and arches are as their ſines. Therefore BE, which is the momentary preceſſion of the equinoctial point E, is equal to A $\frac{\text{ſin. AE}}{\text{ſin. B}}$, $= \dot{r} \times \frac{3t^2}{2T^2}k\ m\ n$, $\frac{\text{ſin. R. aſcenſ.}}{\text{ſin. obl. ecl.}}$.

35 Various modes of application.

The equator EAC, by taking the poſition BAD, recedes from the ecliptic in the colure of the ſolſtices CL, and CD is the change of obliquity or the nutation. For let CL be the ſolſtitial colure of BAD, and $c\ l$ the ſolſtitial colure of EAC. Then we have ſin. B : ſin. E = ſin. LD : ſin. $l\,c$; and therefore the difference of the arches LD and $l\,c$ will be the meaſure of the difference of the angles B and E. But when BE is indefinitely ſmall, CD may be taken for the difference of LD and $l\,c$, they being ultimately in the ratio of equality. Therefore CD meaſures the change of the obliquity of the ecliptic, or the nutation of the axis with reſpect to the ecliptic.

The real deviation of the axis is the ſame with the change in the poſition of the equator, P p being the meaſure of the angle EAB. But this not being always made in a plane perpendicular to the ecliptic, the change of obliquity generally differs from the change in the poſition of the axis. Thus when the ſun is in the ſolſtice, the momentary change of the poſition of the equator is the greateſt poſſible; but being made at right angles to the plane in which the obliquity of the ecliptic is computed, it makes no change whatever in the obliquity, but the greateſt poſſible change in the preceſſion.

36 In order to find CD the change of obliquity, obſerve that in the triangle CAD, R : ſin. AC, or R : coſ. AE = ſin. A : ſin. CD, = A : CD (becauſe A and CD are exceedingly ſmall). Therefore the change of obliquity (which is the thing commonly meant by nutation) CD = A × coſ. AE, $= \dot{r}\frac{3t^2}{2T^2}kmn$, coſ. AE $= \dot{r}\frac{3t^2}{2T^2}$ $k \times$ ſin. declin. × coſ. declin. × coſ. R. aſcenſ.

37 But it is more convenient for the purpoſes of aſtronomical computation to make uſe of the ſun's longitude SE. Therefore make

The ſun's longitude ES - - = z
Sine of ſun's long. - - = x
Coſine - - - $\sqrt{1-x^2}$ = y
Sine obliq. eclipt. - - $23\frac{1}{2}$ = p
Coſine obliq. - - - - = q

38 In the ſpherical triangle EAS, right angled at A (becauſe AS is the ſun's declination perpendicular to the equator), we have R : ſin. ES = ſin. E : ſin. AS, and ſin. AS = $p\,x$. Alſo R : coſ. AS = coſ. AE : coſ. ES, and coſ. ES or y = coſ. AS × coſ. AE. Therefore pxy = ſin. AS × coſ. AS × coſ. AE, = mn × coſ. AE. Therefore the momentary nutation CD $= \dot{r} \times \frac{3t^2}{2T^2}kpxy$.

39 We muſt recollect that this angle is a certain fraction of the momentary diurnal rotation. It is more convenient to conſider it as a fraction of the ſun's annual motion, that ſo we may directly compare his motion on the ecliptic with the preceſſion and nutation correſponding to his ſituation in the heavens. This change is eaſily made, by augmenting the fraction in the ratio of the ſun's angular motion to the motion of rotation, or multiplying the fraction by $\frac{T}{t}$; therefore the momentary nutation will be $\dot{r}\frac{t\,3}{2T}k\,p\,x\,y$. In this value $\frac{3tkp}{2T}$ is a conſtant quantity, and the momentary nutation is proportional to $x\,y$, or to the product of the ſine and coſine of the ſun's longitude, or to the ſine of twice the ſun's longitude; for $x\,y$ is equal to half the ſine of twice z.

40 If therefore we multiply this fraction by the ſun's momentary angular motion, which we may ſuppoſe, with abundant accuracy, proportional to $\dot{z}$, we obtain the fluxion of the nutation, the fluent of which will expreſs the whole nutation while the ſun deſcribes the arch z of the ecliptic, beginning at the vernal equinox. Therefore, in place of y put $\sqrt{1-x^2}$, and in place of $\dot{z}$ put $\frac{\dot{x}}{\sqrt{1-x^2}}$, and we have the fluxion of the nutation for the moment when the ſun's longitude is z and the fluent will be the whole nutation. The fluxion reſulting from this proceſs is $\frac{3tkp}{2T}x\,\dot{x}$, of which the fluent is $\frac{3tkp}{4T}x^2$. This is the whole change produced on the obliquity of the ecliptic while the ſun moves along the arch z ecliptic, reckoned from the vernal equinox. When this arch is 90°, x^2 is 1, and therefore $\frac{3tkp}{4T}$ is the nutation produced while the ſun moves from the equinox to the ſolſtice.

The momentary change of the axis and plane of the equator (which is the meaſure of the changing force) is $\frac{3tk}{2T}mn$.

41 The real and momentary changes greateſt at the ſolſtices and at the equinoxes, nothing.

The momentary change of the obliquity of the ecliptic is $\frac{3tkp}{2T}x\,\dot{x}$

The whole change of obliquity is $\frac{3tkp}{4T}x^2$.

Hence we ſee that the force and the real momentary change of poſition are greateſt at the ſolſtices, and diminiſh to nothing in the equinoxes.

The momentary change of obliquity is greateſt at the octants, being proportional to $x\,\dot{x}$ or to $x\,y$.

The whole accumulated change of obliquity is greateſt at the ſolſtices, the obliquity itſelf being then ſmalleſt.

42 Quantity of preceſſion in a given time.

We muſt in like manner find the accumulated quantity of the preceſſion after a given time, that is, the arch BE for a finite time.

We have ER : CD = ſin. EA : ſin. CA (or coſ. EA) = tan. EA : 1, and EB : ER = 1 : ſin. B. Therefore EB : CD = tan. EA : ſin. B. But tan. EA = coſ. E × tan. ES, = coſ. E × $\frac{\text{ſin. long.}}{\text{coſ. long.}} = \frac{q\ x}{\sqrt{1-x^2}}$. Therefore EB : CD $= \frac{q\,x}{\sqrt{1-x^2}\,p}$, and CD = EB : $\frac{\text{ſin. obliq. eclip.}}{\text{tan. long. ☉}}$. If we now ſubſtitute for CD its value found in nº 40. viz. $\frac{3tkp}{2T}x\,\dot{x}$, we obtain EB $= \frac{3t}{2T} \times \frac{k\,q\,x^2\dot{x}}{\sqrt{1-x^2}}$, the fluxion of the preceſſion of the equinoxes occaſioned by the action of the ſun. The fluent of the variable part $\frac{x^2\dot{x}}{\sqrt{1-x^2}} = x\dot{y}$, of which the fluent is evidently a ſegment of a circle whoſe arch is z and ſine x, that is, $= \frac{z-x\sqrt{1-x^2}}{2}$, and the whole preceſſion, while the ſun deſcribes the arch z, is $\frac{3t}{2T} \times \frac{kq}{2}\left(z-x\sqrt{1-x^2}.\right)$ This is the preceſſion of the equinoxes while the ſun moves from the vernal equinox along the arch z of the ecliptic.

In this expreſſion, which conſiſts of two parts, $\frac{3tkq}{4T}z$, and $\frac{3tkq}{4T}\left(-x\sqrt{1-x^2}\right)$, the firſt is incomparably greater than the ſecond, which never exceeds 1'', and is always compenſated in the ſucceeding quadrant. The preceſſion occaſioned by the ſun will be $\frac{3tkq}{4T}z$, and from this expreſſion we ſee that the preceſſion increaſes uniformly, or at leaſt increaſes at the ſame rate with the ſun's longitude z, becauſe the quantity $\frac{3tkq.}{4T}$ is conſtant.

43
Mode of uſing the formulæ.

In order to make uſe of theſe formulæ, which are now reduced to very great ſimplicity, it is neceſſary to determine the values of the two conſtant quantities $\frac{3tkp}{4T}$, $\frac{3tkq}{4T}$, which we ſhall call N and P, as factors of the nutation and preceſſion. Now t is one ſidereal day, and T is 366¼. k is $\frac{a^2-b^2}{a^2}$, which according to Sir Iſaac Newton is $\frac{231^2-230^2}{231^2}, = \frac{1}{115}$; p and q are the ſine and coſine of 23° 28', viz. 0,39822 and 0,91729.

Theſe data give $N = \frac{1}{141030}$ and $P = \frac{1}{61224}$ of which the logarithms are 4.85069 and 5.21308, viz. the arithmetical complements of 5.14931 and 4.78692.

44
Example of the utility of the inveſtigation.

Let us, for an example of the uſe of this inveſtigation, compute the preceſſion of the equinoxes when the ſun has moved from the vernal equinox to the ſummer ſolſtice, ſo that z is 90°, or 324000''.

Log 324000''=z - -	5.51055
Log P - - - -	5.21308
Log 5'',292 - - -	0.72363

The preceſſion therefore in a quarter of a year is 5,292 ſeconds; and, ſince it increaſes uniformly, it is 21'',168 annually.

45
Aſſumptions on which the computation proceeds.

We muſt now recollect the aſſumptions on which this computation proceeds. The earth is ſuppoſed to be homogeneous, and the ratio of its equatorial diameter to its polar axis is ſuppoſed to be that of 231 to 230. If the earth be more or leſs protuberant at the equator, the preceſſion will be greater or leſs in the ratio of this protuberance. The meaſures which have been taken of the degrees of the meridian are very inconſiſtent among themſelves; and although a compariſon of them all indicates a ſmaller protuberancy, nearly $\frac{1}{311}$ inſtead of $\frac{1}{231}$, their differences are too great to leave much confidence in this method. But if this figure be thought more probable, the preceſſion will be reduced to about 17'' annually. But even though the figure of the earth were accurately determined, we have no authority to ſay that it is hemogeneous. If it be denſer towards the centre, the momentum of the protuberant matter will not be ſo great as if it were equally denſe with the inferior parts, and the preceſſion will be diminiſhed on this account. Did we know the proportion of the matter in the moon to that in the ſun, we could eaſily determine the proportion of the whole obſerved annual preceſſion of 50⅓'' which is produced by the ſun's action. But we have no unexceptionable data for determining this; and we are rather obliged to infer it from the effect which ſhe produces in diſturbing the regularity of the preceſſion, as will be conſidered immediately. So far, therefore, as we have yet proceeded in this inveſtigation, the reſult is very uncertain. We have only aſcertained unqueſtionably the law which is obſerved in the ſolar preceſſion. It is probable, however, that this preceſſion is not very different from 20'' annually; for the phenomena of the tides ſhow the diſturbing force of the ſun to be very nearly ⅖ of the diſturbing force of the moon. Now 20'' is ⅖ of 50''.

46
Effect of the moon's action on the protuberant matter of the earth.

But let us now proceed to conſider the effect of the moon's action on the protuberant matter of the earth; and as we are ignorant of her quantity of matter, and conſequently of her influence in ſimilar circumſtances with the ſun, we ſhall ſuppoſe that the diſturbing force of the moon is to that of the ſun as m to 1. Then *(cæteris paribus)* the preceſſion will be to the ſolar preceſſion π in the ratio of the force and of the time of its action jointly. Let t and T therefore repreſent a periodical month and year, and the lunar proceſſion will be $= \frac{m\pi t}{T}$. This preceſſion muſt be reckoned on the plane of the lunar orbit, in the ſame manner as the ſolar preceſſion is reckoned on the ecliptic. We muſt alſo obſerve, that $\frac{m\pi t}{T}$ repreſents the lunar preceſſion only on the ſuppoſition that the earth's equator is inclined to the lunar orbit in an angle of 23½ degrees. This is indeed the mean inclination; but is ſometimes increaſed to above 28°, and ſometimes reduced to 18°. Now in the value of the ſolar preceſſion the coſine of the obliquity was employed. Therefore whatever is the angle E contained between the equator and the lunar orbit, the preceſſion will be $= \frac{m\pi t}{T} \cdot \frac{\text{Coſ. E}}{\text{Coſ. } 23\frac{1}{2}^\circ}$, and it muſt be reckoned on the lunar orbit.

47

Now let ♈B (fig. 8.) be the immoveable plane of the ecliptic, ♈ED♎F the equator in its firſt ſituation, before it has been deranged by the action of the moon, AGRDBH the equator in its new poſition, after the momentary action of the moon. Let EGNFH be the moon's orbit, of which N is the aſcending node, and the angle N=5° 8' 46''.

Let N♈ the long. of the node be -	z
Sine N♈ - - - -	x
Coſine N♈ - - - -	y
Sine ♈ =23½ - - -	a
Coſine ♈ - - - -	b
Sine N=5.8.46 - - -	c
Coſine N - - - -	d
Circumference to radius 1,=6,28 -	e

Force

Force of the moon - -	m
Solar preceſſion (ſuppoſed = $14\frac{1}{2}''$ by obſervation) - - -	π
Revolution of ☾ = $27^{d}\frac{1}{3}$ - -	t
Revolution of ☉ = $366\frac{1}{4}$ - -	T
Revolution of N = 18 years 7 months -	n

48 Lunar preceſſion in a month reduced to the ecliptic.

In order to reduce the lunar preceſſion to the ecliptic, we muſt recollect that the equator will have the ſame inclination at the end of every half revolution of the ſun or of the moon, that is, when they paſs through the equator, becauſe the ſum of all the momentary changes of its poſition begins again each revolution. Therefore if we neglect the motion of the node during one month, which is only $1\frac{1}{2}$ degrees, and can produce but an inſenſible change, it is plain that the moon produces, in one half revolution, that is, while ſhe moves from H to G, the greateſt difference that ſhe can in the poſition of the equator. The point D, therefore, half-way from G to H, is that in which the moveable equator cuts the primitive equator, and DE and DF are each 90°. But S being the ſolſtitial point, ♈S is alſo 90°. Therefore DS=♈E. Therefore, in the triangle DGE, we have ſin. ED : ſin. G=ſin. EG : ſin. D, =EG : D. Therefore D=EG× ſin. G, =EG× ſin. E nearly. Again, in the triangle ♈DA we have ſin. A : ſin. ♈D (or coſ. ♈E) = ſin. D : ſin. ♈A, = D : ♈A. Therefore

$$\Upsilon A = \frac{D\cdot\text{Coſ. }\Upsilon E}{\text{Sin. A}}, = \frac{EG\cdot\text{Sin. E}\cdot\text{Coſ. }\Upsilon E}{\text{Sin. }23\frac{1}{2}}, = \frac{m\pi t}{T}\;\frac{\text{Sin. E}\cdot\text{Coſ. E}\cdot\text{Coſ. }\Upsilon E}{\text{Sin. }\Upsilon\cdot\text{Coſ. }\Upsilon}.$$

49 This is the lunar preceſſion produced in the courſe of one month, eſtimated on the ecliptic, not conſtant like the ſolar preceſſion, but varying with the inclination or the angle E or F, which varies both by a change in the angle N, and alſo by a change in the poſition of N on the ecliptic.

50 Nutation in the ſame time,

We muſt find in like manner the nutation SR produced in the ſame time, reckoned on the colure of the ſolſtices RL. We have R : ſin. DS=D : RS, and RS=D · ſin. DS,=D · ſin. ahE. But D=EG · ſin. E. Therefore RS=EG · ſin. E · ſin. ♈E, $=\frac{m\pi t\ \text{Coſ. E}}{T\cdot\text{Coſ. }\Upsilon}$ × ſin. E × ſin. ♈E. In this expreſſion we muſt ſubſtitute the angle N, which may be conſidered as conſtant during the month, and the longitude ♈N, which is alſo nearly conſtant, by obſerving that ſin. E : ſin. ♈N=ſin. N : ſin. ♈E. Therefore $\text{RS}=\frac{m\pi t}{T}\times\frac{\text{Sin.N}\cdot\text{Sin.}\,\Upsilon\text{N}\cdot\text{Coſ.E.}}{\text{Coſ. }\Upsilon}$

But we muſt exterminate the angle E, becauſe it changes by the change of the poſition of N. Now, in the triangle EN♈ we have coſ. E=coſ. ♈N· ſin. N · ſin. ♈— coſ. N · coſ. ♈, $=yca-db$. And becauſe the angle E is neceſſarily obtuſe, the perpendicular will fall without the triangle, the coſine of E will be negative, and we ſhall have coſ. E$=bd-acy$. Therefore the nutation for one month will be $=\frac{m\pi t}{T}\times\frac{cx(bd-acy)}{b}$, the node being ſuppoſed all the while in N.

51 May be conſidered as momentary parts of the moon's action.

Theſe two expreſſions of the monthly preceſſion and nutation may be conſidered as momentary parts of the moon's action, correſponding to a certain poſition of the node and inclination of the equator, or as the fluxions of the whole variable preceſſion and nutation, while the node continually changes its place, and in the ſpace of 18 years makes a complete tour of the heavens.

52 Preceſſion and nutation compared.

We muſt, therefore, take the motion of the node as the fluent of compariſon, or we muſt compare the fluxions of the node's motion with the fluxions of the preceſſion and nutation; therefore, let the longitude of the node be z, and its monthly change$=\dot{z}$; we ſhall then have $t:n=\dot{z}:e$, and $t=\frac{n\dot{z}}{e}, =\frac{n\dot{x}}{e\sqrt{1-x^2}}$. Let T be = 1, in order that n may be 18,6, and ſubſtitute for t its value in the fluxion of the nutation, by putting $\sqrt{1-x^2}$ in place of y. By this ſubſtitution we obtain $m\pi n\frac{c}{eb}\left(\frac{dbx\dot{x}}{\sqrt{1-x^2}}-acx\dot{x}\right)$. The fluent of this is $m\pi n\frac{c}{eb}\left(-db\sqrt{1-x^2}-\frac{acx^2}{2}\right)$. (*Vide* Simpſon's Fluxions, § 77). But when x is $=o$, the nutation muſt be $=o$, becauſe it is from the poſition in the equinoctial points that all our deviations are reckoned, and it is from this point that the periods of the lunar action recommences. But if we make $x=o$ in this expreſſion, the term $-\frac{acx^2}{2}$ vaniſhes, and the term $-db\sqrt{1-x^2}$ becomes $=-db$; therefore our fluent has a conſtant part $+db$; and the complete fluent is $m\pi n\frac{c}{eb}\left(db-db\sqrt{1-x^2}-\frac{acx^2}{2}\right)$. Now this is equal to $m\pi n\frac{c}{eb}$(db× verſed ſine, $z-\frac{1}{4}ac$× verſed ſine $2z$): For the verſed ſine of z is equal to (1— coſ. z); and the ſquare of the ſine of an arch is $\frac{1}{2}$ the verſed ſine of twice that arch.

53 This, then, is the whole nutation while the moon's aſcending node moves from the vernal equinox to the longitude ♈N=z. It is the expreſſion of a certain number of ſeconds, becauſe π, one of its factors, is the ſolar preceſſion in ſeconds; and all the other factors are numbers, or fractions of the radius 1; even e is expreſſed in terms of the radius 1.

54 The fluxion of the preceſſion, or the monthly preceſſion, is to that of the nutation as the cotangent of ♈E is to the ſine of ♈. This alſo appears by conſidering figure 7. Pp meaſures the angle A, or change of poſition of the equator; but the preceſſion itſelf, reckoned on the ecliptic, is meaſured by Po, and the nutation by po; and the fluxion of the preceſſion is equal to the fluxion of nutation × $\frac{\text{cot. }\Upsilon E}{\text{ſine }\Upsilon}$, but cot. ♈E $=\frac{ad+bcy}{cx}$; therefore $\frac{\text{cot. }\Upsilon E}{\text{ſine }\Upsilon}=\frac{ad+bc\sqrt{1-x^2}}{cx}$: This, multiplied into the fluxion of the nutation, gives $\frac{m\pi n}{abe}\left(\frac{abd^2}{\sqrt{1-xx}}+(b^2-a^2)dc-abc^2.\sqrt{1-xx}\right)\dot{x}$ for the monthly preceſſion. The fluent of this $\frac{m\pi n}{abe}\left(ad^2bz+(b^2-a^2)dcx-\frac{1}{2}abc^2z-\frac{1}{2}abc^2x\sqrt{1-x^2}\right)$, or it is equal to $\frac{m\pi n}{abe}\left((d^2-\frac{1}{2}c^2)abz+(b^2-a^2)dcz-\frac{1}{4}abc^2\text{ ſine }2z\right)$.

55 Let us now expreſs this in numbers: When the node has made a half revolution, we have $z=180°$, whoſe verſed ſine is 2, and the verſed ſine of $2z$, or 360°, is $=0$; therefore, after half a revolution of the node, the nutation (n° 52.) becomes $\frac{m\pi n c}{eb} 2bd$. If, in this expreſſion, we ſuppoſe $m=2\frac{1}{2}$, and $\pi=14\frac{1}{2}''$, we ſhall find the nutation to be $19\frac{1}{5}''$.

56 Now the obſerved nutation is about 18″. This requires m to be $2\frac{1}{10}$, and $\pi=16\frac{1}{4}''$. But it is evident, that no aſtronomer can pretend to warrant the accuracy of his obſervations of the nutation within 1″.

To find the lunar preceſſion during half a revolution of the node, obſerve, that then z becomes $=\frac{e}{2}$, and the ſine of z and of $2z$ vaniſh, d^2 becomes $1-c^2$, and the preceſſion becomes $\frac{m\pi n}{2}(d^2-\frac{1}{2}c^2)$, $=\frac{m\pi n}{2}(1-\frac{3}{2}c^2)$, and the preceſſion in 18 years is $m\pi n\,\overline{1-\frac{3}{2}c^2}$.

57 We ſee, by comparing the nutation and preceſſion for nine years, that they are as $\frac{4cd}{e}$ to $1-\frac{3}{2}c^2$ nearly as 1 to $17\frac{1}{3}$. This gives 313″ of preceſſion, correſponding to 18″, the obſerved nutation, which is about 35″ of preceſſion annually produced by the moon.

58 Gives the diſturbing force and matter of the moon.

And thus we ſee, that the inequality produced by the moon in the preceſſion of the equinoxes, and, more particularly, the nutation occaſioned by the variable obliquity of her orbit, enables us to judge of her ſhare in the whole phenomenon; and therefore informs us of her diſturbing force, and therefore of her quantity of matter. This phenomenon, and thoſe of the tides, are the only facts which enable us to judge of this matter: and this is one of the circumſtances which has cauſed this problem to occupy ſo much attention. Dr Bradley, by a nice compariſon of his obſervations with the mathematical theory, as it is called, furniſhed him by Mr Machin, found that the equation of preceſſion computed by that theory was too great, and that the theory would agree better with the obſervations, if an ellipſe were ſubſtituted for Mr Machin's little circle. He thought that the ſhorter axis of this ellipſe, lying in the colure of the ſolſtices, ſhould not exceed 16″. Nothing can more clearly ſhow the aſtoniſhing accuracy of Bradley's obſervations than this remark: for it reſults from the theory, that the pole muſt really deſcribe an ellipſe, having its ſhorter axis in the ſolſtitial colure, and the ratio of the axes muſt be that of 18 to 16,8; for the mean preceſſion during a half revolution of the node is $\frac{m\pi n}{2}(d^2-\frac{c^2}{2})$; and therefore, for the longitude z, it will be $\frac{z m\pi n}{e}(d^2-\frac{c^2}{2})$; when this is taken from the true preceſſion for that longitude (n° 54.), it leaves the equation of preceſſion $\frac{m\pi n}{abe}\left((b^2-a^2)\,dc\cdot\text{ſine }z-\frac{1}{4}abc\text{ ſine }2z\right)$; therefore, when the node is in the ſolſtice, and the equation greateſt, we have it $=\frac{m\pi ncd}{abe}(b^2-a^2)$. We here neglect the ſecond term as inſignificant.

59 Greateſt equation of preceſſion.

This greateſt equation of preceſſion is to $\frac{2m\pi ncd}{6}$, the nutation of 18″, as b^2-a^2 to $2ab$; that is, as radius to the tangent of twice the obliquity of the ecliptic. This gives the greateſt equation of preceſſion 16″,8, not differing half a ſecond from Bradley's obſervations.

Thus have we attempted to give ſome account of this curious and important phenomenon. It is curious, becauſe it affects the whole celeſtial motions in a very intricate manner, and received no explanation from the more obvious application of mechanical principles, which ſo happily accounted for all the other appearances. It is one of the moſt illuſtrious proofs of Sir Iſaac Newton's ſagacity and penetration, which catched at a very remote analogy between this phenomenon and the libration of the moon's orbit. It is highly important to the progreſs of practical and uſeful aſtronomy, becauſe it has enabled us to compute tables of ſuch accuracy, that they can be uſed with confidence for determining the longitude of a ſhip at ſea. This alone fixes its importance: but it is ſtill more important to the philoſopher, affording the moſt inconteſtable proof of the univerſal and mutual gravitation of all matter to all matter. It left nothing in the ſolar ſyſtem unexplained from the theory of gravity but the acceleration of the moon's mean motion; and this has at laſt been added to the liſt of our acquiſitions by Mr de la Place.

PRECIÆ, (*precius*, "early,") the name of the 21ſt order in Linnæus's fragments of a natural method; conſiſting of primroſe, an early flowering plant, and a few genera which agree with it in habit and ſtructure, though not always in the character or circumſtance expreſſed in the title. See BOTANY, p. 461 col. 2.

PRECIPITANT, in chemiſtry, is applied to any liquor, which, when poured on a ſolution, ſeparates what is diſſolved, and makes it precipitate, or fall to the bottom of the veſſel.

PRECIPITATE, in chemiſtry, a ſubſtance which, having been diſſolved in a proper menſtruum, is again ſeparated from its ſolvent, and thrown down to the bottom of the veſſel, by pouring ſome other liquor upon it.

PRECIPITATION. See *CHEMISTRY-Index.*

PRECOGNITION, in Scots law. See LAW, Part III. n° CLXXXVI. 43.

PRECORDIA, in anatomy, a general name for the parts ſituated about the heart, in the forepart of the thorax: as the diaphragm, pericardium, and even the heart itſelf, with the ſpleen, lungs, &c.

PREDECESSOR, properly ſignifies a perſon who has preceded or gone before another in the ſame office or employment; in which ſenſe it is diſtinguiſhed from anceſtor.

1 The doctrine ſtated.

PREDESTINATION, the decree of God, whereby he hath from all eternity unchangeably appointed whatſoever comes to paſs; and hath more eſpecially fore-ordained certain individuals of the human race to everlaſting

everlaſting happineſs, and hath paſſed by the reſt, and fore-ordained them to everlaſting miſery. The former of theſe are called the *elect*, and the latter are called the *reprobate*.

2 Not peculiar to Chriſtianity.

This doctrine is the ſubject of one of the moſt perplexing controverſies that has occurred among mankind. But it is not altogether peculiar to the Chriſtian faith. The opinion, that whatever occurs in the world at large, or in the lot of private individuals, is the reſult of a previous and unalterable arrangement by that Supreme Power which preſides over nature, has always been a favourite opinion among the vulgar, and has been believed by many ſpeculative men. Thus, in that beautiful ſcene in the ſixth book of the Iliad, Hector, taking leave of his wife and his child, ſpeaks thus:

> Andromache! my ſoul's far better part,
> Why with untimely ſorrows heaves thy heart?
> No hoſtile hand can antedate my doom,
> Till fate condemns me to the ſilent tomb.
> Fix'd is the term to all the race of earth,
> And ſuch the hard condition of our birth.
> No force can then reſiſt, no flight can ſave,
> All ſink alike, the fearful and the brave. l. 624.

The ancient Stoics, Zeno and Chryſippus, whom the Jewiſh Eſſenes ſeem to have followed, aſſerted the exiſtence of a Deity that, acting wiſely, but neceſſarily, contrived the general ſyſtem of the world; from which, by a ſeries of cauſes, whatever is now done in it unavoidably reſults. This ſeries, or concatenation of cauſes, they held to be neceſſary in every part; and that God himſelf is ſo much the ſervant of neceſſity, and of his own decrees, that he could not have made the ſmalleſt object in the world otherwiſe than it now is, much leſs is he able to alter any thing.

According to the words of Seneca, *Eadem neceſſitas et Deos alligat. Irrevocabilis divina pariter atque humana curſus vehit. Ille ipſe omnium conditor ac rector ſcripſit quidem fata ſed ſequitur. Semper paret, ſemel juſſit.* "The ſame chain of neceſſity conſtrains both gods and men. Its unalterable courſe regulates divine as well as human things. Even he who wrote the Fates, the Maker and Governor of all things, ſubmits to them. He did but once command, but he always obeys." The ſtoical fate differs, however, from the Chriſtian predeſtination in ſeveral points. They regarded the divine nature and will as a neceſſary part of a neceſſary chain of cauſes; whereas the Chriſtians conſider the deity as the Lord and Ruler of the Univerſe, omnipotent and free, appointing all things according to his pleaſure. Being doubtful of the immortality of the ſoul, the Stoics could have no idea of the doctrine of election and reprobation; nor did they ever doubt their own freedom or will, or power of doing good as well as evil, as we ſhall preſently ſee the Chriſtian predeſtinarians have done.

Mahomet introduced into his Koran the doctrine of an abſolute predeſtination of the courſe of human affairs. He repreſented life and death, proſperity and adverſity, and every event that befals a man in this world, as the reſult of a previous determination of the one God who rules over all; and he found this opinion the beſt engine for inſpiring his followers with that contempt of danger which, united to their zeal, has extended the empire of their faith over the faireſt portion of the habitable globe.

3 When firſt agitated in the church.

The controverſy concerning predeſtination firſt made its appearance in the Chriſtian church about the beginning of the fifth century †. Pelagius a Britiſh, and Cœleſtius an Iriſh, monk, both lived at Rome during that period, and poſſeſſed great celebrity on account of their piety and learning. They taught that the opinion is falſe, which aſſerts, that human nature is neceſſarily corrupted by a depravity derived from our firſt parents.—They contended, that men are born at preſent in a ſtate as pure as that in which Adam was originally created; and that they are not leſs qualified than he was for fulfilling all righteouſneſs, and for reaching the moſt ſublime eminence of piety and virtue: that the external grace of God, which is given unto all, and attends the preaching of the goſpel, is neceſſary to call forth the attention and exertions of men; but that we do not want the aſſiſtance of any internal grace to purify the heart, and to give it the firſt impulſe towards what is good. Having fled into Africa on account of the Goths, who at that time invaded Italy, A. D. 410, Cœleſtius remained at Carthage as a Preſbyter; but Pelagius went into the Eaſt, where he ſettled, and proſpered under the patronage of John biſhop of Jeruſalem, to whom his ſentiments were agreeable. On the contrary, the celebrated Auguſtine, biſhop of Hippo, ſtrenuouſly aſſerted the depravity of human nature ſince the fall of the firſt man, the neceſſity of a ſpecial interpoſition of divine grace to enable us to do any one good action; and conſequently, that none could obtain ſalvation excepting thoſe whom God has thought fit to elect, and upon whom he beſtows this grace. The diſpute was carried on with great zeal. Zozimus biſhop of Rome decided at firſt in favour of Pelagius and Cœleſtius, whoſe followers were called *Pelagians*; but he afterwards altered his opinion: and by the activity of Auguſtine, the council of Epheſus was called, at which the opinion of his antagoniſts was formally condemned.

4 Auguſtine a predeſtinarian.

In the courſe of the ſame century, theſe opinions aſſumed a variety of forms and modifications. One party, called *Predeſtinarians*, carried Auguſtine's doctrine fully farther than he himſelf had ventured to do in expreſs words; and aſſerted, that God had not only predeſtinated the wicked to *puniſhment*, but alſo that he had decreed that they ſhould commit thoſe very *ſins* on account of which they are hereafter to be puniſhed.—Another party moderated the doctrine of Pelagius, and were called *Semipelagians*. Their peculiar opinion is expreſſed in a different manner by different writers; but all the accounts ſufficiently agree. Thus, ſome repreſent them as maintaining that inward grace is not neceſſary to the firſt beginning of repentance, but only to our progreſs in virtue. Others ſay, that they acknowledged the power of grace, but ſaid that faith depends upon ourſelves, and good works upon God; and it is agreed upon all hands, that theſe Semipelagians held that predeſtination is made upon the foreſight of good works. The aſſiſtance of Auguſtine, though then far advanced in life, was called in to combat theſe tenets, and he wrote ſeveral treatiſes upon the ſubject. In all theſe he ſtrenuouſly maintained, that the predeſtination of the elect was independent of any foreſight

---

† Moſheim. Inſtit. Hiſt. Eccl.

of their good works, but was according to the good pleaſure of God only; and that perſeverance comes from God, and not from man. Thereafter the doctrine of Auguſtine, or St Auſtin as he is often called, became general. He was the oracle of the ſchoolmen. They never ventured to differ from him in ſentiment; they only pretended to diſpute about the true ſenſe of his writings.

5 And all the earlieſt reformers, but more eſpecially Calvin.

The whole of the earlieſt reformers maintained theſe opinions of Auguſtine. They aſſumed under Luther a more regular and ſyſtematic form than they had ever formerly exhibited. But as the Lutherans afterwards abandoned them, they are now known by the name of *Calviniſtic Doctrines*, from John Calvin of Geneva. He aſſerted, that the everlaſting condition of mankind in a future world was determined from all eternity by the unchangeable decree of the Deity, ariſing from his ſole good pleaſure or free will. Being a man of great ability, induſtry, and eloquence, Geneva, where he taught, and which was a free ſtate, ſoon became the reſort of all the men of letters belonging to the reformed churches, and was a kind of ſeminary from which miſſionaries iſſued to propagate the Proteſtant doctrines through Europe. Their ſucceſs was ſuch, that, excepting a part of Germany, the principles of all the reformed churches are profeſſedly Calviniſtic or predeſtinarian.

6 Riſe of the Arminians

The opponents of the doctrine of predeſtination among the Proteſtants uſually receive the appellation of *Arminians* or *Remonſtrants*. They derive the firſt of theſe appellations from James Arminius, who was, A. D. 1602, appointed * profeſſor of theology at Leyden. He was violently oppoſed by Gomer his colleague, and died A. D. 1609. After his death, the controverſy was conducted with great eagerneſs on both ſides. The Calviniſts, however, gradually prevailed. A ſynod was called at Dort, A. D. 1618, to which the moſt celebrated divines of different countries were invited. There, in a great meaſure by the authority and influence of Maurice prince of Orange, the Arminians were condemned as heretics; for by this time ambitious and powerful men found themſelves politically intereſted in this religious conteſt. The Arminians preſented to this ſynod a remonſtrance, containing a ſtatement of their faith upon the ſubjects in diſpute; and from this they derived the appellation of *Remonſtrants*. This ſtatement contained the following five articles: 1. That God from all eternity predeſtinated thoſe to everlaſting ſalvation whom he foreſaw would believe in Chriſt unto the end of their lives; and predeſtinated obſtinate unbelievers to everlaſting puniſhment. 2. Jeſus Chriſt died for the whole human race, and for every individual of it, but believers alone reap the benefit of his death. 3. No man can produce faith in his mind by his own free will, but it is neceſſary that man, who is by nature wicked and unfit for acting or thinking aright, ſhould be regenerated by the grace of the Holy Spirit, imparted by God for Chriſt's ſake. 4. This divine grace conſtitutes the ſource, the progreſs, and the fulfilment, of all that is good in man; but it is not irreſiſtible in its operation. 5. Believers, by the aſſiſtance of the Holy Spirit, are abundantly fitted for every good work; but whether it is poſſible for thoſe who have once been truly ſuch to fall away, and to periſh finally, is not clear, and muſt be better inquired into by ſearching the ſacred ſcriptures.

7 Calviniſtic doctrine of predeſtination.

In oppoſition to theſe, a counter-remonſtrance was preſented, containing the opinions of the Calviniſts, which was approved of by the ſynod. The ſubſtance of it was afterwards adopted, and in nearly the ſame expreſſions, into the Confeſſion of Faith compiled by the aſſembly of divines which met at Weſtminſter, A. D. 1643, and which every clergyman and probationer for the miniſtry in Scotland is at preſent required to ſubſcribe previous to his admiſſion. To give as clear and as fair an idea as poſſible of the Calviniſtic doctrine upon this head, we tranſcribe the following paſſage from that Confeſſion: "God from all eternity did, by the moſt wiſe and holy counſel of his own will, freely and unchangeably ordain whatſoever comes to paſs; yet ſo, as thereby neither is God the author of ſin, nor is violence offered to the will of the creatures, nor is the liberty or contingency of ſecond cauſes taken away, but rather eſtabliſhed. Although God knows whatſoever may or can come to paſs upon all ſuppoſed conditions; yet hath he not decreed any thing becauſe he forſaw it as future, or that which would come to paſs upon ſuch conditions. By the decree of God, for the manifeſtation of his glory, ſome men and angels are predeſtinated unto everlaſting life, and others are fore-ordained to everlaſting death. Theſe angels and men, thus predeſtinated and fore-ordained, are particularly and unchangeably deſigned; and their number is ſo certain and definite, that it cannot be either increaſed or diminiſhed. Thoſe of mankind that are predeſtinated unto life, God, before the foundation of the world was laid, according to his eternal and immutable purpoſe, and the ſecret council and good pleaſure of his will, hath choſen, in Chriſt, unto everlaſting glory, out of his mere free grace and love, without any foreſight of faith, or good works, or perſeverance in either of them, or any other thing in the creature, as conditions or cauſes moving him thereunto; and all to the praiſe of his glorious grace. As God hath appointed the elect unto glory, ſo hath he, by the eternal and moſt free purpoſe of his will, fore-ordained all the means thereunto. Wherefore, they who are elected, being fallen in Adam, are redeemed by Chriſt, are effectually called unto faith in Chriſt, by his ſpirit working in due ſeaſon; are juſtified, adopted, ſanctified, and kept, by his power through faith unto ſalvation. Neither are any other redeemed by Chriſt, effectually called, juſtified, adopted, ſanctified, and ſaved, but the elect only. The reſt of mankind, God was pleaſed, according to the unſearchable council of his own will, whereby he extendeth or with-holdeth mercy as he pleaſeth, for the glory of his ſovereign power over his creatures, to paſs by, and to ordain them to diſhonour and wrath for their ſin, to the praiſe of his glorious juſtice."

8 Supralapſarians and Sublapſarians.

There are two kinds of Calviniſts or Predeſtinarians, viz. the *Supralapſarians*, who maintain that God did originally and expreſsly decree the fall of Adam, as a foundation for the diſplay of his juſtice and mercy; while thoſe who maintain that God only *permitted* the fall of Adam, are called *Sublapſarians*, their ſyſtem of decrees concerning election and reprobation being, as it were, ſubſequent to that event. But, as Dr Prieſtley juſtly remarks, if we admit the divine preſcience, there

---

* Relatio Hiſtorica de Origine et Progreſſu Controverſiarum in Fœderato Belgio de Prædeſtinatione Philippi a Limborch.

is not, in fact, any difference between the two ſchemes; and accordingly that diſtinction is now ſeldom mentioned.

9 Diſputes in the church of Rome on the ſubject.

Nor is the church of Rome leſs agitated by the conteſt about predeſtination than the firſt Proteſtants were. The council of Trent was much perplexed how to ſettle the matter without giving offence to the Dominicans, who were much attached to the doctrine of Auguſtine, and poſſeſſed great influence in the council. After much diſpute, the great object came to be, how to contrive ſuch a decree as might give offence to nobody, although it ſhould decide nothing. Upon the whole, however, they ſeem to have favoured the Semipelagian ſcheme. Among other things, it was determined, that good works are of themſelves meritorious to eternal life; but it is added, by way of ſoftening, that it is through the goodneſs of God, that he makes his own gifts to be merits in us. Catarin revived at that council an opinion ot ſome of the ſchoolmen, that God choſe a ſmall number of perſons, ſuch as the bleſſed virgin, the apoſtles, &c. whom he was determined to ſave without any foreſight of their good works; and that he alſo wills that all the reſt ſhould be ſaved, providing for them all neceſſary means, but they are at liberty to uſe them or not. This is called the *Baxterian* ſcheme in England, from one of its promoters there. But at all events, the council of Trent ſeems to have been extremely anxious that any opinions entertained among them concerning predeſtination might have as little influence as poſſible upon practical morality. "Let no man (ſay they), while he remains in this mortal ſtate, preſume that he is among the number of the elect, and that therefore he cannot ſin, or ſin without repentance; for it cannot be known who are elected without a ſpecial revelation from God." Seſ. 6. c. 13.

The Jeſuits at firſt followed the opinion of Auguſtine; but they afterwards forſook it. *Molina*, one of their order, was the author of what is called the *middle ſcheme*, or the doctrine of *a grace ſufficient for all men*, but ſubject to the freedom of the human will. *Janſenius*, a doctor of Louvain, oppoſed the Jeſuits with great vigour, and ſupported the doctrine of Auguſtine. He wrote in a very artful manner. He declared, that he did not preſume to ſtate his own ſentiments upon the ſubject; he pretended only to explain and publiſh the ſentiments of that great father of the church St Auguſtine. But the Jeſuits, in conſequence of that inviolable ſubmiſſion to the authority of the pope which they always maintained, had ſufficient intereſt at Rome to procure the opinions of Janſenius to be condemned there; but with this addition ſubjoined, that nothing was thereby intended to be done in prejudice of the doctrine of St Auguſtine. This produced an abſurd diſpute about the pope's infallibility in matters of fact. The Janſeniſts affirmed, that the Pope had made a miſtake in condemning the opinions of Janſenius as different from thoſe of Auguſtine; whereas in truth they are the ſame, and the one cannot be condemned without the other. But the Jeſuits affirmed, that the pope is no leſs infallible in points of fact than he is in queſtions of faith; and he having decided, that the opinions of Janſenius are different from thoſe of St Auguſtine, every good Catholic is bound to believe accordingly that they are different. Theſe diſputes have never been fully ſettled, and ſtill divide the Roman Catholic churches. Some of the ableſt ſupporters of predeſtination have appeared among the Janſeniſts, and particularly among the gentlemen of Port Royal.

10 Engliſh and Scotch reformers predeſtinarians.

With regard to Great Britain, the earlieſt Engliſh reformers were in general Sublapſarians, although ſome of them were Supralapſarians. But the rigid Predeſtinarians have been gradually declining in number in that church, although they ſtill ſubſcribe the 39 articles of their faith, which are unqueſtionably Calviniſtic. The celebrated Scotch reformer John Knox having been educated at Geneva, eſtabliſhed in his country the doctrine of predeſtination in its ſtricteſt form: and it has probably been adhered to with more cloſeneſs in Scotland than in any country in Europe.

Of late years, however, the diſpute concerning predeſtination has aſſumed a form conſiderably different from that which it formerly poſſeſſed. Inſtead of being conſidered as a point to be determined almoſt entirely by the ſacred ſcriptures, in the hands of a number of able writers, it has in a great meaſure reſolved itſelf into a queſtion of natural religion, under the head of the philoſophical liberty or neceſſity of the will (A); or, whether all human actions are or are not neceſſarily determined

---

(A) Dr Prieſtley, the moſt celebrated Neceſſarian of the age, has written a whole ſection of his *Illuſtrations*, with a view to ſhow, that between "the two ſchemes of Calviniſtic predeſtination and philoſophical neceſſity, there is no ſort of reſemblance, except that the future happineſs or miſery of all men is certainly foreknown and appointed by God. In all other reſpects (ſays he) they are moſt eſſentially different; and even where they agree in the *end*, the difference in the *manner* by which that end is accompliſhed is ſo very great, that the *influence* of the two ſyſtems on the minds of thoſe that adopt and act upon them is the reverſe of one another." The Calviniſtic doctrine of predeſtination, according to a very authentic ſtatement of that doctrine*, is, that "God, for his own glory, hath *fore-ordained whatſoever comes to paſs*." The ſcheme of philoſophical neceſſity, as ſtated by an intimate friend and warm admirer of Dr Prieſtley's, is, "That *every thing* is *predetermined* by the Divine Being; that whatever has been, muſt have been; and that whatever will be, muſt be; that *all events* are *pre-ordained* by infinite wiſdom and unlimited goodneſs; that the will, in all its determinations, is governed by the ſtate of mind; that this ſtate of mind is in every inſtance determined by the Deity; and that there is a continued chain of cauſes and effects, of motives and actions inſeparably connected, and originating from the condition in which we are brought into exiſtence by the Author of our being." The *author* or *compiler* of the ſame book affirms. "That all motion indeed originates in the Deity; that the Deity is ſelf-moved; that he poſſeſſes the ſingular attribute underived of moving himſelf." But it is added in the very ſame paragraph from which this laſt ſentence is quoted, that "the very argument we employ to prove one underived ſource of motion, and

* Shorter Catechiſm of the Aſſembly of Divines at Weſtminſter.

termined by motives ariſing from the character which God has impreſſed on our minds, and the train of circumſtances amidſt which his providence has placed us? We have already diſcuſſed this point (See METAPHYSICS) by giving a candid ſtatement of the arguments on both ſides of the queſtion. We ſhall treat the ſubject of predeſtination in the ſame manner, avoiding as far as poſſible any recapitulation of what has been advanced under the head of *NECESSITY and Liberty*.

11 Points at iſſue between the predeſtinarians and their opponents.

From what has been already ſaid, it will appear that the points chiefly at iſſue between the parties are the following: Firſt, With what views and purpoſes did God create the world and frame his decrees concerning mankind? Did he contrive a great unalterable ſcheme of creation and providence only for the ſake of manifeſting his own glory and perfections? Or did he firſt conſider the free motions of thoſe rational agents whom he intended to create, and frame his decrees upon the conſideration of what they might chooſe or do in all the various circumſtances in which he intended to place them?—The ſecond and following queſtions are branches of this leading one. Did Chriſt die for a particular portion of the human race, who ſhall therefore certainly be ſaved? or was his death intended as a benefit to all, from which none are excluded excepting thoſe who willingly reject it? Is the divine grace certainly and irreſiſtibly efficacious in all thoſe minds to which it is given? or does its effect depend upon the good uſe which men may or may not make of it? Can any good action be done without it? Do thoſe who have once received it certainly perſevere and obtain eternal ſalvation? or is it poſſible for any of them to fall away and periſh finally?

12 Arguments for the doctrine.

WE ſhall begin by ſtating the argument on the ſide of the predeſtinarians, and in the language which they commonly uſe. But it is neceſſary to make this previous remark, that the general * objections to their doctrine are, that it is hoſtile to all our ideas of the juſtice of God, repreſenting him as a partial being, rewarding without merit, and puniſhing without ſin; that it renders him the author of evil, deſtroys moral diſtinctions, makes uſeleſs every effort on our part, makes every prayer abſurd, and even the preaching of the goſpel vain; ſeeing that all things are immutably fixed, and none can believe or be ſaved excepting the elect, and they muſt certainly and at all events be ſafe. Againſt all this they reaſon thus.

The great and everlaſting Author of all things exiſted from eternity alone, independent and eſſentially perfect. As there was no other, he could only conſider himſelf and his own glory. He muſt therefore have deſigned all things in and for himſelf. To make him ſtay his determinations till he ſhould ſee what free creatures would do, is to make him decree with uncertainty, and dependently upon them, which falls ſhort of infinite perfection. He exiſted alone, and his councils could have no object excepting himſelf; he could only then conſider the diſplay of his own attributes and perfection. In doing this, as the end is more important than the means, Divine Wiſdom muſt begin its deſigns with that which is to come laſt in the execution of them; but the concluſion of all things at the laſt judgement will be the complete manifeſtation of the wiſdom, the goodneſs, and juſtice, of God: we muſt therefore ſuppoſe, that, in the order of things, he decreed that firſt, although with him, in the order of time, there is no firſt nor ſecond, but all is from eternity. When this great deſign was laid, the means were next deſigned. Creation, and its inhabitants of every order, form the means by which the author and diſpoſer of all things accompliſhes his will. But creatures in his ſight are nothing, and are figuratively ſaid to be leſs than nothing. We may entertain proud and elevated conceptions of our own dignity if we pleaſe; but if we in our deſigns regard not the duſt on which we tread, or the lives of ants and inſects, the omnipotent Lord of all, from whom we are more infinitely diſtant, muſt regard us as at leaſt equally inconſiderable, and only valuable as we ſerve the accompliſhment of his great and myſterious purpoſes, which cannot be us or our aggrandiſement, but himſelf and his own glory.

13 As neceſſary to explain the Divine attributes.

It is only by this view of the divine conduct that ſome of the attributes of God can be explained, or their exiſtence rendered poſſible. In the ſcriptures he claims the attribute of *preſcience* as his diſtinguiſhing prerogative: but there can be no preſcience of future contingencies; for it involves a contradiction to ſay, that things which are not certainly to be ſhould be certainly foreſeen. If they are certainly foreſeen, they *muſt* certainly be, and can therefore be no longer contingent. An uncertain foreſight is alſo an imperfect act, as it may be a miſtake, and is therefore inconſiſtent with divine perfection. On the other ſide the difficulty is eaſily explained. When God decrees that an event ſhall take place, its exiſtence becomes thenceforth certain, and as ſuch is certainly foreſeen. For it is an obvious abſurdity to ſay, that a thing happens freely, that is to ſay, that it may be or may not be, and yet that it is certainly foreſeen by God. He cannot foreſee things but as he decrees them, and conſequently gives them a future certainty of exiſtence; and therefore any preſcience antecedent to his decree muſt be rejected as impoſſible. Conditional decrees are farther abſurd, inaſmuch as they ſubject the purpoſes of God to the will and the actions of his creatures. Does he will, or wiſh that all mankind ſhould be ſaved, and ſhall they not all be ſaved? Infinite perfection can wiſh nothing but what it can execute; and if it is fit to wiſh, it is alſo fit to execute its wiſhes. We are indeed certainly informed by the ſcrip-

---

and exiſtence, is a groſs ſolecism in logic; and that the aſcription of this power to the Divine Being is in fact nothing elſe than the leſs of two palpable *abſurdities* or rather *impoſſibilities*, if theſe could admit of degrees.†"

The piety of theſe aſſertions will be obvious, we are perſuaded, to every one of our readers; but to ſome it is poſſible that their conſiſtency may not be apparent. We would adviſe all ſuch "to peruſe once and again Dr Prieſtley's Illuſtrations," which, we have the beſt authority to ſay, will remove from their minds all Libertarian prejudices, convince them "that the hypotheſis of neceſſity is incontrovertibly true," and ſhow them that all the defenders of that hypotheſis are in perfect harmony with themſelves and with one another!

[*] Calvini Reſponſ. contra Pighalum, ad 2um lib.

[†] Eſſay on Philoſophical Neceſſity by Alexander Crombie, A. M.

ſcriptures, that all ſhall not be ſaved; and we therefore as certainly conclude, that God never intended that they ſhould be ſo; *for the counſel of the Lord ſtandeth faſt, and the thoughts of his heart, to all generations.*

14 Chriſt died only for the elect.

We conclude upon the ſame principles, that although the bleſſings reſulting from the death of Chriſt are offered to all, yet that intentionally and actually he only died for thoſe whom the Father had choſen and given to him to be ſaved by him. That Chriſt ſhould have *died in vain* is repreſented by the apoſtle Paul as a great abſurdity (Gal. ii. 21.): but if he died for all, he muſt have died in vain with regard to the greater part of mankind who are not to be ſaved by him. In ſo far as ſome inferior bleſſings are concerned, which through him are communicated, if not to all men, at leaſt to all Chriſtians, he may perhaps juſtly be ſaid to have died for all: but with regard to eternal ſalvation, his deſign, to avoid rendering it fruitleſs, could go no farther than the ſecret purpoſe and election of God. This is implied in theſe words, *all that are given me of my Father, thine they were, and thou gaveſt them me.* To theſe his interceſſion is limited; *I pray not for the world, but for thoſe that thou haſt given me; for they are thine, and all thine are mine, and mine are thine* (Jo. xvii. 9, 10.) Univerſal words are indeed uſed with regard to the death of Chriſt: but the reaſon is obvious, the Jewiſh religion was confined to the family and deſcendants of Abraham. In contradiction to this, the goſpel is ſaid to be preached to *every creature*, and *to all the world*; becauſe it is not limited to any one race or nation, and becauſe the apoſtles received a general commiſſion to teach it unto all who ſhould be willing to receive it. Theſe extenſive expreſſions can only be underſtood in this manner, becauſe in their ſtrict acceptation they have never been verified. Nor can their meaning be carried farther without an imputation upon the juſtice of God: for if he has received a ſufficient ſatisfaction for the ſins of the whole world, it is not juſt that all ſhould not be ſaved by it, or at leaſt have the offer of ſalvation made to them, that they may accept of it if they pleaſe.

But to return to the divine purpoſes and attributes in general: it is in vain to aſſert that God is partial and unjuſt while he prefers without merit, and predeſtinates to puniſhment thoſe who have not yet offended. The ſame error miſleads men here that has ſo often ſeduced them from the true path of ſcientific reſearch. Inſtead of ſubmitting to the patient and humble obſervation of nature, they boldly form ſome plauſible hypotheſis of their own, and vainly attempt to reconcile every appearance to their favourite ſyſtem. This mode of procedure never has proved, and never will prove, ſucceſsful in any branch of true philoſophy. We are not entitled to frame to ourſelves certain notions of the juſtice of God, and from theſe to decide that thus he muſt act and in no other manner. He takes no counſel from us concerning his conduct, and we have no right to rejudge his judgments. What he regards as juſt or unjuſt between himſelf and his creatures, is a queſtion of fact not to be known by ingenious conjectures, but by the cautious obſervations of the manner in which he acts in the courſe of his providence, and by attending to what he has declared concerning himſelf in the ſacred ſcriptures. If from theſe it ſhall appear that he does prefer where there is no merit, and reject where there is no crime; it will be in vain thereafter to aſſert that ſuch conduct is unjuſt: the fact will be on our ſide of the queſtion, and we ſhall leave thoſe to account for it who inſiſt that their limited reaſon is capable of comprehending all the myſterious ways of an Infinite Being.

15 Great inequalities in the ordinary courſe of providence.

In the courſe of providence, then, we ſee the greateſt inequalities take place, and ſuch as appear altogether contradictory to our ideas of juſtice. We ſee the ſins of the fathers puniſhed in the perſons of the children, who often derive debilitated bodies from the intemperance of their parents, and corrupted manners from the example of their vices. God frequently afflicts good men in this life for a great length of time, as in the caſe of Job, only for the manifeſtation of his own glory, that their faith and patience may be made manifeſt. Some ſins are puniſhed with other ſins, and often with a courſe of ſevere miſeries in the perſons of thoſe who never committed them. We may transfer this from time to eternity; for if God may do for a little time what is inconſiſtent with our notions, and with our rules of juſtice, he may do it for a longer duration: ſince it is as impoſſible that he can be unjuſt for a day as for all eternity: and the ſame inequality of management appears in the great as in the private affairs of this world. During many ages almoſt the whole human race were loſt in the darkneſs of idolatry: even ſince the Chriſtian religion came into the world, how few nations have received it; and of theſe few, the number is ſtill ſmaller of thoſe who have enjoyed it in tolerable purity. If we conſider how many great nations remain under the deluſion contrived by Mahomet; if we reflect upon the idolatry of the Indies and of China, and the ſuperſtition of the Greek church, and of the church of Rome—we ſhall find that very few nations have poſſeſſed the moſt ordinary means of grace. Even the bleſſings of civilization, of ſcience, and of liberty, are ſo rarely ſcattered over the face of the earth, that it is to be regarded as a melancholy truth, that with a very few favoured exceptions the whole human race have hitherto been ſunk in the depth of barbariſm, ignorance, ſlavery, and idolatry. When the Arminians think fit to aſſert, then, that the doctrine of abſolute decrees is contrary to their ideas of the impartiality and juſtice of God, we can only anſwer that we are ſorry for them if they have formed ideas of the character of God which are contrary to the truth. We preſume not * like them to call his attributes before the tribunal of our underſtandings; we only obſerve the ways of his providence, and declare that thus ſtands the fact. If he leaves whole nations in darkneſs and corruption, and freely chooſes others to communicate the knowledge of himſelf to them, we need not be ſurpriſed if he act in the ſame manner with individuals. For ſurely the rejecting immenſe empires for ſo many ages is much more unaccountable than the ſelection of a few individuals, and the leaving others in ignorance and depravity. It is in vain to allege that he extends his mercy to thoſe who make the beſt uſe of the dim light which they have. This does not remove the difficulty of a choice and a preference; as it cannot be denied that their condition is very deplorable, and that the condition of others is much more hopeful: ſo that the myſterious doctrine of election and reprobation is an unqueſtionable truth under the government of God, ſeeing that great numbers of men are born in ſuch circumſtances that it is morally impoſſible they ſhould not periſh in them; whereas others are more happily ſituated and enlightened.

---

* Calvini Tract. de Eterna Dei Prædeſt.

16 The language of Scripture predeſtination. Nor are we left to common obſervation upon this point. The language of the ſacred ſcriptures is poſitive and clear. The whole reaſoning in the ninth chapter to the Romans reſolves all the acts of God's juſtice and mercy, his *hardening* as well as his *pardoning*, into an abſolute freedom and an unſearchable depth. More pointed expreſſions for this purpoſe can ſcarcely be conceived than thoſe actually made uſe of. *For the children being not yet born, neither having done any good or evil, that the purpoſe of God according to election might ſtand, not of works, but of him that calleth, it was ſaid, The elder ſhall ſerve the younger. As it is written, Jacob have I loved, but Eſau have I hated. What ſhall we ſay then? Is there unrighteouſneſs with God? God forbid. For he ſaith to Moſes, I will have mercy on whom I will have mercy, and I will have compaſſion on whom I will have compaſſion, So then it is not of him that willeth, nor of him that runneth, but of God that ſheweth mercy; for the ſcripture ſaith unto Pharaoh, Even for this ſame purpoſe have I raiſed thee up, that I might ſhow my power in thee, and that my name might be declared throughout all the earth. Therefore hath he mercy on whom he will have mercy, and whom he will he hardeneth.* 17 An objection anſwered. If any man ſhall ſtill be ſufficiently bold to declare that all this is contrary to what he is pleaſed to conſider as juſt and impartial, we can only reply to him in the words of the celebrated John Calvin of Geneva †. *Tibi moleſtum eſt ac odioſum, Deum plus poſſe et facere, quam mens tua capiat; æquali autem tuo interdum concedes, ut ſuo judicio fruatur. Et tu in tanto furore, Dei mentionem ullam facere audes?* "Is it painful to thee that the power and the works of God exceed thy limited capacity? Thou ſometimes ſuffereſt thine equal to judge of his own conduct for himſelf, and dareſt thou in thy folly to cenſure the ways of God?" Or rather we may reply in thoſe words of the apoſtle Paul which immediately follow the paſſage already quoted. *Thou wilt ſay then to me, Why doth he yet find fault? for who hath reſiſted his will? Nay but, O man, who art thou that repliеſt againſt God? Shall the thing formed ſay to him that formed it, Why haſt thou made me thus? Hath not the potter power over the clay; of the ſame lump to make one veſſel unto honour, and another unto diſhonour?* Let theſe paſſages, and even the whole of the chapter now alluded to, be explained in any manner that is judged proper, ſtill their import with regard to the preſent argument will remain the ſame. If God loved Jacob ſo as to chuſe his poſterity to be his people, and rejected or hated Eſau and his poſterity, and this without regard to them or their future conduct, but merely in conſequence of the purpoſe and deſign of his election; if by the ſame purpoſe the Gentiles were to be grafted upon that ſtock from which the once favoured Jews were cut off; it will follow, not only that the great and myſterious decree of final election is unſearchably free and abſolute, but alſo that all the means of grace are granted or withheld in the ſame unlimited and free manner according to the ſovereign will and good pleaſure of God, independent of any foreſight of merit on our part. The words of our Saviour expreſs this: *I thank thee O Father, Lord of heaven and earth, becauſe thou haſt hid theſe things from the wiſe and prudent, and haſt revealed them unto babes:* The reaſon of which is given in the following words, *Even ſo, Father, for ſo it ſeemed good in thy ſight*, (Mat. xi. 26). The paſſage immediately preceding this, ſhows clearly that the means of grace are not beſtowed upon thoſe who, it is foreſeen, will make a good uſe of them; nor denied to thoſe who will make a bad uſe of them. *Wo unto thee Chorazin, wo unto thee Bethſaida: for if the mighty works which were done in you had been done in Tyre and Sidon, they would have repented long ago in ſackcloth and aſhes.* But the paſſages in ſcripture are innumerable, which declare that the whole character and deſtiny of every man is the reſult of the counſel and uncontrouled determination of God. The expreſſion is often repeated in the book of Exodus; God *hardened the heart of Pharaoh, ſo that he would not let his people go*, (Exod. iv. 21), &c. It is ſaid, that *God has made the wicked man for the day of evil* (Prov. xvi. 4). On the other hand, it is ſaid, *as many believed the goſpel as were appointed to eternal life*, (Acts i. 48). Some are ſaid to be *written in the book of life, of the Lamb ſlain from the foundation of the world* (Rev. xiii. 8). Every prayer that is uſed, or directed to be uſed, in ſcripture, is for a grace that opens our eyes, that turns the heart, that makes us to go, that leads us not into temptation, but delivers us from evil. All theſe expreſſions denote that we deſire more than a power or capacity to act, ſuch as is given to all men. Indeed we do not, and we cannot, pray earneſtly for that which we know all men as well as ourſelves poſſeſs at all times.

18 Sure efficacy of grace. The *grace of God* is the medium by which his ſovereign will and abſolute decrees are accompliſhed. Accordingly, it is ſet forth in ſcripture by ſuch expreſſions as clearly denote its ſure efficacy; and that it does not depend upon us to uſe it or not at our pleaſure. It is ſaid to be a creation; *we are created unto good works, and we become new creatures:* It is called a regeneration, or a *new birth;* it is called a quickening and a reſurrection, as our former ſtate is compared to a feebleneſs, a blindneſs, and a death. God is ſaid *to work in us both to will and to do: His people ſhall be willing in the day of his power: He will write his laws in their hearts, and make them to walk in them.* In a paſſage already quoted, the human race are compared to a maſs of *clay* in the hands of the *potter*, who of the ſame lump makes at his pleaſure *veſſels of honour and diſhonour.* Theſe paſſages, and this laſt more particularly, prove that there is an abſolute and a conquering power in divine grace; and that the love of God conſtrains us, as St Paul expreſſes himſelf. Our Saviour compares the union and influence that he communicates to believers to the union of an head with the members, and of a root with the branches, which imparts an internal, a vital, and an efficacious influence. The outward means may indeed be rejected, but this overcoming grace never returns empty: theſe outward means coming from God, the reſiſting of them is ſaid to be the *reſiſting* of God, the *grieving* or *quenching of his ſpirit;* and in that ſenſe we may reſiſt the grace or favour of God; but we can never withſtand him when he intends to overcome us; *For the foundation of God ſtandeth ſure, having this ſeal, The Lord knoweth them that are his*, (2 Tim. ii. 19). *Having prediſtinated us unto the adoption of children by Jeſus Chriſt himſelf, according to the good pleaſure of his will*, (Eph. i. 5).

19 Perſeverance of the ſaints. That the ſaints ſhall certainly perſevere unto the end is a neceſſary conſequence of abſolute decrees and of efficacious grace: all depends on God. He *of his own will begat us;* and with him *there is no variableneſs nor ſhadow of turning: whom he loves, he loves to the end:* and he has promiſed that he will never leave nor forſake thoſe to whom he becomes a God. Our Lord hath

† Ubi ſupra.

hath ſaid, *I give unto them eternal life, and they ſhall never periſh; neither ſhall any pluck them out of my hand*, (Jo. x. 28.) Hence we muſt conclude, that *the purpoſe and calling of God is without repentance*, (Heb. xiii. 5.) And therefore, although good men may fall into great ſins, yet of all thoſe who are given by the father to the Son to be ſaved by him, none are loſt: The concluſion from the whole is, that God did in himſelf, and for his own glory, *foreknow* a determinate number in whom he would be both ſanctified and glorified. Theſe he *predeſtinated* to be holy, conformable to the image of his ſon: they are to be *called*, not by a general calling in the ſenſe of theſe words, *many are called, but few are choſen*; but to be *called according to his purpoſe*. He *juſtified* them upon their obeying that calling, and in the concluſion he will *glorify* them; for nothing can ſeparate us from the love of God in Chriſt, (Rom. ix. 19.) And he is not leſs abſolute in his decree of reprobation than he is in his election: for *ungodly men* are ſaid to be *of old ordained to condemnation, and to be given up by God unto vile affections, and to be given over by him to a reprobate mind*.

20
Arguments againſt the doctrine from the attributes of God.

THUS far we have defended the doctrine of predeſtination: we proceed next to ſtate the arguments uſually adduced in favour of the Arminian ſyſtem.

God is juſt, holy and merciful. In ſpeaking of himſelf in ſcripture, he is pleaſed to make appeals to the human underſtanding, and to call upon men to reaſon with him concerning his ways. The meaning of this is, that men may examine his actions and his attributes with that meaſure of intelligence which they poſſeſs, and they will be forced to approve of them; nay, he propoſes himſelf to us as a pattern for our imitation. We are required to be holy as he is holy, and merciful as he is merciful: which is a proof that he accounts us not incapable of forming juſt notions at leaſt of theſe attributes. What then can we think of a juſtice that ſhall condemn us for a fact that we never committed? that deſigns firſt of all to be glorified by our being eternally miſerable, and which afterwards decrees that we ſhall commit ſins to juſtify this previous decree of our reprobation? For if God originally deſigns and determines all things, and if all his decrees are certainly effected, it is inconceivable how there ſhould be a juſtice in puniſhing that which he himſelf, by an antecedent and irreverſible decree, appointed to be done. Or, ſetting juſtice aſide, is it poſſible that a being of infinite holineſs, and who is *of purer eyes than to behold iniquity*, would by an antecedent decree fix our committing ſo many ſins, in ſuch a manner that it is not poſſible to avoid them? He repreſents himſelf in the ſcriptures as *gracious, merciful, ſlow to anger, and abundant in goodneſs and truth*. It is often ſaid, that *he deſires that no man ſhould periſh, but that all ſhould come to the knowledge of the truth*: this is even ſaid with the ſolemnity of an oath, *As I live, ſaith the Lord, I take no pleaſure in the death of ſinners*. What ſenſe can theſe words bear if we believe that God did by an abſolute decree doom ſo many of them to everlaſting miſery? If all things that happen ariſe out of the abſolute decree of God as their firſt cauſe, then we muſt believe that God takes pleaſure both in his own decrees and in the execution of them, conſequently that *he doth take pleaſure in the death of ſinners*; and this in expreſs contradiction to the moſt poſitive language of ſcripture. Beſides all this what are we to think of the truth of God, and of the ſincerity of thoſe offers of grace and mercy, with the exhortations and expoſtulations upon them that occur ſo frequently in ſcripture, if we can imagine that by antecedent acts he determined that all theſe ſhould be ineffectual? In one word, are we to regard our exiſtence as a bleſſing, and to look up with gratitude to that paternal goodneſs which has placed us in a *land* of hope, which formed our nature, weak indeed and expoſed to many imperfections, but capable of riſing by virtuous efforts and by a patient continuance in well-doing to excellence and to high and immortal felicity? or, are we to curſe the hour in which we were born under the dominion of a maſter, who is not only ſevere, but abſurd, and even adds inſult to cruelty; who, after placing us in a goodly habitation, binds us hand and foot, locks the door, blocks up the windows, ſets fire to the fabric, and then very mercifully calls upon us to come forth leſt we periſh?

It is not true that rational beings are nothing in the ſight of their maker. Compared to his Almighty ſtrength and uncreated exiſtence, our powers do indeed diminiſh into weakneſs, and our years into a moment: yet although our intereſts may be unimportant in themſelves, the attributes of God with which they are connected are far from being ſo. There was no neceſſity for his calling us into exiſtence; but the inſtant he beſtowed upon us that gift, and conferred upon us faculties capable of riſing to happineſs by the contemplation of himſelf and of his works, he became our parent, and granted to us a right to look up to him for protection and mercy, and to hope that our exiſtence and our faculties were not beſtowed in vain. Nor will he trample upon the juſt and reaſonable hopes of the meaneſt of his creatures. He is watchful over our intereſts; he hath ſent his Son to die for us; his providence has been exerted for no other purpoſe but to promote our welfare; and there is joy in heaven even over one ſinner that repenteth. Let it be allowed, that the univerſe was formed for no other purpoſe but to promote the glory of God; that glory can ſurely be little promoted by the exertion of undiſtinguiſhing and blind acts of power, in the arbitrary appointment to eternal reprobation of millions of unreſiſting and undeſerving wretches*. It is not more honourable to the Deity to conceive of him as the parent, guide, governor, and judge of free beings, formed after the likeneſs of himſelf, with powers of reaſon and ſelf-determination, than to conceive of him, as the former and conductor of a ſyſtem of conſcious machinery, or the mover and controuler of an univerſe of puppets, many of whom he is pleaſed to make completely miſerable? The moſt important and fundamental point of religion, conſidered as a ſpeculative ſcience, conſiſts in our forming high and juſt ideas of God and of his attributes, that from them we may underſtand the maxims of true and perfect morality. But were we to attempt to form our own natures upon the idea of the divine character that is given us by the doctrine of abſolute decrees, we would certainly become imperious, partial, and cruel; at leaſt we ſhould not readily learn the virtues of kindneſs, mercy, and compaſſion.

21
The difficulty of preſcience ſolved.

It is true that, ſetting aſide predeſtination, it is not eaſy to ſhow how future contingencies ſhould be certainly foreſeen; but it is obvious that ſuch foreſight involves no contradiction, (ſee METAPHYSICS, n° 308); and if the actions of men be free, we know from the train of prophecies, which in the ſacred ſcriptures appear to have been made in one age and fulfilled in another, that contingencies are foreſeen by that infinite Being who inhabiteth eternity, and to whom a thouſand years are but as one day. The prophecies concerning the death and ſufferings of Chriſt were fulfilled by the free acts of the Jewiſh prieſts and people: Theſe men ſinned in accompliſhing that event, which proves that they acted with their natural liberty. From theſe and all the other prophecies both in the old and new Teſtament, it muſt be confeſſed that future contingencies were certainly foreknown, but where to found that certainty cannot be eaſily reſolved. We doubt not, however, that we may ſafely refer it to the infinite perfection of the Divine mind. And it ought to be obſerved that this difficulty is of a very different nature from that to which our antagoniſts are reduced on their ſide of the argument. They are compelled to confeſs that they cannot reconcile their doctrine with the juſtice of God, an attribute the nature of which we clearly underſtand, and which is held forth to our imitation; whereas we are only at a loſs how to explain the mode in which the divine preſcience is exerted; an attribute which God claims as peculiarly his own, and which it is not to be expected that we ſhould be able in the ſmalleſt degree to comprehend. We can go farther than this. Heaven hath given to man two revelations of itſelf. The one conſiſts in the knowledge which we procure by the right uſe of our rational faculties; and the other is beſtowed by means of the ſacred ſcriptures. Without intending to derogate from the authority of inſpiration, it is fair to aſſert, that we are *more certain* that God is the author and beſtower of our reaſon, than that he is the author of the ſcriptures; at leaſt it is certain that the laſt cannot contradict the firſt, becauſe God cannot contradict himſelf. By the primary revelation from heaven then, that is, by our reaſon, we are informed that God is true, and juſt, and good. If an angel from heaven ſhould preach a doctrine contrary to this, we are entitled to ſay with the apoſtle, *let him be accurſed.* If our antagoniſts then ſhould ſucceed in proving that the doctrine of abſolute decrees, which repreſents the Deity as cruel and unjuſt, is contained in ſcripture, the conſequence would be, not that we would believe it, for that is impoſſible, but that we ſhould be reduced to the neceſſity of rejecting the authority of the ſcriptures, becauſe they contradict the previous ſure revelation of God, our reaſon. We believe that the doctrines contained in the ſcriptures are certainly true, becauſe they were taught by thoſe who wrought miracles and foretold future events in proof of their being inſpired by the God of truth. But miracles and prophecy are *direct* evidences of nothing but the *power* and *wiſdom* of their Author; and unleſs we know by other evidence, that this powerful and wiſe Being is likewiſe the father of truth and juſtice, we cannot be ſure that the ſcriptures, notwithſtanding their ſource, are any thing better than a tiſſue of falſehoods. The very arguments therefore by which predeſtination is ſupported, tend to ſap the foundation of that revelation from which its advocates pretend to draw them. The caſe is very different when no doctrine is aſſerted that is not contradictory to our reaſon, but only above it. For example, when we are told that God can create rational beings, that he attends without diſtraction to the minuteſt affairs that paſs in a thouſand worlds, that he knows all things, the paſt, the preſent, and the future, we do not preſume that we comprehend how he can do all this: but there is nothing in it that contradicts our reaſon; we ourſelves poſſeſs a certain degree of power, can attend at once to a certain number of objects, can in ſome caſes form very ſure conjectures about futurity, and we reſolve all the reſt into the infinite nature and perfections of God.

---

* Correſpondence between Price and Prieſtely

22
Scripture cannot contradict the clear dictates of reaſon.

It is farther to be obſerved, that preſcience does not make effects certain becauſe they are foreſeen; but they are foreſeen becauſe they are to be: ſo that the certainty of the preſcience is not the cauſe, but the conſequence of the certainty of the event. The Roman republic has fallen; but our knowledge or ignorance of that event does not render it more or leſs true and certain. That it was to fall, was as ſurely true before it happened as it is now; and had we known it beforehand, as many men of ſenſe probably did, it would neither have fallen ſooner nor later on that account. This ſhows that the knowledge which an intelligent being has of a paſt or future event need not have any influence upon the circumſtances that produce that event.

23
Conditional preſcience.

On ſome occaſions the ſcripture takes notice of a conditional preſcience *. God anſwered David, that Saul would come to Keilah, and that the men of Keilah would deliver him up: yet both the one and the other reſted upon the condition of his ſtaying there; and he going from thence, neither of them ever happened. Such alſo was the † prophecy of Jonah, at the failure of which he was ſo abſurdly offended: and ſuch was Chriſt's ſaying, That thoſe of Tyre and Sidon, Sodom and Gomorrah would have turned to him, if they had ſeen the miracles that he wrought in the towns of Galilee. Since, then, this preſcience may be ſo certain that it can never err nor miſlead the exertions of providence, and ſince by this, both the attributes of God are vindicated, and the due freedom of man is aſſerted, all difficulties ſeem to be thus eaſily removed.

24
Chriſt died for the whole world.

With regard to the purpoſe of Chriſt's death, he is ſaid to be the *propitiation for the ſins of the whole world;* and the wicked are ſaid *to deny the Lord that bought them.* His death, as to its extent, is ſet in oppoſition to the ſins of *Adam;* ſo that as by the offence of one judgment came upon all men to condemnation, ſo by the righteouſneſs of one the free gift came upon all men to juſtification of life, (Rom. v. 18.) The *all* on the one ſide muſt be as extenſive as the *all* on the other: ſo, ſince *all* are concerned in Adam's ſin, *all* muſt likewiſe be concerned in the death of Chriſt. To this we may add, that *all* men are commanded and required to believe that Chriſt died for their ſins; but no man can be obliged to believe what is not true: he muſt therefore have died for *all.* The following paſſages expreſs clearly the univerſality of the object of Chriſt's death. *If any man ſin, we have an advocate with the Father, Jeſus Chriſt the righteous: and he is the propitiation for our ſins: and not for ours only, but alſo for the ſins of the whole world,* (1 Jo. ii. 1, 2.) *The love of Chriſt conſtraineth us; becauſe we thus judge, that if one died for all, then were all dead: and that he died for all, that they which live*

---

* 1 Sam. xxiii. 11, 12.

† Chap. iii.

ſhould not henceforth live unto themſelves, (2 Cor. v. 14.) *God ſo loved the world that he gave his only begotten Son that whoſoever believeth in him might not periſh, but might have everlaſting life.* (Jo. iii. 16.)

25 Freedom eſſential to moral agents.

But a proper attention to the nature of man will ſet the juſtice of our argument in a ſtill ſtronger point of view. It is obvious, that ſuch an inward freedom as renders a man the maſter of his own conduct, and able to do or not do what he pleaſes, is ſo neceſſary to the morality of our actions, that without it they are neither good nor evil, neither capable of rewards nor puniſhments. Madmen, or men aſleep, are not to be charged with the good or evil of what they do; therefore at leaſt ſome ſmall degree of liberty muſt be left us, otherwiſe why are we praiſed or blamed for our conduct? All virtue and religion, all diſcipline and induſtry, ariſe out of this as their firſt principle, that there is a power in us to govern our own thoughts and actions, and to raiſe and improve our faculties. If this is denied, all efforts, all education, all attention beſtowed upon ourſelves or others, become fruitleſs and vain. If a man accounts himſelf under an inevitable decree, as he will have little remorſe for the evil he does while he imputes it to that inevitable force that conſtrains him, ſo he will naturally conclude that it is to no purpoſe for him to ſtruggle with impoſſibilities. Men are ſufficiently inclined to throw all cenſure off from themſelves, and to indulge in indolence; and upon the doctrine of abſolute predeſtination who can blame them, ſeeing that their efforts can be of no value?

26 Liberty or neceſſity a queſtion of fact.

Matter is inactive of itſelf, and only moves in conſequence of its being acted upon by ſome other being. Man is poſſeſſed of a power to begin motion, and to determine it in any direction that he may judge proper. This power and this intelligence conſtitute his liberty, and form that image of God that is ſtamped upon his nature. Whether man poſſeſſes this power of acting originally and of himſelf, or whether he is incapable of forming any reſolution, or making any effort, without being acted upon by a foreign cauſe, is not a point to be reaſoned on or diſputed about: it is a queſtion of fact, which, as far as it can poſſibly be known, every man has it in his power to determine by the evidence of his own conſciouſneſs. We do aver, then, that every man is conſcious that he is a free agent, and that it is not poſſible for the moſt ſtaunch predeſtinarian that has ever yet appeared ſeriouſly and practically to convince himſelf of the contrary. It is not poſſible for a man in his ſenſes to believe, that in all thoſe crimes which men charge *themſelves* with, and reproach *themſelves* for, God is the agent; and that, properly ſpeaking, they are no more agents than a ſword is when employed to commit murder. We do indeed, on ſome occaſions, feel ourſelves hurried on ſo impetuouſly by violent paſſions, that we ſeem for an inſtant to have loſt our freedom; but on cool reflection we find, that we both might and ought to have reſtrained that heat in its firſt commencement. We feel that we can divert our thoughts, and overcome ourſelves in moſt inſtances, if we ſet ſeriouſly about it. We feel that knowledge, reflection, and proper ſociety, improve the temper and diſpoſition; and that ignorance, negligence, and the ſociety of the worthleſs and abandoned, corrupt and degrade the mind. From all this we conclude, that man is free, and not under inevitable fate, or irreſiſtible motions to good or evil. This concluſion is confirmed by the whole ſtyle of ſcripture, which upon any other ſuppoſition becomes a ſolemn and unworthy mockery. It is full of perſuaſions, exhortations, reproofs, expoſtulations, encouragements, and terrors. But to what purpoſe is it to ſpeak to dead men, to perſuade the blind to ſee, or the lame to run? If we are under impotence till the irreſiſtible grace comes, and if, when it comes, nothing can withſtand it, what occaſion is there for theſe ſolemn diſcourſes which can have no effect? They cannot render us inexcuſable, unleſs it were in our power to be improved by them; and to imagine that God gives light and bleſſings, which can do no good, to thoſe whom he before intended to damn, only to make them more inexcuſable, and for the purpoſe of aggravating their condemnation, gives ſo ſtrange an idea of his character as it is not fit to expreſs in the language that naturally ariſes out of it.

27 Some of the acts of God depend on the conduct of his creatures.

Our antagoniſts ſeem to have formed ideas of the divine perfection and ſovereignty that are altogether falſe. There is no imperfection implied in the ſuppoſition that ſome of the acts of God may depend upon the conduct of his creatures. Perfection conſiſts in forming the wiſeſt deſigns, and in executing them by the moſt ſuitable means. The author of nature conducts the planets in their orbits with immutable preciſion according to fixed rules: but it would be abſurd to pretend to manage free agents, or their affairs, in the ſame manner by mathematical or mechanical principles. The providence that is exerted over material objects is fixed and ſteady in its operations, becauſe it is fit that material objects which cannot move of themſelves ſhould be moved in a regular manner: but free and intelligent beings enjoy a wider range, and ought not to be confined to a preſcribed train of exertions; it may therefore be neceſſary that the providence which ſuperintends them ſhould accommodate itſelf to circumſtances. This, however, is not injurious to the divine ſovereignty; for God himſelf is the author of that freedom of agency which he is pleaſed to watch over. He is not leſs the Lord of the univerſe; and ſurely his wiſdom and benevolence are more conſpicuous when he brings good out of evil, and renders the perverſe wanderings of the human heart ſubſervient to purpoſes of mercy, than when he hurls into the immenſity of ſpace the moſt enormous maſs of dead and paſſive matter ſubjected to unerring laws.

28 The inequalities of Providence accounted for.

As for the inequalities of moral ſituation that are to be obſerved in the world, and the giving to ſome nations and perſons the means of improvement, and the denying them to others, the ſcriptures do indeed aſcribe theſe wholly to the riches and freedom of God's grace. And, we confeſs, that the ways of Providence are often dark and myſterious. In this world there are many things which are hard to be underſtood, and many which appear altogether unaccountable; we ſee the wicked man proſpering in his wickedneſs, though it impoſe miſery upon thouſands; we ſee truth hiding its head, and the world governed by fraud and abſurdity. Still, however, we can venture to aſſert, that God beſtows upon all what is neceſſary to enable them to fulfil the obligations expected from the ſtate in which they are placed; and it is elſewhere ſhown, that phyſical evil is among men the parent of moral good. (See PROVIDENCE). God winketh at the times of ignorance;

much is required of them to whom much is given; and it ſhall be more tolerable in the day of judgment for the inhabitants of Sodom and Gomorrah than for the enlightened cities of Galilee. Thus God will be juſt when he judges; none will meet with condemnation excepting thoſe who are inexcuſable. For although he grants more to ſome than may be abſolutely neceſſary, yet he grants leſs to none; and where he grants little, he will ſuit his judgments to the little which he gave. There is no injuſtice in this. If it was the intention of the great Creator that his creation ſhould contain within its ample boſom every poſſible variety of intelligent natures, it was neceſſary that there ſhould be ſomewhere ſuch a being as man; and, in forming all poſſible varieties of human minds and ſituations, it was neceſſary that every particular individual ſhould exiſt. Hence a man may as well complain that he was not formed one of the flaming ſeraphims that ſurround the throne of the Eternal, as that he is not placed in other circumſtances in life than thoſe which he now occupies; for if little is given, little will be required from him. Thus the deſigns of Providence go on according to the goodneſs and mercy of God. None can complain, though ſome have more cauſe for joy than others. What happens to individuals may happen to nations in a body; ſome may have higher privileges, and be placed in happier circumſtances than others; but none can complain of the wiſe and juſt diſpoſer of all, who has given enough, although we may have good reaſon to complain of ourſelves, for not uſing what was ſufficient.

As to the caſe of thoſe who are not bleſſed with the light of the goſpel, we may conſider, that if they have fewer and leſs advantages than others, their nature and capacities muſt likewiſe be inferior; to which their future ſtate may be proportioned. God is not obliged to make all men equally perfect in the next world any more than in this; and if their capacity be rendered leſs than that of an ordinary *Chriſtian*, a lower degree of happineſs may fill it. However, we need not be extremely ſolicitous about their ſtate, much leſs caſt any ungrateful imputations on the Governor of the world for not having dealt ſo bountifully with them as he has with ourſelves; ſince we know that Chriſt died for the whole race of mankind; that every one will at length be 'accepted according to that he has, and not according to that he has not; and that to whomſoever much is given, of him ſhall much be required' (B).

29 Scriptural expreſſions explained.

Upon theſe principles, we can eaſily explain all the paſſages in the New Teſtament concerning the *purpoſe*, the *election*, the *foreknowledge*, and the *predeſtination* of God. They relate to the deſign of calling the Gentile world to the knowledge of the Meſſias: This was kept ſecret, though hints had been given of it by ſeveral of the prophets, ſo that it was a myſtery; but it was revealed when the apoſtles, in conſequence of Chriſt's commiſſion, *to go and teach all nations*, went about preaching the goſpel to the Gentiles. This was a ſtumbling-block to the Jews, and it was the chief ſubject of diſpute betwixt them and the apoſtles at the time when the Epiſtles were written: ſo that it was neceſſary for them to clear up this point very fully, and to mention it frequently. But in the beginning of Chriſtianity there was no need of amuſing men with high and unſearchable ſpeculations concerning the decrees of God; the apoſtles therefore take up the point in diſpute, the calling of the Gentiles in a general manner. They ſhow, that Abraham at firſt, and Iſaac and Jacob afterwards, were choſen by a diſcriminating favour, that they and their poſterity ſhould be in covenant with God; but that, nevertheleſs, it always was the intention of Providence to call in the Gentiles, though it was not executed till theſe later times.

With this key we can explain coherently the whole of St Paul's diſcourſes upon this ſubject, without aſſerting antecedent and ſpecial decrees as to particular perſons. Things that happen under a permiſſive and directing Providence, may, by a largeneſs of expreſſion, be aſcribed to the will and counſel of God; for a permiſſive will is really a will, though it is not the agent or cauſe of the effect. The *hardening of Pharaoh's heart* may be aſcribed to God, though it is ſaid that his *heart hardened itſelf*, becauſe he took advantage of the reſpites which God granted him from the plagues, to encourage himſelf to longer reſiſtance. Beſides this, he was a cruel and bloody tyrant, and deſerved ſuch judgments for his other ſins; ſo that he may be conſidered as at that time under final condemnation, and only preſerved from the firſt plagues, to afford a ſtriking inſtance of the avenging juſtice of God. That this is the meaning of the paſſage, appears extremely probable from the manner in which Exod. ix. 16. is rendered in the Vatican and Aldus's edit. of the LXX. Inſtead of ſaying, as in our tranſlation, "And in very deed for this cauſe have I *raiſed thee up*, for to ſhow in thee my power, &c." God is repreſented in that verſion as ſaying, "And in very deed for this cauſe have I *kept thee alive till now*, for to ſhow," &c. *Whom he will he hardeneth*, is an expreſſion that can only be applied to ſuch perſons as this tyrant was. It is obvious that the words of our Saviour concerning thoſe *whom his Father had given him*, are only meant of a diſpenſation of Providence, and not of a decree; ſince he adds, And *I have loſt none of them except the ſon of perdition*: for it cannot be ſaid that *Judas Iſcariot* was in the decree, and yet was loſt. And in the ſame paſſage in which God is ſaid *to work in us both to will and to do*, we are required *to work out our own ſalvation with fear and trembling*. The word *ordained* to eternal life alſo ſignifies fitted and diſpoſed to eternal life. The queſtion, *Who made thee to differ?* (1 Cor. iv. 7.) refers to thoſe extraordinary gifts which, in different degrees and meaſures, were beſtowed upon the firſt Chriſtians, in which they were unqueſtionably paſſive.

30 Grace not irreſiſtible.

If the decrees of God are not abſolute, neither can his grace be ſo efficacious as abſolutely and neceſſarily to determine our conduct, elſe why are we required *not to grieve God's ſpirit?* why is it ſaid, *ye do always reſiſt the Holy Ghoſt; as your fathers did, ſo do ye? How*

often

(B) See Biſhop Law's *Conſiderations on the Theory of Religion*, where this queſtion is treated in a very maſterly manner. The work, though leſs known than it ought to be, has great merit, and of the author we have given a biographical ſketch in our ninth volume.

often would I have gathered you under my wings, and ye would not? What could I have done in my vineyard that has not been done in it? Theſe expreſſions indicate a power in us, by which we not only can, but often do, reſiſt the motions of grace. But if the determining efficacy of grace is not acknowledged, it will be much harder to believe that we are efficaciouſly determined to ſin. This ſuppoſition is ſo contrary both to the holineſs of God, and to the whole ſtyle of the ſacred writings, that it is unneceſſary to accumulate proofs of it. *O Iſrael, thou haſt deſtroyed thyſelf, but in me is thy help: ye will not come unto me that ye may have life: Why will you die, O houſe of Iſrael?*

31 The greateſt ſaint on earth may fall.

As for perſeverance, we may remark, that the many promiſes made in the ſacred ſcriptures to them that *overcome*, that continue *ſtedfaſt and faithful to the death*, do certainly inſinuate that a man may fall from a good ſtate. The words of the apoſtle to the Hebrews are very clear and pointed: *For it is impoſſible for thoſe who were once enlightened, and have taſted of the heavenly gift, and were made partakers of the Holy Ghoſt, and have taſted the good word of God, and the powers of the world to come, if they ſhall fall away, to renew them again unto repentance* (Heb. vi. 4.) It is alſo ſaid, *The juſt ſhall live by faith: but if he draw* (c) *back, my ſoul ſhall have no pleaſure in him,* (Heb. x. 38.) and it is ſaid by the prophet, *When the righteous turneth away from his righteouſneſs and committeth iniquity, all his righteouſneſs that he hath done ſhall not be mentioned; in his ſin that he hath ſinned ſhall he die,* (Ezek. viii. 24). Theſe paſſages, with many others, give us every reaſon to believe that a good man may fall from a good ſtate, as well as that a wicked man may turn from a bad one.

32 All difficulties ſolved at the day of judgment.

We conclude the whole by obſerving, that the only difficulty which attends the queſtion ariſes from the myſterious, and apparently partial and unequal, courſe of the divine government in our preſent ſtate; but there is an important day approaching, when God will condeſcend to remove theſe obſcurities, and to vindicate the ways of his providence to man. On that great day, we are well aſſured, that the queſtion will be decided in our favour; for we know that judgment will be given, not according to any abſolute decree, but, according to the deeds which we ourſelves ſhall have freely done in the body, whether they have been good, or whether they have been evil.

Thus have we ſtated, we hope with fairneſs and impartiality, a ſummary of the arguments on both ſides of this long agitated queſtion. We need hardly add, that it is a queſtion involved in conſiderable difficulties.— Milton, who was an eminent philoſopher and divine, as well as the firſt of poets, when he wiſhed to exhibit the fallen angels themſelves as perplexed by queſtions above their comprehenſion, ſet them to diſpute about predeſtination.

They reaſon'd high, of knowledge, will, and fate,
Fixed fate, free-will, fore-knowledge abſolute;
And found no end, in wand'ring mazes loſt.

Paradiſe Loſt.

33 The weak ſide of each doctrine.

The weak ſide of the Calviniſtic doctrine conſiſts in the impoſſibility of reconciling the abſolute and unconditional decree of reprobation with our ideas of the juſtice and goodneſs of God. The weak ſide of the Arminian ſcheme conſiſts in the difficulty of accounting for the certainty of the divine foreknowledge, upon the ſuppoſition of a contingency of events, or an abſolute freedom of will in man.

To elude the former of theſe difficulties, ſome of the late writers upon philoſophical neceſſity, and Dr Prieſtly is among the number, have given up the doctrine of reprobation, and aſſerted, that this world is only a ſtate of preparation for another, in which all men, of every deſcription and character, ſhall attain to final and everlaſting happineſs, when God *ſhall be all, and in all.*— On the other ſide, ſome of the ſupporters of free agency, and Monteſquieu * is among the number, have been diſpoſed to deny the divine attribute of preſcience.

* Lettres Perſ.

Whatever may be thought of the practical tendency of the two opinions, there is one remark which we think ourſelves bound in juſtice to make, although it appears to us to be ſomewhat ſingular. It is this, that from the earlieſt ages down to our own days, if we conſider the character of the ancient Stoics, the Jewiſh Eſſenes, the modern Calviniſts, and Janſeniſts, when compared with that of their antagoniſts the Epicureans, the Sadducees, Arminians, and the Jeſuits, we ſhall find that they have excelled in no ſmall degree in the practice of the moſt rigid and reſpectable virtues, and have been the higheſt honour of their own ages, and the beſt models for imitation to every age ſucceeding. At the ſame time, it muſt be confeſſed, that their virtues have in general been rendered unamiable by a tinge of gloomy and ſevere auſterity.

34 Mutual forbearance recommended.

So far as the ſpeculative foundation of their principles is conſidered, however, neither party ſeems liable to cenſure in a moral point of view. Each of them wiſhes to ſupport, though in a different manner from the other, the honour of the divine character. The Calviniſts begin their argument with the notion of infinite perfection, independency, and abſolute ſovereignty, and thence deduce their opinions; making every difficulty yield to theſe firſt and leading ideas. Their opponents are more jealous of the reſpect due to the divine attributes of juſtice, truth, holineſs, and mercy, and deduce their ſentiments from the idea which they have formed of theſe. Each party lays down general maxims that are admitted by the other, and both argue plauſibly from their firſt principles. Dr Burnet, whom we have here followed very cloſely, juſtly obſerves †, that "theſe are great grounds for mutual charity and forbearance."

† Expoſition of the 39 articles.

PREDETERMINATION, in philoſophy and theology, is that concurrence of God which makes men act, and determines them in all their actions, both good and evil, and is called by the ſchoolmen *phyſical predetermination* or *premotion.* See METAPHYSICS, Part III. Chap. v. and PREDESTINATION.

PREDIAL SLAVES. See *Predial-Slaves.*

(c) In our tranſlation we read, "If *any man* draw back," &c. &c.; but the words *any man* are not in the original; and if they do not make nonſenſe of the text, they muſt at leaſt be acknowledged to obſcure its meaning.

Predial-Tithes, are thoſe that are paid of things ariſing and growing from the ground only; as corn, hay, fruit, &c.

PREDICABLE, among logicians, denotes a general quality which may be predicated, or aſſerted of ſeveral things: thus animal is predicable of mankind, beaſts, birds, fiſhes, &c.

PREDICAMENT, among logicians, the ſame with category. See Category and Philosophy.

PREDICATE, in logic, that which, in a propoſition, is affirmed or denied of the ſubject. In theſe propoſitions, *ſnow is white, ink is not white*; whiteneſs is the predicate which is affirmed of ſnow, and denied of ink.

PRE-EMPTION, a privilege anciently allowed the king's purveyor, of having the choice and firſt buying of corn and other proviſions for the king's houſe; but taken away by the ſtatute 19 Car. II.

PREENING, in natural hiſtory, the action of birds cleaning, compoſing, and dreſſing their feathers, to enable them to glide more eaſily through the air. For this purpoſe they have two peculiar glands on their rump, which ſecrete an unctuous matter into a bag that is perforated, out of which the bird occaſionally draws it with its bill.

1
The Peripatetics maintained the eternity of the world.

PRE-EXISTENCE, a priority of being, or the being of one thing before another. Thus a cauſe, if not in time, is yet in nature pre-exiſtent to its effect. Thus God is pre-exiſtent to the univerſe. Thus a human father is pre-exiſtent to his ſon. The Peripatetics, though they maintained the eternity of the world, were likewiſe dogmatical in their opinion, that the univerſe was formed, actuated, and governed, by a ſovereign intelligence. See *Ariſtotle on the Soul*, and our articles Creation and Earth. See alſo the *Philoſophical Eſſays of Dr Iſaac Watts*, and the *Principles of natural and revealed Religion*, by the Chevalier Ramſey, where the ſubject of the world's eternity is diſcuſſed. Mr Hume's ſpeculations alſo, on this abſtruſe and arduous ſubject, had a greater tendency to diſſipate its gloom than that philoſopher himſelf could imagine.

2
Pre-exiſtence of the ſoul taught by Aſiatic ſages.

3
Socratic arguments for pre-exiſtence refuted.

4
Pre exiſtence taught by Chriſtian Platoniſts.

The pre-exiſtence of the human ſoul to its corporeal vehicle had been from time immemorial a prevailing opinion among the Aſiatic ſages, and from them was perhaps transferred by Pythagoras to the philoſophy of the Greeks; but his metempſychoſis, or tranſmigration of ſouls, is too trivial either to be ſeriouſly propoſed or refuted. Nevertheleſs, from the ſentiments of Socrates concerning the immortality of the ſoul, delivered in his laſt interview with his friends, it is obvious that the tenet of pre-exiſtence was a doctrine of the Platonic ſchool. If at any period of life, ſay theſe philoſophers, you ſhould examine a boy, of how many ideas, of what a number of principles, of what an extent of knowledge, will you find him poſſeſſed: theſe without doubt could neither be ſelf-derived nor recently acquired. With what avidity and promptitude does he attain the knowledge of arts and ſciences, which appear entirely new to him! theſe rapid and ſucceſsful advances in knowledge can only be the effects of reminiſcence, or of a fainter and more indiſtinct ſpecies of recollection. But in all the other operations of memory, we find retroſpective impreſſions attending every object or idea which emerges to her view; nor does ſhe ever ſuggeſt any thought, word, or action, without informing us, in a manner equally clear and evident, that thoſe impreſſions have been made upon our ſenſes, mind, or intellect, on ſome former occaſion. Whoever contemplates her progreſs, will eaſily diſcover, that aſſociation is her moſt faithful and efficacious auxiliary; and that by joining impreſſion with impreſſion, idea with idea, circumſtance with circumſtance, in the order of time, of place, of ſimilarity or diſſimilarity, ſhe is capacitated to accumulate her treaſures and enlarge her province even to an indefinite extent. But when intuitive principles, or ſimple concluſions, are elicited from the puerile underſtanding by a train of eaſy queſtions properly arranged, where is the retroſpective act of memory, by which the boy recogniſes thoſe truths as having formerly been perceived in his mind? Where are the crowds of concomitant, antecedent, or ſubſequent ideas, with which thoſe recollections ought naturally to have been attended? In a word, where is the ſenſe of perſonal identity, which ſeems abſolutely inſeparable from every act of memory? This hypotheſis, therefore, will not ſupport pre-exiſtence. After the Chriſtian religion had been conſiderably diffuſed, and warmly combated by its philoſophical antagoniſts, the ſame doctrine was reſumed and taught at Alexandria, by Platonic proſelytes, not only as a topic conſtituent of their maſter's philoſophy, but as an anſwer to thoſe formidable objections which had been deduced from the doctrine of original ſin, and from the vices which ſtain, and from the calamities which diſturb, human life: hence they ſtrenuouſly aſſerted, that all the human race were either introduced to being prior to Adam, or pre-exiſtent in his perſon; that they were not, therefore, repreſented by our firſt parents, but actually concurred in their crime, and participated their ruin.

5
But no ſolution of original ſin.

The followers of Origen, and ſuch as entertained the notion of Pre-adamites *, might argue from the doctrine of pre-exiſtence with ſome degree of plauſibility. For the human beings introduced by them to the theatre of probation had already attained the capacity or dignity of moral agents; as their crime therefore was voluntary, their puniſhment might be juſt. But thoſe who believe the whole human race created in Adam to be only pre-exiſtent in their germs or ſtamina, were even deprived of this miſerable ſubterfuge; for in theſe homunculi we can neither ſuppoſe the moral nor rational conſtitution unfolded. Since, therefore, their degeneracy was not ſpontaneous, neither could their ſufferings be equitable. Should it be ſaid that the evil of original ſin was penal, as it extended to our firſt parents alone, and merely conſequential as felt by their poſterity, it will be admitted that the diſtinction between penal and conſequential evil may be intelligible in human affairs, where other laws, aſſortments, and combinations than thoſe which are ſimply and purely moral, take place. But that a moral government, at one of the moſt cardinal periods of its adminiſtration, ſhould admit gratuitous or conſequential evil, ſeems to us irreconcileable with the attributes and conduct of a wiſe and juſt legiſlator. Conſequential evil, taken as ſuch, is miſery ſuſtained without demerit; and cannot reſult from the procedure of wiſdom, benignity, and juſtice; but muſt flow from neceſſity, from ignorance, from cruelty, or from caprice, as its only poſſible ſources. But even upon the ſuppoſition of thoſe who pretend that man was mature in all his faculties before the commiſſion of original ſin, the objections againſt it will ſtill remain in full force: for it is admitted by all except the Samian ſage, that the conſciouſneſs of perſonal identity which was felt in the pre-exiſtence, is obliterated in a ſubſequent ſtate of being.

---

* See Pre-adamites.

Now it may be demanded, whether agents thus reſuſcitated for puniſhment have not the ſame right to murmur and complain as if they had been perfectly innocent, and only created for that dreadful cataſtrophe? It is upon this principle alone that the effects of puniſhment can be either exemplary or diſciplinary; for how is it poſſible, that the puniſhment of beings unconſcious of a crime ſhould ever be reconciled either to the juſtice or beneficence of that intention with which their ſufferings are inflicted? Or how can others be ſuppoſed to become wiſe and virtuous by the example of thoſe who are neither acquainted with the origin nor the tendency of their miſeries, but have every reaſon to think themſelves afflicted merely for the ſake of afflicting? To us it ſeems clear, that the nature and *rationale* of original ſin lie inſcrutably retired in the boſom of Providence; nor can we, without unpardonable preſumption and arrogance, form the moſt ſimple concluſion, or attempt the minuteſt diſcovery, either different from or extraneous to the clear and obvious ſenſe of revelation. This ſenſe indeed may with propriety be extracted from the whole, or from one paſſage collated with another; but independent of it, as reaſon has no premiſſes, ſhe can form no deductions. The boldneſs and temerity of philoſophy, not ſatisfied with contemplating pre-exiſtence as merely relative to human nature, has dared to try how far it was compatible with the glorious and omniſcient God. The Arians, who allowed the ſubordinate divinity of our Saviour, believed him pre-exiſtent to all time, and before all worlds; but the Socinians, who eſteemed his nature as well as his perſon merely human, inſiſted, that before his incarnation he was only pre-exiſtent in the divine idea, not in nature or perſon. But when it is conſidered, that children do not begin to deduce inſtructions from nature and experience, at a period ſo late as we are apt to imagine; when it is admitted, that their progreſs, though inſenſible, may be much more rapid than we apprehend; when the opportunities of ſenſe, the ardour, of curioſity, the avidity of memory, and the activity of underſtanding, are remarked—we need not have recourſe to a pre-exiſtent ſtate for our account of the knowledge which young minds diſcover. It may likewiſe be added, that moral agents can only be improved and cultivated by moral diſcipline. Such effects therefore of any ſtate, whether happy or miſerable, as are merely mechanical, may be noxious or ſalutary to the patient, but can never enter into any moral economy as parts of its own adminiſtration. Pre-exiſtence, therefore, in this view of it, whether rewarded or puniſhed, without the continued impreſſion of perſonal identity, affords no ſolution of original ſin.

PREFACE, ſomething introductory to a book, to inform the reader of the deſign, method, &c. obſerved therein, and generally whatever is neceſſary to the underſtanding of a book.

PREFECT, in ancient Rome, one of the chief magiſtrates who governed in the abſence of the kings, conſuls, and emperors.

This power was greateſt under the emperors. His chief care was the government of the city, taking cognizance of all crimes committed therein and within 100 miles. He judged capitally and finally, and even preſided in the ſenate. He had the ſuperintendance of the proviſions, building, and navigation.

The prefect of modern Rome differs little from the ancient *præfectus*, his authority only extending to 40 miles round the city.

Prefect *of the Prætorium*, the leader of the pretorian bands deſtined for the emperor's guards, conſiſting, according to Dion, of 10,000 men. This officer, according to Suetonius, was inſtituted by Auguſtus, and uſually taken from among the knights.

By the favour of the emperors his power grew very conſiderable; to reduce which, Conſtantine divided the prefecture of the prætorium into four prefectures, and each of theſe again he ſubdivided into civil and military departments, though the name was only reſerved to him who was inveſted with the civil authority, and that of *comes belli* given him who commanded the cohorts.

PREGADI, in hiſtory, a denomination given to the ſenate of Venice, in which reſides the whole authority of the republic. At its firſt inſtitution it was compoſed of 60 ſenators, to whom 60 more have been added. See Venice.

PREGNANCY, the ſtate of a woman who has conceived, or is with child. See Midwifery.

PREHNITE, a ſtone ſo named by Mr Werner, inſpector of the mines of Freyburg, brought by Colonel Prehn from the Cape of Good Hope. In the firſt volume of *Chemical Annals* there is a chemical analyſis of this ſtone extracted from the *Acta Naturæ Curioſorum*, Berlin, tom. viii. p. 211. an. 1788, part 2. by Klaproth; from which it appears, that 100 parts of prehnite contain

ſilice - -	43 5/6 grains.
Alumine - -	30 1/3
Lime - -	18 1/3
Oxyd of iron - -	5 2/3
Water and air - -	1 1/6
Total -	100

Colonel Prehn gave it the name of emerald, and Mr Bruckmann adopted that denomination, but changed his opinion on conſidering that it had neither the hardneſs, the bright green colour, nor the property of cryſtallizing in hexagonal priſms like the emerald. The Dutch dealers call it *chryſopraſus* of the Cape; but chryſopraſus is nothing but quartz tinged green by the oxyd of nickel. Profeſſor Haquet, in the 4th volume of the Berlin Tranſactions, has named it *cryſtallized praſus*. In the 8th volume, however, Mr Bruckmann conſiders it as a cryſtallized felt-ſpar. Mr Sage calls it *chryſolite*. Mr Rome de l'Iſle claſſes it among the ſchoerls. To this claſſification Mr Klaproth objects, and is rather diſpoſed with Mr Werner to conſider it as a zeolite; on the whole, he thinks it may be conveniently ranked between zeolite and ſchoerl. Mr Haſſenfratz publiſhed in the *Journal de Phyſique* for February 1788 an analyſis of the ſame ſtone, under the title of *Pierre Silice, calcaire, alumineuſe, &c. &c. de couleur verte, &c.* And according to his reſults, which are ſomewhat different from thoſe of Mr Klaproth, and obtained by a different proceſs, it contains, ſilice 50, lime 23.4, alumine 20.4, oxyd of iron 4.9, water 0.9, magneſia 0.5=100. The ſpecific gravity of this ſtone, according to the experiments of Mr Briſſon, is 2.9423. The diſſection of its cryſtals, made by Abbé Haüy and Mr Haſſenfratz, diſcovered one angle of 60 degrees, as in ſchoerls; but it has hitherto been impoſſible to determine the others. The Abbé Haüy has convinced himſelf, that it bears no reſemblance to zeolite in its cryſtals. This ſtone ſcratches glaſs, and is itſelf ſcratched by rock cryſtal.

1 Definition.

PREJUDICE, or PREJUDGMENT, from *præ* and *judicium*, means a judgment formed beforehand, without examination; the prepoſition *præ* expreſſing an anticipation, not ſo much of time as of knowledge and due attention: thence the ſchoolmen have called it *anticipation and a preconceived opinion*.

2 Origin of prejudice.

Prejudice ariſes from the aſſociating principle, which we have explained at large in another article (ſee METAPHYSICS, Part I. chap. 5.), and it is a weakneſs from which no human mind can be wholly free. Some are indeed much more than others under its influence; but there is no man who does not occaſionally act upon principles, the propriety of which he never inveſtigated; or who does not hold ſpeculative opinions, into the truth of which he never ſeriouſly inquired. Our parents and tutors, yea our very nurſes, determine a multitude of our ſentiments: our friends, our neighbours, the cuſtom of the country where we dwell, and the eſtabliſhed opinions of mankind, form our belief; the great, the pious, the learned, and the ancient, the king, the prieſt, and the philoſopher, are characters of mighty efficacy to perſuade us to regulate our conduct by their practice, and to receive as truth whatever they may dictate.

The caſe cannot indeed be otherwiſe. The occaſions of acting are ſo frequent, and the principles of action are ſo various, that were a man to inveſtigate accurately the value of every ſingle motive which preſents itſelf to his mind, and to balance them fairly againſt each other, the time of acting would in moſt inſtances paſs away long before he could determine what ought to be done; and life would be waſted in uſeleſs ſpeculation. The great laws of religion and morality, which ought to be the general and leading principles of action, no man of ſcience will take upon truſt; but in the courſe of a buſy life a thouſand circumſtances will occur in which we muſt act with ſuch rapidity, that, after being ſatisfied of the lawfulneſs of what we are about to do, we muſt, for the prudence of it, confide entirely in the general cuſtoms of our country, or in the practice of other individuals placed in circumſtances ſimilar to ours. In all ſuch caſes, though we may act properly, we act from *prejudice*.

3 Its extenſive dominion.

But the dominion of prejudice is not confined to the actions of the man of buſineſs: it extends over the ſpeculations of the philoſopher himſelf, one half of whoſe knowledge reſts upon no other foundation. All human ſciences are related to each other (ſee PHILOSOPHY, n° 2.), and there is hardly one of them in which a man can become eminent unleſs he has ſome general acquaintance with the whole circle; but no man could ever yet inveſtigate for himſelf all thoſe propoſitions which conſtitute the circle of the ſciences, or even comprehend the evidence upon which they reſt, though he admits them perhaps as truths uncontrovertible. He muſt therefore receive many of them upon the authority of others, or, which is the ſame thing, admit them by *prejudice*.

To this reaſoning it may be objected, that when a man admits as true abſtract propoſitions, which, though not ſelf-evident, he cannot demonſtrate, he admits them not by prejudice, but upon teſtimony, which has been elſewhere ſhown to be a ſufficient foundation for human belief (ſee METAPHYSICS, n° 138.) The objection is plauſible, but it is not ſolid; for teſtimony *commands* belief only concerning *events* which, falling under the cognizance of the ſenſes, preclude all poſſibility of miſtake; whereas abſtract propoſitions, not ſelf-evident, can be proved true only by a *proceſs of reaſoning* or by a *ſeries of experiments;* and in conducting both theſe, the moſt vigorous mind is liable to miſtake. When Sir Iſaac Newton told the world that it was the fall of an apple which firſt ſuggeſted to him the general law of gravitation, he bore teſtimony to a fact concerning which he could not be miſtaken; and we receive his teſtimony for the reaſons aſſigned in the article referred to. When he lays down the method of obtaining the fluxion or momentum of the rectangle or product of two indeterminate quantities, which is the main point in his doctrine of fluxions, he labours to eſtabliſh that method on the baſis of demonſtration; and whoever makes uſe of it in practice, without underſtanding that demonſtration, receives the whole doctrine of the modern geometrical analyſis, not as a matter of *fact* upon the credit of Sir Iſaac's *teſtimony*, but as a ſyſtem of abſtract *truth* on the credit of his *underſtanding:* in other words, he is a fluxioniſt by *prejudice*.

In vain will it be ſaid, that in mathematical demonſtration there is no room for miſtake; and that therefore the man who implicitly adopts the method of fluxions may be conſidered as relying upon the *veracity* of its author, who had no inducement to deceive him, and whoſe comprehenſion was confeſſedly greater than his. In fluxionary mathematics, which treat of matters of which it is extremely difficult, if not impoſſible, to have adequate and ſteady conceptions, the moſt comprehenſive mind is liable to miſtake: and it is well known that the celebrated biſhop of Cloyne wrote his *Analyſt* to prove that the incomparable author of the method of fluxions had committed *two miſtakes* in his fundamental propoſition, which balancing one another, produced a true concluſion by falſe reaſoning. One or other of theſe great men, of whom the leaſt was an eminent mathematician, muſt have been bewildered in his reaſoning, and have fallen into error; and therefore whoever follows either of them implicitly without perceiving the error of the other, is unqueſtionably under the influence of prejudice. This is the caſe with the writer of the preſent article. He perceives not the error of Biſhop Berkeley's reaſoning, and yet he admits the doctrine of fluxions on the authority of Sir Iſaac's demonſtration. That demonſtration, however, he pretends not to underſtand; and therefore he admits the doctrine through *prejudice*.

4 Impoſſible to eradicate all prejudices from the mind.

We have made theſe obſervations to point out the abſurdity of the faſhionable cry againſt the harbouring of any prejudices. To eradicate all prejudices from the human mind is impoſſible; and if it were poſſible, it would be very unwiſe: for we ſee that prejudice may exiſt on the ſide of truth as well as on that of falſehood; and that principles profeſſed and believed by any individual may be uſeful and true, though he was brought to them not by a train of fair and candid reaſoning, but through the medium of prepoſſeſſion or authority. Indeed ſuch is our nature, and ſuch are the laws of aſſociation,

ſociation, that many of our beſt principles, and our obligation to perform many of the moſt amiable of our duties in common life, muſt evidently be acquired in this way. From endearing aſſociations, and authoritative inſtruction, we acquire a knowledge of our duty to our parents, and a facility in performing it, together with the firſt principles of religion, without a ſingle effort of our own reaſon. Even when reaſon has begun to aſſert its power, and ſhows us the propriety of ſuch duties, we are wonderfully aſſiſted in performing them by the amiable prejudices which we had before acquired, and which now appear to be natural to us. He who has never had the advantage of ſuch aſſociations, and who acquires a knowledge of the duties ſuggeſted by them after he has come to years of diſcretion, and chiefly by the efforts of his own reaſon, will ſeldom, *cæteris paribus*, perform thoſe duties with an energy and delight equal to that of the perſon who has. This remark appears to be confirmed by experience; for it is often found, that the children of the great, who have been given out to nurſe in their infancy, and who have ſeldom been in the company of their parents till their reaſoning faculties have been far advanced, are much leſs dutiful and affectionate than thoſe in the middle or lower ſtations of life, who have ſcarcely ever been out of their parents company.

5 Which would not be wiſe if it were poſſible.

Would it then be wiſe, even if it were practicable, to diſſolve all thoſe aſſociations which tend ſo powerfully to increaſe the mutual affections of parents and children? We cannot think that it would; as we believe it might be eaſily ſhown that public ſpirit ſprings out of private affection. Plato indeed held an opinion very different from ours; for in order to extend that affection which is uſually laviſhed at home to the whole ſtate, he propoſed that children ſhould be educated at the public expence, and never be permitted to know the authors of their being. But this is only one of the many viſionary projects of that great man, of which daily experience ſhows the abſurdity. In modern times, we are certain that leſs dependence is to be had upon the *patriotiſm* of the man who, for the love which he pretends to his country, can overlook or forget his own partial connections in it, than on him who, at the ſame time that he wiſhes his country well, is feelingly alive to all the endearments of kindred affection.

6 Good effects of ſome prejudices.

Such affection may be called *partial*, and very probably has its foundation in that which is the ſource of all our prejudices: but if it be properly trained in early life, it will gradually extend from our neareſt relations to the perſons with whom we aſſociate, and to the place which not only gave us birth, but alſo furniſhed our youthful and moſt innocent enjoyments. It is thus that the *amor patriæ* is generated (ſee Passion and Patriotism), which in minds unſeduced by falſe principles is exceedingly ſtrong; and though a partial affection, is of the moſt general utility. It is this prejudice which reconciles the Laplander to his freezing ſnows, and the African to his burning ſun; which attaches the native of the Highlands or of Wales as much to his mountains and rocks, as the apparently happier inhabitant of the ſouthern counties of England is to the more fertile and delightful ſpot where he drew his firſt breath. And we find in fact, that when a native of Kent and a Scotch Highlander have in ſome diſtant corner of the world gained a competent fortune without being corrupted by luxury, they return, the one to his hop-gardens, and the other to his mountains. Were this prejudice, for ſuch it ſurely is, wholly eradicated from the human mind, it is obvious that large tracts of country which are now full of inhabitants would be totally deſerted; and that the hungry barbarians, to make room for themſelves, would exterminate the proprietors of more favourable climes. From an affection to our friends and to our country, we naturally contract an affection for that mode of government under which we live; and unleſs it be particularly oppreſſive to ourſelves or any order of citizens, we come as naturally to prefer it to all other modes, whether it deſerve that preference or not. This no doubt is prejudice, but it is a beneficial prejudice; for were the multitude, who are wholly incapable of eſtimating the excellencies and defects of the various modes of government, to become diſſatisfied with their own, and riſe in a maſs to change it for the better, the moſt horrible conſequences might juſtly be dreaded. Of this truth the preſent ſtate of Europe affords too melancholy and convincing a proof. The man therefore who, under the pretence of enlightening the public mind and extirpating prejudices, paints to the illiterate vulgar, in aggravated colours, the abuſe of that government which has hitherto protected them from the ferocity of each other, is one of the greateſt criminals if his views be ſelfiſh, and one of the worſt reaſoners if they be diſintereſted, that human imagination can eaſily conceive.

7 Danger of improper attempts to remove them.

With the ſelfiſh patriot we have at preſent no concern: but we may with propriety aſk the diſintereſted lover of truth, whether he thinks it poſſible, that in a large community, of which nine-tenths of the members are neceſſarily incapable of taking comprehenſive views of things, or feeling the force of political reaſonings, any form of government can be acceptable to the people at large, which does not gain their affections through the medium of prejudice? It has been ſhown by Mr Hume with great ſtrength of argument, that government is founded on *opinion*, which is of two kinds, viz. opinion of intereſt, and opinion of right. By opinion of intereſt, he underſtands the ſenſe of the general advantage which is reaped from government, together with the perſuaſion that the particular government which is eſtabliſhed is equally advantageous with any other that could eaſily be ſettled. The opinion entertained of the *right* of any government is always founded in its antiquity; and hence ariſes the paſſionate regard which under ancient monarchies the people have for the true heir of their royal family. Theſe opinions, as held by the philoſopher converſant with the hiſtory of nations, are founded upon reaſoning more or leſs concluſive; but it is obvious, that in the minds of the multitude they can have no other foundation than prejudice. An illiterate clown or mechanic does not *ſee how* one form of government promotes the general intereſt more than another; but he may *believe* that it does, upon no other evidence than the declamation of a demagogue, who, for ſelfiſh purpoſes, contrives to flatter his pride. The ſame is the caſe with reſpect to the rights of hereditary monarchy. The anatomiſt finds nothing more in the greateſt monarch than the meaneſt peaſant, and the moraliſt may perhaps frequently find leſs; but the true philoſopher acknowledges his right to the ſovereignty: and though he be weak in underſtanding, or infirm in years, would, for the ſake of public peace and the ſtability of government, maintain him in his throne againſt every competitor of the moſt ſhining talents. The vulgar, however, who would act with this philoſopher, are influenced by no ſuch views, but merely by their prejudices in favour of birth and family; and therefore it is ridiculous to think of changing the public mind with reſpect to any form of government by pure reaſoning. In France a total change in the minds of the people has indeed been effected, and from the moſt violent prejudices in favour of royalty, they have now become more violently prejudiced in favour of republicaniſm. Bad as their government unqueſtionably was, the change that has now taken place is not the effect of calm reaſoning and accurate inquiry (for of that the bulk of mankind appears to be incapable), nor are their prejudices leſs violent than they were before. They are changed indeed; but no one will deny that prejudice, and that of the moſt violent kind, leads them on at preſent; nor can any one aſſert that their new prejudices have rendered them more happy, or their country more flouriſhing, than their former ones, which made them cry *Vive le Roi* under the tyrannic government of Louis XIV.

The influence of prejudice is not more powerful in fixing the political opinions of men, than in dictating their religious creed. Every child of a religious father receives his faith by inheritance long before he be capable of judging whether it be agreeable or diſagreeable to the word of God and the light of reaſon. This experience ſhows to be the fact; and ſound philoſophy declares that it cannot be otherwiſe. Parents are appointed to judge for their children in their younger years, and to inſtruct them in what they ſhould believe, and what they ſhould practiſe in the civil and religious life. This is a dictate of nature, and doubtleſs would have been ſo in a ſtate of perfect innocence. It is impoſſible that children ſhould be capable of judging for themſelves before their minds are furniſhed with a competent number of ideas, and before they are acquainted with any *principles* and *rules* of juſt reaſoning; and therefore they can do nothing better than run to their parents, and receive their directions what they ſhould believe and what they ſhould practiſe.

8
Abſurdity of keeping children ignorant of religion from the dread of prejudice.

This mode of tutoring the infant mind, and giving to our inſtructions the force of prejudice, before reaſon can operate with much effect, will, we know, be highly diſpleaſing to many who challenge to themſelves alone the epithet of liberal. With them it will be cramping the genius and perverting the judgment: but we cannot help thinking that ſuch an objection, if it ſhould be made, would be the offspring of ignorance; for it requires but very little knowledge of human nature to be able to ſee, that if children be not reſtrained by authority, and if we do not inſinuate a love of good principles into their minds, bad ones will inſinuate themſelves, and a little time will give *them* the force of inveterate prejudice, which all the future efforts of reaſon and philoſophy will find it difficult to eradicate. The idea of keeping a child ignorant of the being of a God, and the grand duties of morality and religion, till he ſhall come to years of diſcretion, and then allowing him to reaſon them out for himſelf, is an abſurd chimera: it is an experiment which never has been tried, which to us it appears impoſſible to try, and which, if it could be tried, could not poſſibly produce any good effect. For ſuppoſe we had a youth juſt arrived at years of diſcretion, totally ignorant of all theſe things, and unbiaſſed to any ſyſtem of opinions, or rather poſſeſſed of no opinions at all—it would, in the firſt place, we ſuſpect, be abſolutely neceſſary to direct his thoughts into a particular train, and for ſome perſon to lead him on from one idea to another, till he ſhould arrive at ſome concluſion: but in all this there is the influence of authority, aſſociation, and of prejudice.

9
Origin of bigotry.

It being therefore abſolutely neceſſary that ſentiments of religion be inſtilled into the minds of children before they be capable of diſcovering by the uſe of their reaſon whether thoſe ſentiments be juſt or not, it need not excite wonder, nor is it any reflection upon religion, that moſt men adhere with bigotry to the creed of their fathers, and ſupport that creed by arguments which could carry conviction to no minds but their own. The love and veneration which they bear to the memory of thoſe from whom they imbibed their earlieſt opinions, do not permit them to perceive either the falſehood of thoſe opinions, or their little importance, ſuppoſing them true. Hence the many frivolous diſputes which have been carried on amongſt Chriſtians; and hence the zeal with which ſome of them maintain tenets which are at once contrary to ſcripture, to reaſon, and to common ſenſe. A due reflection, however, on the ſource of all prejudices ought to moderate this zeal; for no man is wholly free from that bias which he is ſo ready to condemn in others: and indeed a man *totally free from prejudice*, would be a more unhappy being than the moſt violent bigot on earth. In ſcience, he would admit nothing which he could not himſelf demonſtrate; in buſineſs, he would be perpetually at a ſtand for want of motives to influence his conduct: he could have no attachment to a particular country; and therefore muſt be without patriotiſm, and without the ſolaces of friendſhip; and his religion, we are afraid, would be cold and lifeleſs.

10
An objection anſwered.

What, it will be ſaid, are the authors of a work which profeſſes to enlighten the public mind by laying before it a general view of ſcience and literature, become at laſt the advocates of *prejudice*, which is the *bane* of *ſcience*, and the *prop* of *ſuperſtition?* No, we are advocates for no prejudice which is either inimical to ſcience or friendly to abſurdity; but we do not think that the moraliſt would act wiſely who ſhould deſert his proper buſineſs to make himſelf maſter of the higher mathematics, merely that he might not be obliged to truſt occaſionally to the demonſtrations of others. The writer of this article is not ſkilled in trade; but it is not his opinion that the merchant would ſoon grow rich, who ſhould never make a bargain till he had previouſly calculated with mathematical exactneſs all the probabilities of his gain or loſs. That to diſſolve all the aſſociations which are the ſource of partial attachments of kindred, affection, and private friendſhip, would tend to promote the public happineſs, we cannot poſſibly believe. And whether or not the experience of the preſent day confirms Mr Hume's opinion, that far from endeavouring to extirpate the people's prejudices in favour of birth and family, we ſhould cheriſh ſuch ſentiments, as being abſolutely requiſite to preſerve a due ſubordination in ſociety, we pretend not to determine; but that men ſhould be better Chriſtians if they were to receive no religious inſtruction till they ſhould be able by their own reaſon to judge of its truth, daily obſervation does not warrant us to conclude; for we ſee thoſe who have ſeldom heard of God when children, "live without him in the world" when they are men.

Pernicious prejudices we have traced to their ſource elſewhere, and ſhown how they may be beſt prevented by proper attention in the education of children. See METAPHYSICS, nº 98). We ſhall only add here, that the earlier ſuch attention is paid, the more effectual it will be found; and that it is much eaſier to keep prejudices out of the mind than to remove them after they have been admitted. This however muſt be ſometimes attempted; and where prejudices are ſtrong, ſeveral methods have been recommended for rendering the attempt ſucceſsful. The following are taken moſtly from Dr Watts's improvement of the mind.

11
Proper methods of removing prejudices.

1. Never attack the prejudice *directly*, but lead the perſon who is under its influence ſtep by ſtep to the truth. Perhaps your neighbour is under the influence of *ſuperſtition and bigotry in the ſimplicity of his ſoul*; you muſt not immediately run upon him with violence, and ſhow him the abſurdity or folly of his own opinions, though you might be able to ſet them in a glaring light; but you muſt rather begin at a diſtance, and eſtabliſh his aſſent to ſome familiar and eaſy propoſitions, which have a tendency to refute his miſtakes, and to confirm the truth; and then ſilently obſerve what impreſſion this makes upon him, and proceed by ſlow degrees as he is able to bear, and you muſt carry on the work perhaps at diſtant ſeaſons of converſation. The tender or diſeaſed eye cannot bear a deluge of light at once.

Overhaſtineſs and vehemence in arguing is oftentimes the effect of *pride*; it blunts the poignancy of the argument, breaks its force, and diſappoints the end. If you were to convince a perſon of the falſehood of the *doctrine of tranſubſtantiation*, and you take up the conſecrated bread before him and ſay, "You may ſee, and taſte, and feel, *this is nothing but bread*; therefore whilſt you aſſert that God commands you to believe *it is not bread*, you moſt wickedly accuſe God of commanding you to tell a lie." This ſort of language would only raiſe the indignation of the perſon againſt you, inſtead of making any impreſſions upon him. He will not ſo much as think at all on the argument you have brought, but he rages at you as a *profane wretch*, ſetting up your own ſenſe and reaſon above ſacred authority; ſo that though what you affirm is a truth of great evidence, yet you loſe the benefit of your whole argument by an ill management, and the unreaſonable uſe of it.

2. Where the prejudices of mankind cannot be conquered at once, but will riſe up in arms againſt the evidence of truth, there we muſt make ſome allowances, and yield to them for the preſent, as far as we can ſafely do it without real injury to truth; and if we would have any ſucceſs in our endeavours to convince the world, we muſt practiſe this complaiſance for the benefit of mankind. Take a ſtudent who has deeply imbibed the principles of the *Peripatetics*, and imagines certain immaterial beings, called *ſubſtantial forms* to inhabit every herb, flower, mineral, metal, fire, water, &c. and to be the ſpring of all its properties and operations; or take a Platoniſt, who believes an *anima mundi*, "an univerſal ſoul of the world," to pervade all bodies, to act in and by them according to their nature, and indeed to give them their nature and their ſpecial powers; perhaps it may be very hard to convince theſe perſons by arguments, and conſtrain them to yield up thoſe fancies. Well then, let the one believe his *univerſal ſoul*, and the other go on with his notion of *ſubſtantial forms*, and at the ſame time teach them how by certain original laws of motion, and the various ſizes, ſhapes, and ſituations of the parts of matter, allowing a continued divine concourſe in and with all, the ſeveral appearances in nature may be ſolved, and the variety of effects produced, according to the corpuſcular philoſophy, improved by *Deſcartes*, *Mr Boyle*, and *Sir Iſaac Newton*; and when they have attained a degree of ſkill in this ſcience, they will ſee theſe airy notions of theirs, theſe imaginary powers, to be ſo uſeleſs and unneceſſary, that they will drop them of their own accord. The *Peripatetic forms* will vaniſh from the mind like a dream, and the *Platonic ſoul of the world will expire*.

We may give another inſtance of the ſame practice, where there is a prejudicate fondneſs of particular words and phraſes. Suppoſe a man is educated in an *unhappy form of ſpeech*, whereby he explains ſome *great doctrine of the goſpel*, and by the means of this phraſe he has imbibed a very falſe idea of that doctrine; yet he is ſo bigotted to his form of words, that he imagines if thoſe words are omitted the form is loſt. Now, if we cannot poſſibly perſuade him to part with his improper terms, we will indulge them a little, and try to explain them in a ſcriptural ſenſe, rather than let him go on in his miſtaken ideas. A perſon who has been bred a *Papiſt*, knows but little of religion, yet he reſolves never to depart from the *Roman Catholic faith*, and is obſtinately bent againſt a change. Now it cannot be unlawful to teach ſuch an one the true Chriſtian, *i. e.* the *Proteſtant religion*, out of the *Epiſtle to the Romans*, and ſhow him that the ſame doctrine is contained in the *Catholic Epiſtles of St Peter, James, and Jude*; and thus let him live and die a good Chriſtian in the belief of the religion taught him out of the New Teſtament, while he imagines he is a *Roman Catholic* ſtill, becauſe he finds the doctrine he is taught in the *Catholic* Epiſtles and in that to the *Romans*. Sometimes we may make uſe of the very prejudices under which a perſon labours, in order to convince him of ſome particular truth, and argue with him upon his own profeſſed principles as though they were true. Suppoſe a *Jew* lies ſick of a fever, and is forbid fleſh by his phyſician; but hearing that rabbits were provided for the dinner of the family, deſired earneſtly to eat of them; and ſuppoſe he became impatient, becauſe his phyſician did not permit him, and he inſiſted upon it that it could do him no hurt—ſurely rather than let him perſiſt in that fancy and that deſire, to the danger of his life, we might tell him that theſe animals were ſtrangled, a ſort of food forbidden by the Jewiſh law, though we ourſelves might believe that law to be aboliſhed.

Where we find any perſon obſtinately perſiſting in a miſtake in oppoſition to all reaſon, eſpecially if the miſtake be very injurious or pernicious, and we know this perſon will hearken to the ſentiment or authority of ſome favourite name; it is needful ſometimes to urge the *opinion and authority* of that favourite perſon, ſince that is likely to be regarded much more than *reaſon*. We are almoſt aſhamed indeed to ſpeak of uſing any *influence of authority* in reaſoning or argument; but in ſome caſes it is better that poor, ſilly, perverſe, obſtinate creatures, ſhould be perſuaded to judge and act right, by a veneration for the ſenſe of others, than to be left to wander in pernicious errors, and continue deaf to all argument, and blind to all evidence. They are but children of a larger ſize; and ſince they perſiſt all their lives in their minority, and reject all true reaſoning, ſurely we may try to perſuade them to practiſe what is for their own intereſt by ſuch childiſh reaſons as they will hearken to. We may overaw them from purſuing their own ruin by the terrors of a ſolemn ſhadow, or allure them by a ſugar plum to their own happineſs. But after all, we muſt conclude, that whereſoever it can be done, it is beſt to *remove and root out thoſe prejudices* which obſtruct the entrance of truth into the mind, rather than to palliate, humour, or indulge them; and ſometimes this muſt neceſſarily be done, before you can make a perſon part with ſome beloved error, and lead him into better ſentiments.

12 Mutual forbearance recommended.

On the whole, we would recommend more mutual forbearance and leſs acrimony than is commonly found among writers on diſputed ſubjects, as the only means by which our differences in religion, politics, and ſcience, ever can be healed, and truth certainly diſcovered. If men were leſs violent in defending their particular opinions, they would always gain a more patient hearing, they would be leſs ſuſpected of, and leſs liable to, prejudice, and of courſe more apt either to convince or to be convinced. They would likewiſe by ſo doing ſhow, in the moſt unequivocal manner, their attention to ſound philoſophy, and above all to genuine Chriſtianity; which, though it is far from encouraging ſcepticiſm, or a temporizing ſpirit, recommends, in the ſtrongeſt terms, among all its profeſſors, *univerſal charity and mutual forbearance*. See PROBABILITY, TRUTH, and SUPERSTITION.

PRELATE, an eccleſiaſtic raiſed to ſome eminent and ſuperior dignity in the church; as biſhops, archbiſhops, patriarchs, &c.

PRELIMINARY, in general, denotes ſomething to be examined and determined before an affair can be treated of to the purpoſe.

PRELUDE, in muſic, is uſually a flouriſh or irregular air, which a muſician plays off-hand, to try if his inſtrument be in tune, and ſo lead him into the piece to be played.

PREMISSES, in logic, an appellation given to the two firſt propoſitions of a ſyllogiſm. See LOGIC.

PREMISSES, in law, properly ſignifies the land, &c. mentioned in the beginning of a deed.

PREMIUM, or PRÆMIUM, properly ſignifies a reward or recompenſe: but it is chiefly uſed in a mercantile ſenſe for the ſum of money given to an inſurer, whether of ſhips, houſes, lives, &c. See INSURANCE.

PREMNA, in botany; a genus of the angioſpermia order, belonging to the didynamia claſs of plants. The calyx is bilobed; the corolla quadrifid; the berry quadrilocular; the ſeeds ſolitary.

PREMONSTRANTES, or PRÆMONSTRATENSES, a religious order of regular canons inſtituted in 1120, by S. Norbert; and thence alſo called *Norbertines*.

The firſt monaſtery of this order was built by Norbert in the Iſle of France, three leagues to the weſt of Laon; which he called *Præmonſtre*, *Præmonſtratum*, and hence the order itſelf derived its name; though as to the occaſion of that name, the writers of that order are divided. At firſt the religious of this order were ſo very poor, that they had only a ſingle aſs, which ſerved to carry the wood they cut down every morning, and ſent to Laon in order to purchaſe bread. But they ſoon received ſo many donations, and built ſo many monaſteries, that in 30 years after the foundation of the order, they had above 100 abbeys in France and Germany: and in proceſs of time the order ſo increaſed, that it had monaſteries in all parts of Chriſtendom, amounting to 1000 abbeys, 300 provoſtſhips, a vaſt number of priories, and 500 nunneries. But they are now greatly diminiſhed. The rule they followed was that of St Auguſtine, with ſome ſlight alterations, and an addition of certain ſevere laws, whoſe authority did not long ſurvive their founder.

The order was approved by Honorius II. in 1126, and again by ſeveral ſucceeding popes. At firſt the abſtinence from fleſh was rigidly obſerved. In 1245 Innocent IV. complained of its being neglected to a general chapter. In 1288, their general, William, procured leave of pope Nicholas IV. for thoſe of the order to eat fleſh on journeys. In 1460, Pius II. granted them a general permiſſion to eat meat, excepting from Septuageſima to Eaſter. The dreſs of the religious of this order is white, with a ſcapulary before the caſſock. Out of doors they wear a white cloak and white hat; within, a little camail; and at church, a ſurplice, &c.

In the firſt monaſteries built by Norbert, there was one for men and another for women, only ſeparated by a wall. In 1137, by a decree of a general chapter, this practice was prohibited, and the women removed out of thoſe already built, to a greater diſtance from thoſe of the men.

The Præmonſtratenſes, or monks of Premontre, vulgarly called *white canons*, came firſt into England, A. D. 1146. Their firſt monaſtery, called *New-houſe*, was erected in Lincolnſhire, by Peter de Saulia, and dedicated to St Martial. In the reign of Edward I. this order had 27 monaſteries in England.

PRENANTHES, in botany: A genus of the polygamia æqualis order, belonging to the ſyngeneſia claſs of plants; and in the natural method ranking under the 49th order, *Compoſitæ*. The receptacle is naked; the calyx calyculated; the pappus is ſimple, and almoſt ſeſſile; the florets are placed in a ſingle ſeries.

PRENOMEN, PRÆNOMEN, among the ancient Romans, a name prefixed to their family name, and anſwering to our Chriſtian name: ſuch are Caius, Lucius, Marcus, &c.

PRENOTION, PRÆNOTIO, or *Præcognitio*, is a notice or piece of knowledge preceding ſome other in reſpect of time. Such is the knowledge of the antecedent, which muſt precede that of the concluſion. It is uſed by Lord Bacon for breaking of an endleſs ſearch, which he obſerves to be one of the principal parts of the art of memory. For when one endeavours to call any thing to mind, without ſome previous notion or perception of what is ſought for, the mind exerts itſelf and ſtrives in an endleſs manner: but if it hath any ſhort notion before-hand, the infinity of the ſearch is preſently cut off, and the mind hunts nearer home, as in an incloſure. Thus verſe is eaſier remembered than proſe; becauſe if we ſtick at any word in a verſe, we have a previous notion that it is ſuch a word as muſt ſtand in a verſe. Hence alſo, order is a manifeſt help to memory; for here is a previous notion, that the thing ſought for muſt be agreeable to order. Bacon's *Works Abr.* vol. i. p. 136. and vol. ii. p. 473.

PREPARATION, in a general ſenſe, the act of diſpoſing things in ſuch a manner as to render any foreſeen event more advantageous or leſs hurtful according to its nature.

PREPARATION *of Diſſonances*, in muſic, is their diſpoſition in harmony in ſuch a manner, that, by ſomething congenial in what precedes, they may be rendered leſs harſh to the ear than they would be without that precaution; according to this definition, every diſcord ought to be prepared. But when, in order to prepare a diſſonance, it is exacted that the ſound which forms it ſhould before have formed a conſonance, then there is fundamentally but one ſingle diſſonance which is prepared, viz. the ſeventh. Nor is even this preparation neceſſary in the chord which contains the ſenſible note, becauſe then the diſſonance being characteriſtical, both in its chord and in its mode, the ear has ſufficient reaſon to expect it: it accordingly does expect it, and recogniſe it; nor is either deceived with reſpect to its chord nor its natural progreſs. But when the ſeventh is heard upon a fundamental ſound which is not eſſential to the mode, it ought then to be prepared, in order to prevent all ambiguity; to prevent the ear, whilſt liſtening to this note, from loſing its train: and as this chord of the ſeventh may be inverted and combined in ſeveral different manners, from this ariſe likewiſe a number of different ways by which it may ſeem to be prepared, which, in the main, always iſſue however in the ſame thing.

In making uſe of diſſonances, three things are to be conſidered; viz. the chord which precedes the diſſonance, that in which it is found, and that which is immediately ſubſequent to it. Preparation only reſpects the two firſt; for the third ſee RESOLUTION.

When we would regularly prepare a diſcord in order to arrive at its chord, we muſt chooſe ſuch a career of the fundamental baſs, that the ſound which forms the diſſonance may be a protraction into the perfect time of the ſame note which formed a conſonance formerly ſtruck in the imperfect in the preceding chord; this is what we call *ſincopation*. See SINCOPATION.

From this preparation two advantages reſult; viz. 1. That there is neceſſarily an harmonical connection between the two chords, ſince that connection is formed by the diſſonance itſelf; and, 2. That this diſſonance, as it is nothing elſe but the continuation of the ſame ſound which had formed a conſonance, becomes much leſs harſh to the ear than it would have been with any ſound recently ſtruck. Now this is all that we expect to gain by preparation. See CADENCE, DISCORD, and HARMONY.

By what has been juſt ſaid, it will appear that there is no other part peculiarly deſtined for preparing the diſſonance, except that in which it is heard; ſo that if the treble ſhall exhibit a diſſonance, that muſt be ſincopated; but if the diſſonance is in the baſs, the baſs muſt be ſincopated. Though there is nothing here but what is quite ſimple, yet have maſters of muſic miſerably embroiled the whole matter.

Some diſſonances may be found which are never prepared: ſuch is the ſixth ſuperadded: ſome which are very unfrequently prepared; ſuch is the diminiſhed ſeventh.

PREPARATIONS, in pharmacy, the medicines when mixed together in ſuch a manner as to be fit for the uſe of the patient. See PHARMACY, Part II.

PREPARATIONS, in anatomy, the parts of animal bodies prepared and preſerved for anatomical uſes.

The manner of preſerving anatomical preparations, is either by drying them thoroughly in the air, or putting them into a proper liquor.

Edin. Med. Eſſays, vol ii. p. 8.

In drying parts which are thick, when the weather is warm, care muſt be taken to prevent putrefaction, fly-blows, inſects, &c. This is eaſily done by the uſe of a ſolution of corroſive ſublimate in ſpirit of wine, in the proportion of two drams of ſublimate to a pound of ſpirit: the part ſhould be moiſtened with this liquor as it dries, and by this method the body of a child may be kept ſafe even in ſummer. Dried preparations are apt to crack and moulder away in keeping; to prevent this, their ſurface ſhould be covered with a thick varniſh, repeated as often as occaſion requires.

Though ſeveral parts prepared dry are uſeful, yet others muſt be ſo managed as to be always flexible, and nearer a natural ſtate. The difficulty has been to find a proper liquor for this purpoſe. Dr Monro ſays, the beſt he knows is a well rectified colourleſs ſpirit of wine, to which is added a ſmall quantity of the ſpirit of vitriol or nitre. When theſe are properly mixed, they neither change their colour nor the conſiſtence of the parts, except where there are ſerous or mucous liquors contained in them. The brain, even of a young child, in this mixture grows ſo firm as to admit of gentle handling, as do alſo the vitreous and cryſtalline humours of the eye. The liquor of the ſebaceous glands and the ſemen are coagulated by this ſpirituous mixture; and it heightens the red colour of the injection of the blood-veſſels, ſo that after the part has been in it a little time, ſeveral veſſels appear which were before inviſible. If you will compare theſe effects with what Ruyſch has ſaid of his balſam, you will find the liquor abovementioned to come very near to it.

The proportion of the two ſpirits muſt be changed according to the part prepared. For the brain and humours of the eye, you muſt put two drams of ſpirit of nitre to one pound of ſpirit of wine. In preſerving other parts which are harder, 30 or 40 drops of the acid will be ſufficient; a larger quantity will make bones flexible, and even diſſolve them. The part thus preſerved ſhould be always kept covered with the liquor: therefore great care ſhould be taken to ſtop the mouth of the glaſs with a waxed cork and a bladder tied over it, to prevent the evaporation of the ſpirit; ſome of which, notwithſtanding all this care, will fly off; therefore freſh muſt be added as there is occaſion. When the ſpirits change to a dark tincture, which will ſometimes happen, they ſhould be poured off, and freſh put in their room; but with ſomewhat leſs acid than at firſt.

The glaſſes which contain the preparations ſhould be of the fineſt ſort, and pretty thick; for through ſuch the parts may be ſeen very diſtinctly, and of a true colour, and the object will be ſo magnified as to ſhow veſſels in the glaſs which out of it were not to be ſeen.

As the glaſs when filled with the liquor has a certain focus, it is neceſſary to keep the preparation at a proper diſtance from the ſides of it, which is eaſily done by little ſticks ſuitably placed, or by ſuſpending it by a thread in a proper ſituation. The operator ſhould be cautious of putting his fingers in this liquor oftener than is abſolutely neceſſary; becauſe it brings on a numbneſs on the ſkin, which makes the fingers unfit for any nice operation. The beſt remedy for this is to waſh them in water mixed with a few drops of oil of tartar per deliquium.

Dr Chriſt. Jac. Trew prefers the rectified ſpirit of grain for preſerving anatomical preparations to ſpirit of wine, or to compoſitions of alcohol, amber, camphor, &c. becauſe theſe ſoon change into a brown colour, whereas the ſpirit from malt preſerves its limpid appearance. When any part is to be preſerved wet, waſh it with water till it is no more tinctured. The water is next to be waſhed away with ſpirits, and then the preparation is to be put among ſpirits in a glaſs, the mouth of which is to be cloſely covered with a glaſs head, over which a wet bladder and leaf-tin are to be tied. *Com. Lit. Norimb.* 1731, *ſemeſt.* 1. *ſpecim.* 9. See alſo *Pole's Anatomical Inſtructor*, and *American Tranſactions*, vol. ii. p. 366.

PREPENSED, in law, denotes fore-thought. In which ſenſe we ſay *prepenſed malice*, &c. If, when a man is ſlain upon a ſudden quarrel, there were malice prepenſed formerly between them, it makes it murder; and, as it is called in ſome ſtatutes, *prepenſed murther*.

PREPOSITION, in grammar, one of the parts of ſpeech, being an indeclinable particle which yet ſerves to govern the nouns that follow it; ſuch as *per*, *pro*, *propter;* and through, for, with, &c.

F. Buffier allows it to be only a modificative of a part of ſpeech, ſerving to circumſtantiate a noun.

PREPUCE, in anatomy, the foreſkin; being a prolongation of the cutis of the penis, covering the glans. See ANATOMY, n° 107.

PREROGATIVE, in Engliſh law, an excluſive or uliar privilege.

Royal PREROGATIVE, that ſpecial pre-eminence which the king hath over and above all other perſons, and out of the ordinary courſe of the common law, in right of his regal dignity. It ſignifies in its etymology (from *præ* and *rogo*) ſomething that is required or demanded before, or in preference to, all others. And hence it follows, that it muſt be in its nature ſingular and eccentrical; that it can only be applied to thoſe rights and capacities which the king enjoys alone in contradiſtinction to others, and not to thoſe which he enjoys in common with any of his ſubjects: for if once any one prerogative of the crown could be held in common with the ſubject, it would ceaſe to be prerogative any longer. And therefore Finch lays it down as a maxim, that the prerogative is that law in caſe of the king, which is law in no caſe of the ſubject.

Prerogatives are either *direct* or *incidental*. The *direct* are ſuch poſitive ſubſtantial parts of the royal character and authority, as are rooted in, and ſpring from, the king's political perſon, conſidered merely by itſelf, without reference to any other extrinſic circumſtance; as, the right of ſending ambaſſadors, of creating peers, and of making war or peace. But ſuch prerogatives as are *incidental* bear always a relation to ſomething elſe, diſtinct from the king's perſon; and are indeed only exceptions, in favour of the crown, to thoſe general rules that are eſtabliſhed for the reſt of the community: ſuch as, that no coſts ſhall be recovered againſt the king; that the king can never be a joint tenant; and that his debt ſhall be preferred before a debt to any of his ſubjects.

Theſe ſubſtantive or direct prerogatives may again be divided into three kinds: being ſuch as regard, firſt, the king's royal *character* or *dignity;* ſecondly, his royal *authority* or *power;* and, laſtly, his royal *income*. Theſe are neceſſary, to ſecure reverence to his perſon, obedience to his commands, and an affluent ſupply for the ordinary expences of government; without all of which it is impoſſible to maintain the executive power in due independence and vigour. Yet, in every branch of that large and extenſive dominion, the conſtitution has interpoſed ſuch ſeaſonable checks and reſtrictions, as may crub it from trampling on thoſe liberties which it was meant to ſecure and eſtabliſh. The enormous weight of prerogative, if left to itſelf, (as in arbitrary governments it is), ſpreads havock and deſtruction among all the inferior movements: but, when balanced and bridled by its proper counterpoiſe, timely and judiciouſly applied, its operations are then equable and regular; it invigorates the whole machine, and enables every part to anſwer the end of its conſtruction.

I. Of the royal *dignity*. Under every monarchical eſtabliſhment, it is neceſſary to diſtinguiſh the prince from his ſubjects, not only by the outward pomp and decorations of majeſty, but alſo by aſcribing to him certain qualities as inherent in his royal capacity, diſtinct from, and ſuperior to, thoſe of any other individual in the nation. For though a philoſophical mind will (ſays Sir William Blackſtone) conſider the royal perſon merely as one man appointed by mutual conſent to preſide over many others, and will pay him that reverence and duty which the principles of ſociety demand; yet the maſs of mankind will be apt to grow inſolent and refractory, if taught to conſider their prince as a man of no greater perfection than themſelves. The law therefore aſcribes to the king, in his high political character, not only large powers and emoluments, which form his prerogative and revenue, but likewiſe certain attributes of a great and tranſcendent nature; by which the people are led to conſider him in the light of a ſuperior being, and to pay him that awful reſpect which may enable him with greater eaſe to carry on the buſineſs of government. This is what we underſtand by the royal dignity; the ſeveral branches of which we ſhall now proceed to enumerate.

1. And, firſt, the law aſcribes to the king the attribute of *ſovereignty*, or pre-eminency. See SOVEREIGNTY.

2. "The law alſo (according to Sir William Blackſtone) aſcribes to the king, in his political capacity, abſolute *perfection*. 'The king can do no wrong.' Which ancient and fundamental maxim (ſays he) is not to be underſtood as if every thing tranſacted by the government was of courſe juſt and lawful; but means only two things. Firſt, that whatever

Prerogative.

is exceptionable in the conduct of public affairs, is not to be imputed to the king, nor is he anſwerable for it perſonally to his people: for this doctrine would totally deſtroy that conſtitutional independence of the crown, which is neceſſary for the balance of power, in our free and active, and therefore compounded, conſtitution. And, ſecondly it means that the prerogative of the crown extends not to do any injury; it is created for the benefit of the people, and therefore cannot be exerted to their prejudice.—"The king, moreover, (he obſerves), is not only incapable of *doing* wrong, but even of *thinking* wrong: he can never mean to do an improper thing: in him is no folly or weakneſs. And, thererefore, if the crown ſhould be induced to grant any franchiſe or privilege to a ſubject contrary to reaſon, or in anywiſe prejudicial to the commonwealth or a private perſon, the law will not ſuppoſe the king to have meant either an unwiſe or an injurious action, but declares that the king was deceived in his grant; and thereupon ſuch grant is rendered void, merely upon the foundation of fraud and deception, either by or upon thoſe agents whom the crown has thought proper to employ. For the law will not caſt an imputation on that magiſtrate whom it entruſts with the executive power, as if he was capable of intentionally diſregarding his truſt: but attributes to mere impoſition (to which the moſt perfect of ſublunary beings muſt ſtill continue liable) thoſe little inadvertencies, which, if charged on the will of the prince, might leſſen him in the eyes of his ſubjects."

But this doctrine has been expoſed as ridiculous and abſurd, by Lord Abingdon, in his *Dedication to the collective Body of the People of England*. "Let us ſee (ſays he) how theſe maxims and their comments agree with the conſtitution, with nature, with reaſon, with common ſenſe, with experience, with fact, with precedent, and with Sir Willam Blackſtone himſelf; and whether, by the application of theſe rules of evidence thereto, it will not be found, that (from the want of attention to that important line of diſtinction which the conſtitution has drawn between the *king* of England and the *crown* of England) what was attributed to the *monarchy* has not been given to the *monarch*, what meant for the *kingſhip* conveyed to the *king*, what deſigned for the *thing* transferred to the *perſon*, what intended for *theory* applied to *practice*; and ſo in conſequence, that whilſt the premiſſes (of the perfection of the monarchy) be true, the concluſion (that the king can do no wrong) be not falſe.

"And, firſt, in reference to the conſtitution: to which if this matter be applied (meaning what it expreſſes, and if it do not it is unworthy of notice), it is ſubverſive of a principle in the conſtitution, upon which the preſervation of the conſtitution depends; I mean the principle of *reſiſtance*; a principle which, whilſt no man will now venture to gainſay, Sir William Blackſtone himſelf admits, '*is juſtifiable to the perſon of the prince*, when the being of the ſtate is endangered, and the public voice proclaims ſuch reſiſtance neceſſary;' and thus, by ſuch admiſſion, both diſproves the maxim, and overſets his own comment thereupon: for to ſay that 'the king can do no wrong,' and that 'he is incapable even of thinking wrong,' and then to admit that 'reſiſtance to his perſon is juſtifiable,' are ſuch jarring contradictions in themſelves, that, until reconciled, the neceſſity of argument is ſuſpended.

"With reſpect then, in the next place, to the agreement of this maxim, and its comment, with nature, with reaſon, and with common ſenſe, I ſhould have thought myſelf ſufficiently juſtified in appealing to every man's own reflection for deciſion, if I had not been made to underſtand that nature, reaſon, and common ſenſe, had had nothing to do with either. Sir William Blackſtone ſays, 'That though a philoſophical mind will conſider the royal perſon merely as one man appointed by mutual conſent to preſide over others, and will pay him that reverence and duty which the principles of ſociety demand, yet the maſs of mankind will be apt to grow inſolent and refractory if taught to conſider their prince as a man of no greater perfection than themſelves; and therefore the law aſcribes to the king, in his high political character, certain attributes of a great and tranſcendent nature, by which the people are led to conſider him in the light of a ſuperior being, and to pay him that awful reſpect which may enable him with greater eaſe to carry on the buſineſs of government. So that, in order to govern with greater eaſe (which by the bye is mere aſſertion without any proof), it is neceſſary to deceive the maſs of mankind, by making them believe, not only what a philoſophical mind cannot believe; but what it is impoſſible for any mind to believe; and therefore, in the inveſtigation of this ſubject, according to Sir William, neither nature, reaſon, nor common ſenſe, can have any concern.——

"It remains to examine in how much this maxim and its comment agree with experience, with fact, with precedent, and with Sir William Blackſtone himſelf. And here it is matter of moſt curious ſpeculation, to obſerve a maxim laid down, and which is intended for a rule of government, not only without a ſingle caſe in ſupport of it, but with a ſtring of caſes, that may be carried back to Egbert the firſt monarch of England, in direct oppoſition to the doctrine. Who is the man, that, reading the paſt hiſtory of this country, will ſhow us any king that has done no wrong? Who is the reader that will not find, that all the wrong and injuries which the free conſtitution of this country has hitherto ſuffered, have been ſolely derived from the arbitrary meaſures of our kings? And yet the maſs of mankind are to look upon the king as a ſuperior being; and the maxim, that 'the king can do no wrong,' is to remain as an article of belief. But, without puſhing this inquiry any farther, let us ſee what encouragement Sir William Blackſtone himſelf has given us for our credulity. After ſtating the maxim, and preſenting us with a moſt lively picture, 'of our ſovereign lord thus *all perfect* and *immortal*,' what does he make this all-perfection and immortality in the end to come to? His words are theſe: 'For when king Charles's deluded brother attempted to *enſlave* the nation,' (*no wrong this, to be ſure*), 'he found it was beyond his power: the people both *could*, and *did*, reſiſt him; and in conſequence of ſuch reſiſtence, obliged him to quit his enterpriſe and his throne together *.'"

The ſum of all is this: That the crown of England and the king of England are diſtinguiſhable, and not ſynonymous terms: that allegiance is due *to the crown*, and through the crown *to the king*: that the attributes of the crown are ſovereignty, perfection, and perpetuity; but that it does not therefore follow that the king can do no wrong. It is indeed to be admitted, that in high reſpect for the crown, high reſpect is alſo due to the wearer of that crown; that is, to the king: but the crown is to be preferred to the king, for the firſt veneration is due to the conſtitution. It is likewiſe *to be ſuppoſed* that the king *will* do no wrong: and as, to prevent this, a privy council is appointed by the conſtitution to aſſiſt the king in the execution of the government; ſo if any wrong be done, ‘ theſe men,’ as Monteſquieu expreſſes it, ‘ may be examined and puniſhed (A).’

---

* Comment vol. iv. p. 433

“ But if any future king ſhall think to ſcreen theſe evil counſellors from the juſt vengeance of the people, by becoming *his own miniſter;* and, in ſo doing ſhall take for his ſanction *the attribute of perfection,* ſhall truſt to the deception of his being *a ſuperior being,* and cloak himſelf under the maxim that *the king can do no wrong;* I ſay, in ſuch a caſe, let the appeal already made to the conſtitution, to nature, to reaſon, to common ſenſe, to experience, to fact, to precedent, and to Sir William Blackſtone himſelf, ſuffice; and preclude the neceſſity of any further remarks from me (B).”

Blackſt. Comment.

To proceed now to other particulars: The law determines, that in the king can be no negligence, or LACHES; and therefore no delay will bar his right. *Nullum tempus occurrit regi,* is the ſtanding maxim upon all occaſions; for the law intends that the king is always buſied for the public good, and therefore has not leiſure to aſſert his right within the times limited to ſubjects. In the king alſo can be no ſtain or corruption of blood: for if the heir to the crown were attainted of treaſon or felony, and afterwards the crown ſhould deſcend to him, this would purge the attainder *ipſo facto.* And therefore, when Henry VII. who as earl of Richmond ſtood attainted, came to the crown, it was not thought neceſſary to paſs an act of parliament to reverſe this attainder; becauſe, as Lord Bacon in his hiſtory of that prince informs us, it was agreed that the aſſumption of the crown had at once purged all attainders. Neither can the king, in judgment of law, as king, ever be a minor or under age; and therefore his royal grants and aſſents to acts of parliament are good, though he has not in his natural capacity attained the legal age of 21. By a ſtatute, indeed, 28 Hen. VIII. c. 17. power was given to future kings to reſcind and revoke all acts of parliament that ſhould be made while they were under the age of 24: but this was repealed by the ſtatute 1 Edward VI. c. 11. ſo far as related to that prince, and both ſtatutes are declared to be determined by 24 Geo. II. c. 24. It hath alſo been uſually thought prudent, when the heir-apparent has been very young, to appoint a protector, guardian, or regent, ſor a limited time: but the very neceſſity of ſuch extraordinary proviſion is ſufficient to demonſtrate the truth of that maxim of common law, that in the king is no minority; and therefore he hath no legal guardian. See REGENT.

3. A third attribute of the king's majeſty is his *perpetuity.* The law aſcribes to him, in his political capacity, an abſolute immortality. The king never dies. Henry, Edward, or George, may die; but the king ſurvives them all. For, immediately upon the deceaſe of the reigning prince in his natural capacity, his kingſhip or imperial dignity, by act of law, without any *interregnum* or interval, is veſted at once in his heir; who is *eo inſtanti,* king to all intents and purpoſes. And ſo tender is the law of ſuppoſing even a poſſibility of his death, that his natural diſſolution is generally called his *demiſe; dimiſſia regis vel coronæ:* an expreſſion which ſignifies merely a transfer of property; for, as is obſerved in Plowden, when we ſay the demiſe of the crown, we mean only, that, in conſequence of the diſunion of the king's body-natural from his body-politic, the kingdom is transferred or demiſed to his ſucceſſor, and ſo the royal dignity remains perpetual. Thus, too, when Edward the fourth, in the tenth year of his reign, was driven from his throne for a few months by the houſe of Lancaſter, this temporary transfer of his dignity was denominated his *demiſe;* and all proceſs was held to be diſcontinued, as upon a natural death of the king.

II. We are next to conſider thoſe branches of the royal prerogative which inveſt this our ſovereign lord with a number of *authorities* and *powers;* in the exertion whereof conſiſts the executive part of government. This is wiſely placed in a ſingle hand by the Britiſh conſtitution, for the ſake of unanimity, ſtrength, and diſpatch. Were it placed in many hands, it would be ſubject to many wills: many wills, if diſunited and drawing different ways, create weakneſs in a government; and to unite thoſe ſeveral wills, and reduce them to one, is a work of more

---

(A) Except the parliament, which is the great council of the nation, the judges, and the peers, who, being the hereditary counſellors of the crown, have not only a right, but are bound *in foro conſcientiæ* to adviſe the king for the public good, the conſtitution knows of no other counſel than the privy council. Any other counſel, like Clifford, Arlington, Buckingham, Aſhley, Lauderdale, and, as the initial letters of theſe names expreſs, is a CABAL, and as ſuch ſhould be ſuppreſſed. Nat. Bacon, ſpeaking of the loſs of power in the grand council of lords, ſays “ The ſenſe of ſtate once contracted into a privy-council, is ſoon recontracted into a cabinet council, and laſt of all into a *favourite* or two; which many times brings damage to the public, and both *themſelves* and *kings* into extreme *precipices;* partly for want of maturity, but principally through the providence of God over-ruling irregular courſes to the hurt of ſuch as walk in them.” *Pol. Diſc.* part. 2. p. 201.

(B) For experience, fact, and precedent, ſee the reigns of king John, Henry III. Edward. II. Richard II. Charles I. and James II. See alſo *Mirror of Juſtices;* where it is ſaid, “ that this grand aſſembly (meaning the now parliament, or then Wittenna-gemotte) is to conſider the government of God's people, how they may be kept from ſin, live in quiet, and have right done them, according to the cuſtoms and laws; and more eſpecially *of wrong done by the king,* queen, or their children:” to which Nat. Bacon adds this note: “ At this time *the king might do wrong,* &c. and ſo ſay Bracton and Fleta of the *kings* in their time.” *Diſc.* part 1. p. 37. Lond. 1739.

more time and delay than the exigencies of ſtate will afford. The king of England is therefore not only the chief, but properly the ſole, magiſtrate of the nation; all others acting by commiſſion from, and in due ſubordination to, him: in like manner as, upon the great revolution in the Roman ſtate, all the powers of the ancient magiſtracy of the commonwealth were concentered in the new emperor; ſo that, as Gravina expreſſes it, *in ejus unius perſona veteris rei publicæ vis atque majeſtas per cumulatas magiſtratuum poteſtates exprimebatur*.

Blackſt. Comment.

In the exertion of lawful prerogative the king is held to be abſolute; that is, ſo far abſolute, that there is no legal authority that can either delay or reſiſt him. He may reject what bills, may make what treaties, may coin what money, may create what peers, may pardon what offences, he pleaſes: unleſs where the conſtitution hath expreſsly, or by evident conſequence, laid down ſome exception or boundary; declaring, that thus far the prerogative ſhall go and no farther. For otherwiſe the power of the crown would indeed be but a name and a ſhadow, inſufficient for the ends of government, if, where its juriſdiction is clearly eſtabliſhed and allowed, any man or body of men were permitted to diſobey it, in the ordinary courſe of law: we do not now ſpeak of thoſe *extraordinary* recourſes to the firſt principles, which are neceſſary when the contracts of ſociety are in danger of diſſolution, and the law proves too weak a defence againſt the violence of fraud or oppreſſion. And yet the want of attending to this obvious diſtinction has occaſioned theſe doctrines, of abſolute power in the prince and of national reſiſtance by the people, to be much miſunderſtood and perverted, by the advocates for ſlavery on the one hand, and the demagogues of faction on the other. The former, obſerving the abſolute ſovereignty and tranſcendent dominion of the crown laid down (as it certainly is) moſt ſtrongly and emphatically in our law-books as well as our homilies, have denied that any caſe can be excepted from ſo general and poſitive a rule; forgetting how impoſſible it is, in any practical ſyſtem of laws, to point out beforehand thoſe eccentrical remedies, which the ſudden emergence of national diſtreſs may dictate, and which that alone can juſtify. On the other hand, over-zealous republicans, feeling the abſurdity of unlimited paſſive obedience, have fancifully (or ſometimes factiouſly) gone over to the other extreme: and, becauſe reſiſtance is juſtifiable to the perſon of the prince when the being of the ſtate is endangered, and the public voice proclaims ſuch reſiſtance neceſſary, they have therefore allowed to every individual the right of determining this expedience, and of employing private force to reſiſt even private oppreſſion. A doctrine productive of anarchy, and (in conſequence) equally fatal to civil liberty as tyranny itſelf. For civil liberty, rightly underſtood, conſiſts in protecting the rights of individuals by the united force of ſociety: ſociety cannot be maintained, and of courſe can exert no protection, without obedience to ſome ſovereign power; and obedience is an empty name, if every individual has a right to decide how far he himſelf ſhall obey.

In the exertion, therefore, of thoſe prerogatives which the law has given him, the king is irreſiſtible and abſolute, according to the forms of the conſtitution. And yet, if the conſequence of that exertion be manifeſtly to the grievance or diſhonour of the kingdom, the parliament will call his adviſers to a juſt and ſevere account. For prerogative conſiſting (as Mr Locke has well defined it) in the diſcretionary power of acting for the public good where the poſitive laws are ſilent, if that diſcretionary power be abuſed to the public detriment, ſuch prerogative is exerted in an unconſtitutional manner. Thus the king may make a treaty with a foreign ſtate, which ſhall irrevocably bind the nation; and yet, when ſuch treaties have been judged pernicious, impeachments have purſued thoſe miniſters by whoſe agency or advice they were concluded.

The prerogatives of the crown (in the ſenſe under which we are now conſidering them) reſpect either the nation's intercourſe with foreign nations, or its own domeſtic government and civil polity.

With regard to *foreign concerns*, the king is the delegate or repreſentative of his people. It is impoſſible that the individuals of a ſtate, in their collective capacity, can tranſact the affairs of that ſtate with another community equally numerous as themſelves. Unanimity muſt be wanting to their meaſures, and ſtrength to the execution of their counſels. In the king therefore, as in a centre, all the rays of his people are united, and form by that union a conſiſtency, ſplendor, and power, that make him feared and reſpected by foreign potentates; who would ſcruple to enter into any engagement, that muſt afterwards be reviſed and ratified by a popular aſſembly. What is done by the royal authority, with regard to foreign powers, is the act of the whole nation: what is done without the king's concurrence, is the act only of private men. And ſo far is this point carried by our law, that it hath been held, that ſhould all the ſubjects of England make war with a king in league with the king of England, without the royal aſſent, ſuch war is no breach of the league. And, by the ſtatute 2 Hen. V. c. 6. any ſubject committing acts of hoſtility upon any nation in league with the king, was declared to be guilty of high treaſon: and, though that act was repealed by the ſtatute 20 Hen. VI. c. 11. ſo far as relates to the making this offence high treaſon, yet ſtill it remains a very great offence againſt the law of nations, and puniſhable by our laws, either capitally or otherwiſe, according to the circumſtances of the caſe.

1. The king therefore, conſidered as the repreſentative of his people, has the ſole power of ſending ambaſſadors to foreign ſtates, and receiving ambaſſadors at home.

2. It is alſo the king's prerogative to make treaties, leagues, and alliances, with foreign ſtates and princes. For it is, by the law of nations, eſſential to the goodneſs of a league, that it be made by the ſovereign power; and then it is binding upon the whole community: and in Britain the ſovereign power, *quoad hoc*, is veſted in the perſon of the king. Whatever contracts therefore he engages in, no other power in the kingdom can legally delay, reſiſt, or annul. And yet, leſt this plenitude of authority ſhould be abuſed to the detriment of the public, the conſtitution (as was hinted before) hath here interpoſed a check, by the means of parliamentary impeachment, for the puniſhment of ſuch miniſters as from criminal motives adviſe or conclude any treaty, which ſhall afterwards be judged to derogate from the honour and intereſt of the nation.

3. Upon the ſame principle the king has alſo the ſole prerogative of making war and peace. For it is

held by all the writers on the law of nature and nations, that the right of making war, which by nature ſubſiſted in every individual, is given up by all private perſons that enter into ſociety, and is veſted in the ſovereign power: and this right is given up, not only by individuals, but even by the entire body of people that are under the dominion of a ſovereign. It would indeed be extremely improper, that any number of ſubjects ſhould have the power of binding the ſupreme magiſtrate, and putting him againſt his will in a ſtate of war. Whatever hoſtilities, therefore, may be committed by private citizens, the ſtate ought not to be affected thereby; unleſs that ſhould juſtify their proceedings, and thereby become partner in their guilt. And the reaſon which is given by Grotius, why, according to the law of nations, a denunciation of war ought always to precede the actual commencement of hoſtilities, is not ſo much that the enemy may be put upon his guard (which is matter rather of magnanimity than right), but that it may be certainly clear that the war is not undertaken by private perſons, but by the will of the whole community; whoſe right of willing is in this caſe transferred to the ſupreme magiſtrate by the fundamental laws of ſociety. So that, in order to make a war completely effectual, it is neceſſary in Britain that it be publicly declared and duly proclaimed by the king's authority; and then, all parts of both the contending nations, from the higheſt to the loweſt, are bound by it. And wherever the right reſides of beginning a national war, there alſo muſt reſide the right of ending it, or the power of making peace. And the ſame check of parliamentary impeachment, for improper or inglorious conduct, in beginning, conducting, or concluding a national war, is in general ſufficient to reſtrain the miniſters of the crown from a wanton or injurious exertion of this great prerogative.

4. But, as the delay of making war may ſometimes be detrimental to individuals who have ſuffered by depredations from foreign potentates, our laws have in ſome reſpects armed the ſubject with powers to impel the prerogative; by directing the miniſters of the crown to iſſue letters of marque and repriſal upon due demand: the prerogative of granting which is nearly related to, and plainly derived from, that other of making war; this being indeed only an incomplete ſtate of hoſtilities, and generally ending in a formal denunciation of war. Theſe letters are grantable, by the law of nations, whenever the ſubjects of one ſtate are oppreſſed and injured by thoſe of another, and juſtice is denied by that ſtate to which the oppreſſor belongs. In this caſe, letters of marque and repriſal (words in themſelves ſynonymous, and ſignifying a taking in return) may be obtained, in order to ſeize the bodies or goods of the ſubjects of the offending ſtate, until ſatisfaction be made, wherever they happen to be found. And indeed this cuſtom of repriſals ſeems dictated by nature herſelf; for which reaſon we find in the moſt ancient times very notable inſtances of it. But here the neceſſity is obvious of calling in the ſovereign power, to determine when repriſals may be made; elſe every private ſufferer would be a judge in his own cauſe. In purſuance of which principle, it is declared by the ſtatute 4 Hen. V. c. 7. that if any ſubjects of the realm are oppreſſed in time of truce by any foreigners, the king will grant marque in due form to all that feel themſelves grieved. See MARQUE.

5. Upon exactly the ſame reaſon ſtands the prerogative of granting ſafe-conducts; without which, by the law of nations, no member of one ſociety has a right to intrude into another. And therefore Puffendorff very juſtly reſolves, that it is left in the power of all ſtates to take ſuch meaſures about the admiſſion of ſtrangers as they think convenient; thoſe being ever excepted who are driven on the coaſts by neceſſity, or by any cauſe that deſerves pity or compaſſion. Great tenderneſs is ſhown by the laws, not only to foreigners in diſtreſs (ſee WRECK), but with regard alſo to the admiſſion of ſtrangers who come ſpontaneouſly: for ſo long as their nation continues at peace with ours, and they themſelves behave peaceably, they are under the king's protection; though liable to be ſent home whenever the king ſees occaſion. But no ſubject of a nation at war with us can, by the law of nations, come into the realm, nor can travel himſelf upon the high ſeas, or ſend his goods and merchandize from one place to another, without danger of being ſeized by our ſubjects, unleſs he has letters of ſafe-conduct; which, by divers ancient ſtatutes, muſt be granted under the king's great ſeal and inrolled in chancery, or elſe they are of no effect; the king being ſuppoſed the beſt judge of ſuch emergencies, as may deſerve exception from the general law of arms. But paſſports under the king's ſign-manual, or licences from his ambaſſadors abroad, are now more uſually obtained, and are allowed to be of equal validity.

Theſe are the principal prerogatives of the king reſpecting this nation's intercourſe with foreign nations; in all of which he is conſidered as the delegate or repreſentative of his people. But in domeſtic affairs, he is conſidered in a great variety of characters, and from thence there ariſes an abundant number of other prerogatives.

1. He is a conſtituent part of the ſupreme legiſlative power; and, as ſuch, has the prerogative of rejecting ſuch proviſions in parliament as he judges improper to be paſſed. The expediency of which conſtitution has before been evinced at large under the article PARLIAMENT. We ſhall only farther remark, that the king is not bound by any act of parliament, unleſs he be named therein by ſpecial and particular words. The moſt general words that can be deviſed (any perſon or perſons, bodies politic, or corporate, &c.) affect not him in the leaſt, if they may tend to reſtrain or diminiſh any of his rights or intereſts. For it would be of moſt miſchievous conſequence to the public, if the ſtrength of the executive power were liable to be curtailed, without its own expreſs conſent, by conſtructions and implications of the ſubject. Yet, where an act of parliament is expreſsly made for the preſervation of public rights and the ſuppreſſion of public wrongs, and does not interfere with the eſtabliſhed rights of the crown, it is ſaid to be binding as well upon the king as upon the ſubject: and, likewiſe, the king may take the benefit of any particular act, though he be not eſpecially named.

2. The king is conſidered, in the next place, as the generaliſſimo, or the firſt in military command, within the kingdom. The great end of ſociety is to protect the weakneſs of individuals by the united ſtrength of

the community; and the principal uſe of government is to direct that united ſtrength in the beſt and moſt effectual manner, to anſwer the end propoſed. Monarchical government is ſuppoſed to be the fitteſt of any for this purpoſe: it follows therefore, from the very end of its inſtitution, that in a monarchy the military power muſt be truſted in the hands of the prince.

In this capacity, therefore, of general of the kingdom, the king has the ſole power of raiſing and regulating fleets and armies. The manner in which they are raiſed and regulated is explained under the article *Military State*. We are now only to conſider the prerogative of enliſting and of governing them: which indeed was diſputed and claimed, contrary to all reaſon and precedent, by the long parliament of king Cha. I.; but, upon the reſtoration of his ſon, was ſolemnly declared by the ſtatute 13 Charles II. c. 6. to be in the king alone: for that the ſole ſupreme government and command of the militia within all his majeſty's realms and dominions, and of all forces by ſea and land, and of all forts and places of ſtrength, ever was and is the undoubted right of his majeſty, and his royal predeceſſors, kings and queens of England; and that both or either houſe of parliament cannot, nor ought to, pretend to the ſame.

This ſtatute, it is obvious to obſerve, extends not only to fleets and armies, but alſo to forts and other places of ſtrength within the realm; the ſole prerogative, as well of erecting, as manning and governing of which, belongs to the king in his capacity of general of the kingdom: and all lands were formerly ſubject to a tax, for building of caſtles wherever the king thought proper. This was one of the three things, from contributing to the performance of which no lands were exempted, and therefore called by the Anglo-Saxons the *trinoda neceſſitas; ſc. pontis reparatio, arcis conſtructio, et expeditio contra hoſtem.* And this they were called upon to do ſo often, that, as Sir Edward Coke from M. Paris aſſures us, there were in the time of Henry II. 1115 caſtles ſubſiſting in England. The inconveniencies of which, when granted out to private ſubjects, the lordly barons of thoſe times, were ſeverely felt by the whole kingdom; for, as William of Newburg remarks in the reign of king Stephen, *erant in Anglia quodammodo tot reges vel potius tyranni, quot domini caſtellorum*; but it was felt by none more ſenſibly than by two ſucceeding princes, king John and king Henry III. And therefore, the greateſt part of them being demoliſhed in the baron's wars, the kings of after times have been very cautious of ſuffering them to be rebuilt in a fortified manner: and Sir Edward Coke lays it down, that no ſubject can build a caſtle, or houſe of ſtrength imbattled, or other fortreſs defenſible, without the licence of the king; for the danger which might enſue, if every man at his pleaſure might do it.

It is partly upon the ſame, and partly upon a fiſcal foundation, to ſecure his marine revenue, that the king has the prerogative of appointing *ports* and *havens*, or ſuch places only, for perſons and merchandize to paſs into and out of the realm, as he in his wiſdom ſees proper. By the feodal law, all navigable rivers and havens were computed among the regalia, and were ſubject to the ſovereign of the ſtate. And in England it hath always been held, that the king is lord of the whole ſhore, and particularly is the guardian of the ports and havens, which are the inlets and gates of the realm: and therefore, ſo early as the reign of king John, we find ſhips ſeized by the king's officers for putting in at a place that was not a legal port. Theſe legal ports were undoubtedly at firſt aſſigned by the crown; ſince to each of them a court of portmote is incident, the juriſdiction of which muſt flow from the royal authority: the *great ports* of the ſea are alſo referred to as well known and eſtabliſhed, by ſtatute 4 Hen. IV. c. 20. which prohibits the landing elſewhere under pain of confiſcation; and the ſtatute 1 Eliz. c. 11. recites, that the franchiſe of lading and diſcharging had been frequently granted by the crown.

But though the king had a power of granting the franchiſe of havens and ports, yet he had not the power of reſumption, or of narrowing and confining their limits when once eſtabliſhed; but any perſon had a right to load or diſcharge his merchandiſe in any part of the haven: whereby the revenue of the cuſtom was much impaired and diminiſhed, by fraudulent landings in obſcure and private corners. This occaſioned the ſtatutes of Eliz. c. 11. and 13 and 14 Car. II. c. 11. § 14. which enable the crown by commiſſion, to aſcertain the limits of all ports, and to aſſign proper wharfs and quays in each port, for the excluſive landing and loading of merchandiſe.

The erection of beacons, light-houſes, and ſea-marks, is alſo a branch of the royal prerogative: whereof the firſt was anciently uſed in order to alarm the country, in caſe of the approach of an enemy; and all of them are ſignally uſeful in guiding and preſerving veſſels at ſea by night as well as by day. See BEACON.

3. Another capacity in which the king is conſidered in domeſtic affairs, is as the fountain of juſtice and general conſervator of the peace of the kingdom. See the article *Fountain of* JUSTICE.

4. The king is likewiſe the fountain of honour, of office, and of privilege: and this in a different ſenſe from that wherein he is ſtyled the *fountain of juſtice*; for here he is really the parent of them. See the articles *Fountain of* JUSTICE and *Fountain of* HONOUR.

5. Another light, in which the laws of England conſider the king with regard to domeſtic concerns, is as the arbiter of commerce. By commerce, we at preſent mean domeſtic commerce only; for the king's prerogative with regard to which ſee *Regulation of* WEIGHTS *and Meaſures*, MONEY, &c.

6. The king is, laſtly, conſidered by the laws of England as the head and ſupreme governor of the national church.

To enter into the reaſons upon which this prerogative is founded is matter rather of divinity than of law. We ſhall therefore only obſerve, that by ſtatute 26 Hen. VIII. c. 1. (reciting that the king's majeſty juſtly and rightfully is and ought to be the ſupreme head of the church of England; and ſo had been recogniſed by the clergy of that kingdom in their convocation) it is enacted, that the king ſhall be reputed the only ſupreme head in earth of the church of England; and ſhall have, annexed to the imperial crown of this realm, as well the title and ſtyle thereof, as all juriſdictions, authorities, and commodities, to the ſaid dignity of ſupreme head of the church appertaining. And another ſtatute to the ſame purport was made, 1 Eliz. c. 1.

In virtue of this authority the king convenes, prorogues,

rogues, reſtrains, regulates, and diſſolves, all eccleſiaſtical ſynods or convocations. This was an inherent prerogative of the crown long before the time of Henry VIII. as appears by the ſtatute 8 Hen. VI. c. 1. and the many authors, both lawyers and hiſtorians, vouched by Sir Edward Coke. So that the ſtatute 25 Hen. VIII. c. 19. which reſtrains the convocation from making or putting in execution any canons repugnant to the king's prerogative, or the laws, cuſtoms, and ſtatutes of the realm, was merely declaratory of the old common law: that part of it only being new, which makes the king's royal aſſent actually neceſſary to the validity of every canon. The convocation or eccleſiaſtical ſynod, in England, differs conſiderably in its conſtitution from the ſynods of other Chriſtian kingdoms: thoſe conſiſting wholly of biſhops; whereas in England the convocation is the miniature of a parliament, wherein the archbiſhop preſides with regal ſtate; the upper houſe of biſhops repreſents the houſe of lords; and the lower houſe, compoſed of repreſentatives of the ſeveral dioceſes at large, and of each particular chapter therein, reſembles the houſe of commons with its knights of the ſhire and burgeſſes. This conſtitution is ſaid to be owing to the policy of Edward I. who thereby at one and the ſame time let in the inferior clergy to the privileges of forming eccleſiaſtical canons (which before they had not), and alſo introduced a method of taxing eccleſiaſtical benefices, by conſent of convocation.

From this prerogative alſo, of being the head of the church, ariſes the king's right of nomination to vacant biſhoprics, and certain other eccleſiaſtical preferments.

As head of the church, the king is likewiſe the *dernier reſort* in all eccleſiaſtical cauſes; an appeal lying ultimately to him in chancery from the ſentence of every eccleſiaſtical judge: which right was reſtored to the crown by ſtatute 25 Hen. VIII. c. 9.

III. The king's fiſcal prerogatives, or ſuch as regard his revenue. See the article REVENUE.

Prerogative-Court, an Engliſh court eſtabliſhed for the trial of all teſtamentary cauſes, where the deceaſed hath left *bona notabilia* within two different dioceſes. In which caſe the probate of wills belongs to the archbiſhop of the province, by way of ſpecial prerogative. And all cauſes relating to the wills, adminiſtrations, or legacies of ſuch perſons, are originally cognizable herein, before a judge appointed by the archbiſhop, called the *judge of the prerogative-court*; from whom an appeal lies by ſtatute 25 Hen. VIII. c. 19. to the king in chancery, inſtead of the pope as formerly.

PRESAGE, in antiquity, denotes an augury, or ſign of ſome future event; which was chiefly taken from the flight of birds, the entrails of victims, &c. See AUGURY and ARUSPICES.

PRESBURG, the capital of the kingdom of Lower Hungary, called by the inhabitants *Poſony* and *Preſporen*, ſituated on the Danube, about 46 miles eaſt from Vienna, and 75 from Buda. The caſtle, in which the regalia are kept, ſtands on a hill above the town. Here the ſtates aſſemble; and in the cathedral, dedicated to St Martin, the king is crowned. The town is not very large, nor well built; but is very ancient, pleaſantly ſituated, and enjoys a good air. Its fortifications are only a double wall and ditch. In the lower ſuburbs is a hill, where the king, after his coronation, goes on horſeback, and brandiſhes St. Stephen's ſword towards the four cardinal points, intimating, that he will defend his country againſt all its enemies. Beſides the cathedral, there are ſeveral other Popiſh and one Lutheran church, with a Jeſuits college, three convents, and two hoſpitals. It gives name to a country; and is the reſidence of the archbiſhop of Gran, who is primate, chief ſecretary, and chancellor of the kingdom, *legatus natus* of the Papal ſee, and prince of the holy Roman empire. E. Long. 17. 30. N. Lat. 48. 20.

PRESBYTÆ, perſons whoſe eyes are too flat to refract the rays ſufficiently, ſo that unleſs the object is at ſome diſtance, the rays coming from it will paſs through the retina before their union, conſequently viſion is confuſed; old people are uſually the ſubjects of this diſeaſe. In order to remedy, or at leaſt to palliate, this defect, the perſon ſhould firſt uſe glaſſes which do not magnify, and from them paſs gradually to more convex ſpectacles, which ſhorten the focus.

PRESBYTER, in the primitive Chriſtian church, an elder, one of the ſecond order of eccleſiaſtics; the other two being biſhops and deacons. See the articles BISHOP and DEACON.

Preſbyter or elder is a word borrowed from the Greek tranſlation of the Old Teſtament, where it commonly ſignifies ruler or governor; it being a note of office and dignity, not of age; and in this ſenſe biſhops are ſometimes called *preſbyters* in the New Taſtament. The preſbyters might baptize, preach, conſecrate, and adminiſter the euchariſt in the biſhop's abſence, or in his preſence if he authoriſed and deputed them; and the biſhops did ſcarce any thing in the government of the church without their advice, conſent, and amicable concurrence.

The grand diſpute between the followers of the Geneva and Roman diſcipline, is about the ſameneſs and difference of preſbyters and biſhops at the time of the apoſtles. See EPISCOPACY, INDEPENDENTS, and the following article.

1 Diſcriminating principle of the Preſbyterians.

PRESBYTERIANS, Proteſtants, ſo called from their maintaining that the government of the church appointed in the New Teſtament was by preſbyteries, that is, by aſſociations of miniſters and ruling elders, poſſeſſed all of equal powers, without any ſuperiority among them either in office or in order.

The Preſbyterians believe, that the authority of their miniſters to preach the goſpel, to adminiſter the ſacraments of baptiſm and the Lord's ſupper, and to feed the flock of Chriſt, is derived from the Holy Ghoſt by the impoſition of the hands of the preſbytery; and they oppoſe the independent ſcheme of the common rights of Chriſtians by the ſame arguments which are uſed for that purpoſe by the Epiſcopalians (ſee EPISCOPACY). They affirm, however, that there is no order in the church as eſtabliſhed by Chriſt and his apoſtles ſuperior to that of preſbyters; that all miniſters being ambaſſadors of Chriſt, are equal by their commiſſion; that *preſbyter* and *biſhop*, though different words, are of the ſame import; and that prelacy was gradually eſtabliſhed upon the primitive practice of making the *moderator* or ſpeaker of the preſbytery a permanent officer.

2 Scriptural arguments againſt epiſcopacy.

Theſe poſitions they maintain againſt the Epiſcopalians by the following ſcriptural arguments. They obſerve, that the apoſtles planted churches by ordaining biſhops and deacons in every city; that the miniſters which in one verſe are called biſhops are in the next perhaps denominated preſbyters; that we nowhere read in the New Teſtament of biſhops, preſbyters, and deacons, in any one church; and that therefore we are under the neceſſity of concluding *biſhop* and *preſbyter* to be two names for the ſame church officer. This is apparent from Peter's exhortation to the *elders* or *preſbyters* who were among the Jewiſh Chriſtians. "The *elders* (preſbyters) which are among you I exhort, who am alſo an *elder*, and a witneſs of the ſufferings of Chriſt, and alſo a partaker of the glory that ſhall be revealed: Feed the flock of God which is among you, taking the *overſight* thereof (επισκοπουντες acting as *biſhops* thereof), not by conſtraint, but willingly; not for filthy lucre, but of a ready mind; neither as being LORDS over God's heritage, but being enſamples to the flock *." From this paſſage it is evident, that the preſbyters not only fed the flock of God, but alſo governed that flock with epiſcopal powers; and that the apoſtle himſelf, as a church officer, was nothing more than a preſbyter or elder. The identity of the office of biſhop and preſbyter is ſtill more apparent from Heb. xiii. 7. 17. and 1 Theſſ. v. 12.; for the biſhops are there repreſented as governing the flock, ſpeaking to them the word of God, watching for their ſouls, and diſcharging various offices, which it is impoſſible for any man to perform to more than one congregation.

3
Reaſons for ſuppoſing biſhops and preſbyters of the ſame order.

From the laſt cited text it is evident, that the biſhops (προισταμενους) of the Theſſalonian churches had the paſtoral care of no more ſouls than they could hold perſonal communion with in God's worſhip; for they were ſuch as all the people were to *know*, *eſteem*, and *love*, as thoſe that not only were *over them*, but alſo "cloſely laboured among them and admoniſhed them." But dioceſan biſhops, whom ordinarily the hundredth part of their flock never hear nor ſee, cannot be thoſe biſhops by whom that flock is admoniſhed, nor can they be what Peter requires the biſhops of the Jewiſh converts to be, *enſamples to the flock*. It is the opinion of Dr Hammond, who was a very learned divine, and a zealot for epiſcopacy, that the *elders* whom the apoſtle James deſires † the ſick to call for, were of the higheſt permanent order of eccleſiaſtical officers; but it is ſelf-evident that thoſe elders cannot have been dioceſan biſhops, otherwiſe the ſick muſt have been often without the reach of the remedy propoſed to them.

There is nothing in Scripture upon which the Epiſcopalian is more ready to reſt his cauſe than the alleged epiſcopacy of Timothy and Titus; of whom the former is ſaid to have been biſhop of Epheſus, and the latter biſhop of Crete; yet the Preſbyterian thinks it as clear as the noon-day ſun, that the preſbyters of Epheſus were ſupreme governors under Chriſt of the Epheſian churches, at the very time that Timothy is pretended to have been their proper dioceſan.

In Acts xx. 17, &c. we read, that "from Miletus Paul ſent to Epheſus, and called the elders (preſbyters) of the church. And when they were come to him, he ſaid unto them, Ye know, from the firſt day that I came into Aſia, after what manner I have been with you, at all ſeaſons. And now I know that ye all, among whom I have gone preaching the kingdom of God, ſhall ſee my face no more. Wherefore I take you to record this day, that I am pure from the blood of all men. For I have not ſhunned to declare unto you all the counſel of God. Take heed therefore unto yourſelves, and to all the flock over which the Holy Ghoſt hath made you overſeers (επισκοπους *biſhops*), to feed the church of God, which he hath purchaſed with his own blood. For I know this, that after my departure ſhall grievous wolves enter in among you, not ſparing the flock. Alſo of your ownſelves ſhall men ariſe, ſpeaking perverſe things, to draw away diſciples after them. Therefore watch, and remember, that by the ſpace of three years, I ceaſed not to warn every one night and day with tears. And now, brethren, I recommend you to God, and to the word of his grace," &c.

4
The paſtors of Epheſus of equal authority.

From this paſſage, it is evident that there was in the city of Epheſus a plurality of paſtors of equal authority without any ſuperior paſtor or biſhop over them; for the apoſtle directs his diſcourſe to them all in common, and gives them equal power over the whole flock. Dr Hammond indeed imagines, that the elders whom Paul called to Miletus were the *biſhops* of *Aſia*, and that he ſent for them to Epheſus, becauſe that city was the metropolis of the province. But were this opinion well-founded, it is not conceivable that the ſacred writer would have called them the elders of the church of *Epheſus*, but the elders of the *church in general*, or the elders of the *churches in Aſia*. Beſides, it is to be remembered, that the apoſtle was in ſuch haſte to be at Jeruſalem, that the ſacred hiſtorian meaſures his time by *days*; whereas it muſt have required ſeveral months to call together the biſhops or elders of all the cities of Aſia; and he might certainly have gone to meet them at Epheſus in leſs time than would be requiſite for their meeting in that city and proceeding thence to him at Miletus. They muſt therefore have been either the joint paſtors of one congregation, or the paſtors of different congregations in one city: and as it was thus in Epheſus, ſo was it in Philippi; for we find the apoſtle addreſſing his epiſtle "to all the ſaints in Chriſt Jeſus which are at Philippi, with the biſhops and deacons." From the paſſage before us it is likewiſe plain, that the preſbyters of Epheſus had not only the *name* but the whole *power* of biſhops given to them by the Holy Ghoſt; for they are enjoined to do the whole work of biſhops—ποιμαινειν την εκκλησιαν του θεου—which ſignifies, to *rule* as well as *feed* the church of God. Whence we ſee, that the apoſtle makes the power of *governing* inſeparable from that of *preaching* and *watching*; and that according to him, all who are preachers of God's word, and watchmen of ſouls, are neceſſarily rulers or governors of the church, without being accountable for their management to any prelate, but only to their Lord Chriſt from whom their power is derived.

5
Timothy no biſhop.

It appears therefore, that the apoſtle Paul left in the church of Epheſus, which he had planted, no other ſucceſſors to himſelf than *preſbyter-biſhops*, or Preſbyterian miniſters, and that he did not devolve his power upon any prelate. Timothy, whom the Epiſcopalians allege to have been the firſt biſhop of Epheſus, was preſent when this ſettlement was made *; and it is ſurely not to be ſuppoſed, that, had he been their biſhop, the apoſtle would have devolved the whole epiſcopal power upon the preſbyters before his face. If ever there was a ſeaſon fitter than another for pointing out the duty of this ſuppoſed biſhop to his dioceſe, and his preſbyters duty to him, it was ſurely when Paul was taking his final leave of them, and diſcourſing ſo pathetically concerning the duty of *overſeers*, the coming of ravenous wolves, and the conſequent hazard of the flock. In this farewell diſcourſe, he tells them that "he had not ſhunned to declare unto them all the counſel of God." But with what truth could this have been ſaid, if obedience to a dioceſan biſhop had been any part of their duty either at the time of the apoſtle's ſpeaking or at any future period? He foreſaw that ravenous wolves would enter in among them, and that even ſome of themſelves ſhould ariſe ſpeaking perverſe things; and if, as the Epiſcopalians allege, dioceſan epiſcopacy was the remedy provided for thoſe evils, is it not ſtrange, paſſing ſtrange, that the inſpired preacher did not foreſee that Timothy, who was ſtanding beſide him, was deſtined to fill that important office; or if he did foreſee it, that he omitted to recommend him to his future charge, and to give him proper inſtructions for the diſcharge of his duty?

---

* 1 Peter v. 1, 2, 3.

† Chap. v. 14.

* Acts xx. 5.

6
But an evangeliſt.

But if Timothy was not biſhop of Epheſus, what, it may be aſked, was his office in that city? for that he reſided there for ſome time, and was by the apoſtle inveſted with authority to ordain and rebuke preſbyters, are facts about which all parties are agreed, and which indeed cannot be controverted by any reader of Paul's epiſtles. To this the Preſbyterian replies with confidence, that the power which Timothy exerciſed in the church of Epheſus was that of an evangeliſt †, and not a fixed prelate. But, according to Euſebius, the work of an evangeliſt was, "to lay the foundations of the faith in barbarous nations, and to conſtitute among them paſtors; after which he paſſed on to other countries." Accordingly we find, that Timothy was reſident for a time at Philippi and Corinth ‡ as well as at Epheſus, and that he had as much authority over thoſe churches as over that of which he is ſaid to have been the fixed biſhop. "Now, if Timotheus come, ſee that he may be with you without fear, for he worketh the work of the Lord, as I alſo do. Let no man therefore deſpiſe him." This text might lead us to ſuppoſe, that Timothy was biſhop of Corinth as well as of Epheſus; for it is ſtronger than that upon which his epiſcopacy of the latter church is chiefly built. The apoſtle ſays, "I beſought thee * to abide ſtill at Epheſus, when I went into Macedonia, that thou mighteſt charge ſome that they teach no other doctrine." But had Timothy been the fixed biſhop of that city, there would ſurely have been no neceſſity for *beſeeching* him to abide with his flock. It is to be obſerved, too, that the firſt epiſtle to Timothy, which alone was written to him during his reſidence at Epheſus, was of a date prior to Paul's meeting with the elders of that church at Miletus; for in the epiſtle he hopes to come to him ſhortly, whereas he tells the elders at Miletus that they ſhould ſee his face no more. This being the caſe, it is evident that Timothy was left by the apoſtle at Epheſus only to ſupply his place during his temporary abſence at Macedonia, and that he could not poſſibly have been conſtituted fixed biſhop of that church, ſince the epiſcopal powers were afterwards committed to the preſbyters by the Holy Ghoſt in his preſence.

7
Preſbyterate the higheſt permanent office in the church.

The identity of the office of biſhop and preſbyter being thus clearly eſtabliſhed, it follows, that the preſbyterate is the higheſt permanent office in the church, and that every faithful paſtor of a flock is ſucceſſor to the apoſtles in every thing in which they were to have any ſucceſſors. In the apoſtolic office there were indeed ſome things peculiar and extraordinary, ſuch as their immediate call by Chriſt, their infallibility, their being witneſſes of our Lord's reſurrection, and their unlimited juriſdiction over the whole world. Theſe powers and privileges could not be conveyed by impoſition of hands to any ſucceſſors, whether called preſbyters or biſhops; but as rulers or office-bearers in particular churches, we have the confeſſion of "the very chiefeſt apoſtles," Peter and John, that they were nothing more than preſbyters or pariſh miniſters. This being the caſe, the diſpute, which in the early part of the paſſing century was ſo warmly agitated concerning the validity of Preſbyterian ordination, may be ſoon decided; for if the ceremony of ordination be at all eſſential, it is obvious that ſuch a ceremony performed by preſbyters muſt be valid, as there is no higher order of eccleſiaſtics in the church by whom it can be performed. Accordingly we find, that Timothy himſelf, though ſaid to be a biſhop, was ordained by the laying on of the hands of a preſbytery. At that ordination indeed St Paul preſided, but he could preſide only as *primus in paribus*; for we have ſeen that, as permanent officers in the church of Chriſt, the apoſtles themſelves were no more than preſbyters. If the apoſtles hands were impoſed for any other purpoſe, it muſt have been to communicate thoſe *chariſmata* or miraculous gifts of the Holy Spirit, which were then ſo frequent; but which no modern preſbyter or biſhop will pretend to give, unleſs his underſtanding be clouded by the groſſeſt ignorance, or perverted by the moſt frantic enthuſiaſm.

8
Riſe of epiſcopacy.

But if the office of biſhop and preſbyter was originally the ſame, how, it will be aſked, came dioceſan epiſcopacy to prevail ſo univerſally as it is confeſſed to have done before the converſion of Conſtantine and the civil eſtabliſhment of Chriſtianity in the Roman empire? To give a ſatisfactory anſwer to this queſtion is certainly the moſt arduous taſk which the advocate for preſbytery has to perform; but it is a taſk not inſurmountable.

From many paſſages in the New Teſtament *, it is evident, that when the apoſtles planted churches in different cities, they generally ſettled more than one paſtor in the ſame church, to feed and govern it with joint authority. The propriety of this conſtitution is obvious. In thoſe days, when the diſciples of Chriſt were perſecuted for their religion, and often obliged to meet in the "night for fear of the Jews," they could not with any degree of prudence aſſemble in large numbers; and therefore, had there been no more than one paſtor in a city, the Chriſtian converts, though, when aſſembled, they might have amounted to but a ſmall congregation, could not all have enjoyed the benefit of public worſhip on the ſame day; at leaſt it is obvious that they could not poſſibly have aſſembled for this purpoſe ſo often as their want of inſtruction, and the duty of "breaking of bread and of prayer," required them to meet. It was therefore with great wiſdom that the apoſtles ordained ſeveral preſbyters in the ſame church; but as theſe preſbyters would have occaſion to meet frequently, and to deliberate on the ſtate of the flock which it was their duty to feed, and over which they had all equal authority, they would be under the neceſſity of electing one of their own number

Preſbyterians.

number to be preſident or *moderator* of the preſbytery, that order might be preſerved, and all things done with decency. At firſt there is reaſon to believe that thoſe preſidents held their office no longer than while the preſbyteries ſat in which they were elected. Among the apoſtles themſelves there was no fixed preſident. Peter indeed appears to have been moſt frequently admitted to that honour; but there is one very memorable occaſion on record †, when James the Lord's brother preſided in an aſſembly of apoſtles, elders, and brethren, held at Jeruſalem, to determine the queſtion concerning the neceſſity of circumciſing the Gentiles, and commanding them to keep the law of Moſes.

† Acts xv.

Upon this model were the primitive preſbyteries formed. They conſiſted of ſeveral preſbyters poſſeſſed of equal powers, who at their meetings appointed one of their own number to diſcharge the office of moderator or temporary preſident; but to this preſident they gave no prelatical powers or negative voice over the deliberations of his brethren; for, as Jerome informs us, the church was then governed *communi preſbyterorum concilio*, "by a common council of preſbyters." It appears, however, that when an apoſtle, an apoſtolical man, or an evangeliſt, fixed his reſidence in any city, and took upon himſelf the paſtoral care of part of the flock, his co-preſbyters, from reſpect to his ſingular gifts, made him their conſtant and fixed moderator. Hence Timothy, during his abode at Epheſus, was moderator of the preſbytery; and hence too Mark the evangeliſt, who reſided many years in Alexandria, has been called the firſt biſhop of that church, though he appears to have been nothing more than permanent moderator. We advance this upon the authority of Jerome, one of the moſt learned fathers of the Chriſtian church, who informs us, that upon the death of the evangeliſt, the preſbyters of Alexandria, for more than 200 years, choſe their biſhops from their own number, and placed them in the epiſcopal chair, without dreaming that they ought to be raiſed to a higher order by a new conſecration;—*Preſbyteri unum ex ſe electum in excelſiori gradu collocatum, epiſcopum nominabant.* As this practice of making the moderator of the preſbytery of Alexandria a permanent officer, was thought a good expedient to guard the infant churches againſt ſchiſms and diviſions, thoſe churches gradually adopted it. For, as Jerome tells us, *Poſtquam unuſquiſque eos quos baptizaverat, ſuos putabat eſſe, non Chriſti, in toto orbe decretum eſt, ut unus de preſbyteris electus, ſuperponeretur cæteris, ad quem omnis eccleſiæ cura pertineret, et ſchiſmatum ſemina tollerentur.*

9 According to Jerome.

The advantages which, in diſplaying his talents and authority, the perpetual preſident or ſpeaker of any aſſembly has over his colleagues in office, are ſo obvious, that when the practice of electing their moderators for life became univerſal among the preſbyteries of the primitive church, it is eaſy to conceive how ambitious men might ſo magnify the difficulties and importance of their ſtation, as to introduce the cuſtom of filling it by a new conſecration of the biſhop elect. But when this was done, dioceſan epiſcopacy, with all its powers and prerogatives, would follow as a thing of courſe, until "by little and little (as Jerome expreſſes himſelf) the whole paſtoral care of the flock was devolved upon one man."

Our limits will not permit us to trace more minutely the riſe and progreſs of this eccleſiaſtical uſurpation, as the Preſbyterian calls it; but the reader who wiſhes for fuller information, after ſtudying the remains of the four firſt centuries of the Chriſtian church, may conſult *An Inquiry into the Conſtitution, Diſcipline, and Worſhip, of the Primitive Church*, ſaid to have been written by Sir Peter King, afterwards lord chancellor of England. As an impartial lover of truth, he will do well to conſult alſo a book intitled *An original Draught of the Primitive Church*, which was publiſhed as an anſwer to the Inquiry; and he may read with much advantage to himſelf *A Letter from a parochial biſhop to a prelatical gentleman*, with *An Apology for the church of Scotland*, both written by Mr Williſon ſome time miniſter in Dundee, and both evincing conſiderable learning and great ingenuity in their pious author.

10 The church of Scotland

Of the churches at preſent formed upon this model, we believe, that without heſitation, we may ſafely affirm the church of Scotland to be in general the moſt reſpectable. Her mode of worſhip is ſimple and ſolemn; her eſtabliſhed faith agreeable to the confeſſions of moſt other Proteſtant churches; her judicatories are calculated to maintain the rights of the people; and her paſtors are confeſſedly men of liberal and enlightened minds. On theſe accounts it appears to us, that we cannot more properly conclude this article than with a ſhort view of her conſtitution, as being that in which our Preſbyterian readers will find themſelves moſt intereſted.

No one is ignorant, that from the firſt dawn of reformation in Scotland, till the era of the revolution, there was a perpetual ſtruggle between the court and the people for the eſtabliſhment of an Epiſcopal or a Preſbyterian form of church government: The former model of eccleſiaſtical polity was patroniſed by the houſe of Stuart on account of the ſupport which it gave to the prerogatives of the crown; the latter was the favourite of the majority of the people, perhaps not ſo much on account of its ſuperior claim to apoſtolical inſtitution, as becauſe the laity are mixed with the clergy in church judicatories, and the two orders, which under epiſcopacy are kept ſo diſtinct, incorporated, as it were, into one body. In the Scottiſh church, every regulation of public worſhip, every act of diſcipline, and every eccleſiaſtical cenſure, which in other churches flows from the authority of a dioceſan biſhop, or from a convocation of the clergy, is the joint work of a certain number of clergymen and laymen acting together with equal authority, and deciding every queſtion by a plurality of voices. The laymen who thus form an eſſential part of the eccleſiaſtical courts of Scotland, are called *ruling elders*; and hold the ſame office, as well as the ſame name, with thoſe brethren * who joined with the apoſtles and elders at Jeruſalem in determining the important queſtion concerning the neceſſity of impoſing upon the Gentile converts the ritual obſervances of the law of Moſes. Theſe lay-elders Paul enjoined Timothy § to account worthy of double honour, if they ſhould rule well, and diſcharge the duties for which they were ſeparated from the multitude of their brethren. In the church of Scotland every pariſh has two or three of thoſe lay-elders, who are grave and ſerious perſons choſen from among the heads of families, of known orthodoxy and ſteady adherence to the worſhip, diſcipline, and government of the church. Be-

11 Governed by clergymen and laymen.

* Acts xv.

§ 1 Tim. v. 17.

ing ſolemnly engaged to uſe their utmoſt endeavours for the ſuppreſſion of vice and the cheriſhing of piety and virtue, and to exerciſe diſcipline faithfully and diligently, the miniſter, in the preſence of the congregation, ſets them apart to their office by ſolemn prayer; and concludes the ceremony, which is ſometimes called ordination, with exhorting both elders and people to their reſpective duties.

12
The kirk-ſeſſion.

The kirk-ſeſſion, which is the loweſt eccleſiaſtical judicatory, conſiſts of the miniſter and thoſe elders of the congregation. The miniſter is *ex officio* moderator, but has no negative voice over the deciſion of the ſeſſion; nor indeed has he a right to vote at all, unleſs when the voices of the elders are equal and oppoſite. He may indeed enter his proteſt againſt their ſentence, if he think it improper, and appeal to the judgment of the preſbytery; but this privilege belongs equally to every elder, as well as to every perſon who may believe himſelf aggrieved by the proceedings of the ſeſſion. The deacons, whoſe proper office it is to take care of the poor, may be preſent in every ſeſſion, and offer their counſel on all queſtions that come before it; but except in what relates to the diſtribution of alms, they have no deciſive vote with the miniſter and elders.

13
The preſbytery.

The next judicatory is the *preſbytery*, which conſiſts of all the paſtors within a certain diſtrict, and one ruling elder from each pariſh commiſſioned by his brethren to repreſent, in conjunction with the miniſter, the ſeſſion of that pariſh. The preſbytery treats of ſuch matters as concern the particular churches within its limits; as the examination, admiſſion, ordination, and cenſuring of miniſters; the licenſing of probationers, rebuking of groſs or contumacious ſinners, the directing of the ſentence of excommunication, the deciding upon references and appeals from kirk-ſeſſions, reſolving caſes of conſcience, explaining difficulties in doctrine or diſcipline; and cenſuring, according to the word of God, any hereſy or erroneous doctrine which hath been either publicly or privately maintained within the bounds of its juriſdiction. Whatever advantages may ariſe from this equality, we cannot altogether approve of that part of the conſtitution which gives an equal vote, in queſtions of hereſy, to an illiterate mechanic and his enlightened paſtor. We are perſuaded that it has been the ſource of much trouble to many a pious clergyman; who, from the laudable deſire of explaining the ſcriptures and declaring to his flock all the counſel of God, has employed a variety of expreſſions of the ſame import, to illuſtrate thoſe articles of faith, which may be obſcurely expreſſed in the eſtabliſhed ſtandards. The fact however is, that, in preſbyteries, the only prerogatives which the paſtors have over the ruling elders, are the power of ordination by impoſition of hands, and the privilege of having the moderator choſen from their body.

14
The provincial ſynod.

From the judgment of the preſbytery there lies an appeal to the provincial ſynod, which ordinarily meets twice in the year, and exerciſes over the preſbyteries within the province a juriſdiction ſimilar to that which is veſted in each preſbytery over the ſeveral kirk-ſeſſions within its bounds. Of theſe ſynods there are in the church of Scotland fifteen, which are compoſed of the members of the ſeveral preſbyteries within the reſpective provinces which give names to the ſynods.

15
The general aſſembly.

The higheſt authority in the church of Scotland is the general aſſembly, which conſiſts of a certain number of miniſters and ruling elders delegated from each preſbytery, and of commiſſioners from the univerſities and royal boroughs. A preſbytery in which there are fewer than twelve pariſhes, ſends to the general aſſembly two miniſters and one ruling elder: if it contain between 12 and 18 miniſters, it ſends three of theſe, and one ruling elder: if it contain between 18 and 24 miniſters, it ſends four miniſters and two ruling elders; and of 24 miniſters, when it contains ſo many, it ſends five with two ruling elders. Every royal borough ſends one ruling elder, and Edinburgh two; whoſe election muſt be atteſted by the kirk-ſeſſions of their reſpective boroughs. Every univerſity ſends one commiſſioner from its own body. The commiſſioners are choſen annually ſix weeks before the meeting of the aſſembly; and the ruling elders are often men of the firſt eminence in the kingdom for rank and talents. In this aſſembly, which meets once a year, the king preſides by his commiſſioner, who is always a nobleman; but he has no voice in their deliberations. The order of their proceedings is regular, though ſometimes the number of members creates a confuſion, which the moderator, who is choſen from among the miniſters to be, as it were, the ſpeaker of the houſe, has not ſufficient authority to prevent. Appeals are brought from all the other eccleſiaſtical courts in Scotland to the general aſſembly; and in queſtions purely religious no appeal lies from its determinations.—In the ſubordination of theſe aſſemblies, parochial, preſbyterial, provincial, and national, the leſs unto the greater, conſiſts the external order, ſtrength, and ſtedfaſtneſs of the church of Scotland.

PRESCIENCE, in theology, previſion, or foreknowledge; that knowledge which God has of things to come.—The doctrine of predeſtination is founded on the preſcience of God, and on the ſuppoſition of all futurity's being preſent to him. See Predeſtination.

PRESCRIPTION, in medicine, is the aſſigning a proper and adequate remedy to the diſeaſe, from an examination of its ſymptoms, and an acquaintance with the virtues and effects of the materia medica.

Preſcription, in law, is a title acquired by uſe and time, and allowed by law; as when a man claims any thing, becauſe he, his anceſtors, or they whoſe eſtate he hath, have had or uſed it all the time whereof no memory is to the contrary: or it is where for continuance of time, *ultra memoriam hominis*, a particular perſon hath a particular right againſt another.

There is a difference between preſcription, cuſtom, and uſage. *Preſcription* hath reſpect to a certain perſon, who *by intendment* may have continuance *for ever;* as for inſtance, he and all they *whoſe eſtate he hath* in ſuch a thing, this is a preſcription: but, *Cuſtom*, is *local*, and always applied to a *certain* place; as, *time out of mind there has been ſuch a cuſtom in ſuch a place*, &c. And *preſcription* belongeth to *one* or a *few* only; but *cuſtom* is common to *all*. *Uſage* differs from both, for it may be either to *perſons* or *places;* as to *inhabitants of a town to have a way*, &c.

A cuſtom and preſcription are in the *right;* uſage is in the *poſſeſſion*; and a preſcription that is good for the matter and ſubſtance, may be bad by the manner of ſetting it forth: but where that which is claimed *as a cuſtom*, in or for many, will be good, *that* regularly will be ſo when claimed by *preſcription* for one. *Preſcription* is to be *time out of mind;* though it is not the length of time that begets the right of preſcription, nothing being done by time, although every thing is done in time; *but it is a preſumption in law, that a thing cannot continue ſo long quiet, if it was againſt right, or injurious to another.*

PRESCRIPTION, in Scotch law. See LAW, p. 698, and 725.

PRESCRIPTION, in theology, was a kind of argument pleaded by Tertullian and others in the 3d century againſt erroneous doctors. This mode of arguing has been deſpiſed by ſome, both becauſe it has been uſed by Papiſts, and becauſe they think that truth has no need of ſuch a ſupport.

PRESENCE, a term of relation, uſed in oppoſition to abſence, and ſignifying the exiſtence of a perſon in a certain place.

PRESENT Tenſe, in grammar, the firſt tenſe of a verb, expreſſing the preſent time, or that ſomething is now performing; as *ſcribo,* I write, or am writing. See GRAMMAR.

PRESENTATION, in eccleſiaſtical law. See PATRONAGE.

PRESENTATION of the Virgin, is a feaſt of the Romiſh church, celebrated on the 21ſt of November, in memory of the Holy Virgin's being preſented by her parents in the temple, to be there educated. Emanuel Comnenus, who began to reign in 1143, makes mention of this feaſt in his Conſtitution. Some imagine it to have been eſtabliſhed among the Greeks in the 11th century; and think they ſee evident proofs of it in ſome homilies of George of Nicomedia, who lived in the time of Photius. Its inſtitution in the Weſt is aſcribed to Gregory XI. in 1372. Some think it was inſtituted in memory of the ceremony practiſed among the Jews for their new-born females; correſponding to the circumciſion on the eighth day for males.

PRESENTATION of our Lady alſo gives the title to three orders of nuns. The firſt, projected in 1618, by a maid named Joan of Cambray. The habit of the nuns, according to the viſion ſhe pretended to have, was to be a grey gown of natural wool, &c.; but this project was never accompliſhed. The ſecond was eſtabliſhed in France, about the year 1627, by Nicholas Sanguin, biſhop of Senlis; it was approved by Urban VIII. This order never made any great progreſs. The third was eſtabliſhed in 1664, when Frederic Borromeo, being apoſtolical viſitor in the Valteline, was intreated by ſome devout maids at Morbegno to allow them to live in community in a retired place; which he granted, and erected them into a congregation, under the title of *congregation of our Lady.* They live under the rule of St Auguſtine.

PRESENTMENT, in law. See PROSECUTION.

A preſentment, generally taken, is a very comprehenſive term; including not only *preſentments* properly ſo called, but alſo inquiſitions of office, and indictments by a grand jury. A preſentment, properly ſpeaking, is the notice taken by a grand jury of any offence from their own knowledge or obſervation, without any bill of indictment laid before them at the ſuit of the king: As the preſentment of a nuiſance, a libel, and the like; upon which the officer of the court muſt afterwards frame an indictment, before the party preſented can be put to anſwer it. An inquiſition of office is the act of a jury, ſummoned by the proper officer to inquire of matters relating to the crown, upon evidence laid before them. Some of theſe are in themſelves convictions, and cannot afterwards be traverſed or denied; and therefore the inqueſt, or jury, ought to hear all that can be alleged on both ſides. Of this nature are all inquiſitions of *felo de ſe;* of flight in perſons accuſed of felony; of deodands, and the like; and preſentments of petty offences in the ſheriff's tourn or court-leet, whereupon the preſiding officer may ſet a fine. Other inquiſitions may be afterwards traverſed and examined; as particularly the coroner's inquiſition of the death of a man, when it finds any one guilty of homicide; for in ſuch caſes the offender ſo preſented muſt be arraigned upon this inquiſition, and may diſpute the truth of it; which brings it to a kind of indictment, the moſt uſual and effectual means of proſecution. See INDICTMENT.

PRESIDENT, PRÆSES, is an officer created or elected to preſide over a company or aſſembly; ſo called in contradiſtinction to the other members, who are termed *reſidents.*

PRESIDENT of the United States of America. The officer in whom the executive power is veſted by the conſtitution. He muſt be a natural born citizen of the United States, he muſt be at leaſt thirty five years of age, and have reſided fourteen years in the United States. He is choſen by electors appointed by the different States, equal in number to the Senators and Repreſentatives in Congreſs, whoſe votes, ſealed up, are tranſmitted to the Preſident of the Senate, who opens and counts them in preſence of the whole Congreſs, and the whole majority of votes decides. He holds his office for four years, and is commander in chief of the army and navy of the United States, and of the militia when called into the actual ſervice of the United States; and by and with the conſent of the Senate he has power to appoint ambaſſadors and other public miniſters; he can fill up vacancies which happen during the receſs of the Senate; he can convene and adjourn the Congreſs; receive ambaſſadors; take care that the laws be faithfully executed; and commiſſion all the officers of the United States: but like all the officers of the United States, he ſhall be removed from office on impeachment for, and conviction of, treaſon, bribery or other high crimes and miſdemeanors.

Vice-PRESIDENT of the United States, is choſen by the electors at the ſame time and in the ſame manner with the Preſident. See above. He is the Preſident of the Senate, but has no vote unleſs they be equally divided. The powers and duties of the Preſident of the United States devolve on him in caſe of the removal of the Preſident until a new Preſident be elected.

PRESS (PRELUM), in the mechanic arts, a machine made of iron or wood, ſerving to ſqueeze or compreſs any body very cloſe.

The ordinary preſſes conſiſt of ſix members, or pieces; viz. two flat ſmooth planks; between which the things to be preſſed are laid; two ſcrews, or worms, faſtened to the lower plank, and paſſing through two holes in the upper; and two nuts, in form of an S, ſerving to drive the upper plank, which is moveable, againſt the lower, which is ſtable, and without motion.

PRESSES uſed for expreſſing of Liquors, are of various kinds; ſome, in moſt reſpects, the ſame with the common preſſes, excepting that the under plank is perforated with a great number of holes, to let the juice expreſſed run through into a tub, or receiver, underneath.

A very uſeful machine for a preſs, in the proceſs of cyder-making, has been lately conſtructed by Mr Anſtice, who, with his well-known zeal for the improvement of mechanics, permits us to lay before our readers the following deſcription of it.

Plate CCCCXV.

AA, nº 1. two pieces of timber, 21 feet long, 12 by 6 inches, laid ſide by ſide at the diſtance of 12 inches, and ſecured in that ſituation by blocks placed between and bolts paſſing through them; this frame forms the bed of the machine. BB, two uprights, 12 feet long, 6 by 8 inches, morticed upon them, and ſecured in their poſition by pins and iron ſquares. CC, two uprights, five feet long, ſix by 10 inches, morticed near the end of the under frame, and ſecured as before. D, a lever, 17 feet long, 12 by 13 inches, turning on a large bolt which paſſes through the ſhort uprights, alſo through iron ſtraps, which ſecure them to the bed inſide, and a ſtirrup of iron which paſſes over the end of the lever, and which makes the turning point in the line of its lower ſide, and not through its middle. E, a lever 20 feet long, ſix by eight inches at its largeſt part, and tapering towards the other end: this lever turns on a bolt in the uprights BB. F. 1, 2, 3, 4. four pieces of oak (which he calls *needles*, 10 feet long), four by two and an half inches, morticed looſely into the upper lever, and hung thereto by bolts, ſo as to ſwing perpendicularly, and play in a long mortice or channel cut through the large lever to receive them. Theſe needles have inch-holes pretty cloſely bored through them (in a direction croſſing the machine), from the lower ends, as far upwards as the great lever will reach, when it is as high as it can go. G, a bed to receive what is to be preſſed. H, a frame to ſupport a winch worked by a handle at I. At the end of the ſmall lever two blocks or pulleys are fixed, one above and the other below it; a rope of about half an inch diameter is then faſtened to the cieling (or continuation of the uprights of the winch frame if neceſſary) at K; then paſſed through the upper block on the lever, from thence paſſed through a block at L, and then goes with four turns round the winch, from whence it is carried through the block under the lever, and faſtens to the machine at M; by this means, if the winch be turned one way, it raiſes the end of the ſmall lever if the other depreſſes it.

To work the machine. If we ſuppoſe the great lever bearing on the matter to be preſſed, an iron pin muſt be put into one of the holes in the needles above the great lever; and when the ſmall lever is worked as far as it will go, either up or down, another bolt is to be put into the hole, which comes neareſt above the great lever on the other ſide of the uprights BB, and the winch then turned the contrary way, by which means the preſſing goes on whether the ſmall lever riſes or falls. Before the reſiſtance is very great, the needles fartheſt from the fulcrum of the ſmall lever are uſed; after that the neareſt are employed, which doubles the power of the machine. In raiſing the great lever, or lowering it to its bearing, the needles moſt diſtant from the fulcrum of the ſmall lever, are uſed *under* inſtead of *over* it. As the rope is liable to ſtretch and get ſlack, he paſſes it, after taking two turns on the winch, through a pulley, to which is ſuſpended a weight of half a hundred, and then takes two turns more before it is carried through the other block, by which means the ſlack is conſtantly gathered in, and the weight holds on without increaſing the friction, as by hanging under the winch it counteracts the preſſure upwards on its axis.

The power of this machine is very great, being as 1 to 1136 nearly, and capable by a trifling addition of any other proportion. It is applicable to many purpoſes beſide cyder-preſſing, and is more ſimple, and leſs liable to injury, than any other which has fallen under our obſervation. Perhaps, however, it would be an improvement to uſe, inſtead of the ropes and pulleys, by which the lever E is moved, a ſmall wheel or pinion of 10 or 12 teeth, on the axis of the winch W (nº 2.), and a ſtiff beam *e n* down from the lever, having on its lower end an iron rack, of which the teeth take into thoſe of the pinion. The action of theſe teeth would, in our opinion, be leſs diminiſhed by friction and obliquity, than the pulleys are by friction and the ſtiffneſs of the rope; and the machine would retain all its other advantages.

Press *uſed by Joiners*, to keep cloſe the pieces they have glued, eſpecially panels, &c. of wainſcot, is very ſimple, conſiſting of four members; viz. two ſcrews, and two pieces of wood, four or five inches ſquare, and two or three feet long; whereof the holes at the two ends ſerve for nuts to the ſcrews.

Press *uſed by Inlayers*, reſembles the joiner's-preſs, except that the pieces of wood are thicker, and that only one of them is moveable; the other, which is in form of a treſſel, being ſuſtained by two legs or pillars, jointed into it at each end. This preſs ſerves them for ſawing and cleaving the pieces of wood required in marquetry or inlaid work.

Founder's Press, is a ſtrong ſquare frame, conſiſting of four pieces of wood, firmly joined together with tenons, &c. This preſs is of various ſizes, according to the ſizes of the moulds; two of them are required to each mould, at the two extremes whereof they are placed; ſo as that, by driving wooden wedges between the mould and the ſides of the preſſes, the two parts of the mould wherein the metal is to be run may be preſſed cloſe together.

*Printing-*Press. See Printing-*Preſs*.

*Rolling-*Press, is a machine uſed for the taking off prints from copper-plates. It is much leſs complex than that of the letter-printers. See its deſcription and uſe under the article *Rolling-preſs* Printing.

Press, in *Coining*, is one of the machines uſed in ſtriking of money; differing from the balance, in that it has only one iron bar to give it motion, and preſs the moulds or coins; is not charged with lead at its extreme, nor drawn by cordage. See Coining.

*Binder's Cutting-*Press, is a machine uſed equally by book-binders, ſtationers, and paſteboard-makers; conſiſting of two large pieces of wood, in form of cheeks, connected by two ſtrong wooden ſcrews; which, being turned by an iron bar, draw together, or ſet aſunder, the cheeks, as much as is neceſſary for the putting in the books or paper to be cut. The cheeks are placed lengthwiſe on a wooden ſtand, in the form of a cheſt, into which the cuttings fall. Aſide of the cheeks are two pieces of wood, of the ſame length with the ſcrews, ſerving to direct the cheeks, and prevent their opening unequally. Upon the cheeks the plough moves, to which the cutting knife is faſtened by a ſcrew; which has its key, to diſmount it, on occaſion, to be ſharpened.

The plough conſiſts of ſeveral parts; among the reſt a wooden ſcrew or worm, which, catching within the nuts of the two feet that ſuſtain it on the cheeks, brings the knife to the book or paper which is faſtened in the preſs between two boards. This ſcrew, which is pretty long, has two directories, which reſemble thoſe of the ſcrews of the preſs. To make the plough ſlide ſquare and even on the cheeks, ſo that the knife may make an equal paring, that foot of the plough where the knife is not fixed, ſlides in a kind of groove, faſtened along one of the cheeks. Laſtly, the knife is a piece of ſteel, ſix or ſeven inches long, flat, thin, and ſharp, terminating at one end in a point, like that of a ſword, and at the other in a ſquare form, which ſerves to faſten it to the plough. See *Book-Binding*.

As the long knives uſed by us in the cutting of books or papers, are apt to jump in the cutting thick books, the Dutch are ſaid to uſe circular knives, with an edge all round; which not only cut more ſteadily, but laſt longer without grinding.

Press, in the *Woollen Manufactory*, is a large wooden machine, ſerving to preſs cloths, ſerges, rateens, &c. thereby to render them ſmooth and even, and to give them a gloſs.

This machine conſiſts of ſeveral members; the principal whereof are the cheeks, the nut, and the worm or ſcrew, accompanied with its bar, which ſerves to turn it round, and make it deſcend perpendicularly on the middle of a thick wooden plank, under which the ſtuffs to be preſſed are placed. The calender is alſo a kind of preſs, ſerving to preſs or calender linens, ſilks, &c.

Liberty of the Press. See *Liberty of the Preſs*.

PRESSING, in the manufactures, is the violently ſqueezing a cloth, ſtuff, &c. to render it ſmooth and gloſſy.

There are two methods of preſſing, viz. cold and hot.

As to the former, or cold preſſing: After the ſtuff has been ſcoured, fulled, and ſhorn, it is folded ſquare in equal plaits, and a ſkin of vellum or paſteboard put between each plait. Over the whole is laid a ſquare wooden plank, and ſo put into the preſs, which is ſcrewed down tight by means of a lever. After it has lain a ſufficient time in the preſs, they take it out, removing the paſteboards, and lay it up to keep. Some only lay the ſtuff on a firm table after plaiting and paſteboarding, cover the whole with a wooden plank, and load it with a proper weight.

The method of preſſing hot is this: When the ſtuff has received the above preparations, it is ſprinkled a little with water, ſometimes gum-water; then plaited equally, and between each two plaits are put leaves of paſteboard; and between every ſixth and ſeventh plait, as well as over the whole, an iron or braſs plate well heated in a kind of furnace. This done, it is laid upon the preſs, and forcibly ſcrewed down. Under this preſs are laid five, ſix, &c. pieces at the ſame time, all furniſhed with their paſteboards and iron-plates. When the plates are well cooled, the ſtuffs are taken out and ſtitched a little together to keep them in the plaits. This manner of preſſing was only invented to cover the defects of the ſtuffs; and, accordingly, it has been frequently prohibited.

Pressing, or *Impreſſing*. See Impressing.

PRESSION, or pressure, in the Carteſian Philoſophy, is a ſuppoſed impulſive kind of motion, or rather an endeavour to move, impreſſed on a fluid medium, and propagated through it.

PRESSURE of air. See Pneumatics.

Pressure of Fluids. See Hydrostatics and Pneumatics.

PREST, is uſed for a duty in money, to be paid by the ſheriff on his account, in the exchequer, or for money left or remaining in his hands: 2 & 3 Edw. VI. c. 4.

Prest-Money, is ſo called from the French word *preſt*, that is, *promptus, expeditus*; for that it binds thoſe who receive it, to be ready at all times appointed, being commonly meant of ſoldiers.

PRESTATION-money, is a ſum of money paid yearly by archdeacons and other dignitaries to their biſhop, *pro exteriori juriſdictione*.

Prestation (*præſtatio*), was anciently uſed for other payments: *Et quieti ſint de præſtatione muragii.* Chart. Hen. VII. Sometimes alſo for pourveyance.

PRESTEIGN is a town in Radnorſhire, diſtant 149 miles weſt-north-weſt from London, in the direct road to Aberyſtwith, and throughout South Wales, in N. Lat. 52° 12', bounded to the north, and north eaſt by Herefordſhire. It is a neat well built town, with clean and regular ſtreets, and is the reſidence of many genteel families. The neighbourhood abounds with all the comforts and conveniencies of life. It is ſeated on a gravelly ſoil on the banks of the river Lug, and at the head of a very fertile vale: the mountains to the weſt and north-weſt of the town forming, as it were, an amphitheatre round it. The name of it in Welſh is *Slan-Andras*, which is ſuppoſed to be derived from the church, which is dedicated to Saint Andrew. The town is divided into four wards, which have each a ſeparate juriſdiction, ſeparate officers, levies, &c. The curfew-bell of William the Conqueror ſtill remains in this place, and is rung every night. It is a borough by preſcription, and is governed by a bailiff annually elected, and ſworn in by a ſteward appointed by the crown. The living is a rectory and vicarage united, and reported to be worth from L. 500 to L. 600 *per annum*; the pariſh lying in two counties. Here is an excellent free ſchool well endowed. The county hall, the county gaol, the country bridewell, and houſe of correction, are kept in this place. The markets are held on Saturdays; and there are two fairs in the year. About a century and a half ago Preſteign was conſiderably larger; had a good woollen manufactory, of which the very large buildings now ſtanding (formerly belonging to clothiers) bear ample teſtimony, but a fire, ſucceeded by the plague, in the town about the year 1636, reduced the ſame, and with it, its conſequence as a manufacturing town. The healthineſs of its ſituation cannot be better aſcertained than by the regiſter of births and burials. The pariſh embraces at leaſt a circle of 19 miles; and the average of burials for the laſt ſeven years was only 26 perſons *per annum*, and that of births for the ſame time was 42; and of the former upwards of 18 were from 80 to 100 years old.

PRESTER (John, or Jean), an appellation formerly given to an emperor of the Tartars who was overcome and killed by Jenghiz Khan. Since that time it has been given to the emperor of Abyſſinia or Ethiopia; however, in Ethiopia itſelf this name is utterly unknown, the emperor being there called the *grand negus*.

Prester, a meteor, conſiſting of an exhalation thrown from the clouds downwards with ſuch violence, as that by the colliſion it is ſet on fire. The word is Greek ϖρηϛηρ, the name of a kind of ſerpent; called alſo *dipſas*, to which this meteor is ſuppoſed to bear a reſemblance. The preſter differs from the thunderbolt in the manner of its inflammation; and in its burning and breaking every thing it touches with greater violence.

Prester, a word uſed by ſome to expreſs the external part of the neck, which is uſually inflated in anger.

PRESTIMONY, in canon law, is derived *a præſtatione quotidiana;* and is, by ſome, defined to be a kind of benefice, ſerved by a ſingle prieſt. Others ſay, it is the incumbency of a chapel, without any title or collation; ſuch as are moſt of thoſe in caſtles, where prayers or maſs are ſaid; and which are mere unendowed oratories. Whence the term is alſo applied, in the Romiſh church, to certain perpetual offices beſtowed on canons, religious, or others, for the ſaying of maſſes, by way of augmentation of their livings. Others think it is a leaſe, or conceſſion of any eccleſiaſtical fund or revenue, belonging to a monaſtery, to be enjoyed during life. Du Moulin calls it a *profane benefice*, which, however, has a perpetual title, and an eccleſiaſtical office, with certain revenues attached to it; which the incumbent is allowed to ſell, and which may be poſſeſſed without tonſure; ſuch as the lay church-wardens of Notre-dame. He adds, that, in propriety, the canonries of chapels are benefices of this nature. The moſt probable opinion ſeems to be, that preſtimony is a fund, or revenue, appropriated by the founder for the ſubſiſtence of a prieſt, without being erected into any title of benefice, chapel, prebend, or priory; and which is not ſubject either to the pope or to the ordinary, but whereof the patron, and thoſe who have a right from him, are the collators, and nominate and confer *pleno jure*.

PRESTO, in the Italian muſic, intimates to perform quick; as *preſtiſſimo* does extremely quick.

PRESTON, a town of Lancaſhire in England, ſeated on the river Ribble, over which there is a handſome ſtone bridge. Here is held a court of chancery, and other offices of juſtice for the county palatine of Lancaſter. It is noted for the defeat of the rebels here in 1715, when they were all made priſoners, and ſent up to London. W. Long. 2. 26. N. Lat. 53. 45.

PRESTRE. See Vauban.

PRETENSED or pretended right, in law, is where one is in poſſeſſion of lands and tenements, which another, who is out, claims and ſues for. Here the pretenſed right is in him who ſo claims or ſues.

PRETERITE, in grammar, a tenſe which expreſſes the time paſt, or an action completely finiſhed; as, *ſcripſi*, "I have written." See Perfect and Grammar.

PRETERITION, or pretermission, in rhetoric, a figure whereby, in pretending to paſs over a thing untouched, we make a ſummary mention thereof. *I will not ſay he is valiant, he is learned, he is juſt*, &c. The moſt artful praiſes are thoſe given by way of preterition. See Oratory.

PRETEXT, a colour or motive, whether real or feigned, for doing ſomething.

Toga **PRETEXTA**, among the ancient Romans, a long white gown, with a border of purple round the edges, and worn by children of quality till the age of puberty, *viz.* by the boys till 17, when they changed it for the *toga virilis:* and by the girls till marriage.

PRETIUM sepulchri, in old law books, &c. thoſe goods accruing to the church wherein a corps is buried. In the Iriſh canons, lib. xix. cap. 6. it is ordered, that along with every body that is buried, there go his cow, horſe, apparel, and the furniture of his bed; none of which may be diſpoſed of otherwiſe than for the payment of debts, &c. as being familiars and domeſtics of the deceaſed.

PRETOR, a magiſtrate among the ancient Romans, not unlike the lord chief juſtices, or lord chancellor in England, or both in one; as being veſted with the power of diſtributing juſtice among the citizens. At firſt there was only one pretor; but afterwards, another being created, the firſt or chief one had the title of *prætor urbanus*, or the "city pretor:" the other was called *peregrinus*, as being judge in all matters relating to foreigners. But, beſides theſe, there were afterwards created many provincial pretors; who were not only judges, but alſo aſſiſted the conſuls in the government of the provinces, and even were inveſted with the government of provinces themſelves.

PRETORIAN guards, in Roman antiquity, were the emperor's guards, who at length were increaſed to 10,000: they had this denomination, according to ſome, from their being ſtationed at a place called *Prætorium:* their commander was ſtyled *præfectus prætorii.*

PRETORIUM, or Prætorium, among the Romans, denoted the hall or court wherein the pretor lived, and wherein he adminiſtered juſtice.

It likewiſe denoted the tent of the Roman general, wherein councils of war, &c. were held: alſo a place in Rome where the Pretorian guards were lodged.

PREVARICATION, in the civil law, is where the informer colludes with the defendants, and ſo makes only a ſham proſecution.

Prevarication, in our laws, is when a man falſely ſeems to undertake a thing, with intention that he may deſtroy it; where a lawyer pleads booty, or acts by colluſion, &c.

It alſo denotes a ſecret abuſe committed in the exerciſe of a public office, or of a commiſſion given by a private perſon.

PRIAM, king of Troy, was the ſon of Laomedon, He was carried into Greece after the taking of that city by Hercules; but was afterwards ranſomed, on which he obtained the name of *Priam*, a Greek word ſignifying "ranſomed." At his return he rebuilt Ilium, and extended the bounds of the kingdom of Troy, which became very flouriſhing under his reign. He married Hecuba, the daughter of Ciſſeus king of Thrace, by whom he had 19 children; and among the reſt Paris, who

Priapiſmus
‖
Price.

who carried off Helen, and occaſioned the ruin of Troy, which is ſuppoſed to have been ſacked by the Greeks about 1184 B. C. when Priam was killed by Pyrrhus the ſon of Achilles at the foot of an altar where he had taken refuge, after a reign of 52 years. See TROY.

PRIAPISMUS, or PRIAPISM, is an erection of the penis without any concomitant pain, or the conſent of other parts. It is thus called, becauſe the perſon in this ſtate reſembles the lewd god Priapus. Cœlius Aurelianus ſays it is a palſy of the ſeminal veſſels, and other nerves diſtributed to the parts about the penis, by the diſtenſion of which this diſorder is produced. It is of the ſame nature as the ſatyriaſis. See MEDICINE, n° 372.

PRIAPUS, in Pagan worſhip, the ſon of Bacchus and Venus, who preſided over gardens and the moſt indecent actions. He was particularly adored at Lampſacus, a city at the mouth of the Helleſpont, ſaid to be the place of his birth; and his image was placed in gardens to defend them from thieves and birds deſtructive to fruit. He was uſually repreſented naked, with a ſtern countenance, matted hair, and holding either a wooden ſword or ſickle in his hand, and with a monſtrous privity; from whence downward his body ended in a ſhapeleſs trunk. The ſacrifice offered to this obſcene deity was the aſs; either on account of the natural uncomelineſs of this animal, and its propenſity to venery, or from the diſappointment which Priapus met with on his attempting the chaſtity of Veſta, while that goddeſs was aſleep, when ſhe eſcaped the injury deſigned her by her being awaked by the braying of old Silenus's aſs.

PRICE (Rev. Richard), D. D. L L. D. fellow of the Royal Society of London, and of the Academy of Sciences, New England, was born at Tynton in Glamorganſhire, February 22, 1723. His father was a diſſenting miniſter at Bridgend in that country, and died in 1739. At eight years old he was placed under a Mr Simmons of Neath; and in four years removed to Pentwyn in Caermarthenſhire under the Rev. Samuel Jones, whom he repreſented as a man of a very enlarged mind, and who firſt inſpired him with liberal ſentiments of religion. Having lived as long with him as with Mr Simmons, he was ſent to Mr Griffith's academy at Talgarth in Breconſhire. In 1740 he loſt his mother; and on this he quitted the academy and came to London. Here he was ſettled at that academy, of which Mr Eames was the principal tutor, under the patronage of his uncle the Rev. S. Price, who was copaſtor with Dr Watts upwards of 40 years. At the end of four years he left this academy, and reſided with Mr Streatfield of Stoke Newington in the quality of domeſtic chaplain, while at the ſame time he regularly aſſiſted Dr Chandler at the Old Jewry, and occaſionally aſſiſted others. Having lived with Mr Streatfield near 13 years, on his death and his uncle's he was induced to change his ſituation, and in 1757 married Miſs S. Blundell of Leiceſterſhire. He then ſettled at Hackney, but being ſhortly after choſen miniſter at Newington Green, he lived there until the death of his wife, which was in 1786, when he returned to Hackney. He was next choſen afternoon-preacher at the meeting-houſe in Poor Jewry-ſtreet, but this he reſigned on being elected paſtor of the Gravel-pit meeting Hackney, and afternoon-preacher at Newington Green. Theſe he reſigned with a farewel-ſermon in February 1791. Shortly after he was attacked with a nervous fever, which diſappearing was ſucceeded by a diſorder in his bladder, which reduced him to ſuch a degree that, worn out with agony and diſeaſe, he died without a groan on the 19th April 1791. He left his property to a ſiſter and two nephews.

Price.

Dr Kippis, ſpeaking of his learning and purſuits, obſerves*, that "his chief aim was to lay a foundation for ſolid knowledge, by an application to ſciences of the nobleſt kind. It was on the great and fundamental principles and obligations of morality, on the higher ſpecies of mathematics, on the ſublimer parts of natural philoſophy, on the true baſis of government, and on the queſtions which relate to the eſſential welfare and dignity of man, that his ſtudies were employed; and in the proſecution of theſe ſtudies he not only enriched his own mind, but was enabled to become of eminent ſervice to his country and to the world. In his moral writings he has laboured with diſtinguiſhed ability to build the ſcience of ethics on an immutable baſis; and what he has advanced will always ſtand high in eſtimation as one of the ſtrongeſt efforts of human reaſon in favour of the ſyſtem he has adopted. For myſelf (adds Dr Kippis), I ſcruple not to ſay, that I regard the treatiſe referred to as a rich treaſure of valuable information, and as deſerving to be ranked among the firſt productions of its kind. With reſpect to his other ethical works, every one muſt admire the zeal, earneſtneſs, and ſtrength, with which he endeavours to lead men into pious views of God, of providence and prayer; and to promote the exerciſe of devout and amiable diſpoſitions. In conſequence of his profound knowledge in mathematical calculations, he was qualified at a particular criſis for being of ſingular utility to his fellow-citizens. A number of ſchemes for inſurance for lives, and the benefit of ſurvivorſhip, promiſing mighty advantages, were riſing up in the metropolis. Theſe ruinous ſchemes would have been carried to great exceſs had not Dr Price ſtepped forward and diſpelled the deluſion. Gratitude will not allow us to forget the ability and ſpirit with which he awakened the attention of his countrymen to the reduction of the national debt. With him it was that the ſcheme of the preſent miniſter for that purpoſe is underſtood to have originated. What crowned the whole of his character was, its being an aſſemblage of the moſt amiable and excellent private virtues. His piety was ſincere, humble, and fervent; his ſoul pure and elevated; in his views diſintereſted and noble; and in his manners mild and gentle: the applauſe of his talents and virtues will be tranſmitted to future ages, and he will be united in the catalogue with the moſt eminent benefactors of mankind."

This is the panegyric of a friend; but with few abatements it will be admitted by every candid reader. In morals Dr Price's principles were thoſe of Cudworth and Clarke; and by many who have themſelves adopted a very different theory, he is allowed to have defended thoſe principles with greater ability than any other writer in the Engliſh language (ſee *MORAL Philoſophy*, n° 14.) In metaphyſics he was perhaps too great an admirer of Plato, from whom he has borrowed a doctrine concerning ideas which we confeſs ourſelves unable to comprehend. He was a firm believer in the immateriality of the ſoul; but, with Dr Law, the late learned biſhop of Carliſle, he thought, that from death to the reſurrection of the body it remains in a dormant or

* Addreſs at his Funeral, 8vo.

quieſcent ſtate. He contended for its indiviſibility, but maintained at the ſame time its extenſion; which furniſhed Dr Prieſtley with ſome advantages in their celebrated controverſy, which his own acuteneſs would never have obtained. In propagating his political principles, which were republican, he ſometimes expreſſed himſelf with undue vehemence; and he was a zealous enemy to all religious eſtabliſhments which, in his opinion, encroach upon that liberty wherewith Chriſt has made us free. His faith reſpecting the Son of God was what has been called ſometimes *low Arianiſm* and ſometimes *Semi-arianiſm*. From a very early age he claimed the privilege of thinking for himſelf on every ſubject. His father was a rigid Calviniſt, and ſpared no pains to inſtil his own theological dogmas into the tender mind of his ſon; but young Richard would often ſtart his doubts and difficulties, and ſometimes incur the old man's diſpleaſure by arguing againſt his favourite ſyſtem with an ingenuity that perplexed, and a ſolidity that could not be eaſily overturned. He had once the misfortune to be caught reading a volume of Clarke's ſermons, which his father in great wrath ſnatched from him and threw into the fire. Perhaps he could not have taken a more effectual method to make the book a favourite, or to excite the young man's curioſity after the other works of the ſame author; and it is by no means improbable that this orthodox bigotry contributed more than any other circumſtance to lay the foundation of his ſon's Arianiſm.

But whatever may be thought of Dr Price's ſpeculative opinions, whether political or religious, his virtues in private life have never been called in queſtion. Of his practical religion it is impoſſible to ſpeak in terms too high. There was a fervour even in his public prayers which indicated the ſtrongeſt ſenſibility as well as ſincerity in himſelf, and communicated its warmth to thoſe who joined with him. But in his family devotions he gave ſtill fuller ſcope to the pious emotions of his ſoul, and proved to thoſe friends who were occaſionally preſent at them how deeply he felt religious impreſſions, and how happily he blended in this as well as in other things the cool deciſions of the underſtanding with the amiable and exalted ſenſibilities of the heart.

But it was not in devotion only that theſe ſenſibilities were diſplayed. He was as exemplary in affection to his relatives as in love to his Maker. Of this he gave a ſtriking though private inſtance before he firſt quitted his native place to try his fortune in London. His father had left to an elder brother by a former marriage a very conſiderable fortune; to Richard he left a mere trifle; and to each of two ſiſters ſtill leſs. Our author divided his ſhare between his ſiſters, reſerving to himſelf only a few pounds to defray the expences of his journey, and truſting for his future ſupport to the bleſſing of God upon his talents and his induſtry. As in early life he was an affectionate and generous brother, in old age he was a loving and attentive huſband. His wife, who for a conſiderable time before her death was almoſt wholly helpleſs, found during the laſt years of her life hardly any enjoyment except in a game at whiſt; and though our Doctor diſliked cards as a waſte of time, and never touched them on any other occaſion, to amuſe her he would ſit down every evening to the card-table, and play till it was late, with a cheerfulneſs and good humour which charmed every perſon who had the happineſs of viewing him in that endearing ſituation.

Yet, though thus attentive to the obligations of domeſtic life, he did not ſuffer his private affections to encroach upon his ſocial duties. His talents and his labours were ever ready at the call of friendſhip; nay, ſo much did his nature abound with the milk of human kindneſs, that he could not reſiſt without extreme reluctance even troubleſome and unreaſonable ſolicitations. His hours of ſtudy and retirement were frequently broken in upon by applications for aſſiſtance and advice, eſpecially matters relating to annuities and life inſurances; and in this way he ſacrificed much of his perſonal convenience to individuals of whom he knew but little, and from whom he would accept of no pecuniary recompenſe. His good nature in this reſpect amounted almoſt to a foible; and ſubjected him to importunities and loſs of time, of which he would ſometimes complain as interfering materially with more important and more generally uſeful ſtudies.

Whilſt he thus obliged the rich by his mental talents, he ſuccoured the poor with his earthly ſubſtance. A fifth part of his annual income was regularly devoted to charitable purpoſes; and he was laudably anxious to diſtribute it in ſuch a way as might produce the greateſt good. In the practice of this, and indeed of all his virtues, he was utterly devoid of oſtentation. Simplicity and humility were among the ſtrong features of his character. No man was ever leſs ſenſible of his own excellence, or leſs elated by his own celebrity; and in no man was the dignity of artleſs manners and unaffected modeſty more happily diſplayed.

His face was the true index of his mind. It beamed with philanthropy; and when lighted up in converſation with his friends, aſſumed an aſpect peculiarly pleaſing. His perſon was ſlender, and rather below the common ſize, but poſſeſſed of great muſcular ſtrength and remarkable activity. A habit of deep thought had given a ſtoop to his figure, and he generally walked a briſk pace with his eyes on the ground, his coat buttoned, one hand in his pocket, and the other ſwinging by his ſide.

It is natural to ſuppoſe that ſuch a man as Dr Price, ſome of whoſe writings were tranſlated into foreign languages, would be very generally reſpected in the republic of letters, and have many correſpondents. The ſuppoſition is well founded. In 1763 or 1764 he was choſen a fellow of the Royal Society, and contributed largely to the tranſactions of that learned body; in 1769 he received from Aberdeen a diploma creating him DD.; and in 1783 the degree of LL.D. was conferred upon him by the college of Yale in Connecticut. As in 1770 he had refuſed an American degree which had been conveyed to him by Dr Franklin, his acceptance of one 13 years afterwards can be attributed only to his very great regard for a republican form of government; which was a peculiar trait in his character, and ſhows what ſtrong attachments the vigorous mind will imbibe by thinking always on the ſame ſubjects, and in the ſame track. Among his correſpondents, the moſt eminent in his own country were the late Lord Chatham, Lord Stanhope, Lord Lanſdowne, the late biſhops of Carliſle and St Aſaph, and the preſent biſhop of Landaff; Mr Hume, Mr Harris of Saliſbury,

liſbury, Dr Gregory of Edinburgh, and the celebrated Mr Howard, who lived with him on terms of the greateſt intimacy; in America he correſponded with Dr Franklin, Dr Chauncey, Mr Adams, and others; and in France with the celebrated Turgot, the Duke de Rochefoucault, and ſeveral of the firſt national aſſembly. One of his female correſpondents ſketched his character with great juſtneſs many years ago under the fictitious but well applied name of *Simplicius*; and with this character we ſhall cloſe theſe ſhort memoirs.

"While the vain man is painfully ſtriving to outſhine the company and to attract the admiration by falſe wit, forced compliments, and ſtudied graces, he muſt ſurely be mortified to obſerve how conſtantly Simplicius engages their attention, reſpect, and complacency, without having once thought of himſelf as a perſon of any conſequence among them. Simplicius imparts his ſuperior knowledge, when called upon, as eaſily and naturally as he would tell you what it is o'clock; and with the ſame readineſs and good will informs the moſt ignorant or confers with the moſt learned. He is as willing to receive information as to give it, and to join the company, as far as he is able, in the moſt trifling converſation into which they may happen to fall as in the moſt ſerious and ſublime. If he diſputes, it is with as much candour on the moſt important and intereſting as on the moſt inſignificant ſubjects; and he is not leſs patient in hearing than in anſwering his antagoniſt. If you talk to him of himſelf or his works, he accepts praiſe or acknowledges defects with equal meekneſs, and it is impoſſible to ſuſpect him of affectation in either. We are more obliged by the plain unexaggerated expreſſions of his regard, than by the compliments and attentions of the moſt accompliſhed pattern of high breeding; becauſe his benevolence and ſincerity are ſo ſtrongly marked in every look, word, and action, that we are convinced his civilities are offered for our ſakes, not for his own, and are the natural effects of real kindneſs, not the ſtudied ornaments of behaviour. Every one is deſirous to ſhow him kindneſs in return, which we know will be accepted juſt as it is meant. All are ready to pay him that deference which he does not deſire, and to give him credit for more than he aſſumes, or even more than he poſſeſſes. With a perſon ungraceful, and with manners unpoliſhed by the world, his behaviour is always proper, eaſy, and reſpectable; as free from conſtraint and ſervility in the higheſt company, as from haughtineſs and inſolence in the loweſt. His dignity ariſes from his humility; and the ſweetneſs, gentleneſs, and frankneſs of his manners, from the real goodneſs and rectitude of his heart, which lies open to inſpection in all the fearleſsneſs of truth, without any need of diſguiſe or ornament."

Such was Dr Price.—Of his public principles men will think differently; of his private worth there can be but one opinion. He will live in the memory of his friends till memory has loſt her power. To poſterity his works will be his monument. They are: A Review of the principal Queſtions and Difficulties in Morals, 8vo, 1758; Diſſertations on Providence, &c. 8vo, 1767; Obſervations on Reverſionary Payments, &c. 8vo, 1771; Appeal on the National Debt, &c. 8vo, 1773; Obſervations on the Nature of Civil Liberty, 1776; on Materialiſm and Neceſſity, in a correſpondence between Dr Price and Dr Prieſtley, 1779; on Annuities, Aſſurances, Population, &c. 8vo, 1779; on the Population of England, 1780; on the Public Debts, Finances, Loans, &c. 8vo, 1783; on Reverſionary Payments, 2 vols, 1783; on the importance of the American Revolution, 1784: beſides Sermons, and a variety of papers in the Philoſophical Tranſactions on aſtronomical and other philoſophical ſubjects.

PRIDE, inordinate and unreaſonable ſelf-eſteem, attended with inſolence and rude treatment of others.—It is frequently confounded with vanity, and ſometimes with dignity; but to the former paſſion it has no reſemblance, and in many circumſtances it differs from the latter. Vanity is the parent of loquacious boaſting; and the perſon ſubject to it, if his pretences be admitted, has no inclination to inſult the company. The proud man, on the other hand, is naturally ſilent, and, wrapt up in his own importance, he ſeldom ſpeaks but to make his audience feel their inferiority. It is this circumſtance which diſtinguiſhes pride from dignity, and conſtitutes its ſinfulneſs. Every man poſſeſſed of great powers of mind is conſcious of them, and feels that he holds a higher rank in the ſcale of exiſtence than he whoſe powers are leſs. If he recollect, at the ſame time, that he has nothing which he did not receive, and that his ſuperiority is owing to the good pleaſure of Him who forms his creatures differently, as the potter forms his clay; he will be ſo far from inſulting his inferiors, that when neceſſarily in company with them, he will bear with their foibles, and, as far as is proper, make them loſe ſight of the diſtance which the laws of God and man have for ever placed between them and him. This condeſcenſion, however, if he be a man of dignity, will never lead him to join with them in any mean or dirty action. He will even excuſe in them many things which he would condemn in himſelf, and give them his good wiſhes, after they have forfeited his eſteem. Such a character is amiable and reſpectable, and what every man ſhould labour to obtain. From the weakneſs of human nature, however, it is too apt to degenerate into pride.

To a man of great intellectual powers and various erudition, the converſation of ordinary perſons affords neither inſtruction nor amuſement; and ſuch converſation, when often repeated, muſt, from the nature of things, become tedious and irkſome. But it requires great command of temper and of manners to prevent uneaſineſs long felt from ſometimes betraying itſelf by external ſymptoms, ſuch as peeviſh expreſſions, a forbidding look, or abſence of mind; and theſe are the infallible indications of contempt for the company, the very worſt ingredient in the paſſion of pride. If this contempt be often excited, it will be formed into a habit; and the proud man will be ſo much under its influence, as to inſult his inferiors, and ſometimes his equals, without forming the reſolution to inſult either the one or the other. Such a character is hateful to every company, and is ſo far from indicating true dignity of mind in him to whom it belongs, that it is obviouſly aſſociated with meanneſs, and indicates a conſciouſneſs of ſome radical defect. He who poſſeſſes real and conſpicuous merit has no occaſion to depreſs others for the purpoſe of raiſing himſelf; his ſuperiority will be cheerfully acknowledged: but when a man of undoubted eminence in one reſpect, is ſo ſwollen with pride as to make him wiſh to appear great in all reſpects, he has no other means of enforcing his ill-founded claim, than diſplaying his acknowledged ſuperiority, with ſuch inſolence as may drive at a diſtance from him every perſon by whom he is conſcious that in many inſtances he might be more than rivalled. Whoever is proud of knowledge, would do well to conſider how much knowledge he wants.

The ſame obſervations which we have made on pride of parts will apply to every other ſpecies of pride, ſuch as pride of birth, office, or riches, &c. The peace and order of ſociety require difference of rank, accompanied with different degrees of authority; and he who inherits a title or office from his anceſtors, may without pride be conſcious of his ſuperiority, provided he forget not that ſuch ſuperiority is conferred on families and individuals, not for their own ſakes, but for the good of the community. The peer, who keeps this circumſtance in mind, may maintain his ſtation, and repreſs the forward petulence of the plebeian, without giving offence to any thinking man; but if he dwell upon his rank with too much complacency, he will in proceſs of time be apt to conſider himſelf and his family as ſuperior by nature to thoſe upon whom no title has been conferred, and then his pride will become intolerable. If we could trace our deſcent, ſays Seneca, we ſhould find all ſlaves to come from princes, and all princes from ſlaves. To be proud of knowledge, is to be blind in the light; to be proud of virtue, is to poiſon ourſelves with the antidote; to be proud of authority, is to make our riſe our downfall. The beſt way to humble a proud man is to neglect him.

PRIDEAUX (Humphry) was born at Padſtow in Cornwall in 1648, and was honourably deſcended by both parents. Three years he ſtudied at Weſtminſter under Dr Buſby; and then was removed to Chriſt-church, Oxford. Here he publiſhed, in 1676, his *Marmora Oxonienſia ex Arundelianis, Seldenianis, aliiſque conflata, cum perpetuo Commentario.* This introduced him to the lord chancellor Finch, afterwards earl of Nottingham, who in 1679 preſented him to the rectory of St Clements near Oxford, and in 1681 beſtowed on him a prebend of Norwich. Some years after he was engaged in a controverſy with the Papiſts at Norwich, concerning the validity of the orders of the church of England, which produced his book upon that ſubject. In 1688 he was inſtalled in the archdeaconry of Suffolk; to which he was collated by Dr Lloyd, then biſhop of Norwich. In 1691, upon the death of Dr Edward Pococke, the Hebrew profeſſorſhip at Oxford being vacant, was offered to Dr Prideaux, but he refuſed it. In 1697, he publiſhed his Life of Mahomet, and in 1702 was inſtalled dean of Norwich. In 1710 he was cut for the ſtone, which interrupted his ſtudies for more than a year. Some time after his return to London, he proceeded with his Connection of the Hiſtory of the Old and New Teſtament; which he had begun when he laid aſide the deſign of writing the Hiſtory of Appropriations. He died in 1724.

Chandler's Travels in Aſia Minor.

PRIENE, an ancient town of Aſia Minor. It is now called *Samſun*, and *Samſun-kateſi*, which do not however appear to be very recent. It was taken in 1391 by Bajazet, who ſubdued Ionia. It had formerly, without including the citadel, three gateways; one of which was towards Kelibeſh, an adjoining village; and without it are vaults of ſepulchres. The entrance was not wide. A part of the arch, conſiſting of a ſingle row of maſſive ſtones, ſtill remains; but thoſe on which it reſts are ſo corroded by age, broken, or diſtorted, as to ſeem every moment ready to yield and let down their load. A rugged way leads to a ſecond opening in the wall oppoſite to this, and about a mile from it; beyond which are likewiſe vaults of ſepulchres. Between theſe was a gate facing to the plain; and on the left hand going out of it is a hole, reſembling the mouth of an oven, in the ſide of a ſquare tower; and over it an inſcription in ſmall characters, exceedingly difficult to be read. It ſignifies, that a certain Cyprian in his ſleep had beheld Ceres and Proſerpine arrayed in white; and that in three viſions they had enjoined the worſhip of a hero, the guardian of the city, and pointed out the place where, in obedience to them, he had erected the god. This was probably ſome local hero, whoſe little image was ſet in the wall, and whoſe name and memory have periſhed.

PRIEST, a perſon ſet apart for the performance of ſacrifice, and other offices and ceremonies of religion. Before the promulgation of the law of Moſes, the firſt born of every family, the fathers, the princes, and the kings, were prieſts. Thus Cain and Abel, Noah, Abraham, Melchizedec, Job, Iſaac, and Jacob, offered themſelves their own ſacrifices. Among the Iſraelites, after their exod from Egypt, the prieſthood was confined to one tribe, and it conſiſted of three orders, the *high*-prieſt, *prieſts*, and *Levites*. The prieſthood was made hereditary in the family of Aaron, and the firſt-born of the oldeſt branch of that family, if he had no legal blemiſh, was always the high-prieſt. This divine appointment was obſerved with conſiderable accuracy till the Jews fell under the dominion of the Romans, and had their faith corrupted by a falſe philoſophy.—Then, indeed, the high-prieſthood was ſometimes ſet up to ſale, and inſtead of continuing for life, as it ought to have done, it ſeems from ſome paſſages in the New Teſtament, to have been nothing more than an annual office. There is ſufficient reaſon, however, to believe, that it was never diſpoſed of but to ſome deſcendant of Aaron, capable of filling it, had the older branches been extinct. (For the conſecration and offices of the Jewiſh prieſthood, we refer our readers to the books of Moſes). In the time of David, the inferior prieſts were divided into 24 companies, who were to ſerve in rotation, each company by itſelf, for a week. The order in which the ſeveral courſes were to ſerve was determined by lot; and each courſe was in all ſucceeding ages called by the name of its original chief.—All nations have had their *prieſts*. The Pagans had *prieſts* of Jupiter, Mars, Bacchus, Hercules, Oſiris, and Iſis, &c.; and ſome deities had *prieſteſſes*. The Mahometans have prieſts of different orders, called *ſchiek* and *mufti*; and the Indians and Chineſe have their *bramins* and *bonzes*.

It has been much diſputed, whether, in the Chriſtian church, there be any ſuch officer as a *prieſt*, in the proper ſenſe of the word. The church of Rome, which holds the *propitiatory* ſacrifice of the *maſs*, has of courſe her proper *prieſthood*. In the church of England, the word *prieſt* is retained to denote the ſecond order in her hierarchy, but we believe with very different ſignifications, according to the different opinions entertained of the

Lord's ſupper. Some few of her divines, of great learning, and of undoubted Proteſtantiſm, maintain that the Lord's ſupper is a *commemorative* and *euchariſtical ſacrifice*. Theſe conſider all who are authoriſed to adminiſter that ſacrament as in the ſtricteſt ſenſe *prieſts*. Others hold the Lord's ſupper to be a *feaſt* upon the *one* ſacrifice, once offered on the croſs; and theſe too muſt conſider themſelves as clothed with ſome kind of prieſthood. Great numbers, however, of the Engliſh clergy, perhaps the majority, agree with the church of Scotland, in maintaining that the Lord's ſupper is a rite of no other moral import, than the mere commemoration of the death of Chriſt. Theſe cannot conſider themſelves as *prieſts* in the rigid ſenſe of the word, but only as *preſbyters*, of which the word *prieſt* is a contraction of the ſame import with *elder*. See Supper *of the Lord*.

PRIMÆ viæ, among phyſicians, denote the whole alimentary duct; including the œſophagus, ſtomach, and inteſtines, with their appendages.

PRIMAGE, in commerce, a ſmall duty at the water-ſide, uſually about 12d. *per* ton, or 6d. *per* bale, due to the maſter and mariners of a ſhip.

PRIMARY, firſt in dignity, chief, or principal.

Primary Qualities of Bodies. See Metaphysics, n° 152.

PRIMATE, in church-polity, an archbiſhop, who is inveſted with a juriſdiction over other biſhops.

PRIME, primus, an appellation given to whatever is firſt in order, degree, or dignity, among ſeveral things of the ſame or like kind; thus we ſay, the prime miniſter, prime coſt, &c.

Prime is ſometimes uſed to denote the ſame with decimal, or the tenth part of an unit.

Prime-Figure, in geometry, one which cannot be divided into any other figures more ſimple than itſelf, as a triangle among planes, and the pyramid among ſolids.

For prime numbers, in arithmetic, ſee the article Number.

Prime of the Moon, is the new moon when ſhe firſt appears, which is about three days after the change.

Prime Vertical, is that vertical circle which paſſes through the poles of the meridian, or the eaſt and weſt points of the horizon; whence dials projected on the plane of this circle are called *prime vertical*, or *north-and-ſouth dials*.

Prime, in the Romiſh church, is the firſt of the canonical hours, ſucceeding to lauds.

Prime, in fencing, is the firſt of the chief guards. See Guard.

PRIMER seisin, in feodal law, was a feodal burden, only incident to the king's tenants *in capite*, and not to thoſe who held of inferior or meſne lords. It was a right which the king had, when any of his tenants *in capite* died ſeized of a knight's fee, to receive of the heir (provided he were of full age) one whole year's profits of the lands if they were in immediate poſſeſſion, and half a year's profits if the lands were in reverſion expectant on an eſtate for life. This ſeems to be little more than an additional relief, (ſee Relief); but grounded upon this feodal reaſon, That, by the ancient law of feods, immediately upon the death of a vaſſal the ſuperior was entitled to enter and take ſeiſin or poſſeſſion of the land, by way of protection againſt intruders, till the heir appeared to claim it, and receive inveſtiture: and for the time the lord ſo held it, he was entitled to take the profits; and unleſs the heir claimed within a year and day, it was by the ſtrict law a forfeiture. This practice however ſeems not to have long obtained in England, if ever, with regard to tenures under inferior lords; but, as to the king's tenures *in capite*, this *prima ſeiſina* was expreſsly declared, under Hen. III. and Ed. II. to belong to the king by prerogative, in contradiſtinction to other lords. And the king was entitled to enter and receive the whole profits of the land, till livery was ſued; which ſuit being commonly within a year and day next after the death of the tenant, therefore the king uſed to take at an average the *firſt-fruits*, that is to ſay, one year's profits of the land. And this afterwards gave a handle to the popes, who claimed to be feodal lords of the church, to claim in like manner from every clergyman in England the firſt year's profits of his benefice, by way of *primitiæ*, or firſt-fruits.—All the charges ariſing by primer ſeiſin were taken away by 12 Car. II. c. 24.

PRIMING, in gunnery, the train of powder that is laid, from the opening of the vent, along the gutter or channel on the upper part of the breech of the gun: which, when fired, conveys the flame to the vent, by which it is further communicated to the charge, in order to fire the piece. This operation is only uſed on ſhipboard at the proof, and ſometimes in garriſon; for, on all other occaſions, tubes are uſed for that purpoſe.

Priming-Wire, in gunnery, a ſort of iron needle employed to penetrate the vent or touch-hole of a piece of ordnance, when it is loaded: in order to diſcover whether the powder contained therein is thoroughly dry and fit for immediate ſervice; as likewiſe to ſearch the vent and penetrate the cartridge, when the guns are not loaded with the looſe powder.

Priming, among painters, ſignifies the laying on of the firſt colour.

PRIMIPILUS, in antiquity, the centurion of the firſt cohort of a legion, who had the charge of the Roman eagle.

PRIMITIÆ, the firſt-fruits gathered of the earth, whereof the ancients made preſents to the gods.

PRIMITIVE, in grammar, is a root or original word in a language, in contradiſtinction to *derivative*; thus, *God* is a primitive; *godly*, a derivative; and *godlike*, a compound.

PRIMOGENITURE, the right of the firſt-born, has among moſt nations been very conſiderable. The firſt-born ſon in the patriarchal ages had a ſuperiority over his brethren, and, in the abſence of his father, was prieſt to the family. Among the Jews, he was conſecrated to the Lord, had a double portion of the inheritance, and ſucceeded in the government of the family or kingdom. It is, however, remarkable, and unqueſtionably ſhows the connection between this inſtitution and the birth and office of our Saviour, that if a woman's firſt child was a girl, neither ſhe, nor the children that came after her, were conſecrated.

In every nation of Europe, the right of primogeniture prevails in ſome degree at preſent, but it did not prevail always. The law which calls the elder-born to the crown, preferably to all others, was not introduced into France till very late; it was unknown to the firſt race of kings, and even to the ſecond. The four ſons of Clovis ſhared the kingdom equally among themſelves; and Louis le Debonnaire did the ſame: it was not till the race of Hugh Capet, that the prerogative of ſucceſſion to the crown was appropriated to the firſt-born.

By the ancient cuſtom of *Gavel-kind*, ſtill preſerved in ſome parts of Britain, primogeniture is of no account; the paternal eſtate being equally ſhared by all the ſons. And it has been a matter of violent and learned diſpute, whether, at the death of Alexander III. Baliol or Bruce was, by the law as it then ſtood, heir to the crown of Scotland. The former had undoubtedly the right of primogeniture, but the latter ſtood in one degree of nearer relation to the deceaſed ſovereign: and the Scottiſh barons, not being able to determine whoſe claim was beſt founded, referred the queſtion to Edward I. of England, and thereby involved their country in a long and ruinous war. See SCOTLAND.

PRIMORIE, is a name given by the Slavi to that tract of ſea-coaſt which lies between the two rivers Cettina and Narenta, the firſt of which is the Neſtus and Tiluras, and the ſecond the Narus, of the ancients; compriſing what was properly called Dalmatia two ages before our era, and which was known to the Greeks of the low times under the name of *Paratalaſſia*. Appian informs us, that the Ardei or Vardei poſſeſſed many cities there, part of which they ſeized before the invaſion of the Romans, and part they built themſelves. We learn alſo from the *Tabula Pentingeriana*, that after the conqueſt many of thoſe cities remained, and were inhabited by the conquerors, who alſo founded new ſettlements. And indeed were theſe proofs wanting, the numerous inſcriptions found near the ſea, and ſometimes among the hills, would render it at leaſt probable. The coaſt is extremely pleaſant, the ſoil fertile, and the ſituation moſt convenient for commerce with the inland provinces. By bad management, however, much ground has been loſt near the ſea, by its being covered with gravel, and by imprudent cultivation of the hills, the impetuous fury of the mountain torrents has rendered a part of it uninhabitable. Macarſka is now the only town in the territory, and it appears to have riſen out of the ruins of the ancient RATANEUM of Pliny. It formed a part of the Narentan ſtate for ſeveral ages, and afterwards, together with the reſt of Primorie, paſſed under the obedience of various Chriſtian princes. It afterwards became ſubject to the Ottoman Porte, and at laſt voluntarily ſubjected itſelf to the Venetian republic. See DALMATIA and MACARSKA. See alſo Fortis's *Travels into Dalmatia*, p. 265——318.

PRIMULA, the PRIMROSE: A genus of the monogynia order, belonging to the pentandria claſs of plants; and in the natural method ranking under the 21ſt order, *Preciæ*. The involucrum lies under a ſimple umbel; the tube of the corolla cylindrical; with the mouth or limb patulous. This genus, including alſo the polyanthus and auricula, furniſhes an excellent collection of low, fibrous-rooted, herbaceous flowery perennials.

1. The primula veris, or ſpring primroſe, has thick and very fibrous roots, crowned by a cluſter of large oblong indented rough leaves, and numerous flower-ſtalks, from about three or four, to five or ſix inches high; each terminated commonly by one flower.—The varieties are, common yellow-flowered primroſe of the woods—white primroſe—paper-white—red—double red—double yellow, and double white.—All theſe flower abundantly in March and April, and continue for a month or ſix weeks.

The cowſlip primroſe, or cowſlip, has very thick fibrous roots, crowned by a cluſter of oblong, indented round leaves, and upright, firm, flower-ſtalks five or ſix inches high, terminated each by a cluſter of ſmall flowers. The varieties are, Common ſingle yellow cowſlip of the meadows—double yellow cowſlip—ſcarlet cowſlip—hoſe-and-hoſe cowſlip; one flower growing out of the boſom of another, the lowermoſt ſerving as a calyx; all of which varieties have the flower-ſtalks crowned by many flowers in branches.—They flower in April and May, continuing in ſucceſſion a month or ſix weeks.

2. The polyanthus, has thick fibrous roots, increaſing into large bunches, crowned with a cluſter of large oblong indented rough leaves; amidſt them upright flower-ſtalks ſix or eight inches high, terminated moſtly by a cluſter of ſeveral ſpreading flowers of many different colours in the varieties. The principal are, purple, red, gold, orange-coloured, &c. They all flower beautifully in April and May, and frequently again in autumn; and ſometimes even in winter, if the ſeaſon is mild. The polyanthus is one of the noted prize-flowers among the floriſts; many of whom are remarkably induſtrious in raiſing a conſiderable variety of different ſorts, as well as in uſing every art to blow them with all requiſite perfection; for, among the virtuoſi, a polyanthus muſt poſſeſs ſeveral peculiar properties in order to be admitted in their collections. The chief properties required in a floriſt's polyanthus are, 1. The ſtem or flower-ſtalk ſhall be upright, moderately tall, with ſtrength in proportion, and crowned by a good regular branch of flowers on ſhort pedicles, ſtrong enough to ſupport them nearly in an upright poſition. 2. The florets of each branch ſhould be equally large, ſpreading open flat, with the colours exquiſite, and the ſtripes and variegations lively and regular. 3. The eye in the centre of each floret ſhould be large, regular, and bright; and the antheræ, by the floriſts called the *thrum*, ſhould riſe high enough to cover the mouth of the tube or hollow part in the middle of the florets, and render them what they call *thrum-eyed*; but when the ſtyle elevates the ſtigma above the antheræ, the eye of the tube generally appears hollow, ſhowing the ſtigma in the middle, like the head of a pin, and is rejected as an incomplete flower, though its other properties ſhould be ever ſo perfect. This pin-eyed polyanthus, however, though rejected by the floriſts, is the flower in its moſt perfect ſtate, and great numbers of them are of as beautiful forms and colours as the thrum-eyed varieties.

3. The auricula has a thick fibrous root, crowned by a cluſter of oblong, fleſhy, broad, ſerrated, ſmooth leaves, reſembling the ſhape of a bear's ear; and amidſt them upright flower-ſtalks from about three or four to ſix or eight inches high, terminated by an umbellate cluſter of beautiful flowers, of many different

colours in the varieties. All of theſe have a circular eye in the middle of each flower, and of which there are different colours; whence the auriculas are diſtinguiſhed into yellow-eyed, white-eyed, &c. The petals of moſt of the kinds are powdered with an exceeding fine farina or mealy powder, which contributes greatly to the beauty of the flower. They all flower in April or May, continuing a month or ſix weeks in beauty, and ripening plenty of ſeeds in June.

Culture. All the varieties of the common ſpring primroſe multiply ſo faſt by the roots, that it is ſcarce worth while to raiſe them from ſeeds. However, though many ſingle kinds may be raiſed from ſeed, yet parting the roots is the only method by which the double kind can be preſerved; and the ſame thing is to be obſerved of all the reſt.

PRIMUM MOBILE, in the Ptolemaic aſtronomy, the ninth or higheſt ſphere of the heavens, whoſe centre is that of the world, and in compariſon of which the earth is but a point. This they will have to contain all other ſpheres within it, and to give motion to them, turning itſelf, and all them, quite round in 24 hours.

PRINCE, PRINCEPS, in polity, a perſon inveſted with the ſupreme command of a ſtate, independent of any ſuperior.

PRINCE alſo denotes a perſon who is a ſovereign in his own territories, yet holds of ſome other as his ſuperior; ſuch are the princes of Germany, who, though abſolute in their reſpective principalities, are bound to the emperor in certain ſervices.

PRINCE alſo denotes the iſſue of princes, or thoſe of the royal family. In France, before the revolution, they were called *princes of the blood*, and during the ſhort continuance of the conſtitution of 1791, *French princes*. In England the king's children are called *ſons and daughters of England*; the eldeſt ſon is created prince of Wales; the cadets are created dukes or earls as the king pleaſes; and the title of all the children is *royal highneſs*; all ſubjects are to kneel when admitted to kiſs their hand, and at table out of the king's preſence they are ſerved on the knee. See *ROYAL Family*

PRINCE of the Senate, in old Rome, the perſon who was called over firſt in the roll of ſenators, whenever it was renewed by the cenſors: he was always of conſular and cenſorian dignity. See the article SENATE.

PRINCE's Metal, a mixture of copper and zinc, in imitation of gold. See CHEMISTRY, n° 1154.

PRINCETOWN. See *New Jerſey*.

Edin. Phil. Tranſ. v. iii. p. 13. &c.

PRINCE of Wales's Iſland, or *Polu Penany*, is ſituated in the entrance of the ſtraits of Malacca, in 100 degrees of eaſt longitude, and in five degrees of north latitude. It is about ſeven leagues in length and three in breadth. Its northern extremity runs nearly parallel with the main land at a diſtance of about two miles, by which a fine channel is formed, where the greateſt fleets might ride in perfect ſafety, the height of the ſurrounding mountains acting as a barrier againſt the force of the prevailing winds. The climate, conſidering its vicinity to the equator, is remarkably mild. Eighty degrees is about the mean height of the thermometer at noon, which, during the night, is ſeldom above 70. Its healthfulneſs is certainly not ſurpaſſed by that of any European ſettlement on the coaſt. Out of a garriſon of 300 troops (natives of Hindoſtan), not one died for the ſpace of 14 months; a ſingular fact to be experienced by a new ſettlement in an uncleared country. This great ſalubrity is perhaps the effect of a conſtant ventilation, ſupported by almoſt continued but gentle breezes, added to the dryneſs of the ſoil, the uniform but gradual elevation from the ſea to the foot of the hills preventing thoſe ſtagnations of water which, in tropical latitudes, are ſo highly prejudicial to the health of man.

A ridge of beautiful mountains, deeply indented with valleys, and covered with evergreens, divides the iſland longitudinally. Innumerable rivulets receive their origin from theſe mountains, and are remarkable for the tranſparency and coolneſs of their waters. The ſoil, which is light and ſandy near the ſea, gradually changes to a rich clay as it approaches to the high lands. There the ſugar-cane grows with the utmoſt luxuriance, and the moſt plentiful crops of rice are everywhere produced. The gardens have already furniſhed the inhabitants with cabbages and potatoes; and when induſtry ſhall have reached the tops of the mountains, it will be no ſurpriſe to ſee in the plantations moſt of the productions of Europe in their utmoſt perfection. In decorating the landſcapes of this little iſland, nature has been peculiarly laviſh. An aſſemblage of flowering trees and ſhrubs in perpetual bloſſom, and endleſs in the variety of their ſpecies, form the firſt ſhade. Theſe are overtopped by foreſt trees of an immenſe height, which ſpread their vaſt branches on every ſide, and are covered with the richeſt foliage. Here ſtrangers feel with rapture the effect of the breezes, which, from whatſoever quarter they blow, are ſtrongly impregnated with the fragrance of the groves.

The original animal productions of this iſland are very limited. Of quadrupeds, the wild hog, deer, and ſquirrel, nearly comprehend the whole: but the abſence of the tiger and leopard, whoſe numbers and ferocity almoſt render the oppoſite ſhores uninhabitable, amply compenſates for this deficiency. The flying fox and ſquirrel are natives of this iſland; the former a nondeſcript, and a great natural curioſity. Of birds there are alſo but few, and only one which is remarkable for the melody of its notes. The crow and ſparrow, the never-failing attendents on population, have but lately made their appearance. They are now, however, rapidly increaſing and multiplying. All the domeſtic animals arrive here at great perfection.

The ſea which ſurrounds the iſland, affords a vaſt variety of fiſh of the moſt delicious flavour, and its ſhores abundance of the fineſt turtle and oyſters. In no ſituation indeed are the conveniencies and luxuries of life enjoyed in greater profuſion. The advantages of the iſland in a political and commercial view, are too obvious to require to be pointed out.

PRINCE William's Sound, ſituated on the north weſt coaſt of America, and ſo named by Captain Cook in 1778. The men, women, and children of this ſound are all clothed in the ſame manner. Their ordinary dreſs is a ſort of cloſe frock, or rather robe, which ſometimes reaches only to the knees, but generally down to the ancles. Theſe frocks are compoſed of the ſkins of various animals, and are commonly worn with the hairy ſide outwards. The men often paint their faces of a black colour, and of a bright red, and ſometimes of a bluiſh or leaden hue; but not in any regular figure. The women puncture or ſtain the chin with black, that comes to a point in each of their cheeks. Their canoes are of two ſorts; the one large and open, the other ſmall and covered. The framing conſiſts of ſlender pieces of wood, and the outſide is compoſed of the ſkins of ſeals, or other ſea animals, ſtretched over the wood. Their weapons, and implements for hunting and fiſhing, are the ſame as thoſe uſed by the Greenlanders and Eſquimaux. Many of their ſpears are headed with iron, and their arrows are generally pointed with bone. The food they were ſeen to eat was the fleſh of ſome animal, either roaſted or broiled, and dried fiſh. Some of the former that was purchaſed had the appearance of bear's fleſh. They alſo eat a larger ſort of fern-root, either baked or dreſſed in ſome other method. Their drink, in all probability, is water; for, in their canoes, they brought ſnow in wooden veſſels, which they ſwallowed by mouthfuls. Our knowledge of the animals of this part of the American continent is entirely derived from the ſkins that were brought by the natives for ſale. Theſe were principally of bears, common and pine martins, ſea-otters, ſeals, racoons, ſmall ermines, foxes, and the whitiſh cat or lynx. The birds found here were the halcyon, or great king's-fiſher, which had fine bright colours; the white-headed eagle, and the humming-bird. The fiſh that were principally brought to market for ſale were torſk and halibut. The rocks were almoſt deſtitute of ſhell-fiſh; and the only other animal of this tribe that was obſerved was a reddiſh crab, covered with very large ſpines. Few vegetables of any kind were obſerved; and the trees that chiefly grew about this ſound were the Canadian ſpruce pine, ſome of which were of a conſiderable ſize. E. Long. 115. 21. N. Lat. 59. 33.

PRINCIPAL, the chief and moſt neceſſary part of a thing. The principal of a college or hall is the maſter thereof.

In commerce, principal is the capital of a ſum due or lent; ſo called in oppoſition to intereſt. See INTEREST.

It alſo denotes the firſt fund put by partners into a common ſtock, by which it is diſtinguiſhed from the calls or acceſſions afterwards required.

PRINCIPAL, in muſic. See FUNDAMENTAL, in muſic, and GENERATOR, in muſic.

Blackſt. Comment. b. iv. c. 3.

PRINCIPAL, in law, is either the actor or abſolute perpetrator of the crime, who is called a *principal*, in the firſt degree; or he who is preſent, aiding and abetting the fact to be done, who is denominated a *principal* in the ſecond degree. The preſence of a principal need not always be an actual immediate ſtanding by, within ſight or hearing of the fact; but there may be alſo a conſtructive preſence, as when one commits a robbery or murder, and another keeps watch or guard at ſome convenient diſtance. And this rule has alſo other exceptions; for in caſe of murder by poiſoning, a man may be a principal felon by preparing and laying the poiſon, or giving it to another (who is ignorant of its poiſonous quality) for that purpoſe; and yet not adminiſter it himſelf, nor be preſent when the very deed of poiſoning is committed. And the ſame reaſoning will hold, with regard to other murders committed in the abſence of the murderer, by means which he had prepared before-hand, and which probably could not fail of their miſchievous effect. As by laying a trap or pit-fall for another, whereby he is killed; letting out a wild beaſt, with an intent to do miſchief; or exciting a madman to commit murder, ſo that death thereupon enſues: in every one of theſe caſes the party offending is guilty of murder as a principal, in the firſt degree. For he cannot be called an acceſſory, that neceſſarily pre-ſuppoſing a principal; and the poiſon, the pit-fall, the beaſt, or the madman, cannot be held principals, being only the inſtruments of death. As therefore he muſt be certainly guilty, either as principal or acceſſory, and cannot be ſo as acceſſory, it follows that he muſt be guilty as principal; and if principal, then in the firſt degree; for there is no other criminal, much leſs a ſuperior in the guilt, whom he could aid, abet, or aſſiſt.

PRINCIPAL *Point*, in perſpective, is a point in the perſpective plane, upon which a line drawn from the eye, perpendicular to the plane falls.

This point is in the interſection of the horizontal and vertical plane; and is alſo called the *point of ſight*, and *point of the eye*. See PERSPECTIVE.

PRINCIPAL *Ray*, in perſpective, is that which paſſes perpendicularly from the ſpectator's eye to the perſpective plane, or picture.

Whence the point where this ray falls on the plane, is by ſome alſo called the *principal point*, which other writers call *the centre of the picture*, and *the point of concurrence*.

PRINCIPATO, the name of a province of Italy, in the kingdom of Naples, which is divided into two parts, called by the Italians the *Principato Ultra* and the *Principato Citra*, that is, the Hither and Farther Principato. The Hither Principato is bounded on the north by the Farther Principato and part of the Terra-di-Lavoro, on the weſt and ſouth by the Tuſcan Sea, and on the eaſt by the Baſilicata. It is about 60 miles in length, and 30 in breadth; the ſoil is fertile in wine, corn, oil, and ſaffron; and they have a great deal of ſilk, beſides ſeveral mineral ſprings. The capital town is Salerno. The Farther Principato is bounded on the north by the county of Moleſe and the Terra-di-Lavoro, on the weſt by the Tuſcan Sea, on the ſouth by the Hither Principato, and on the eaſt by the Capitanata. It is about 37 miles in length, and 30 in breadth. The Appennine mountains render the air cold; and the ſoil is not very fertile either in corn or wine, but it produces cheſnuts, and paſtures in great plenty. Benevento is the capital town.

PRINCIPLE, PRINCIPIUM, in general, is uſed for the cauſe, ſource, or origin of any thing.

PRINCIPLE, in human nature. See DISPOSITION.

PRINCIPLE in ſcience, is a truth, admitted without proof, from which other truths are inferred by a chain of reaſoning. Principles are of two kinds, *primary* and *general;* and to the laſt the name of *axioms* is uſually given on account of their importance and *dignity*. An axiom or *general* principle, when the terms in which it is expreſſed are underſtood, muſt be a ſelf-evident truth; but from its very nature it cannot be a *firſt* truth. Our firſt truths are all *particular*. A child knows that two *particular* lines, each an inch long, are equal to one another, before he has formed any *general* notions of length and equality. "Things equal to one and the ſame thing are equal to one another," is the firſt of Euclid's axioms; and an axiom it undoubtedly is, but to no man has it been a *firſt* truth. It is, if we may uſe the expreſſion, a *genus* or *claſs* of truths comprehending under it numberleſs individuals. Were a full-grown man introduced into the world, without a ſingle idea in his mind, as we may ſuppoſe Adam to have been, he would inſtantly perceive, upon laying together three pieces of wood each a foot long, that they were all equal in length; and if he were to cut another to the ſame length with *any one* of them, he would find upon trial, that it was of the ſame length with them all. After a few ſimple experiments of this kind, he would, by a law of human thought, infer that all things equal in length or in any other dimenſion, to any *one* thing, are in that dimenſion equal to one another.

It was not therefore with ſuch weakneſs as ſome have imagined, that Hobbes affirmed thoſe propoſitions commonly called axioms, not to be primary but ſecondary principles. A primary principle deſerves not the name of an axiom, as it is only a particular truth including in it no other truth. There is not one of Euclid's axioms which has not been the reſult of induction, though we remember not the time at which the induction was made. That the whole is greater than any of its parts is a general truth which no man of common ſenſe can controvert; but every one diſcovered that truth by obſerving that his body was larger than his head, his foot, or his hand; that a mountain is larger than a mole-hill in the middle of it; and that a piece of timber meaſuring what is called a yard is longer than any one of the diviſions marked upon it, and termed inches. The particular obſervations are made through the ſenſes and treaſured up in the memory; and the intellect, by its conſtitution, compares them together, marks in what they agree and diſagree, and thence draws its *axioms* or *general* principles. He, therefore, who ſhould admit the truth of an axiom, and deny the evidence of ſenſe and perception, would act as abſurdly as he who accepts payment in a bank-bill, and refuſes it in the individual pieces of gold or ſilver which that bill repreſents. General axioms are of infinite uſe in the purſuits of ſcience; but it is not becauſe they create new truths; they only ſhorten the proceſs in the diſcovery of ſuch as might be found, with labour, through the medium of particular propoſitions. See *Campbell's Philoſophy of Rhetoric* and *Tatham's Chart and Scale of Truth*.

PRINCIPLES, in Phyſics, are often confounded with elements, or the firſt and ſimpleſt parts whereof natural bodies are compounded, and into which they are again reſolvable by the force of fire.

PRINGLE (Sir John), an eminent phyſician and philoſopher, was a younger ſon of Sir John Pringle of Stitchel, in the ſhire of Roxburgh, Baronet; took the degree of M. D. at Leyden, 1730; and publiſhed there *Diſſertatio Inauguralis de Marcore Senili*, 4to. After having been ſome years profeſſor of moral philoſophy at Edinburgh, he was in June 1745 appointed phyſician to the duke of Cumberland, and phyſician-general to the hoſpital of the forces in Flanders, where the earl of Stair appears to have been his patron. In February 1746, Dr Pringle, Dr Armſtrong, and Dr Barker, were nominated phyſicians to the hoſpital for lame, maimed, and ſick ſoldiers, behind Buckingham-houſe; and in April 1749, Dr Pringle was appointed phyſician in ordinary to the king. In 1750 he publiſhed "Obſervations on the Nature and Cure of Hoſpital and Gaol Fevers, in a Letter to Dr Mead," 8vo (reprinted in 1755); and in 1752 he favoured the public with the reſult of his long experience in an admirable treatiſe under the title of "Obſervations on the Diſorders of the Army in Camp and Garriſon," 8vo. On the 14th of April 1752, he married Charlotte, ſecond daughter of Dr Oliver, an eminent phyſician at Bath. In 1756 he was appointed jointly with Dr Wintringham (now Sir Clifton Wintringham, Bart.) phyſician to the hoſpital for the ſervice of the forces of Great Britain. After the acceſſion of his preſent majeſty, Dr Pringle was appointed phyſician to the queen's houſehold, 1761; phyſician in ordinary to the queen in 1763, in which year he was admitted of the college of phyſicians in London; and on the 5th of June 1766, he was advanced to the dignity of a baronet of Great Britain. In 1772 he was elected preſident of the Royal Society, where his ſpeeches for five ſucceſſive years, on delivering the prize-medal of Sir Godfrey Copley, gave the greateſt ſatisfaction. Sir John Pringle in 1777 was appointed phyſician-extraordinary to the king. He was alſo a fellow of the College of Phyſicians at Edinburgh, and of the Royal Medical Society at Paris; member of the Royal Academies at Paris, Stockholm, Gottingen, and of the Philoſophical Societies at Edinburgh and Haerlem; and continued preſident of the Royal Society till November 1778; after which period he gradually withdrew from the world, and in 1781 quitted his elegant houſe in Pall Mall (where he had long diſtinguiſhed himſelf as the warm friend and patron of literary men of every nation and profeſſion), and made an excurſion to his native country. He returned to London in the latter end of that year; died greatly beloved and reſpected January 18. 1782; and having no children, was ſucceeded in eſtate, and alſo (agreeably to the limitation of the patent) in title, by his nephew, now Sir James Pringle, Bart. Among this worthy phyſician's communications to the Royal Society, the following are the principal: 1. "Some Experiments on Subſtances reſiſting Putrefaction," Phil. Tranſ. N° 495, p. 580; and N° 496, p. 525, 550; reprinted, with additions, in Martin's Abridgment, vol. xi. p. 1365. 2. "Account of ſome Perſons ſeized with the Gaol Fever by working in Newgate, and of the manner by which the Infection was communicated to one entire Family," vol. xlviii. p. 42. At the requeſt of Dr Hales, a copy of this uſeful paper was inſerted in the Gentleman's Magazine, 1753, p. 71, before its appearance in the Tranſactions. 3. "A remarkable Caſe of Fragility, Flexibility, and Diſſolution of the Bones." ib. p. 297. 4. "Account of the Earthquakes felt at Bruſſels," vol. xlix. p. 546. 5. "Account of ſinking of a River near Pontypool, in Monmouthſhire," ib. p. 547. 6. "Account of an Earthquake felt Feb. 18. 1756, along the coaſt of England, between Margate and Dover," ib. p, 579. 7. "Account of the Earthquake felt at Glaſgow and Dumbarton; alſo of a Shower of Duſt falling on a Ship between Shetland and Iceland," ib. p. 509. 8. "Several Accounts of the Fiery Meteor which appeared on Sunday, November 26. 1758, between eight and nine at night," vol. l. p. 218. 9. "Account of the Virtues of Soap in diſſolving the Stone, in the Caſe of the Reverend Mr Matthew Simpſon," ib. p. 221. 10. "Account of the Effects of Electricity in Paralytic Caſes," ib. p. 481. And ſee a letter to him on that ſubject from Profeſſor Winthorp. "Some Account of the Succeſs of the *Vitrum Ceratum Antimonii*," was printed in the Edinburgh Medical Eſſays, vol. v.

PRINOS, in botany: A genus of the monogynia order, belonging to the hexandria claſs of plants; and in the natural method ranking under the 43d order, *Dumoſæ*. The calyx is ſexfid; the corolla monopetalous, and rotaceous; the belly hexaſpermous.

PRINTER, a perſon who compoſes and takes impreſſions from moveable characters ranged in order, by means of ink, and a preſs.

PRINTING, the art of taking impreſſions from characters or figures, moveable and immoveable, on paper, linen, ſilk, &c. There are three kinds of printing: the one from moveable letters, for books; another from copper-plates, for pictures; and the laſt from blocks, in which the repreſentation of birds, flowers, &c. are cut, for printing calicoes, linen, &c. The firſt is called *common* or *letter-preſs* printing; the ſecond, *rolling-preſs* printing; and the laſt, *calico*, &c. printing. The principal difference between the three conſiſts in this, that the firſt is caſt in relievo, in diſtinct pieces; the ſecond engraven in creux; and the third cut in relievo, and generally ſtamped, by placing the block upon the materials to be printed, and ſtriking upon the back of it.

1 Letter-preſs printing.

Of the above branches, LETTER-PRESS PRINTING is the moſt curious, and deſerves the moſt particular notice: for to it are owing chiefly our deliverance from ignorance and error, the progreſs of learning, the revival of the ſciences, and numberleſs improvements in arts, which, without this noble invention, would have been either loſt to mankind, or confined to the knowledge of a few. 2 Utility of this art. "To the art of printing (ſays an elegant eſſayeſt*), it is acknowledged we owe the reformation. It has been juſtly remarked, that if the books of Luther had been multiplied only by the ſlow proceſs of the hand-writing, they muſt have been few, and would have been eaſily ſuppreſſed by the combination of wealth and power: but, poured forth in abundance from the preſs, they ſpread over the land with the rapidity of an inundation, which acquires additional force from the efforts uſed to obſtruct its progreſs. He who undertook to prevent the diſperſion of the books once iſſued from the preſs, attempted a taſk no leſs arduous than the deſtruction of the hydra. Reſiſtance was vain, and religion was reformed: and we who are chiefly intereſted in this happy revolution muſt remember, amidſt the praiſes beſtowed on Luther, that his endeavours had been ineffectual, unaſſiſted by the invention of Fauſtus.

3 Good and evil reſulting from it.

"How greatly the cauſe of religion has been promoted by the art, muſt appear, when it is conſidered, that it has placed thoſe ſacred books in the hand of every individual, which, beſides that they were once locked up in a dead language, could not be procured without great difficulty. The numerous comments on them of every kind, which tend to promote piety, and to form the Chriſtian philoſopher, would probably never have been compoſed, and certainly would not have extended their beneficial influence, if typography had ſtill been unknown. By that art, the light, which is to illuminate a dark world, has been placed in a ſituation more advantageous to the emiſſion of its rays: but if it has been the means of illuſtrating the doctrines, and enforcing the practice of religion, it has alſo, particularly in the preſent age, ſtruck at the root of piety and moral virtue, by propagating opinions favourable to the ſceptic and the voluptuary. It has enabled modern authors, wantonly to gratify their avarice, their vanity, and their miſanthropy, in diſſeminating novel ſyſtems ſubverſive of the dignity and happineſs of human nature: but though the perverſion of the art is lamentably remarkable in thoſe volumes which iſſue, with offenſive profuſion, from the vain, the wicked, and the hungry, yet this good reſults from the evil, that as truth is great and will prevail, ſhe muſt derive freſh luſtre, by diſplaying the ſuperiority of her ſtrength in the conflict with ſophiſtry.

"Thus the art of printing, in whatever light it is viewed, has deſerved reſpect and attention. From the ingenuity of the contrivance, it has ever excited mechanical curioſity; from its intimate connection with learning, it has juſtly claimed hiſtorical notice; and from its extenſive influence on morality, politics, and religion, it is now become a ſubject of very important ſpeculation.

4 Its good effects overbalance the bad.

"But however we may felicitate mankind on the invention, there are perhaps thoſe who wiſh, that, together with its compatriot art of manufacturing gunpowder, it had not yet been brought to light. Of its effects on literature, they aſſert, that it has increaſed the number of books, till they diſtract rather than improve the mind; and of its malignant influence on morals, they complain, that it has often introduced a falſe refinement, incompatible with the ſimplicity of primitive piety and genuine virtue. With reſpect to its literary ill conſequences, it may be ſaid, that though it produces to the world an infinite number of worthleſs publications, yet true wit and fine compoſition will ſtill retain their value, and it will be an eaſy taſk for critical diſcernment to ſelect theſe from the ſurrounding maſs of abſurdity: and though, with reſpect to its moral effects, a regard to truth extorts the confeſſion, that it has diffuſed immorality and irreligion, divulged with cruel impertinence the ſecrets of private life, and ſpread the tale of ſcandal through an empire; yet theſe are evils which will either ſhrink away unobſerved in the triumphs of time and truth over falſehood, or which may, at any time, be ſuppreſſed by legiſlative interpoſition."

5 Hiſtory of the invention of printing.

Some writers have aſcribed the origin of this art to the Eaſt, and affixed a very early period to its invention; particularly P. Jovius, (*Hiſt.* lib. xiv. p. 226. ed. Florent. 1550), from whom Oſorius and many others have embraced the ſame opinion. But theſe have evidently confounded the European mode of printing with the *engraved tablets* which to this day are uſed in China. The invention of theſe tablets has been aſcribed by many writers even to an earlier period than the commencement of the Chriſtian era; but is with more probability aſſigned, by the very accurate Phil. Couplet, to the year 930. The *Hiſtoria Sinenſis* of Abdalla, written in Perſic in 1317, ſpeaks of it as an art in very common uſe. MEERMAN, vol. i. p. 16. 218, 219, vol. ii. p. 186. N. Trigault aſſerts that the Chineſe practiſed the art of printing five centuries before. Count Ferre Rezzonico found at Lyons plates with words and names engraven by a Nuremberger 1380.

---

* Dr Knox.

The honour of having given riſe to the European method has been claimed by the cities of *Harlem*, *Mentz*, and *Straſburg*. And to each of theſe it may be aſcribed in a qualified ſenſe, as they made improvements upon one another.

6
Claim of Harlem.

I. The firſt teſtimony of the inventor is that recorded by Hadrian Junius, in his *Batavia*, p. 253, ed. Lugd. Bat. 1588; which, though it hath been rejected by many, is of undoubted authority. Junius had the relation from two reputable men; Nicolaus Galius (A), who was his ſchoolmaſter; and Quirinius Taleſius, his intimate and correſpondent. He aſcribes it to Laurentius, the ſon of John (Ædituus, or Cuſtos, of the cathedral at HARLEM, at that time a reſpectable office), upon the teſtimony of Cornelius, ſome time a ſervant to Laurentius, and afterwards bookbinder to the cathedral, an office which had before been performed by Franciſcan friars. His narrative was thus: "That, walking in a wood near the city (as the citizens of opulence uſe to do), he began at firſt to cut ſome letters upon the rind of a beech-tree; which for fancy's ſake, being impreſſed on paper, he printed one or two lines, as a ſpecimen for his grand-children (the ſons of his daughter) to follow. This having happily ſucceeded, he meditated greater things (as he was a man of ingenuity and judgment); and firſt of all, with his ſon-in-law Thomas Peter (who, by the way, left three ſons, who all attained the conſular dignity), invented a more glutinous writing-ink, becauſe he found the common ink ſunk and ſpread; and then formed whole pages of wood, with letters cut upon them; of which ſort I have ſeen ſome eſſays, in an anonymous work, printed only on one ſide, intitled, *Speculum noſtræ ſalutis*; in which it is remarkable, that in the infancy of printing (as nothing is complete at its firſt invention) the back ſides of the pages were paſted together, that they might not by their nakedneſs betray their deformity. Theſe beechen letters he afterwards changed for leaden ones, and theſe again for a mixture of tin and lead [*ſtanneas*] as a leſs flexible and more ſolid and durable ſubſtance. Of the remains of which types, when they were turned to waſte metal, thoſe old wine-pots were caſt, that are ſtill preſerved in the family-houſe, which looks into the market-place, inhabited afterwards by his great-grandſon Gerard Thomas, a gentleman of reputation; whom I mention for the honour of the family, and who died old a few years ſince. A new invention never fails to engage curioſity. And when a commodity never before ſeen excited purchaſers, to the advantage of the inventor, the admiration of the art increaſed, dependents were enlarged, and workmen multiplied; the firſt calamitous incident! Among theſe was one John, whether, as we ſuſpect, he had ominouſly the name of *Fauſtus* (B), unfaithful and unlucky to his maſter, or whether it was really a perſon of that name, I ſhall not much inquire; being unwilling to moleſt the ſilent ſhades, who ſuffer from a conſciouſneſs of their paſt actions in this life. This man, bound by oath to keep the ſecret of printing, when he thought he had learned the art of joining the letters, the method of caſting the types, and other things of that nature, taking the moſt convenient time that was poſſible, on Chriſtmas eve, when every one was cuſtomarily employed in luſtral ſacrifices, ſeizes the collection of types, and all the implements his maſter had got together, and, with one accomplice, marches off to Amſterdam, thence to Cologne, and at laſt ſettled at Mentz, as at an aſylum of ſecurity, where he might go to work with the tools he had ſtolen. It is certain, that in a year's time, viz. in 1442, the *Doctrinale* of Alexander Galius, which was a grammar much uſed at that time, together with the *Tracts* of Peter of Spain, came forth there, from the ſame types as Laurentius had made uſe of at Harlem."

Thus far the narrative of Junius, which he had frequently heard from Nicolaus Galius; to whom it was related by Cornelius himſelf, who lived to a great age, and uſed to burſt into tears upon reflecting on the loſs his maſter had ſuſtained, not only in his ſubſiſtence, but in his honour, by the roguery of his ſervant, his former aſſociate and bedfellow. Cornelius, as appears by the regiſters of Harlem cathedral, died either in 1515, or the beginning of the following year; ſo that he might very well give this information to Nicolaus Galius, who was ſchoolmaſter to Hadrian Junius.

Though this circumſtance is probable as to the main fact, yet we muſt ſet aſide the evidence of it in ſome particulars. 1. The firſt obvious difficulty is noticed by Scriverius; "that the types are ſaid to be made of the *rind* of beech, which could not be ſtrong enough to bear the impreſſion of the preſs:" though this is removed, if, inſtead of the *bark*, we ſubſtitute a *bough* of the beach. The idea of the *bark*, when Junius wrote this, was perhaps ſtrong in his mind, from what Virgil tells us (Ecl. v. 13.) of its being uſual to cut words in the *bark* of a beech; and thence he was eaſily led to make a wrong application of it here.

Bower and Nichols's Origin of Printing.

2. The letters were at firſt *wooden*, and are ſaid to be afterwards exchanged for *metal* types; from which the wine-pots were formed, remaining in the time of Junius. According to tradition, printing was carried on in the ſame houſe long after the time of Laurentius: theſe pots might therefore be formed from the waſte metal of the printing-houſe, after the uſe of *fuſile types* became univerſal.—But Laurentius ſeems to have carried the art no farther than *ſeparate wooden types*. What is a

---

(A) Galius ſeems to be the ſame who is called *Claes Lottynſz. Gael*, Scabinus Harlemni, as it is in the Faſti of that city, in the years 1531, 1533, and 1535. Quirinius in the ſame Faſti is called *Mr Quiryn Dirkſzoon*. He was many years amanuenſis to the great Eraſmus, as appears from his epiſtle, 23d July 1529. tom. iii. Oper. p. 1222. He was afterwards Scabinus in 1537 & ſeq. and Conſul in 1552 & ſeq. But in the troubles of Holland he was cruelly killed by the Spaniſh ſoldiers, May 23. 1573. There are ſome letters of Hadrian Junius to this Taleſius, in the *Epiſtolæ Junianæ*, p. 198.

(B) *John Fauſt*, or *Fuſt*, is by many ſuppoſed to have derived his name from *fauſtus*, "happy;" and Dr Fauſtus ſeems to carry an air of grandeur in the appellation: but very erroneouſly. *John Fauſt*, or *Fuſt*, is no more than *John Hand*, whence our name *Fiſt*.

remarkable confirmation of this, Henry Spiechel, who wrote, in the 16th century, a Dutch poem intitled *Hertſpiegel*, expreſſes himſelf thus: "Thou firſt, Laurentius, to ſupply the defect of wooden tablets, adaptedſt *wooden types*, and afterwards didſt connect them with a thread, to imitate writing. A treacherous ſervant ſurreptitiouſly obtained the honour of the diſcovery. But truth itſelf, though deſtitute of common and wide-ſpread fame; truth, I ſay, ſtill remains." No mention in the poem of *metal types;* a circumſtance which, had he been robbed of ſuch, as well as of *wooden* ones, would ſcarcely have been paſſed over in ſilence.

When Laurentius firſt deviſed his rough ſpecimen of the art, can only be gueſſed at. He died in 1440, after having publiſhed the *Speculum Belgicum*, and two editions of *Donatus*, all with different *wooden types;* which it is probable (conſidering the difficulties he had to encounter, and the many artiſts whom he muſt neceſſarily have had occaſion to conſult) coſt him ſome years to execute; ſo that the firſt eſſay might be about 1430, which nearly agrees with Petrus Scriverius, who ſays the invention was about 10 or 12 years before 1440. See LAURENTIUS.

3. What was the ſpecimen he firſt diverted himſelf with in cutting, at the diſtance of three centuries, one would think impoſſible to be diſcovered. And yet Joh. Enſchedius, a printer, thinks he was ſo happy as to find it, being an old parchment *Horarium*, printed on both ſides, in eight pages, containing the Letters of the Alphabet, the Lord's Prayer, the Apoſtles Creed, and three ſhort prayers. And Mr Meerman having ſhown this to proper artiſts who were judges of theſe matters, they gave it as their opinion that it agreed exactly with the deſcription of Junius. It is conformable to the firſt edition of the Dutch *Speculum Salvationis*, and the fragments of both *Donatus's* of Holland, both which are the works of the ſame Laurentius, and were preceded by this. In theſe types, which are certainly moveable, cut, and uneven, there is a rudeneſs which Mr Meerman has not obſerved in any other inſtances. There are no numbers to the pages, no ſignatures, no *direction-words*, no diviſions at the end of the lines; on the contrary, a ſyllable divided in the middle is ſeen, thus, *Spiritū*, in p. 8. l. 2, 3. There are neither diſtinctions nor points, which are ſeen in the other works of Laurentius; and the letter *i* is not marked with an accent, but with a dot at the top. The lines throughout are uneven. The ſhape of the pages not always the ſame; not (as they ſhould be) rectangular, but ſometimes rhomb-like, ſometimes an *iſoſcele trapezium;* and the performance ſeems to be left as a ſpecimen both of his piety, and of his ingenuity in this eſſay of a new invented art. Mr. Meerman has given an exact engraving of this ſingular curioſity.

But, whatever elſe may appear doubtful in the narrative of Junius, it is very clear, that the firſt eſſays of the art are to be attributed to Laurentius, who uſed only *ſeparate wooden types*. See the article LAURENTIUS.

7
Claim of Mentz.

II. Some of Laurentius's types were ſtolen from him by one of his ſervants (c), *John* GEINSFLEICH *ſenior;* who fled therewith to MENTZ. Having introduced the art from Harlem into this his native city, he ſet with all diligence to carry it on; and publiſhed, in 1442, *Alexandri Galli Doctrinale*, *Petri Hispani Tractatus*; two works, which, being ſmall, beſt ſuited his circumſtances; and for which, being much uſed in the ſchools, he might reaſonably expect a profitable ſale. They were executed with *wooden types*, cut after the model of thoſe he had ſtolen.

(c) Authors differ as to the perſon who committed this robbery. It is clear from all accounts that his name was *John;* but what his ſurname was is the diſputed point. Junius, after ſome heſitation, aſcribes it to John Fuſt; but with injuſtice: for he was a wealthy man, who aſſiſted the firſt printers at Mentz with money; and though he afterwards was proprietor of a printing-office, yet he never, as far as appears, performed any part of the buſineſs with his own hands, and conſequently he could never have been a ſervant to Laurentius. Nor is the conjecture of Scriverius better founded, which fixes it upon John Gutenberg, who (as appears by authentic teſtimonies) reſided at Straſburg from 1436 to 1444, and during all that period employed much fruitleſs labour and expence in endeavouring to attain this art. Mr Meerman once thought, "it might be either John Meidenbachius, (who, we are told by Seb. Munſter and the author of *Chronographia Moguntinenſis*, was an aſſiſtant to the firſt Mentz printers); or John Peterſheimius (who was ſome time a ſervant to Fuſt and Schoeffer, and ſet up a printing-houſe at Francfort in 1459): or, laſtly, ſome other perſon, who, being unable through poverty to carry on the buſineſs, diſcovered it to *Geinsfleich* at Mentz." But more authentic intelligence afterwards convinced him there were two perſons of this name; and that John Geinsfleich ſenior† was the diſhoneſt ſervant, who was born at Mentz, and who in the papers publiſhed by Kohlerus, we find there in the year 1441, and not before: for though he was of a good family, yet he was poor, and ſeems to have been obliged, as well as his brother, to ſeek his livelihood in a foreign country; and perhaps was content to be under Laurentius, that, when he had learned the art, he might follow it in his own. But, to leave conjecture, we may produce ſome certain teſtimonies.

1. It is what Junius himſelf ſays, that the perſon who ſtole the types did it with a view to ſet up elſewhere; nor is it likely that he would either make no uſe of an art he had ſeen ſo profitable to Laurentius, or that he would teach it to another and ſubmit to be again a ſervant.

2. The Lambeth Record (which is printed below, from Mr Atkyns) tells us, that "Mentz gained the art by the brother of one of the workmen of Harlem, who learned it at home of his brother, who after ſet up for himſelf at Mentz."—By the ſtricteſt examination of the beſt authorities, it is plain, that by theſe *two brothers* the two Geinsfleiches muſt be meant. But as the younger *(Gutenberg)* was never a ſervant to Laurentius, it muſt be the ſenior who carried off the types, and inſtructed his brother in the art; who firſt applied himſelf to the buſineſs at Straſburg, and afterwards joined his elder brother, who had in the mean time ſettled at Mentz.

† He was called *Geinsfleich* κατ' ἐξοχὴν; the other was diſtinguiſhed by the name of *Gutenberg*. They were both poor; though of a family diſtinguiſhed by knighthood. They were both married men; and were moſt probably brothers, as it was not uncommon in that age for two brothers to have the ſame Chriſtian name. Theſe both appear in a diſreputable light. The eldeſt robbed his maſter, with many aggravating circumſtances. The youngeſt was remarkably contentious; and, after entering into a contract of marriage with Anna, a noble girl of *The Iron Gate*, refuſed to marry her till compelled by a judicial decree; and afterwards cared not what became of the lady, but left her behind at Straſburg when he removed to Mentz. He had not only frequent quarrels with his wife; but with *Andrew Drizehen*, *Andrew Heilmann*, and *John Riff*, all of whom were aſſociated with him at Straſburg in his different employments of making of looking glaſſes, poliſhing of precious ſtones, and endeavouring to attain the art of printing: and with theſe he involved himſelf in three law-ſuits. See *Meerman*, vol. I. p. 163, &c. N.

In 1443 he hired the houſe **Zum Jungen**; and was aſſiſted with money by Fust, a wealthy perſon, who in return had a ſhare of the buſineſs: and about the ſame time *John Meidenbachius* was admitted a partner, as were ſome others whoſe names are not tranſmitted to our times; and in 1444 they were joined by Gutenberg, who for the purpoſe quitted Straſburg. Wooden types being found not ſufficiently durable, and not anſwering expectation in other reſpects, the two brothers firſt invented *cut metal types*. But while theſe were preparing, which muſt have been a work of time, ſeveral works were printed, both on *wooden ſeparate types* and on *wooden blocks*; which were well adapted to ſmall books of frequent uſe, ſuch as the *Tabula Alphabetica*, the *Catholicon*, *Donati Grammatica*, and the *Confeſſionalia*.

From the abovementioned printers in conjunction, after many ſmaller eſſays, the Bible was publiſhed in 1450, with *large cut metal types* (d). And it is no wonder, conſidering the immenſe labour this work coſt, that it ſhould be ſeven or eight years in completing. In this ſame year the partnerſhip was diſſolved, and a new one entered into, in Auguſt, between *Fuſt and Gutenberg*; the former ſupplying the money, the latter ſkill, for their common benefit. Various difficulties ariſing, occaſioned a law-ſuit for the money which Fuſt had advanced; which was determined againſt Gutenberg. A diſſolution of this partnerſhip enſued in 1455; and in 1457 a magnificent edition of the Pſalter was publiſhed by *Fuſt and Schoeffer*, with a remarkable commendation, in which they aſſumed to themſelves the merit of a new invention, (viz. of *metal types*), *ad inventionem artificioſam imprimendi ac characterizandi.* This book was uncommonly elegant, and in ſome meaſure the work of Gutenberg; as it was four years in the preſs, and came out but 18 months after the partnerſhip was diſſolved between him and Fuſt.

The latter continued in poſſeſſion of the printing-office: and *Gutenberg*, by the pecuniary aſſiſtance of Conrad Humery ſyndic of Mentz (e), and others, opened another office in the ſame city; whence appeared, in 1460, without the printer's name, the *Catholicon Jo. de Janua*, with a pompous colophon in praiſe of its beauty, and aſcribing the honour of the invention to the city of Mentz. It was a very handſome book, though inferior to the Pſalter which had been publiſhed in 1457 by Fuſt and Schoeffer. Both the Pſalter and *Catholicon* were printed on *cut metal types* (f). It may not be improper to obſerve here, that as the Pſalter is the earlieſt book which is known to have a genuine date, it became a common practice, after that publication, for printers to claim their own performances, by adding their names to them.

III. The progreſs of the art has been thus traced

What is ſtill ſtronger, two chronologers of Straſburg, the one named *Dan Speklinus*, the other anonymous (in Meerman's *Documenta*, n° lxxxv. lxxxvi.), tells us expreſsly, that John Geinsfleich (viz. the ſenior, whom they diſtinguiſhed from Gutenberg), having learned the art by being ſervant to its *firſt inventor*, carried it by theft into Mentz his native country. They are right in the fact, though miſtaken in the application of it; for they make Straſburg the place of the invention, and Mentelius the inventor, from whom the types were ſtolen. But this is plainly an error: for Geinsfleich lived at Mentz in 1441, as appears from undoubted teſtimonies; and could not be a ſervant to Mentelius, to whom the before mentioned writers aſcribe the invention in 1440, though more ancient ones do not attempt to prove that he began to print before 1444 or 1447. Nor will the narrative agree better with Gutenberg, who was an earlier printer than Mentelius; ſince, among the evidences produced by him in his law-ſuit, 1439, no Geinsfleich ſenior appears, nor any other ſervant but Laurentius Beildek. The narration therefore of the theft of Geinsfleich, being ſpread by various reports through the world, and ſubſiſting in the time of theſe chronologers, was applied by them (to ſerve the cauſe they wrote for) to Straſburg; but ſerves to confirm the truth, ſince no writer derives the printing ſpoils from any other country than Holland or Alſatia. The chronologers have likewiſe, inſtead of Fuſt, called Gutenberg the wealthy man; who, from all circumſtances, appears to have been poor. They alſo call Schoeffer the ſon-in-law of Mentelius; when it is clear that he married the daughter of Fuſt.

(d) Many writers have ſuppoſed that this was the edition of which ſome copies were ſold in France, by Fuſt, as manuſcripts, for the great price of 500 or 600 crowns, which he afterwards lowered to 60, and at laſt to leſs than 40. But it was the ſecond and more expenſive edition of 1462, that was thus diſpoſed of, when Fuſt went to Paris in 1466, and which had coſt 4000 florins before the third *quaternion* (or quire of four ſheets) was printed. Meerman, vol. I. p. 6. 151, 152.

(e) At the death of Gutenberg, Conrad Humery took poſſeſſion of all his printing materials; and engaged to the archbiſhop Adolphus, that he never would ſell them to any one but a citizen of Mentz. They were, however, ſoon diſpoſed of to Nicholas Bechtermuntze of Altavilla, who, in 1469, publiſhed *Vocabularium Latino-Teutonicum*, which was printed with the ſame types which had been uſed in the *Catholicon*. This very curious and ſcarce *Vocabulary* was ſhown to Mr Meerman, by Mr Bryant, in the Duke of Marlborough's valuable library at Blenheim. It is in quarto, 35 lines long, contains many extracts from the *Catholicon*, and is called *Ex quo*, from the preface beginning with thoſe words. Meerman, vol. II. p. 96.

(f) Gutenberg never uſed any other than either *wooden* or *cut metal types* till the year 1462. In 1465 he was admitted *inter Aulicos* by the elector Adolphus, with an annual penſion; and died in February 1468. His elder brother Geinsfleich died in 1462. Their epitaphs are printed by Mr Meerman, vol. II. p. 154, 295.

through its *ſecond* period the invention of *cut metal types*. But the honour of completing the diſcovery is due to Peter Schoeffer (G) de Gernſheim.

8 Invention of caſt types.

A very clear account of this final completion of the types is preſerved by Trithemius (H). *Poſt hæc inventis ſucceſſerunt ſubtiliora, invenerutque modum* fundendi formas *omnium Latini alphabeti literarum, quas ipſi* matrices *nominabant: ex quibus rurſum æneos ſive ſtanneos characteres fundebant, ad omnem preſſuram ſufficientes, quos prius manibus ſculpebant. Et revera ſicuti* ante *xxx* ferme annos *ex ore Petri Opilionis de Gernſheim, civis Moguntini, qui gener erat primi artis inventoris, audivi, magnam a primo inventionis ſuæ hæc ars impreſſoria habuit difficultatem.—Petrus autem memoratus Opilio, tunc famulus poſtea gener, ſicut diximus, inventoris primi, Johannis Fuſt, homo ingenioſus et prudens, faciliorem modum* fundendi characteres *excogitavit, et artem, ut nunc eſt, complevit.*

Another ample teſtimony in favour of Schoeffer is given by Jo. Frid. Fauſtus of Aſchaffenburg, from papers preſerved in his family: "Peter Schoeffer of Gernſheim, perceiving his maſter Fuſt's deſign, and being himſelf ardently deſirous to improve the art, found out (by the good providence of God) the method of cutting *(incidendi)* the characters in a *matrix*, that the letters might eaſily be ſingly *caſt*, inſtead of being *cut*. He privately *cut matrices* for the whole alphabet; and when he ſhowed his maſter the letters caſt from theſe matrices. Fuſt was ſo pleaſed with the contrivance, that he promiſed Peter to give him his only daughter, Chriſtina, in marriage; a promiſe which he ſoon after performed. But there were as many difficulties at firſt with theſe letters, as there had been before with *wooden* ones; the metal being too ſoft to ſupport the force of the impreſſion: but this defect was ſoon remedied, by mixing the metal with a ſubſtance which ſufficiently hardened it (I)."

Fuſt and Schoeffer concealed this new improvement, by adminiſtering an oath of ſecrecy to all whom they intruſted, till the year 1462; when, by the diſperſion of their ſervants into different countries, at the ſacking of Mentz by the archbiſhop Adolphus, the invention was publicly divulged.

The firſt book printed with theſe *improved types* was *Durandi Rationale*, in 1459; at which time, however, they ſeem to have had only *one ſize* of *caſt* letters, all the larger characters which occur being *cut types*, as appears plainly by an inſpection of the book From this time to 1466, Fuſt and Schoeffer continued to print a conſiderable number of books; particularly two famous editions of *Tully's Offices*. In the earlieſt books, they printed more copies on *vellum* than on *paper*, which was the caſe both of their *Bibles* and *Tulley's Offices*. This, however, was ſoon inverted; and *paper* introduced for the greateſt part of their impreſſions; a few only being printed on *vellum* for curioſities, and for the purpoſe of being *illuminated*. How long Fuſt lived, is uncertain; but in 1471 we find Schoeffer was in partnerſhip with *Conrad Henlif* and a kinſman of his maſter Fuſt. He publiſhed many books after the death of his father-in-law; the laſt of which that can be diſcovered is a third edition of the *Pſalter* in 1490, in which the old *cut* types of the firſt edition were uſed.

9 Claim of Straſburg.

IV. With regard to the claim of STRASBURG: It has been already mentioned, that Gutenberg was engaged in that city in different employments; and, among others, in endeavouring to attain the art of printing. That theſe endeavours were unſucceſsful, is plain from an authentic judicial decree of the ſenate of Straſburg in 1439, after the death of Andrew Drizehen (K).

But there are many other proofs that Gutenberg and his partners were never able to bring the art to perfection.

1. Wimphelingius*, the oldeſt writer in favour of Straſburg, tells us, that Gutenberg was the inventor of "a new art of writing," *ars impreſſoria*, which might alſo be called a *divine benefit*, and which he happily completed at Mentz; but does not mention one book of his printing: though he adds, that Mentelius printed many volumes correctly and beautifully, and acquired great wealth; whence we may conclude that he perfected what Gutenberg had in vain eſſayed.

2. Wimphelingius, in another book †, tells us, the art of printing was found out by Gutenberg *incomplete*; which implies, not that he practiſed the art in an imperfect manner (as Laurentius had done at Harlem), but rather that he had not been able to accompliſh what he aimed at.

3. Gutenberg, when he left Straſburg in 1444 or the

* Epitome Rerum Germanicarum ed Argent. 1505, Meerman, vol. i. p. 202. vol. ii. p. 139

† Catal. Epiſc. Argent 1508, Meerman, ut ſupra.

(G) In German, Schoeffer; in Latin, *Opilio*; in Engliſh, *Shepherd*.——He is ſuppoſed by Mr Meerman to have been the firſt engraver on copperplates.

(H) *Annales Hirſaugienſes*, tom. ii. ad ann. 1450.—As this book was finiſhed in 1514, and Trithemius tells us he had the narrative from Schoeffer himſelf about 30 years before; this will bring us back to 1484, when Schoeffer muſt have been advanced in years, and Trithemius about 22 years old, who died in 1516. See *Voſſ.* Hiſt. Lat. l. 1. c. 10. *Fabr*. Med. & Infim. Æt. l. 9.

(I) See *Meerman*, vol. I. 9. 183. who copied this teſtimony from Wolfius, *Monument. Typograph*. vol. i. p. 468. ſeq.

(K) Their firſt attempts were made about 1437 with *wooden types*. Mr Meerman is of opinion that Geinsfleich junior (who was of an enterpriſing genius, and had already engaged in a variety of projects) gained ſome little inſight into the buſineſs by viſiting his brother who was employed by Laurentius at Haerleim, but not ſufficient to enable him to practiſe it. It is certain that, at the time of the law-ſuit in 1439, much money had been expended, without any profit having ariſen; and the unfortunate Drizehen, in 1438, on his death-bed, lamented to his confeſſor, that he had been at great expence, without having been reimburſed a ſingle *obolus*. Nor did Gutenberg (who perſiſted in his fruitleſs endeavours) reap any advantage from them; for, when he quitted Straſburg, he was overwhelmed in debt, and under a neceſſity of ſelling every thing he was in poſſeſſion of. [Meerman, vol. I. p. 198—202.] All the depoſitions in the law-ſuit above-mentioned (with the judicial decree) are printed by Mr Meerman, vol. II. p. 58—88. N.

the following year, and entered into partnerſhip with Geinsfleich ſenior and others, had occaſion for his brother's aſſiſtance to enable him to complete the art; which ſhows that his former attempts at Straſburg had been unſucceſsful ‡.

4. Theſe particulars are remarkably confirmed by Trithemius, who tells us, in two different places||, that Gutenberg ſpent all his ſubſtance in queſt of this art; and met with ſuch inſuperable difficulties, that, in deſpair, he had nearly given up all hopes of attaining it, till he was aſſiſted by the liberality of Fuſt, and by his brother's ſkill, in the city of Mentz.

5. Ulric Zell ſays * the art was completed at Mentz; but that ſome books had been publiſhed in Holland earlier than in that city. Is it likely that Zell, who was a German, would have omitted to mention Straſburg, if it had preceded Mentz in printing?

There is a little doubt therefore that all Gutenberg's labours at Straſburg amounted to no more than a fruitleſs attempt, which he was at laſt under the neceſſity of relinquiſhing: and there is no certain proof of a ſingle book having been printed in that city till after the diſperſion of the printers in 1462, when Mentellius and Eggeſtenius ſucceſsfully purſued the buſineſs.

In fine, the pretenſions of *Straſburg* fall evidently to be ſet aſide. And as to the other two cities, *Harlem* and *Mentz*, the diſputes between them ſeem eaſily cleared up, from the twofold invention of printing abovementioned: the firſt with *ſeparate* WOODEN *types* at Harlem, by Laurentius, about 1430, and after continued by his family; the other with METAL *types* firſt *cut*, and afterwards *caſt*, which were invented at Mentz, but not uſed in Holland till brought thither by Theodoric Martens at Aloſt about 1472.

From this period printing made a rapid progreſs in moſt of the principal towns of Europe. In 1490, it reached Conſtantinople; and, according to Mr Palmer, p. 281, &c. it was extended, by the middle of the next century, to Africa and America. It was introduced into Ruſſia about 1560; but, from motives either of policy or ſuperſtition, it was ſpeedily ſuppreſſed by the ruling powers; and, even under the preſent enlightened empreſs, has ſcarcely emerged from its obſcurity.—That it was early practiſed in the inhoſpitable regions of Iceland, we have the reſpectable authority of Mr Bryant: "Arngrim Jonas was born amidſt the ſnows of Iceland; yet as much prejudiced in favour of his country as thoſe who are natives of an happier climate. This is viſible in his *Crymogæa;* but more particularly in his *Anatome Bleſkiniana*. I have in my poſſeſſion this curious little treatiſe, written in Latin by him in his own country, and printed *Typis Holenſibus in Iſlandiâ Boreali, anno* 1612. *Hola* is placed in ſome maps within the Arctic circle, and is certainly not far removed from it. I believe it is the fartheſt north of any place where arts and ſciences have ever reſided." *Obſervations and Inquiries relating to various parts of Ancient Hiſtory*, 1767, p. 277.

10 Introduction of the art into Britain.

It was a conſtant opinion, delivered down by our hiſtorians, as hath been obſerved by Dr Middleton, that the Art of Printing was introduced and firſt practiſed in England by *William Caxton*, a mercer, and citizen of London; who, by his travels abroad, and a reſidence of many years in Holland, Flanders, and Germany, in the affairs of trade, had an opportunity of informing himſelf of the whole method and proceſs of the art; and by the encouragement of the great, and particularly of the abbot of Weſtminſter, firſt ſet up a preſs in that abbey, and began to print books ſoon after the year 1471.

This was the tradition of our writers; till a book, which had ſcarce been obſerved before the Reſtoration, was then taken notice of by the curious, with a date of its impreſſion from Oxford, *anno* 1468, and was conſidered immediately as a clear proof and monument of the exerciſe of printing in that univerſity ſeveral years before Caxton began to deal in it.

This book, which is in the public library at Cambridge, is a ſmall volume of 41 leaves in 4to, with this title; *Expoſitio Sancti Jeronimi in Simbolum Apoſtolorum ad Papam Laurentium:* and at the end, *Explicit expoſitio, &c. Impreſſa Oxonie, & finita Anno Domini* M.CCCC.LXVIII. XVII *die Decembris.*

11 The firſt printing-preſs ſet up in England was at Oxford.

The appearance of this book has robbed Caxton of a glory that he had long poſſeſſed, of being the author of printing in England; and Oxford has ever ſince carried the honour of the firſt preſs. The only difficulty was, to account for the ſilence of hiſtory in an event ſo memorable, and the want of any memorial in the univerſity itſelf concerning the eſtabliſhment of a new art amongſt them of ſuch uſe and benefit to learning. But this likewiſe has been cleared up by the diſcovery of a record, which had lain obſcure and unknown at Lambeth-palace, in the Regiſter of the See of Canterbury; and gives a narrative of the whole tranſaction, drawn up at the very time.

An account of this record was firſt publiſhed in a thin quarto volume, in Engliſh; with this title: "The Original and growth of Printing, collected out of Hiſtory and the Records of this Kingdom: wherein is alſo demonſtrated, that Printing appertaineth to the Prerogative Royal, and is a Flower of the Crown of England. By Richard Atkyns, eſq.—Witehall, April the 25, 1664. By order and appointment of the right honourable Mr Secretary Morrice, let this be printed. Tho. Rycaut. London: Printed by John Streater, for the Author. 1664." 4to.

It ſets forth in ſhort, "That as ſoon as the art of printing made ſome noiſe in Europe, Thomas Bourchier, archbiſhop of Canterbury, moved the then king (Henry VI.) to uſe all poſſible means for procuring a printing-mould (for ſo it was then called) to be brought into this kingdom. The king (a good man, and much given to works of this nature) readily hearkened to the motion; and, taking private advice how to effect his deſign, concluded it could not be brought about without great ſecrecy, and a conſiderable ſum of money given to ſuch perſon or perſons as would draw off ſome of the workmen of Harlem in Holland, where John Gutenberg had newly invented it, and was himſelf perſonally at work. It was reſolved, that leſs than 1000 merks would not produce the deſired effect; towards which ſum the ſaid archbiſhop preſented the king 300 merks. The money being now prepared, the management of the deſign was committed to Mr Robert Turnour; who then was maſter of the robes to the king, and a perſon moſt in favour with him of any of his condition. Mr Turnour took to his aſſiſtance Mr Caxton, a citizen of good abilities, who traded much into Holland; which was a credible pretence, as well for his going, as ſtay in the Low Countries. Mr Turnour was in diſguiſe

(his

* Chronicon Coloniæ, 1499.

(his beard and hair ſhaven quite off); but Mr Caxton appeared known and public. They, having received the ſaid ſum of 1000 merks, went firſt to Amſterdam, then to Leyden, not daring to enter Harlem itſelf; for the town was very jealous, baving impriſoned and apprehended divers perſons who came from other parts for the ſame purpoſe. They ſtaid till they had ſpent the whole thouſand merks in gifts and expences: ſo as the king was fain to ſend 500 merks more, Mr Turnour having written to the king that he had almoſt done his work; a bargain, as he ſaid, being ſtruck betwixt him and two Hollanders, for bringing off one of the underworkmen, whoſe name was Frederick Corſells (or rather Corſellis), who late one night ſtole from his fellows in diſguiſe into a veſſel prepared before for that purpoſe; and ſo, the wind favouring the deſign, brought him ſafe to London. It was not thought ſo prudent to ſet him on work at London: but, by the archbiſhop's means (who had been vice-chancellor and afterwards chancellor of the univerſity of Oxon) Corſellis was carried with a guard to Oxon; which guard conſtantly watched, to prevent Corſellis from any poſſible eſcape, till he had made good his promiſe in teaching them how to print. So that at Oxford printing was firſt ſet up in England, which was before there was any printing-preſs or printer in France, Spain, Italy, or Germany (except the city of Mentz), which claims ſeniority, as to printing, even of Harlem itſelf, calling her city, *Urbem Moguntinam artis typographicæ inventricem primam;* though it is known to be otherwiſe, that city gaining the art by the brother of one of the workmen of Harlem, who had learnt it at home of his brother, and after ſet up for himſelf at Mentz. This preſs at Oxon was at leaſt ten years before there was any printing in Europe, except at Harlem and Mentz, where it was but new-born. This preſs at Oxford was afterwards found inconvenient to be the ſole printing-place of England; as being too far from London and the ſea. Wherefore the king ſet up a preſs at St Alban's, and another in the city of Weſtminſter, where they printed ſeveral books of *divinity* and *phyſic: for the king* (for reaſons beſt known to himſelf and council) *permitted then no law-books to be printed*; nor did any printer exerciſe that art, but only ſuch as were the king's ſworn ſervants; *the king himſelf having the price and emolument for printing books.*—By this means the art grew ſo famous, that anno primo Richard III. c. 9. when an act of parliament was made for reſtraint of aliens for uſing any handicrafts here (except as ſervants to natives), a ſpecial proviſo was inſerted, that ſtrangers might bring in printed or written books to ſell at their pleaſure, and exerciſe the art of printing here, notwithſtanding that act: ſo that in the ſpace of 40 or 50 years, by the indulgence of Edward IV. Edward V. Richard III. Henry VII. and Henry VIII. the Engliſh proved ſo good proficients in printing, and grew ſo numerous, as to furniſh the kingdom with books; and ſo ſkilful, as to print them as well as any beyond the ſeas; as appears by the act 25 Hen. VIII. c. 15. which abrogates the ſaid proviſo for that reaſon. And it was further enacted in the ſaid ſtatute, that if any perſon bought foreign books bound, he ſhould pay 6s. 8d. *per* book. And it was further provided and enacted, that in caſe the ſaid printers or ſellers of books were unreaſonable in their prices, they ſhould be moderated by the lord chancellor, lord treaſurer, the two lords chief juſtices, or any two of them; who alſo had power to fine them 3s. 4d. for every book whoſe price ſhould be enhanced.—But when they were by charter corporated with *bookbinders, bookſellers,* and *founders of letters,* 3 & 4 Philip and Mary, and called *the Company of Stationers*—they kick'd againſt the power that gave them life, &c.—Queen Eliſabeth, the firſt year of her reign, grants by patent *the privilege of ſole printing all books that touch or concern the common laws of England,* to Tottel a ſervant to her majeſty, who kept it entire to his death; after him, to one Yeſt Weirt, another ſervant to her majeſty; after him, to Weight and Norton; and after them, king James grants the ſame privilege to More, one of the ſignet; which grant continues to this day, &c."

11 Whether Caxton or Corſellis was the firſt printer.

From the authority of this record, all our late writers declare Corſellis to be the firſt printer in England; Mr Anthony Wood, the learned Mr Maittaire, Palmer, and one John Bagford, an induſtrious man, who had publiſhed propoſals for an Hiſtory of Printing, (Phil. Tranſ. for April 1707). But Dr Middleton has called in queſtion the authenticity of this account, and has urged ſeveral objections to it, with the view of ſupporting Caxton's title to the precedency with reſpect to the introduction of the art into this country; of which we ſhall quote one or two, with the anſwers that have been made to them.

Objection 1.—"The ſilence of Caxton concerning a fact in which he is ſaid to be a principal actor, is a ſufficient confutation of it: for it was a conſtant cuſtom with him, in the prefaces or concluſions of his works, to give an hiſtorical account of all his labours and tranſactions, as far as they concerned the publiſhing and printing of books. And, what is ſtill ſtronger, in the continuation of the Polychronicon, compiled by himſelf, and carried down to the end of Henry the ſixth's reign, he makes no mention of the expedition in queſt of a printer: which he could not have omitted, had it been true; whilſt in the ſame book he takes notice of the invention and beginning of printing in the city of Mentz."

Anſwer.—As Caxton makes no mention in his Polychronicon of his *expedition in queſt of a printer;* ſo neither does he of his *bringing the art into England,* which it is as much a wonder he ſhould omit as the other. And as to his ſaying that *the invention of printing was at Mentz,* he means, of printing on *fuſile* ſeparate types. In this he copies, as many others have, from the *Faſciculus Temporum;* a work written in 1470, by Wernerus Rolevinch de Laer, a Carthuſian monk, a MS. copy of which was in the library of Gerard Jo. Voſſius (ſee lib. iii. *de Hiſtor. Latin.* c. 6.); and afterwards continued to the year 1474, when it was firſt printed at Cologne *typis Arnoldi ter Huernen.* It was republiſhed in 1481 by Heinricus Wirczburgh de Vach, a Cluniac monk, without mentioning the name either of the printer or of the place of publication. It is plain that Caxton had one at leaſt, or more probably both, of theſe editions before him, when he wrote his continuation of Polychronicon, as he mentions this work in his preface, and adopts the ſentiments of its editor. (See MEERMAN, vol. ii. p. 37. and his *Documenta,* N° VII. XXIV. and XXV.)

Obj. 2. "There is a farther circumſtance in Caxton's hiſtory, that it ſeems inconſiſtent with the record; for we find him ſtill beyond ſea, about twelve years after the ſuppoſed tranſactions, "learning with great charge and trouble the art of printing" (*Recule of the Hiſtories of Troye*, in the end of the 2d and 3d books); which he might have done with eaſe at home, if he had got Corſellis into his hands, as the record imports, ſo many years before: but he probably learnt it at Cologne, where he reſided in 1471, (*Recule*, &c. ibid.), and whence books had been firſt printed with date the year before."

Anſ.—Caxton tells us, in the preface to *The Hiſtory of Troy*, that he began that tranſlation March 1. 1468, at Bruges; that he proceeded on with it at Ghent; that he finiſhed it at Cologne in 1471; and printed it, probably, in that city with his own types. He was 30 years abroad, chiefly in Holland; and lived in the court of Margaret ducheſs of Burgundy, ſiſter of Edward IV. It was therefore much eaſier to print his book at Cologne, than to croſs the ſea to learn the art at Oxford. But further, there was a ſpecial occaſion for his printing it abroad. Corſellis had brought over ſo far the art of printing as he had learned it at Harlem, which was the method of printing on *wooden ſeparate* types, having the face of the letter cut upon them. But the art of *caſting* metal types being divulged in 1462 by the workmen of Mentz, Caxton thought proper to learn that advantageous branch before he returned to England. This method of caſting the types was ſuch an improvement, that they looked on it as the *original* of printing; and Caxton, as moſt others do, aſcribes that to Mentz.—Caxton was an aſſiſtant with Turnour in getting off Corſellis; but it is nowhere ſuppoſed that he came with him into England. (See MEERMAN, vol. ii. p. 34. B.)

Obj. 3.—"As the Lambeth record was *never heard of before the publication of Atkyn's book*, ſo it has never ſince been ſeen or produced by any man; though the regiſters of Canterbury have on many occaſions been diligently and particularly ſearched for it. They were examined, without doubt, very carefully by archbiſhop Parker, for the compiling his *Antiquities of the Britiſh Church*; where, in the life of Thomas Bourchier, tho' he congratulates that age on the noble and uſeful invention of printing, yet he is ſilent as to the introduction of it into England by the endeavours of that archbiſhop: nay, his giving the honour of the invention to Straſburg clearly ſhows that he knew nothing of the ſtory of Corſellis conveyed from Harlem, and that the record was not in being in his time. Palmer himſelf owns, "That it is not to be found there now; for that the late earl of Pembroke aſſured him, that he had employed a perſon for ſome time to ſearch for it, but in vain:" (*Hiſt. of Printing*, p. 314.) On theſe grounds we may pronounce the record to be a forgery; though all the writers abovementioned take pains to ſupport its credit, and call it an *authentic piece*.

Atkyns, who by his manner of writing ſeems to have been *a bold and vain man*, might poſſibly be *the inventor*: for he had an intereſt in impoſing it upon the world, in order to confirm the argument of his book, that *printing was of the prerogative royal*; in oppoſition to the *company of ſtationers*, with whom he was engaged in an expenſive ſuit of law, in defence of the *king's patents*, under which he claimed *ſome excluſive powers of printing*. For he tells us, p. 3. 'That, upon conſidering the thing, he could not but think that a public perſon, more eminent than a mercer, and a public purſe, muſt needs be concerned in ſo public a good: and the more he conſidered, the more inquiſitive he was to find out the truth. So that he had formed his hypotheſis before he had found his record; which he publiſhed, he ſays, as a friend to truth; not to ſuffer one man to be intitled to the worthy atchievements of another; and as a friend to himſelf, not to loſe one of his beſt arguments of entitling the king to this art.' But, if Atkyns was not himſelf the contriver, he was impoſed upon at leaſt by ſome more crafty man; who imagined that his intereſt in the cauſe, and the warmth that he ſhowed in proſecuting it, would induce him to ſwallow for genuine whatever was offered of the kind."

Anſ.—On the other hand, is it likely that Mr Atkyns would dare to *forge* a record, to be laid before the king and council, and which his adverſaries, with whom he was at law, could diſprove?—(2.) He ſays he received this hiſtory from a perſon of honour, who was ſome time keeper of the Lambeth library. It was eaſy to have confuted this evidence, if it was falſe, when he publiſhed it, April 25. 1664.—(3.) John Bagford (who was born in England 1651, and might know Mr Atkyns, who died in 1677), in his Hiſtory of Printing at Oxford, blames thoſe who doubted of the authenticity of the Lambeth MS.; and tells us that he knew Sir John Birkenhead had an authentic copy of it, when in 1665 [which Bagford by ſome miſtake calls 1664, and is followed in it by Meerman] he was appointed by the houſe of commons to draw up a bill relating to the exerciſe of that art. This is confirmed by the Journals of that houſe, Friday Oct. 27. 1665. vol. VIII. p. 622. where it is ordered, that this Sir John Birkenhead ſhould carry the bill on that head to the houſe of lords for their conſent.—The act was agreed to in the upper houſe on Tueſday Oct. 31. and received the royal aſſent on the ſame day; immediately after which the parliament was prorogued. See *Journals of the Houſe of Lords*, Vol. XI. p. 700.—Is it probable, then, that after Mr Atkyns had publiſhed his book in April 1664, the parliament thought proper, the next year, to inquire into *the right of the king's prerogative*; and that Sir John Birkenhead took care to inſpect the original, then in the cuſtody of archbiſhop Sheldon: and, finding it not ſufficient to prove what Mr Atkyns had cited it for, made no report of the MS. to the houſe; but only moved, that the former law ſhould be renewed. The MS. was probably never returned to the proper keeper of it; but was afterwards burnt in the fire of London, Sept. 13. 1666.—(4.) That printing was practiſed at Oxford, was a prevailing opinion long before Atkyns. Bryan Twyne, in his *Apologia pro Antiquitate Academiæ Oxonienſis*, publiſhed 1608, tells us, it is ſo delivered down in *ancient writings*; having heard, probably, of this Lambeth MS. And king Charles I. in his letters patent to the Univerſity of Oxford, March 5. in the eleventh of his reign, 1635, mentions printing as brought to *Oxford* from abroad. As to what is objected, "that it is not likely that the preſs ſhould undergo a ten or eleven years ſleep, viz. from 1468 to 1479," it is probably urged without foundation. Corſellis might print ſeveral books without date or name of the place, as Ulric Zell did at Cologne, from 1467 to 1473, and from that time to 1494. Corſellis's name, it may be ſaid, appears not in any of his publications; but neither does that of Joannes Peterſhemius. [See MEERMAN, vol. I. p. 34.; vol. II. p. 21—27, &c.

Further, the famous Shakeſpeare, who was born in 1564, and died in 1616, in the Second Part of Henry VI. act iv. ſc. 7. introduces the rebel John Cade, thus upbraiding Lord Treaſury Say: "Thou haſt moſt traiterouſly corrupted the youth of the realm, in creating a grammar-ſchool: and whereas, before, our forefathers had no other book but the ſcore and the tally, thou haſt cauſed *Printing* to be uſed; and, contrary to the king, his crown, and dignity, thou haſt built a paper-mill."—Whence now had Shakeſpeare this accuſation againſt lord Say? We are told in the Poetical Regiſter, vol. II. p. 231. ed. Lond. 1724, that it was from Fabian, Pol. Vergel, Hall, Hollingſhed, Grafton, Stow, Speed. &c. But not one of theſe aſcribes printing to the reign of Henry VI. On the contrary, Stow, in his Annals, printed at London 1560, p. 686, gives it expreſsly to William Caxton, 1471. "The noble ſcience of printing was about this time found out in Germany at Magunce, by one John Guthumburgus a knight. One Conradus an Almaine brought it into Rome: William Caxton of London mercer, brought it into England about the year 1471, and firſt practiſed the ſame in the Abbie of St Peter at Weſtminſter; after which time it was likewiſe practiſed in the Abbies of St Auguſtine at Canterburie, Saint Albons, and other monaſteries of England." What then ſhall we ſay, that the above is an anachroniſm arbitrarily put into the mouth of an ignorant fellow out of Shakeſpeare's head? We might believe ſo, but that we have the record of Mr Atkyns confirming the ſame in king Charles II.'s time. Shall we ſay, that Mr Atkyns borrowed the ſtory from Shakeſpeare, and publiſhed it with ſome improvements of money laid out by Henry VI. from whence it might be received by Charles II. as a prerogative of the crown? But this is improbable, ſince Shakeſpeare makes Lord Treaſurer Say the inſtrument of importing it, of whom Mr Atkyns mentions not a word. Another difference there will ſtill be between Shakeſpeare and the Lambeth MS.; the poet placing it before 1449, in which year Lord Say was beheaded; the MS. between 1454 and 1459, when Bourchier was archbiſhop. We muſt ſay, then, that lord Say firſt laid the ſcheme, and ſent ſome one to Harlem, though without ſucceſs; but after ſome years it was attempted happily by Bourchier. And we muſt conclude, that as the generality of writers have overlooked the invention of printing at Harlem with *wooden* types, and have aſcribed it to Mentz where *metal* types were firſt made uſe of; ſo in England they have paſſed by Corſellis (or the firſt *Oxford Printer*, whoever he was, who printed with *wooden* types at Oxford), and only mentioned Caxton as the original artiſt who printed with *metal* types at Weſtminſter. [See MEERMAN, vol. ii. 7, 8.] It is ſtrange, that the learned commentators on the great dramatic poet, who are ſo minutely particular upon leſs important occaſions, ſhould every one of them, Dr Johnſon excepted, paſs by this curious paſſage, leaving it entirely unnoticed. And how has Dr Johnſon trifled, by ſlightly remarking, "that Shakeſpeare is a little *too early* with this accuſation!"—The great critic had undertaken to decipher obſolete words, and inveſtigate unintelligible phraſes; but never, perhaps, beſtowed a thought on Caxton or Corſellis, on Mr Atkyns or the authenticity of the Lambeth Record.

But, independent of the record altogether, the book ſtands firm as a monument of the exerciſe of printing in Oxford ſix years older than any book of Caxton's with a date. In order to get clear of this ſtrong fact Dr Middleton,

1. Suppoſes the date in queſtion to have been falſified originally by the printer either by deſign or miſtake; and an X to have been dropped or omitted in the age of its impreſſion. Examples of this kind, he ſays, are common in the hiſtory of printing. And, "whilſt I am now writing, an unexpected inſtance is fallen into my hands, to the ſupport of my opinion; an *Inauguration Speech of the Woodwardian Profeſſor, Mr Maſon*, juſt freſh from the preſs, with its date given 10 years earlier than it ſhould have been, by the omiſſion of an x, viz. MDCCXXIV; and the very blunder exemplified in the laſt piece printed at Cambridge, which I ſuppoſe to have happened in the firſt from Oxford."——To this it has been very properly anſwered, That we ſhould not pretend to ſet aſide the authority of *a plain date*, without very ſtrong and cogent reaſons; and what the Doctor has in this caſe advanced will not appear, on examination, to carry that weight with it that he ſeems to imagine. There may be, and have been, miſtakes and forgeries in the date both of books and of records too; but this is never allowed as a reaſon for ſuſpecting ſuch as bear no mark of either. We cannot from a blunder in the laſt book printed at Cambridge, infer a like blunder in the firſt book printed at Oxford. Beſides, the *type* uſed in this our Oxford edition ſeems to be no ſmall proof of its antiquity. It is the German letter, and very nearly the ſame with that uſed by Fuſt [who has been ſuppoſed to be] the firſt printer; whereas Caxton and Rood uſe a quite different letter, ſomething between this German and our old Engliſh letter, which was ſoon after introduced by De Worde and Bynſon.

2. "For the probability of his opinion (he ſays), the book itſelf affords ſufficient proof: for, not to inſiſt on what is leſs material, the *neatneſs of the letter, and regularity of the page*, &c. above thoſe of Caxton, it has one mark, that ſeems to have carried the matter beyond probable, and to make it even certain, viz. *the uſe of ſignatures*, or letters of the alphabet placed at the bottom of the page, to ſhow the ſequel of the pages and leaves of each book; an improvement contrived for the direction of the bookbinders; which yet was not practiſed or invented at the time when this book is ſuppoſed to be printed; for we find no ſignatures in the books of Fauſt or Schoeffer at Mentz, nor in the improved or beautiful impreſſions of John de Spira and Jenſon at Venice, till ſeveral years later. We have a book in our library, that ſeems to fix the very time of their invention, at leaſt in Venice; the place where the art itſelf received the greateſt improvements: *Baldi lectura ſuper Codic. &c.* printed by *John de Colonia* and *Jo. Manthem de Gherretzem anno* MCCCCLXXIIII. It is a large and fair volume in folio, *without ſignatures*, till about the middle of the book, in which they are firſt introduced, and ſo continued forward: which makes it probable, that the firſt thought of them was ſuggeſted during the impreſſion; for we have likewiſe *Lectura Bartholi ſuper Codic.* &c. in two noble and beautiful volumes in folio, printed

the year before at the ſame place, by Vindelin de Spira, without them: yet from this time forward they are gerally found in all the works of the Venetian printers, and from them propagated to the other printers of Europe. They were uſed at (L) Cologne, in 1475; at Paris, 1476; by Caxton, not before 1480: but if the diſcovery had been brought into England, and practiſed at Oxford 12 years before, it is not probable that he would have printed ſo long at Weſtminſter without them. Mr Palmer indeed tells us, p. 54, 180, that Anthony Zarot was eſteemed the inventor of ſignatures; and that they are found in a Terence printed by him at Milan in the year 1470, in which he firſt printed. I have not ſeen that Terence; and can only ſay, that I have obſerved the want of them in ſome later works of this, as well as of other excellent printers of the ſame place. But, allowing them to be in the Terence, and Zarot the inventor, it confutes the date of our Oxford book as effectually as if they were of later origin at Venice; as I had reaſon to imagine, from the teſtimony of all the books that I have hitherto met with."——As to theſe proofs, firſt, the neatneſs of the letter, and the regularity of the page, prove, if any thing, the very reverſe of what the Doctor aſſerts. The art of printing was almoſt in its infancy brought to perfection; but afterwards debaſed by later printers, who conſulted rather the cheapneſs than the neatneſs of their work. Our learned diſſertator cannot be unacquainted with the labours of Fuſt and Jenſon. He muſt know, that though other printers may have printed more correctly, yet ſcarce any excel them, either in the neatneſs of the letter, or the regularity of the page. The ſame may be obſerved in the Engliſh printers. Caxton and Rood were indifferently good printers; de Worde and Pynſon were worſe; and thoſe that follow them moſt abominable. This our *anonymous Oxford printer* excels them all; and for this very reaſon we ſhould judge him to be the moſt ancient of all. Our diſſertator lays great ſtreſs on the uſe of ſignatures. But no certain concluſion can be drawn either from the uſe or non-uſe of theſe leſſer improvements of printing. They have in different places come in uſe at different times, and have not been continued regularly even at the ſame places. If Anthony Zarot uſed them at Milan in 1470, it is certain later printers there did not follow his example; and the like might happen alſo in England. But, what is more full to our purpoſe, we have in the Bodleian library an Æſop's Fables printed by Caxton. This is, it is believed, the firſt book which has *the leaves numbered*. But yet this improvement, though more uſeful than that of the ſignatures, was diſuſed both by Caxton himſelf and other later printers in England. It is therefore not at all ſurpriſing (if true) that the ſignatures, though invented by our Oxford printer, might not immediately come into general uſe. And conſequently, this particular carries with it no ſuch certain or effectual confutation as our diſſertator boaſts of.

3. What the Doctor thinks farther confirms his opinion is, "That, from the time of the pretended date of this book, *anno* 1468, we have no other fruit or production from the preſs at Oxford for 11 years next following; and it cannot be imagined that a preſs, eſtabliſhed with ſo much pains and expence, could be ſuffered to be ſo long idle and uſeleſs."—To this it may be anſwered, in the words of Oxonides, 1ſt, That his books may have been loſt. Our firſt printers, in thoſe days of ignorance, met with but ſmall encouragement; they printed but few books, and but few copies of thoſe books. In after-times, when the ſame books were reprinted more correctly, thoſe firſt editions, which were not as yet become curioſities, were put to common uſes. This is the reaſon that we have ſo few remains of the firſt printers. We have only four books of Theodoric Rood, who ſeems by his own verſes to have been a very celebrated printer. Of John Lettou-William de Machlinia, and the ſchoolmaſter of St Alban's, we have ſcarce any remains. If this be conſidered, it will not appear *impoſſible* that our printer ſhould have followed his buſineſs from 1468 to 1479, and yet time have deſtroyed his intermediate works. But, 2dly, We may account ſtill another way for this diſtance of time, without altering the date. The Civil Wars broke out in 1469: this might probably oblige our Oxford printer to ſhut up his preſs; and both himſelf and his readers be otherwiſe engaged. If this were the caſe, he might not return to his work again till 1479; and the next year, not meeting with that encouragement he deſerved, he might remove to ſome other country with his types.

Dr Middleton concludes with apologiſing for his "ſpending ſo much pains on an argument ſo inconſiderable, to which he was led by his zeal to do a piece of juſtice to the memory of our worthy countryman William Caxton; nor ſuffer him to be robbed of the glory, ſo clearly due to him, of having *firſt imported into this kingdom* an art of great uſe and benefit to mankind: a kind of merit that, in the ſenſe of all nations, gives the beſt title to true praiſe, and the beſt claim to be commemorated with honour to poſterity."

23
The real claims of Caxton and Corſellis reſpectively.

The fact, however, againſt which he contends, but which it ſeems impoſſible to overturn, does by no means derogate from the honour of Caxton, who, as has been ſhown, was the firſt perſon in England that practiſed the art of printing with *fuſile types*, and conſequently the firſt who brought it to perfection; whereas Corſellis printed with *ſeparate cut types in wood*, being the only method which

---

(L) Dr Middleton is miſtaken in the time and place of the invention of ſignatures. They are to be found even in very ancient MSS. which the earlieſt printers very ſtudiouſly imitated; and they were even uſed in ſome editions from the office of Lawrence Coſter (whence Corſellis came), which conſiſted of wooden cuts, as in *Figuræ typicæ et antitypicæ Novi Teſtamenti*; and in ſome editions with metal types, as in *Gaſp. Pergamenſis epiſtolæ*, publiſhed at Paris, without a date, but printed A. D. 1470, (Maittaire *, Annal. vol. i. p. 25.); and in *Mammetrectus*, printed by Helias de Llouffen, at Bern in Switzerland, 1470; and in *De Tondeli viſione*, at Antwerp, 1472. Venice, therefore, was not the place where they were firſt introduced.—They began to be uſed in *Baldus*, it ſeems, when the book was half finiſhed. The printer of that book might not know, or did not think, of the uſe of them before. See *Meerman*, vol. ii. p. 18.; and *Phil. Tranſ.* vol. xxiii. n° 208. p. 1509.

* See Maittaire.

which he had learned at Harlem. Into this detail, therefore, we have been led, not ſo much by the importance of the queſtion, as on account of ſeveral anecdotes connected with it, which ſeemed equally calculated to ſatisfy curioſity and afford entertainment.

Caxton had been bred very reputably in the way of trade, and ſerved an apprenticeſhip to one Robert Large a mercer; who, after having been ſheriff and lord mayor of London, died in the year 1441, and left by will, as may be ſeen in the prerogative-office, XXIIII merks to his apprentice William Caxton: a conſiderable legacy in thoſe days, and an early teſtimonial of his good character and integrity.

From the time of his maſter's death, he ſpent the following thirty years beyond ſea in the buſineſs of merchandiſe: where, in the year 1464, we find him employed by Edward IV. in a public and honourable negociation, jointly with one Richard Whitehill, Eſq; to tranſact and conclude a treaty of commerce between the king and his brother-in-law the duke of Burgundy, to whom Flanders belonged. The commiſſion ſtyles them, *ambaſſiatores, procuratores, nuncios, & deputatos ſpeciales*; and gives to both or either of them full powers to treat, &c.

Whoever turns over his printed works, muſt contract a reſpect for him, and be convinced that he preſerved the ſame character through life, of an honeſt, modeſt, man; greatly induſtrious to do good to his country, to the beſt of his abilities, by ſpreading among the people ſuch books as he thought uſeful to religion and good manners, which were chiefly tranſlated from the French. The novelty and uſefulneſs of his art recommended him to the ſpecial notice and favour of the great; under whoſe protection, and at whoſe expence, the greateſt part of his works were publiſhed. Some of them are addreſſed to king Edward IV. his brother the duke of Clarence, and their ſiſter the ducheſs of Burgundy; in whoſe ſervice and pay he lived many years before he began to print, as he often acknowledges with great gratitude. He printed likewiſe for the uſe, and by the expreſs order, of Henry VII. his ſon prince Arthur, and many of the principal nobility and gentry of that age.

It has been generally aſſerted and believed, that all his books were printed in the abbey of Weſtminſter; yet we have no aſſurance of it from himſelf, nor any mention of the place before the year 1477: ſo that he had been printing ſeveral years without telling us where.

There is no clear account left of Caxton's age: but he was certainly very old, and probably above fourſcore, at the time of his death. In the year 1471 he complained of the infirmities of age creeping upon him, and feebling his body: yet he lived 23 years after, and purſued his buſineſs, with extraordinary diligence, in the abbey of Weſtminſter, till the year 1494, in which he died; not in the year following, as all who write of him affirm. This appears from ſome verſes at the end of a book, called "Hilton's Scale of Perfection," printed in the ſame year:

Infynite laud with thankynges many folde
  I yield to God me ſocouryng with his grace
This boke to finyſhe which that ye beholde
  Scale of Perfection calde in every place
Whereof th' auctor Walter Hilton was
  And Wynkyn de Worde this hath ſett in print
In William Caxſtons hows ſo fyll the caſe,
  God reſt his ſoule. In joy ther mot it ſtynt.
      Impreſſus anno ſalutis MCCCCLXXXXiiii.

Though he had printed for the uſe of Edward IV. and Henry VII. yet there appears no ground for the notion which Palmer takes up, that the firſt printers, and particularly Caxton, were ſworn ſervants and printers to the crown; for Caxton, as far as can be obſerved, gives not the leaſt hint of any ſuch character or title; though it ſeems to have been inſtituted not long after his death; for of his two principal workmen, Richard Pynſon and Wynkyn de Worde, the one was made printer to the king, the other to the king's mother the Lady Margaret. Pynſon gives himſelf the firſt title, in *The Imitation of the Life of Chriſt*; printed by him at the commandment of the Lady Margaret, who had tranſlated the fourth book of it from the French, in the year 1504: and Wynkyn de Worde aſſumes the ſecond, in *The ſeven Penitential Pſalms*, expounded by Biſhop Fiſher, and printed in the year 1509. But there is the title of a book given by Palmer, that ſeems to contradict what is here ſaid of Pynſon: viz. *Pſalterium ex mandato victorioſiſſimi Angliæ Regis Henrici Septimi, per Gulielmum Fanque, impreſſorem regium*, anno MDIIII; which being the only work that has ever been found of this printer, makes it probable that he died in the very year of its impreſſion, and was ſucceeded immediately by Richard Pynſon. No book hath yet been diſcovered printed in Scotland in this period, though the Engliſh printers were able to export ſome of their works to other countries. See Henry's *Hiſtory of Great Britain*, vol. v. p. 471.

14
Different characters when firſt uſed in printing.

Before 1465, the uniform character was the old *Gothic* or *German*; whence our *Black* was afterwards formed. But in that year an edition of Lactantius was printed in a kind of Semi-Gothic, of great elegance, and approaching nearly to the preſent *Roman* type; which laſt was firſt uſed at Rome in 1467, and ſoon after brought to great perfection in Italy, particularly by Jenſon.

Towards the end of the fifth century, Aldus invented the *Italic* character which is now in uſe, called, from his name, *Aldine* or *curſivus*. This ſort of letter he contrived, to prevent the great number of abbreviations that were then in uſe.

15
Of the firſt Greek printing.

The firſt eſſays in Greek that can be diſcovered are a few ſentences which occur in the edition of Tully's *Offices*, 1465, at Mentz; but theſe were miſerably incorrect and barbarous, if we may judge from the ſpecimens Mr Maittaire has given us, of which the following is one:

Οτιcαταακαρτμακατα και τατωτωκα.

In the ſame year, 1465, was publiſhed an edition of Lactantius's *Inſtitutes*, printed *in monaſterio Sublacenſi*, in the kingdom of Naples, in which the quotations from the Greek authors are printed in a very neat Greek letter. They ſeem to have had but *a very ſmall quantity* of Greek types in the monaſtery; for, in the firſt part of the work, whenever a long ſentence occurred, a blank was left, that it might be written in with a pen: after the middle of the work, however, all the Greek that occurs is printed.

The firſt printers who ſettled at Rome were Conrad Sweynheim and Arnold Pannartz, who introduced the preſent *Roman* type, in 1466, in Cicero's *Epiſtolæ Familiares:* in 1469 they printed a beautiful edition of *Aulus Gellius,* with the Greek quotations in a fair character, without accents or ſpirits, and with very few abbreviations.

The firſt whole book that is yet known is the Greek Grammar of Conſtantine Laſcaris, in quarto, reviſed by Demetrius Cretenſis, and printed by Dionyſius Palaviſinus, at Milan, 1476. In 1481, the Greek *Pſalter* was printed here, with a Latin tranſlation, in folio; as was Æſop's Fables in quarto.

Venice ſoon followed the example of Milan; and in 1486 were publiſhed in that city the *Greek Pſalter* and the *Batrachomyomachia,* the former by Alexander, and the latter by Laonicus, both natives of Crete. They were printed in a very uncommon character; the latter of them with *accents* and *ſpirits,* and alſo with *ſcholia.*

In 1488, however, all former publications in this language were eclipſed by a fine edition of *Homer's Works* at Florence, in folio, printed by Demetrius, a native of Crete. Thus printing (ſays Mr Maittaire, p. 185.) ſeems to have attained its ακμη of perfection, after having exhibited moſt beautiful ſpecimens of Latin, Greek, and Hebrew.

In 1493, a fine edition of *Iſocrates* was printed at Milan, in folio, by Henry German and Sebaſtian ex Pantremulo.

All the above works are prior in time to thoſe of Aldus, who has been erroneouſly ſuppoſed to be the *firſt* Greek printer: the beauty, however, correctneſs, and number of his editions, place him in a much higher rank than his predeceſſors; and his characters in general were more elegant than any before uſed. He was born in 1445, and died in 1515.

Though the noble Greek books of Aldus had raiſed an univerſal deſire of reviving that tongue, the French were backward in introducing it. The only pieces printed by them were ſome quotations, ſo wretchedly performed, that they were rather to be gueſſed at than read; in a character very rude and uncouth, and without accents. But Francis Tiſſard introduced the ſtudy of this language at Paris, by his Βιϐλος η γνωμαγυρικη, in 1507; and that branch of printing was afterwards ſucceſsfully practiſed by Henry, Robert, and Henry Stephens. See the article Stephens.

The earlieſt edition of the *whole Bible* was, ſtrictly ſpeaking, the Complutenſian Polyglott of Cardinal Ximenes; but as that edition, though finiſhed in 1517, was not publiſhed till 1522, the *Venetian* Septuagint of 1518 may properly be called the firſt edition of the *whole* Greek Bible; Eraſmus having publiſhed the New Teſtament *only* at Baſil in 1516.

16 Of the firſt Hebrew printing.

A very ſatisfactory account of Hebrew printing is thus given by Dr Kennicott in his *Annual Accounts of the Collation of Hebrew MSS.* p. 112. "The method which ſeems to have been originally obſerved in printing the Hebrew Bible was juſt what might have been expected: 1. The Pentateuch in 1482. 2. The Prior Prophets, in 1484. 3. The Poſterior Prophets, in 1486. 4. The Hagiographa, in 1487. And, after the four great parts had been thus printed ſeparately (each with a comment), the whole text (without a comment) was printed in one volume in 1488; and the text continued to be printed, as in theſe firſt editions, ſo in ſeveral others for 20 or 30 years, without Marginal *Keri* or *Maſora,* and with greater arguments to the more ancient MSS. till about the year 1520 ſome of the Jews adopted later MSS. and the *Maſora;* which abſurd preference has obtained ever ſince."

Thus much for the ancient editions given by Jews.

In 1642 a Hebrew Bible was printed at Mantua under the care of the moſt learned Jews in Italy. This Bible had not been heard of among the Chriſtians in this country, nor perhaps in any other; though the nature of it is very extraordinary. The text indeed is nearly the ſame with that in other modern editions; but at the bottom of each page are various readings, amounting in the whole to above 2000, and many of them of great conſequence, collected from manuſcripts, printed editions, copies of the Talmud, and the works of the moſt renowned Rabbies. And in one of the notes is this remark:—"That in ſeveral paſſages of the Hebrew Bible the differences are ſo many and ſo great, that they know not which to fix upon as the true readings."

We cannot quit the ſubject without obſerving, on Dr Kennicott's authority, that as the firſt printed Bibles are more correct than the latter ones; ſo the variations between the firſt edition, printed in 1488, and the edition of Vander Hooght, in 1705, at Amſterdam, in 2 vols 8vo, amount, upon the whole, to above 1200! See further *Bowyer and Nichols,* p. 112—117.

17 Anecdotes of early printing.

When the art of printing was firſt diſcovered, they only made uſe of one ſide of a leaf: they had not yet found out the expedient of impreſſing the other. When their editions were intended to be curious, they omitted to print the firſt letter of a chapter, for which they left a blank ſpace, that it might be painted or illuminated at the option of the purchaſer. Several ancient volumes of theſe early times have been found, where theſe letters are wanting, as they neglected to have them painted.

When the art of printing was firſt eſtabliſhed, it was the glory of the learned to be correctors of the preſs to the eminent printers. Phyſicians, lawyers, and biſhops themſelves, occupied this department. The printers then added frequently to their names thoſe of the correctors of the preſs; and editions were then valued according to the abilities of the corrector.

In the productions of early printing may be diſtinguiſhed the various ſplendid editions they made of *Primers* or *Prayer-books.* They were embelliſhed with cuts finiſhed in moſt elegant taſte: many of them were ludicrous, and ſeveral were obſcene. In one of them an angel is repreſented crowning the Virgin Mary, and God the Father himſelf aſſiſting at the ceremony. We have ſeen in a book of natural hiſtory the Supreme Being repreſented as *reading* on the ſeventh day, when he reſted from all his works. Sometimes St Michael is ſeen overcoming Satan; and ſometimes St Anthony appears attacked by various devils of moſt hideous forms. The *Prymer of Saliſbury,* 1533, is full of cuts: at the bottom of the title page there is the following remarkable prayer:

God be in my Bede,
  And in my Underſtandynge.
God be in my Eyen,
  And in my Lokynge.

God be in my Mouthe,
And in my Spekynge.
God be in my Herte,
And in my thinkinge.
God be at myn ende,
And at my departynge.

18 Method of printing. The workmen employed in the art of printing are of two kinds: compoſitors, who range and diſpoſe the letters into words, lines, pages, &c. according to the copy delivered them by the author; and preſſmen, who apply ink upon the ſame, and take off the impreſſion. The types being caſt, the compoſitor diſtributes each kind by itſelf among the diviſions of two wooden frames, an upper and an under one, called *caſes;* each of which is divided into little cells or boxes. Thoſe of the upper caſe are in number 98: theſe are all of the ſame ſize; and in them are diſpoſed the capitals, ſmall capitals, accented letters, figures, &c. the capitals being placed in alphabetical order. In the cells of the lower caſe, which are 54, are placed the ſmall letters, with the points, ſpaces, &c.. The boxes are here of different ſizes, the largeſt being for the letters moſt uſed; and theſe boxes are not in alphabitical order, but the cells which contain the letter ofteneſt wanted are neareſt the compoſitor's hand. Each caſe is placed a little aſlope, that the compoſitor may the more eaſily reach the upper boxes. Plate CCCCXV The inſtrument in which the letters are ſet is called a *compoſing-ſtick* (n° 1.), which conſiſts of a long and narrow plate of braſs or iron, &c. on the right ſide of which ariſes a ledge, which runs the whole length of the plate, and ſerves to ſuſtain the letters, the ſides of which are to reſt againſt it; along this ledge is a row of holes, which ſerve for introducing the ſcrew *a* in order to lengthen or ſhorten the extent of the line, by moving the ſliders *b c* farther from or nearer to the ſhorter ledge at the end *d*. Where marginal notes are required in a work, the two ſliding pieces *bc* are opened to a proper diſtance from each other in ſuch a manner as that while the diſtance between *dc* forms the length of the line in the text, the diſtance between the two ſliding-pieces forms the length of the lines for the notes on the ſide of the page. Before the compoſitor proceeds to compoſe, he puts a rule or thin ſlip of braſs-plate, cut to the length of the line, and of the ſame height as the letter, in the compoſing-ſtick, againſt the ledge, for the letter to bear againſt. Things thus prepared, the compoſitor having the copy lying before him, and his ſtick in his left hand, his thumb being over the ſlider *c;* with the right he takes up the letters, ſpaces, &c. one by one, and places them againſt the rule, while he ſupports them with his left thumb by preſſing them to the end of the ſlider *c*, the other hand being conſtantly employed in ſetting in other letters: the whole being performed with a degree of expedition and addreſs not eaſy to be imagined.

A little being thus compoſed, if it end with a word or ſyllable, and exactly fill the meaſure, there needs no further care; otherwiſe, more ſpaces are to be put in, or elſe the diſtance leſſened, between the ſeveral words, in order to make the meaſure quite full, ſo that every line may end even. The ſpaces here uſed are pieces of metal exactly ſhaped like the ſhanks of the letters: they are of various thickneſſes, and ſerve to ſupport the letters, and to preſerve a proper diſtance between the words; but not reaching ſo high as the letters, they make no impreſſion when the work is printed. The firſt line being thus finiſhed the compoſitor proceeds to the next; in order to which he moves the braſs-rule from behind the former, and places it before it, and thus compoſes another line againſt it after the ſame manner as before; going on thus till his ſtick is full, when he empties all the lines contained in it into the gally.

The compoſitor then fills and empties his compoſing-ſtick as before, till a complete page be formed; when he ties it up with a cord or pack-thread; and ſetting it by, proceeds to the next, till the number of pages to be contained in a ſheet is completed; which done, he carries them to the impoſing ſtone, there to be ranged in order, and faſtened together in a frame called a *chaſe;* and this is termed *impoſing*. The chaſe is a rectangular iron frame, of different dimenſions according to the ſize of the paper to be printed, having two croſs-pieces of the ſame metal, called a *long* and *ſhort croſs*, mortiſed at each end ſo as to be taken out occaſionally. By the different ſituations of theſe croſſes the chaſe is fitted for different volumes: for quartos and octavos, one traverſes the middle lengthwiſe, the other broadwiſe, ſo as to interſect each other in the centre: for twelves and twenty-fours, the ſhort croſs is ſhifted nearer to one end of the chaſe; for folios, the long croſs is left entirely out, and the ſhort one left in the middle; and for broadſides, both croſſes are ſet aſide. To dreſs the chaſe, or range and fix the pages therein, the compoſitor makes uſe of a ſet of furniture, conſiſting of ſlips of wood of different dimenſions, and about half an inch high, that they may be lower than the letters: ſome of theſe are placed at the top of the pages, and called *head-ſticks;* others between them, to form the inner margin; others on the ſides of the croſſes, to form the outer margin, where the paper is to be doubled; and others in the form of wedges to the ſides and bottoms of the pages. Thus all the pages being placed at their proper diſtances, and ſecured from being injured by the chaſe and furniture placed about them, they are all untied, and faſtened together by driving ſmall pieces of wood called *quoins*, cut in the wedge-form, up between the ſlanting ſide of the foot and the ſide ſticks and the chaſe, by means of a piece of hard wood and a mallet; and all being thus bound faſt together, ſo that none of the letters will fall out, it is ready to be committed to the preſſmen. In this condition the work is called a *form;* and as there are two of theſe forms required for every ſheet, when both ſides are to be printed, is is neceſſary the diſtances between the pages in each form ſhould be placed with ſuch exactneſs, that the impreſſion of the pages in one form ſhall fall exactly on the back of the pages of the other, which is called *regiſter*.

As it is impoſſible but that there muſt be ſome miſtakes in the work, either through the overſight of the compoſitor, or by the caſual tranſpoſition of letters in the caſes; a ſheet is printed off, which is called a *proof*, and given to the corrector; who reading it over, and rectifying it by the copy, making the alterations in the margin, it is delivered back to the compoſitor to be corrected.

The compoſitor then unlocking the form upon the correcting-ſtone, by looſening the quoins or wedges which bound the letters together, rectifies the miſtakes by picking out the faulty or wrong letters with a ſlender ſharp-pointed ſteel-bodkin, and putting others into their places. After this another proof is made, ſent to the author, and corrected as before; and laſtly, there is another proof called a *reviſe*, which is made in order to ſee whether all the miſtakes marked in the laſt proof are corrected.

The preſſman's buſineſs is to work off the forms thus prepared and corrected by the compoſitor; in doing which there are four things required, paper, ink, balls, and a preſs. To prepare the paper for uſe, it is to be firſt wetted by dipping ſeveral ſheets together in water: theſe are afterwards laid in a heap over each other; and to make them take the water equally, they are all preſſed cloſe down with a weight at the top. The ink is made of oil and lamp-black; for the manner of preparing which, ſee *Printing-Ink*. The balls, by which the ink is applied on the forms, are a kind of wooden funnels with handles, the cavities of which are filled with wool or hair, as is alſo a piece of alum leather or pelt nailed over the cavity, and made extremely ſoft by ſoaking in urine and by being well rubbed. One of theſe the preſſman takes in each hand; and applying one of them to the ink-block, daubs and works them together to diſtribute the ink equally; and then blackens the form which is placed on the preſs, by beating with the balls upon the face of the letter.

Plate CCCCXV. The printing-preſs, repreſented n° 2. is a very curious though complex machine. The body conſiſts of two ſtrong cheeks *a a*, placed perpendicularly, and joined together by four croſs-pieces; the cap *b;* the head *c*, which is moveable, being partly ſuſtained by two iron pins or long bolts, that paſs the cap; the till or ſhelf *d d*, by which the ſpindle and its apparatus are kept in their proper poſition; and the winter *e*, which bears the carriage, and ſuſtains the effort of the preſs beneath. The ſpindle *f* is an upright piece of iron pointed with ſteel, having a male ſcrew which goes into the female one in the head about four inches. Through the eye *g* of this ſpindle is faſtened the bar *k*, by which the preſſman makes the impreſſion. The ſpindle paſſes through a hole in the middle of the till; and its point works into a braſs pan or nut, ſupplied with oil, which is fixed to an iron plate let into the top of the platten. The body of the ſpindle is ſuſtained in the centre of an open frame of poliſhed iron, 1, 1, 2, 2. 3, 3, fixed to it in ſuch a manner as, without obſtructing its free play, to keep it in a ſteady direction; and at the ſame time to ſerve for ſuſpending the platten. This frame conſiſts of two parts; the upper called the *garter*, 1, 1; the under, called the *crane*, 2, 2. Theſe are connected together by two ſhort legs or bolts, 3, 3; which being fixed below in the two ends of the crane, paſs upward, through two holes in the till, and are received at top into two eyes at the ends of the garter, where they are ſecured by ſcrews. The carriage *l l* is placed a foot below the platten, having its fore-part ſupported by a prop called the *fore-ſtay*, while the other reſts on the winter. On this carriage, which ſuſtains the plank, are nailed two long iron bars or ribs; and on the plank are nailed ſhort pieces of iron or ſteel called *cramp-irons*, equally tempered with the ribs, and which ſlide upon them when the plank is turned in or out. Under the carriage is fixed a long piece of iron called the *ſpit*, with a double wheel in the middle, round which leather-girts are faſtened, nailed to each end of the plank: and to the outſide of the ſpit is fixed a rounce *m*, or handle to turn round the wheel. Upon the plank is a ſquare frame or coffin, in which is incloſed a poliſhed ſtone on which the form *n* is laid; at the end of the coffin are three frames, *viz.* the two tympans and friſket: the tympans *o* are ſquare, and made of three ſlips of very thin wood, and at the top a piece of iron ſtill thinner; that called the *outer tympan* is faſtened with hinges to the coffin: they are both covered with parchment; and between the two are placed blankets, which are neceſſary to take off the impreſſion of the letters upon the paper. The friſket *p* is a ſquare frame of thin iron, faſtened with hinges to the tympan: it is covered with paper cut in the neceſſary places, that the ſheet, which is put between the friſket and the great or outward tympan, may receive the ink, and that nothing may hurt the margins. To regulate the margins, a ſheet of paper is faſtened upon this tympan, which is called the *tympan ſheet;* and on each ſide is fixed an iron point, which makes two holes in the ſheet, which is to be placed on the ſame points when the impreſſion is to be made on the other ſide. In preparing the preſs for working, the parchment which covers the outer tympan is wetted till it is very ſoft, in order to render the impreſſion more equable; the blankets are then put in, and ſecured from ſlipping by the inner tympan: then while one preſſman is beating the letter with the balls *q*, covered with ink taken from the ink-block, the other perſon places a ſheet of white paper on the tympan-ſheet; turns down the friſket upon it, to keep the paper clean and prevent its ſlipping; then bringing the tympans upon the form, and turning the rounce, he brings the form with the ſtone, &c. weighing about 300 lbs. weight, under the platten; pulls with the bar, by which means the platten preſſes the blankets and paper cloſe upon the letter, whereby half the form is printed; then eaſing the bar, he draws the form ſtill forward; gives a ſecond pull; and letting go the bar, turns back the form, takes up the tympans and friſket, takes out the printed ſheet, and lays on a freſh one; and this is repeated till he has taken off the impreſſion upon the full number of ſheets the edition is to conſiſt of. One ſide of the ſheet being thus printed, the form for the other is laid upon the preſs, and worked off in the ſame manner.

Chineſe Printing, is performed from wooden planks or blocks, cut like thoſe uſed in printing of callico, paper, cards, &c.

Rolling-preſs Printing, is employed in taking off prints or impreſſions from copperplates engraven, etched, or ſcraped, as in mezzotintos. See Engraving.

This art is ſaid to have been as ancient as the year 1540, and to owe its origin to Finiguerra, a Florentine goldſmith, who pouring ſome melted brimſtone on an engraven plate, found the exact impreſſion of the engraving left in the cold brimſtone, marked with black taken out of the ſtrokes by the liquid ſulphur: upon this he attempted to do the ſame on ſilver plates with wet paper, by rolling it ſmoothly with a roller; and this ſucceeded: but this art was not uſed in England till the reign of king James I. when it was brought from Antwerp by Speed. The form of the rolling preſs, the compoſition of the ink uſed therein, and the manner of applying both in taking off prints, are as follow:

Plate CCCCXV.

The rolling-preſs AL, n° 3. may be divided into two parts, the body and carriage: the body conſiſts of two wooden cheeks PP, placed perpendicularly on a ſtand or foot LM, which ſuſtains the whole preſs. From the foot likewiſe are four other perpendicular pieces *c, c, c, c*, joined by other croſs or horizontal ones *d, d, d*, which ſerve to ſuſtain a ſmooth even plank or table HIK, about four feet and a half long, two feet and a half broad, and an inch and a half thick. Into the cheeks go two wooden cylinders or rollers, DE, FG, about ſix inches in diameter, borne up at each end by the cheeks, whoſe ends, which are leſſened to about two inches diameter, and called *trunnions*, turn in the cheeks about two pieces of wood in form of half-moons, lined with poliſhed iron to facilitate the motion. Laſtly, to one of the trunnions of the upper roller is faſtened a croſs, conſiſting of two levers AB, or pieces of wood, traverſing each other, the arms of which croſs ſerve inſtead of the bar or handle of the letter-preſs, by turning the upper roller, and when the plank is between the two rollers, giving the ſame motion to the under one, by drawing the plank forward and backward.

The ink uſed for copperplates, is a compoſition made of the ſtones of peaches and apricots, the bones of ſheep and ivory, all well burnt, and called *Frankfort black*, mixed with nut-oil that has been well boiled, and ground together on a marble, after the ſame manner as painters do their colours.

The method of printing from copperplates is as follows: They take a ſmall quantity of this ink on a rubber made of linen-rags, ſtrongly bound about each other, and therewith ſmear the whole face of the plate as it lies on a grate over a charcoal fire. The plate being ſufficiently inked, they firſt wipe it over with a foul rag, then with the palm of their left hand, and then with that of the right; and to dry the hand and forward the wiping, they rub it from time to time in whiting. In wiping the plate perfectly clean, yet without taking the ink out of the engraving, the addreſs of the workman conſiſts. The plate thus prepared, is laid on the plank of the preſs; over the plate is laid the paper, firſt well moiſtened, to receive the impreſſion; and over the paper two or three folds of flannel. Things thus diſpoſed, the arms of the croſs are pulled, and by that means the plate with its furniture paſſed through between the rollers, which pinching very ſtrongly, yet equally, preſſes the moiſtened paper into the ſtrokes of the engraving, whence it licks out the ink.

PRINTS, the impreſſions taken from a copperplate. See the laſt article, and ENGRAVING.

Strutt's Dict. of Engravers.

From the facility of being multiplied, prints have derived an advantage over paintings by no means inconſiderable. They are found to be more durable; which may, however, in ſome degree be attributed to the different methods in which they are preſerved. Many of the beſt paintings of the early maſters have generally had the misfortune to be either painted on walls, or depoſited in large and unfrequented, and conſequently damp and deſtructive, buildings; whilſt a print, paſſing, at diſtant intervals, from the *porte feuille* of one collector to that of another, is preſerved without any great exertion of its owner: And hence it happens, that whilſt the pictures of Raphael have mouldered from their walls, or deſerted their canvas, the prints of his friend and cotemporary Mark Antonio Raimondi continue in full perfection to this day, and give us a lively idea of the beauties of thoſe paintings, which, without their aſſiſtance, had been loſt to us for ever; or at leaſt, could have been only known to us, like thoſe of Zeuxis and Apelles, by the deſcriptions which former writers on theſe ſubjects have left us.

Independent of the advantages which prints afford us, when conſidered as accurate repreſentations of paintings, and imitations of ſuperior productions, they are no leſs valuable for their poſitive merit, as immediate repreſentations of nature. For it muſt be recollected, that the art of engraving has not always been confined to the copying other productions, but has frequently itſelf aſpired to originality, and has, in this light, produced more inſtances of its excellence than in the other. Albert Durer, Goltzius, and Rembrant, amongſt the Dutch and Germans; Parmigiano and Della Bella amongſt the Italians, and Callot amongſt the French, have publiſhed many prints, the ſubjects of which, there is great reaſon to ſuppoſe, were never painted. Theſe prints may therefore be conſidered as original pictures of thoſe maſters, deficient only in thoſe particulars in which a print muſt neceſſarily be inferior to a painting.

The preceding diſtinction may perhaps throw ſome light on the proper method of arranging and claſſing a collection of prints, which has been a matter of no ſmall difficulty. As an art imitating another, the principal ſhould take the lead, and the deſign, compoſition, and drawing, in a print, being previous requiſites to the manner of execution and finiſhing; prints engraved after paintings ſhould be arranged under the name of the painter; and every perſon who looks upon engraving only as auxiliary to painting, will conſequently adopt this mode of arrangement. But when engraving is conſidered as an original art, as imitating nature without the intervention of other methods, then it will certainly be proper to regulate the arrangement according to the names of the engravers.

PRIOR, in general, ſomething before or nearer the beginning than another, to which it is compared.

PRIOR, more particularly denotes the ſuperior of a convent of monks, or the next under the abbot. See ABBOT.

Priors are either *clauſtral* or *conventual*. *Conventual* are the ſame as abbots. *Clauſtral* prior, is he who governs the religious of an abbey or priory *in commendam*, having his juriſdiction wholly from the abbot.

Grant PRIOR, is the ſuperior of a large abbey, where ſeveral ſuperiors are required.

PRIOR (Matthew), an eminent Engliſh poet, was born at London in 1664. His father dying while he was very young, an uncle a vintner, having given him ſome education at Weſtminſter ſchool, took him home in order to breed him up to his trade. However, at his leiſure hours he proſecuted his ſtudy of the claſſics, and eſpecially of his favourite Horace. This in-

BRITISH MUSEUM

troduced him to ſome polite company, who frequented his uncle's houſe; among whom the earl of Dorſet took particular notice of him, and procured him to be ſent to St John's college in Cambridge, where, in 1686, he took the degree of A. B. and afterwards became fellow of that college. Upon the revolution, Mr Prior was brought to court by the earl of Dorſet; and in 1690 he was made ſecretary to the earl of Berkeley, plenipotentiary at the Hague; as he was afterward to the ambaſſador and plenipotentiaries at the treaty of Ryſwick in 1697; and the year following to the earl of Portland, ambaſſador to the court of France. He was in 1697 made ſecretary of ſtate for Ireland; and in 1700 was appointed one of the lords commiſſioners of trade and plantations. In 1710, he was ſuppoſed to have had a ſhare in writing *The Examiner*. In 1711, he was made one of the commiſſioners of the cuſtoms; and was ſent miniſter plenipotentiary to France, for the negociating a peace with that kingdom. Soon after the acceſſion of George I. to the throne in 1714, he preſented a memorial to the court of France, requiring the demoliſhing of the canal and new works at Mardyke. The year following he was recalled; and upon his arrival was taken up by a warrant from the houſe of commons, and ſtrictly examined by a committe of the privy-council. Robert Walpole, Eſq; moved the houſe of commons for an impeachment againſt him; and Mr Prior was ordered into cloſe cuſtody. In 1717, he was excepted out of the act of grace; however, at the cloſe of that year, he was ſet at liberty. The remainder of his days he ſpent in tranquillity and retirement; and died in 1721. His poems are well known, and juſtly admired. He is ſaid to have written the following epitaph for himſelf:

"Nobles and heralds, by your leave,
Here lie the bones of Matthew Prior,
The ſon of Adam and of Eve:
Let Bourbon or Naſſau go higher."

Alien PRIORIES, were cells of the religious houſes in England which belonged to foreign monaſteries: for when manors or tithes were given to foreign convents, the monks, either, to increaſe their own rule, or rather to have faithful ſtewards of their revenues, built a ſmall convent there for the reception of ſuch a number as they thought proper, and conſtituted priors over them.—Within theſe cells there was the ſame diſtinction as in thoſe priories which were cells ſubordinate to ſome great abbey; ſome of theſe were conventual, and, having priors of their own chooſing, thereby became entire ſocieties within themſelves, and received the revenues belonging to their ſeveral houſes for their own uſe and benefit, paying only the ancient apport (A), acknowledgment, or obvention, at firſt the ſurpluſage, to the foreign houſe; but others depended entirely on the foreign houſes, who appointed and removed their priors at pleaſure. Theſe tranſmitted all their revenues to the foreign head houſes; for which reaſon their eſtates were generally ſeized to carry on the wars between England and France, and reſtored to them again on return of peace. Theſe alien priories were moſt of them founded by ſuch as had foreign abbeys founded by themſelves or by ſome of their family.

The whole number is not exactly aſcertained: the Monaſticon hath given a liſt of 100: Weever, p. 338. ſays 110.

Some of theſe cells were made indigenous or denizon, or endenized. The alien priories were firſt ſeized by Edward I. 1285, on the breaking out of the war between France and England; and it appears from a roll, that Edward II. alſo ſeized them, though this is not mentioned by our hiſtorians; and to theſe the act of reſtitution 1 Ed. III. ſeems to refer.

In 1337, Edward III, confiſcated their eſtates, and let out the priories themſelves with all their lands and tenements, at his pleaſure, for 23 years; at the end of which term, peace being concluded between the two nations, he reſtored their eſtates 1361, as appears by his letters patent to that of Montacute, county of Somerſet, printed at large in Rymer, vol. vi. p. 311. and tranſlated in Weever's *Funeral Monuments*, p. 339. At other times he granted their lands, or lay penſions out of them, to divers noblemen. They were alſo ſequeſtered during Richard II.'s reign, and the head monaſteries abroad had the king's licence to ſell their lands to other religious houſes or to any particular perſons who wanted to endow others.

Henry IV. began his reign with ſhowing ſome favour to the alien priories, reſtoring all the conventual ones, only reſerving to himſelf in time of war what they paid in time of peace to the foreign abbeys.

They were all diſſolved by act of parliament 2 Henry V. and all their eſtates veſted in the crown, except ſome lands granted to the college of Fotheringhay. The act of diſſolution is not printed in the ſtatute books, but it is to be found entire in Rymer's *Fædera*, IX. 283. and in the Parliament Rolls, vol. iv. p. 22. In general, theſe lands were appropriated to religious uſes. Henry VI. endowed his foundations at Eton in Cambridge with the lands of the alien priories, in purſuance of his father's deſign to appropriate them all to a noble college at Oxford. Others were granted in fee to the prelates, nobility, or private perſons. Such as remained in the crown were granted by Henry VI. 1440, to archbiſhop Chichley, &c. and they became part of his and the royal foundations. See *Some Account of Alien-priories*, &c. in two volumes octavo.

PRIORITY, the relation of ſomething conſidered as prior to another.

PRIORITY, in law, denotes an antiquity of tenure, in compariſon of another leſs ancient.

PRISCIANUS, an eminent grammarian, born at Cæſarea, taught at Conſtantinople with great reputation about the year 525. Laurentius Valla calls Priſcian, Donatus, and Servius, *triumviri in re grammatica*; and thinks none of the ancients who wrote after them fit to be mentioned with them. He compoſed a work *De arte grammatica*, which was firſt printed by Aldus at

---

(A) *Apportus* or *apportagium* (from *portare*), an acknowledgment, oblation, or obvention, to the mother houſe or church. *Du Cange*.

at Venice in 1476; and another *De naturalibus quæſtionibus*, which he dedicated to Choſroes king of Perſia: beſide which, he tranſlated Dionyſius's deſcription of the world into Latin verſe. A perſon who writes falſe Latin, is proverbially ſaid to "break Priſcian's head."

PRISCILLIANISTS, in church-hiſtory, Chriſtian heretics, ſo called from their leader Priſcillian, a Spaniard by birth, and biſhop of Avila. He is ſaid to have practiſed magic, and to have maintained the principal errors of the Manichees; but his peculiar tenet was, That it is lawful to make falſe oaths in order to ſupport one's cauſe and intereſt.

PRISM, an oblong ſolid, contained under more than four planes, whoſe baſes are equal, parallel, and alike ſituated. See OPTICS, nº 142.

PRISON, a goal, or place of confinement.

Lord Coke obſerves, that a priſon is only a place of ſafe cuſtody, *ſalva cuſtodia*, not a place of puniſhment. If this be ſo, and it cannot be queſtioned, priſons ought not to be, what they are in moſt parts of Europe, loathſome dungeons. Any place where a perſon is confined may be ſaid to be a priſon; and when a proceſs is iſſued againſt one, he muſt, when arreſted thereon, either be committed to priſon, or be bound in a recognizance with ſureties, or elſe give bail, according to the nature of the caſe, to appear at a certain day in court, there to make anſwer to what is alledged againſt him. Where a perſon is taken and ſent to priſon, in a civil caſe, he may be releaſed by the plaintiff in the ſuit; but if it be for treaſon or felony, he may not regularly be diſcharged, until he is indicted of the fact and acquitted. See INDICTMENT, and the next article.

PRISONER, a perſon reſtrained or kept in priſon upon an action civil or criminal, or upon commandment: and one may be a priſoner on matter of record, or matter of fact. A priſoner upon matter of record, is he who, being preſent in court, is by the court committed to priſon; and the other is one carried to priſon upon an arreſt, whether it be by the ſheriff, conſtable or other officer.

PRISTIS, the SAWFISH, is generally conſidered as a ſpecies of the *ſqualus* or *ſhark* genus, comprehending under it ſeveral varieties. Mr Latham, however, is of opinion that it ought to be conſidered as a diſtinct genus itſelf, and that the characteriſtics of the ſeveral varieties are ſufficient to conſtitute them diſtinct ſpecies. According to him therefore the *priſtis* is a genus belonging to the order of *amphibia nantes*; and its characters are as follow: A long plane beak or ſnout, with ſpines growing like teeth out of both edges; four or five *ſpiracula*, or breathing apertures, in the ſides of the neck: the body is oblong and almoſt round, with a rough coriaceous ſkin; the mouth is ſituated in the lower part of the head; and the noſtrils, before the mouth, are half covered with a membranaceous lobe; behind the eys are two oval holes; the ventral fins approach one another, and in the male are placed about the organs of generation; there are no fins at the anus. Of this genus our author enumerates five ſpecies.

1. *Priſtus antiquorum*. The head is rather flat at top; the eyes large, with yellow irides; behind each is a hole, which ſome have ſuppoſed may lead to an organ of hearing. The mouth is well furniſhed with teeth, but they are blunt, ſerving rather to bruiſe its prey than to divide it by cutting. Before the mouth are two foramina, ſuppoſed to be the noſtrils. The *roſtrum*, beak, or ſnout, is in general about one-third of the total length of the fiſh, and contains in ſome 18, in others as far as 23 or 24 ſpines on each ſide; theſe are very ſtout, much thicker at the back-part, and channelled, inclining to an edge forwards. The fins are ſeven in number—viz. two dorſal, placed at ſome diſtance from each other—two pectoral, taking riſe juſt behind the breathing-holes, which are five in number—two ventral, ſituated almoſt underneath the firſt dorſal—and laſtly the caudal, occupying the tail both above and beneath, but longeſt on the upper part. The general colour of the body is a dull grey, or browniſh, growing paler as it approaches the belly, where it is nearly white. 2. *Pectinatus*, which, with the former ſpecies, grows to the largeſt ſize of any that have yet come under the inſpection of the naturaliſt, ſome ſpecimens meaſuring 15 feet in length. The pectinatus differs from the priſtis antiquorum, in having the ſnout more narrow in proportion at the baſe, and the whole of it more ſlender in all its parts; whereas the firſt is very broad at the baſe, and tapers conſiderably from thence to the point. The ſpines on each ſide alſo are longer and more ſlender, and vary from 25 to 34 in the different ſpecimens: we have indeed been informed of one which contained no leſs than 36 ſpines on each ſide of the ſnout; but we muſt confeſs that we have never been fortunate enough to have ſeen ſuch a ſpecimen. 3. *Cuſpidatus*, of which our author has ſeen only two ſpecimens, the one about a foot and a half in length, and the other more than two feet and a half. In both of theſe were 28 ſpines on each ſide; but the diſtinguiſhing feature is in the ſpines themſelves, being particularly flat and broad, and ſhaped at the point more like the lancet uſed by ſurgeons in bleeding, than any other figure. We believe that no other author has hitherto taken notice of this ſpecies. 4. *Microdon*, of which the total length is 28 inches, the ſnout occupying 10; from the baſe of this to that of the pectoral fins four inches; between the pectoral and ventral fins ſix. The two dorſal fins occupy nearly the ſame proportions in reſpect to each other; but the hinder one is the ſmalleſt, and all of them are greatly hollowed out at the back-part, much more ſo than in the two firſt ſpecies. The ſnout differs from that of every other, in ſeveral particulars: it is longer in proportion, being more than one-third of the whole fiſh. The ſpines do not ſtand out from the ſides more than a quarter of an inch, and from this circumſtance ſeem far leſs capable of doing injury than any other ſpecies yet known. 5. *Cirratus*, of which, continues our author, we have only met with one ſpecimen, which was brought from Port Jackſon in New Holland. It is a male, and the total length about 40 inches: the ſnout, from the tip of it to the eye, 11: the ſpines widely different from any of the others; they are indeed placed, as uſual, on the edge, but are continued on each ſide even beyond the eyes. The longer ones are ſlender, ſharp, ſomewhat bent, and about 20 in number; and between theſe are others not half the length of the primal ones, between ſome three or four, between others as far as ſix; and in general the middle one of theſe ſmaller ſeries is the longeſt: beſide theſe a

ſeries of minute ones may be perceived beneath, at the very edge. In the ſnout likewiſe another ſingularity occurs:—about the middle of it, on each ſide, near the edge, ariſes a flexible, ligamentous cord, about three inches and a half in length, appearing not unlike the beards at the mouth of ſome of the gadus or cod genus, and no doubt as pliant in the recent ſtate. The colour of the fiſh is a pale brown: the breathing apertures four in number: the mouth furniſhed with five rows of minute, but very ſharp teeth. See Plate CCCCXVI. where the ſnout marked 1 is that of the priſtis antiquorum; that marked 2, of pectinatus; and that marked 4, of microdon: the entire fiſh is the cirratus.

PRIVATEERS, are a kind of private men of war, the perſons concerned wherein adminiſter at their own coſts a part of a war, by fitting out theſe ſhips of force, and providing them with all military ſtores; and they have, inſtead of pay, leave to keep what they take from the enemy, allowing the admiral his ſhare, &c.

Privateers may not attempt any thing againſt the laws of nations; as to aſſault an enemy in a port or haven, under the protection of any prince or republic, whether he be friend, ally, or neuter; for the peace of ſuch places muſt be inviolably kept: therefore, by a treaty made by King William and the States of Holland, before a commiſſion ſhall be granted to any privateer, the commander is to give ſecurity, if the ſhip be not above 150 tons, in L. 1500, and if the ſhip exceeds that burden, in L. 3000, that they will make ſatisfaction for all damages which they ſhall commit in their courſes at ſea, contrary to the treaties with that ſtate, on pain of forfeiting their commiſſions; and the ſhip is made liable.

Jacob's Law Dict.

Beſides theſe private commiſſions, there are ſpecial commiſſions for privateers, granted to commanders of ſhips, &c. who take pay; who are under a marine diſcipline; and if they do not obey their orders, may be puniſhed with death: and the wars in later ages have given occaſion to princes to iſſue theſe commiſſions, to annoy the enemies in their commerce, and hinder ſuch ſupplies as might ſtrengthen them or lengthen out the war; and likewiſe to prevent the ſeparation of ſhips of greater force from their fleets or ſquadrons.

Ships taken by Britiſh privateers were to be divided into five parts; four parts whereof to go to the perſons intereſted in the privateer, and the fifth to his Majeſty: and as a farther encouragement, privateers, &c. deſtroying any French man of war or privateer, ſhall receive, for every piece of ordnance in the ſhip ſo taken, L. 10 reward, &c.

By a particular ſtatute lately made, the lord admiral, or commiſſioners of the admiralty, may grant commiſſions to commanders of privateers, for taking ſhips, &c. which being adjudged prize, and the tenth part paid to the admiral, &c. wholly belong to the owners of the privateers and the captors, in proportions agreed on between themſelves.

PRIVATION, in a general ſenſe, denotes the abſence or want of ſomething; in which ſenſe darkneſs is only the privation of light.

PRIVATIVE, in grammar, a particle, which, prefixed to a word, changes it into a contrary ſenſe. Thus, among the Greeks, the α is uſed as a primitive; as in α-θεος, *atheiſt*, *acephalus*, &c.——The Latins have their privitive *in*; as *incorrigibilis*, *indeclinabilis*, &c.——The Engliſh, French, &c. on occaſion borrow both the Latin and Greek privatives.

PRIVERNUM, (Livy, Virgil); a town of the Volſci, in Latium, to the eaſt of Setia. *Privernates*, the people. Whoſe ambaſſadors being aſked, What puniſhment they deſerved for their revolt? anſwered, What thoſe deſerve who deem themſelves worthy of liberty. And again, being aſked by the Roman conſul, ſhould the puniſhment be remitted, What peace was to be expected with them? If you grant a good peace, you may hope to have it ſincere and laſting; but if a bad one, you may well expect it of ſhort continuance. At which anſwer, the Romans were ſo far from being diſpleaſed, that by a vote of the people they had the freedom of the city granted them. *Privernas, atis*, the epithet. The town is now called *Piperno Vecchio*, ſituated in the Campania of Rome. E. Long. 10. 0. N. Lat. 41. 30.

PRIVET, in botany. See LIGUSTRUM.

PRIVILEGE, in law, ſome peculiar benefit granted to certain perſons or places, contrary to the uſual courſe of the law.

Privileges are ſaid to be *perſonal* or *real*.

Perſonal privileges are ſuch as are extended to peers, ambaſſadors, members of parliament, and of the convocation, &c. See LORDS, AMBASSADOR, PARLIAMENT, ARREST, &c.

A *real* privilege is that granted to ſome particular place; as the king's palace, the courts at Weſtminſter, the univerſities, &c.

PRIVILEGES of the Clergy. See CLERGY.

PRIVY, in law, is a partaker, or perſon having an intereſt, in any action or thing. In this ſenſe they ſay, privies in blood: every heir in tail is privy to recover the land intailed. In old law-books, merchants privy are oppoſed to merchants ſtrangers. Coke mentions four kinds of privies. Privies in blood, as the heir to his father; privies in repreſentation, as executors and adminiſtrators to the deceaſed; privies in eſtate, as he in reverſion, and he in remainder; donor and donee; leſſor and leſſee: laſtly, privy in tenure, as the lord by eſcheat; *i. e.* when land eſcheats to the lord for want of heirs.

PRIVY-Council. See COUNCIL. The king's will is the ſole conſtituent of a privy-counſellor; and it alſo regulates their number, which in ancient times was about twelve. Afterwards it increaſed to ſo large a number, that it was found inconvenient for ſecrecy and diſpatch; and therefore Charles II. in 1679, limited it to 30; whereof 15 were principal officers of ſtate, and to be counſellors *ex officio*; and the other 15 were compoſed of 10 lords and five commoners of the king's chooſing. Since that time however the number has been much augmented, and now continues indefinite. At the ſame time alſo, the ancient office of lord preſident of the council was revived, in the perſon of Anthony earl of Shafteſbury. Privy-counſellors are made by the king's nomination, without either patent or grant; and, on taking the neceſſary oaths, they become immediately privy-counſellors during the life of the king that chooſes them, but ſubject to removal at his diſcretion.

Privy.

Privy ‖ Proa.

Any natural born ſubject of England is capable of being a member of the privy-council; taking the proper oaths for ſecurity of the government, and the teſt for ſecurity of the church. By the act of ſettlement, 12 and 13 W. III. cap. 2. it is enacted, that no perſon born out of the dominions of the crown of England, unleſs born of Engliſh parents, even though naturalized by parliament, ſhall be capable of being of the privy-council. The duty of a privy-counſellor appears from the oath of office, which conſiſts of ſeven articles. 1. To adviſe the king according to the beſt of his cunning and diſcretion. 2. To adviſe for the king's honour and good of the public, without partiality, through affection, love, meed, doubt, or dread. 3. To keep the king's counſel ſecret. 4. To avoid corruption. 5. To help and ſtrengthen the execution of what ſhall be there reſolved. 6. To withſtand all perſons who would attempt the contrary. And, laſtly, in general, 7. To obſerve, keep, and do all that a good and true counſellor ought to do to his ſovereign lord.

The privy-council is the *primum mobile* of the ſtate, and that which gives the motion and direction to all the inferior parts. It is likewiſe a court of juſtice of great antiquity; the primitive and ordinary way of government in England being by the king and privy-council. It has been frequently uſed by all their kings for determining controverſies of great importance: the ordinary judges have ſometimes declined giving judgment till they had conſulted the king and privy-council; and the parliament have frequently referred matters of high moment to the ſame, as being by long experience better able to judge of, and, by their ſecrecy and expedition, to tranſact ſome ſtate affairs, than the lords and commons. At preſent, the privy-council takes cognizance of few or no matters except ſuch as cannot well be determined by the known laws and ordinary courts; ſuch as matters of complaint and ſudden emergencies: their conſtant buſineſs being to conſult for the public good in affairs of ſtate. This power of the privy-council is to inquire into all offences againſt the government, and to commit the offenders to ſafe cuſtody, in order to take their trial in ſome of the courts of law. But their juriſdiction herein is only to inquire, and not to puniſh; and the perſons committed by them are intitled to their *habeas corpus* by ſtatute 16 Car. I. cap. 10. as much as if committed by an ordinary juſtice of the peace.

In plantation or admiralty cauſes, which ariſe out of the juriſdiction of the kingdom, and in matters of lunacy and idiocy, the privy-council has cognizance, even in queſtions of extenſive property, being the court of appeal in ſuch cauſes; or, rather, the appeal lies to the king's majeſty himſelf in council. From all the dominions of the crown, excepting Great Britain and Ireland, an appellate juriſdiction (in the laſt reſort) is veſted in this tribunal; which uſually exerciſes its judicial authority in a committee of the whole privy-council, who hear the allegations and proofs, and make their report to his majeſty in council, by whom the judgment is finally given.

Anciently, to ſtrike in the houſe of a privy-counſellor, or elſewhere in his preſence, was grievouſly puniſhed: by 3 Hen. VII. cap. 14. if any of the king's ſervants of his houſehold conſpire or imagine to take away the life of a privy-counſellor, it is felony, though nothing ſhall be done upon it; and by 9 Ann. cap. 16. it is enacted, that any perſons who ſhall unlawfully attempt to kill, or ſhall unlawfully aſſault, and ſtrike, or wound, any privy-counſellor in the execution of his office, ſhall be felons, and ſuffer death as ſuch. With advice of this council, the king iſſues proclamations that bind the ſubject, provided they be not contrary to law. In debates, the loweſt delivers his opinion firſt, the king laſt; and thereby determines the matter. A council is never held without the preſence of a ſecretary of ſtate.

The diſſolution of the privy-council depends upon the kings pleaſure; and he may, whenever he thinks proper, diſcharge any particular member, or the whole of it, and appoint another. By the common law alſo it was diſſolved *ipſo facto* by the king's demiſe, or deriving all its authority from him. But now, to prevent the inconveniences of having no council in being at the acceſſion of a new prince, it is enacted, by 6 Ann, cap. 7. that the privy-council ſhall continue for ſix months after the demiſe of the crown, unleſs ſooner determined by the ſucceſſor. *Blackſt. Com.* book i. p. 229, &c.

The officers of the privy-council are four clerks of the council in ordinary, three clerks extraordinary, a keeper of the records, and two keepers of the council-chamber. See PRESIDENT.

PRIVY Seal, a ſeal which the king uſes previouſly to ſuch grants, &c. as are afterwards to paſs the great ſeal.

The privy ſeal is alſo ſometimes uſed in matters of leſs conſequence, which do not require the great ſeal.

Lord PRIVY Seal. See *KEEPER of the Privy Seal.*

Clerks of the PRIVY Seal. See CLERK.

PRIVY Chamber. See CHAMBER.

PRIZE, or PRISE, in maritime affairs, a veſſel taken at ſea from the enemies of a ſtate, or from pirates; and that either by a man of war, a privateer, &c. having a commiſſion for that purpoſe.

Veſſels are looked on as prize, if they fight under any other ſtandard than that of the ſtate from which they have their commiſſion; if they have no charter-party, invoice, or bill of lading aboard; if loaded with effects belonging to the king's enemies, or with contraband goods.

In Britiſh ſhips of war, the priſes are to be divided among the officers, ſeamen, &c. as his majeſty ſhall appoint by proclamation; but among privateers, the diviſion is according to the agreement between the owners.

By ſtat. 13. Geo. II. c. 4. judges and officers, failing of their duty in reſpect to the condemnation of prizes, forfeit L. 500, with full coſts of ſuit; one moiety to the king, and the other to the informer.

PROA, FLYING, in navigation, is a name given to a veſſel uſed in the ſouth ſeas, becauſe with a briſk trade-wind it ſails near 20 miles an hour. In the conſtruction of the proa, the head and ſtern are exactly alike, but the ſides are very different; the ſide intended to be always the lee-ſide being flat; and the windward ſide made rounding, in the manner of other veſſels; and, to prevent her over-ſetting, which from her ſmall breadth, and the ſtraight run of her leeward ſide, would, without this precaution, infallibly happen, there is a frame laid out to her from windward, to the end of which is faſtened a log, faſhioned into the ſhape of a ſmall boat, and made hollow. The weight of the frame

frame is intended to balance the proa, and the ſmall boat is by its buoyancy (as it is always in the water) to prevent her overſetting to windward; and this frame is uſually called an outrigger. The body of the veſſel is made of two pieces joined endwiſe, and ſewed together with bark, for there is no iron uſed about her; ſhe is about two inches thick at the bottom, which, at the gunwale, is reduced to leſs than one. The ſail is made of matting, and the maſt, yard, boom, and outriggers, are all made of bamboo. See *Anſon's Voyage*, quarto, p. 341.

PROBABILITY is a word of nearly the ſame import with likelihood. It denotes the appearance of truth, or that evidence ariſing from the preponderation of argument which produces opinion. (See OPINION.) Locke claſſes all arguments under the heads of *demonſtrative* and *probable*: Hume with greater accuracy divides them into *demonſtrations*, *proofs*, and *probabilities*. Demonſtration produces *ſcience*; proof, *belief*; and probability, *opinion*.

Hardly any thing is ſuſceptible of ſtrict demonſtration beſides the mathematical ſciences, and a few propoſitions in metaphyſical theology. Phyſics reſt upon principles capable, ſome of them, of complete proof by experience, and others of nothing more than probability by analogical reaſoning. What has *uniformly* happened, we expect with the fulleſt confidence to happen again in ſimilar circumſtances; what has *frequently* happened, we likewiſe expect to happen again; but our expectation is not confident. Uniform experience is proof; frequent experience is probability. The ſtrongeſt man has *always* been able to lift the greateſt weight; and therefore, knowing that one man is ſtronger than another, we expect, with confidence, that the former will lift more than the latter. The beſt diſciplined army has *generally* proved victorious, when all other circumſtance were equal. We therefore expect that an army of veterans will, upon fair ground, defeat an equal number of new levied troops: but as ſudden panics have ſometimes ſeized the oldeſt ſoldiers, this expectation is accompanied with doubt, and the utmoſt that we can ſay of the expected event is, that it is *probable*; whereas in the competitions between the two men, we look upon it as *morally certain*. (See METAPHYSICS, part 1. chap. vii. ſec. 3.) When two or three perſons of known veracity atteſt the ſame thing as conſiſtent with their knowledge, their teſtimony amounts to *proof*, if not contradicted by the teſtimony of others; if contradicted, it can, at the utmoſt, amount only to probability. In common language we talk of *circumſtantial* proofs and *preſumptive* proofs; but the expreſſions are improper, for ſuch evidence amounts to nothing more than probability. Of probability there are indeed various degrees from the confines of certainty down to the confines of impoſſibility; and a variety of circumſtances tending to the ſame point, though they amount not to what, in ſtrictneſs of language, ſhould be called *proof*, afford to the mind a very high degree of evidence, upon which, with the addition of one direct teſtimony, the laws of many countries take away the life of a man.

PROBABILITY *of an Event*, in the *Doctrine of Chances*, is greater or leſs according to the number of chances by which it may happen or fail. (See EXPECTATION). The *probability of life* is liable to the rules of computation. In the *Encyclopedie Methodique*, we find a table of the probabilities of the duration of life, conſtructed from that which is to be found in the ſeventh volumee of the *Supplemens à l'Hiſtoire de M. de Buffon*; of which the following is an abridgement.

Of 23,994 children born at the ſame time, there will probably die

$\frac{1}{3}$	In one year - -	7998
$\frac{2}{3}$	Remaining $\frac{2}{3}$ or 15996	
$\frac{1}{2}$	In eight years - -	11997
$\frac{1}{2}$	Remaining $\frac{1}{2}$ or 11997	
$\frac{2}{3}$	In thirty eight years -	15996
$\frac{1}{3}$	Remaining $\frac{1}{3}$ or 7998	
$\frac{3}{4}$	In fifty years -	17994
$\frac{1}{4}$	Remaining $\frac{1}{4}$ or 5998	
$\frac{5}{6}$	In ſixty one years -	19995
$\frac{1}{6}$	Remaining $\frac{1}{6}$ or 3999	
$\frac{9}{10}$	In ſeventy years -	21595
$\frac{1}{10}$	Remaining $\frac{1}{10}$ or 2399	
$\frac{39}{40}$	In eighty years -	22395
$\frac{1}{40}$	Remaining $\frac{1}{40}$ or 599	
$\frac{299}{300}$	In ninety years -	23914
$\frac{1}{300}$	Remaining $\frac{1}{300}$ or 80	
	In an hundred years -	23992

Remaining $\frac{1}{10000}$ or 2. See *Bills of* MORTALITY.

PROBATE of a will or teſtament, in law, is the exhibiting and proving of laſt wills and teſtaments before the officer delegated by the government of the place where the party died.

PROBATION, in the univerſities, is the examination and trial of a ſtudent who is about to take his degrees.

PROBATION, in a monaſtic ſenſe, ſignifies the year of a novitiate, which a religious muſt paſs in a convent, to prove his virtue and vocation, and whether he can bear the ſeverities of the rule.

PROBATION, in Scots law. See LAW, p. 714.

PROBATIONER, in the church of Scotland, a ſtudent in divinity, who bringing a certificate from a profeſſor in an univerſity of his good morals, and his having performed his exerciſes to approbation, is admitted to undergo ſeveral trials; and, upon his acquitting himſelf properly in theſe, receives a licence to preach.

PROBATUM EST *(It is proved)*, a term frequently ſubjoined to a receipt for the cure of ſome diſeaſe.

PROBE, a ſurgeon's inſtrument for examining the circumſtances of wounds, ulcers, and other cavities, ſearching for ſtones in the bladder, &c.

PROBITY means honeſty, ſincerity, or veracity; and conſiſts in the habit of actions uſeful to ſociety, and in the conſtant obſervance of the laws which juſtice and conſcience impoſe on us. The man who obeys all the laws of ſociety, with an exact punctuality is not therefore a man of probity; laws can only reſpect the external and definite parts of human conduct, but probity reſpects our more private actions, and ſuch as it is impoſſible in all caſes to define; and it appears to be in morals what charity is in religion. Probity teaches us to perform in ſociety thoſe actions which no external power can oblige us to perform, and is that quality in the human mind from which we claim the performance of the *rights* commonly called *imperfect*. See MORAL PHILOSOPHY.

PROBLEM, in logic, is a propoſition that neither appears abſolutely true nor falſe; and, conſequently, may be aſſerted either in the affirmative or negative.

Problem, in geometry, is a propoſition, wherein ſome operation or conſtruction is required; as to divide a line or angle, erect or let fall perpendiculars, &c. See Geometry.

PROBOSCIS, in natural hiſtory, is the trunk or ſnout of an elephant, and ſome other animals and inſects.

Flies, gnats, &c. are furniſhed with a proboſcis or trunk; by means of which they ſuck the blood of animals, the juice of vegetables, &c. for their food.

PROBUS (Marcus Aurelius), from the ſon of a gardener, became, by his great valour as a ſoldier, and his eminent virtues, emperor of Rome, to which dignity he was raiſed by the army. After having ſubdued the barbarous nations that had made incurſions into different parts of the empire, where they committed horrid cruelties, and governed with great wiſdom and clemency, he was maſſacred in the 7th year of his reign, by ſome ſoldiers who were weary of the public works at which he made them labour, in 282.

POCATARCTIC cause, in medicine, the pre-exiſting, or prediſpoſing cauſe or occaſion of a diſeaſe.

PROCELEUSMATICUS, in the ancient poetry, a foot conſiſting of four ſhort ſyllables, or two pyrrhychiuſes; as *hominibus*.

PROCELLARIA, in ornithology; a genus of birds, belonging to the order of anſeres. The beak is ſomewhat compreſſed, and without teeth; the mandibles are equal, the ſuperior one being crooked at the point; the feet are palmated, the hind claw being ſeſſile, without any toe. Mr Latham (See his *Index Ornithologicus*, p. 820.) enumerates 24 ſpecies, which are principally diſtinguiſhed by their colour. The moſt remarkable are,

1. The cinerea, or petrel. The ſize of this bird is rather ſuperior to that of the common gull: the bill very ſtrong, much hooked at the end, and of a yellow colour. The noſtrils are compoſed of two large tubes, lodged in one ſheath: the head, neck, whole under ſide of the body, and tail, are white: the back and coverts of the wings aſh-coloured: the quill-feathers duſky: and the legs yellowiſh. In lieu of a back toe, it has only a ſort of ſpur, or ſharp ſtraight nail. Theſe birds feed on the blubber or fat of whales, &c. which being ſoon convertible into oil, ſupplies them conſtantly with means of defence, as well as proviſion for their young, which they caſt up into their mouths. They are likewiſe ſaid to feed on ſorrel, which they uſe to qualify the unctuous diet they live on. This ſpecies inhabits the iſle of St Kilda; makes its appeance there in November, and continues the whole year, except September and October; it lays a large, white, and very brittle egg; and the young are hatched the middle of June. No bird is of ſuch uſe to the iſlanders as this: the fulmar ſupplies them with oil for their lamps, down for their beds, a delicacy for their tables, a balm for their wounds, and a medicine for their diſtempers. The fulmar is alſo a certain prognoſticator of the change of the wind: if it comes to land, no weſt wind is expected for ſome time; and the contrary when it returns and keeps the ſea. The whole genus of petrels have a peculiar faculty of ſpouting from their bills, to a conſiderable diſtance, a large quantity of pure oil; which they do, by way of defence, into the face of any one that attempts to take them: ſo that they are, for the ſake of this panacæa, ſeized by ſurpriſe; as this oil is ſubſervient to the abovementioned medical purpoſes. Martin tells us, it has been uſed in London and Edinburgh with ſucceſs in rheumatic caſes. Frederick Martens, who had opportunity of ſeeing vaſt numbers of theſe birds at Spitzbergen, obſerves, that they are very bold, and reſort after the whale-fiſhers in great flocks; and that, when a whale is taken, they will, in ſpite of all endeavours, light on it and pick out large lumps of fat, even when the animal is alive: That the whales are often diſcovered at ſea by the multitudes of them flying; and that when one of the former are wounded, prodigious multitudes immediately follow its bloody track. He adds, that it is a moſt gluttonous bird, eating till it is forced to diſgorge itſelf.

2. The puffinus, or ſhear-water, is 15 inches in length; the breadth 31; the weight 17 ounces: the bill is an inch and three quarters long; noſtrils tubular, but not very prominent: the head, and whole upper ſide of the body, wings, tail, and thighs, are of a ſooty blackneſs; the under ſide from chin to tail, and inner coverts of the wings, white: the legs weak, and compreſſed ſidewiſe; duſky behind, whitiſh before. Theſe birds are found in the Calf of Man; and, as Mr Ray ſuppoſes, in the Scilly iſles. They reſort to the former in February; take a ſhort poſſeſſion of the rabbet-burrows, and then diſappear till April. They lay one egg, white and blunt at each end; and the young are fit to be taken the beginning of Auguſt; when great numbers are killed by the perſon who farms the iſle: they are ſalted and barrelled; and when they are boiled, are beaten with potatoes. During the day they keep at ſea, fiſhing; and towards evening return to their young; whom they feed, by diſcharging the contents of their ſtomachs into their mouths; which by that time is turned into oil: by reaſon of the backward ſituation of their legs, they ſit quite erect. They quit the iſle the latter end of Auguſt, or beginning of September; and, from accounts lately received from navigators, we have reaſon to imagine that like the ſtorm-finch, they are diſperſed over the whole Atlantic ocean. This ſpecies inhabits alſo the Orkney iſles, where it makes its neſt in holes on the earth near the ſhelves of the rocks and headlands: it is called there the *lyre*; and is much valued, both on account of its being a food, and for its feathers. The inhabitants take and ſalt them in Auguſt for winter proviſions, when they boil them with cabbage. They alſo take the old ones in March; but they are then poor, and not ſo well taſted as the young: they appear firſt in thoſe iſlands in February.

3. The pelagica, or ſtormy petrel, is about the bulk of the houſe-ſwallow: the length ſix inches; the extent of wings, 13. The whole bird is black except the coverts of the tail and vent-feathers, which are white: the bill is hooked at the end: the noſtrils tubular: the legs ſlender, and long. It has the ſame faculty of ſpouting oil from its bill as the other ſpecies: and Mr Brunnich tells us, that the inhabitants of the Ferroe iſles make this bird ſerve the purpoſes of a candle, by drawing a wick through the mouth and rump, which being lighted, the flame is fed by the fat and oil of the body. Except in breeding-time, it is always at ſea; and is ſeen all over the vaſt Atlantic ocean, at the greateſt

diſtance

Procellaria.
Proceſs.

diſtance from land; often following the veſſels in great flocks, to pick up any thing that falls from on board: for trial ſake, chopped ſtraw has been flung over, which they would ſtand on with expanded wings; but were never obſerved to ſettle on or ſwim in the water: it preſages bad weather, and cautions the ſeamen of the approach of a tempeſt, by collecting under the ſtern of the ſhips: it braves the utmoſt fury of the ſtorm, ſometimes ſkimming with incredible velocity along the hollows of the waves, ſometimes on the ſummits: Cluſius makes it the Camilla of the ſea.

Vel mare per medium fluctu ſuſpenſa tumenti
Ferret iter, celeres nec tingeret æquore plantas. VIRG.

She ſwept the ſeas; and, as ſhe ſkimm'd along,
Her flying feet unbath'd on billows hung. DRYDEN.

Theſe birds are the *cypſelli* of Pliny, which he places among the *apodes* of Ariſtotle; not becauſe they wanted feet, but were Κακοποδα, or had bad or uſeleſs ones; an attribute he gives to theſe ſpecies, on a ſuppoſition that they were almoſt always on the wing. In Auguſt 1772, Mr Pennant found them on the rocks called *Macdonald's Table*, off the north end of the iſle of Skie; ſo conjectures they breed there. They lurked under the looſe ſtones, but betrayed themſelves by their twittering noiſe.

In Mr White's *Journal of a Voyage to New South Wales* we have a figure of the fuliginous petrel, with a whitiſh beak; which he takes to be a variety of the *Procellaria Æquinoctialis* of Linnæus. It is nearly of the ſize of a raven; its colour is a deep ſooty brown or blackiſh; on the chin there is a ſmall patch of white running down a little on each ſide from the lower mandible; the beak is of a yellowiſh white. See Plate CCCCXVI. Captain Bligh, in his *Voyage to the South Seas*, in S. Lat. 60. 1. and W. Long. 71. 45. ſaw both petrels and pintadas; ſome of which he took with baited hooks.

PROCESS, in law, denotes the proceedings in any cauſe, real or perſonal, civil or criminal, from the original writ to the end thereof.

In a more limited ſenſe, proceſs denotes that by which a man is called firſt into any temporal court.

It is the next ſtep for carrying on the ſuit, after ſuing out the original writ. See SUIT and WRIT.

Blackſt. Comment.

It is the method taken by the law to compel a compliance with the original writ, of which the primary ſtep is by giving the party notice to obey it. This notice is given upon all real *præcipes*; and alſo upon all perſonal writs for injuries not againſt the peace, by *ſummons*; which is a warning to appear in court at the return of the original writ, given to the defendant by two of the ſheriff's meſſengers called *ſummoners*, either in perſon, or left at his houſe or land: in like manner as in the civil law the firſt proceſs is by perſonal citation, *in jus vocando*. This warning on the land is given, in real actions, by erecting a white ſtick or wand on the defendant's grounds (which ſtick or wand among the northern nations is called the *baculus nunciatorius*), and by ſtatute 31 Eliz. c. 3. the notice muſt alſo be proclaimed on ſome Sunday before the door of the pariſh-church.

If the defendant diſobeys this verbal monition, the next proceſs is by writ of *attachment* or *pone*; ſo called from the words of the writ, *pone per vadium et ſalvos plegios*, "put by gage and ſafe pledges A. B. the defendant," &c. This is a writ not iſſuing out of chancery, but out of the court of common-pleas, being grounded on the non-appearance of the defendant at the return of the original writ; and thereby the ſheriff is commanded to attach him, by taking *gage*, that is, certain of his goods, which he ſhall forfeit if he doth not appear; or by making him find *ſafe pledges* or ſureties, which ſhall be amerced in caſe of his non-appearance. This is alſo the firſt and immediate proceſs, without any previous ſummons, upon actions of treſpaſs *vi et armis*, or for other injuries, which, though not forcible, are yet treſpaſſes againſt the peace, as *deceit* and *conſpiracy*; where the violence of the wrong requires a more ſpeedy remedy, and therefore the original writ commands the defendant to be at once attached, without any precedent warning.

If, after attachment, the defendant neglects to appear, he not only forfeits this ſecurity, but is moreover to be farther compelled by writ of *diſtringas*, or diſtreſs infinite: which is a ſubſequent proceſs iſſuing from the court of common-pleas, commanding the ſheriff to diſtrain the defendant from time to time, and continually afterwards, by taking his goods and the profits of his lands, which are called *iſſues*, and which he forfeits to the king if he doth not appear. But the iſſues may be ſold, if the court ſhall ſo direct, in order to defray the reaſonable coſts of the plaintiff. In like manner, by the civil law, if the defendant abſconds, ſo that the citation is of no effect, *mittitur adverſarius in poſſeſſionem bonorum ejus*.

And here, by the common as well as the civil law, the proceſs ended in caſe of injuries without force: the defendant if he had any ſubſtance, being gradually ſtripped of it all by repeated diſtreſſes, till he rendered obedience to the king's writ; and, if he had no ſubſtance, the law held him incapable of making ſatisfaction, and therefore looked upon all further proceſs as nugatory. And beſides, upon feodal principles, the perſon of a feudatory was not liable to be attached for injuries merely civil, leſt thereby his lord ſhould be deprived of his perſonal ſervices. But, in caſes of injury accompanied with force, the law, to puniſh the breach of the peace and prevent its diſturbance for the future, provided alſo a proceſs againſt the defendant's perſon, in caſe he neglected to appear upon the former proceſs of attachment, or had no ſubſtance whereby to be attached; ſubjecting his body to impriſonment by the writ of *capias ad reſpondendum*. But this immunity of the defendant's perſon, in caſe of peaceable though fraudulent injuries, producing great contempt of the law in indigent wrongdoers, a *capias* was alſo allowed, to arreſt the perſon in actions of account, though no breach of the peace be ſuggeſted, by the ſtatutes of Marlbridge, 52 Hen. III. c. 23. and Weſtm. 2. 13 Edw. I. c. 11. in actions of debt and detinue, by ſtatute 25 Edw. III. c. 17. and in all actions on the caſe, by ſtatute 19 Hen. VII. c. 9. Before which laſt ſtatute a practice had been introduced of commencing the ſuit by bringing an original writ of treſpaſs *quare clauſum fregit*, by breaking the plaintiff's cloſe, *vi et armis*; which by the old common law ſubjected the defendant's perſon to be arreſted by writ of *capias*: and then afterwards, by connivance of the court the plaintiff might proceed to proſecute for any other leſs forcible injury. This practice (through cuſtom rather than neceſſity, and for ſaving ſome trouble and expence

pence, in ſuing out a ſpecial original adapted to the particular injury) ſtill continues in almoſt all caſes, except in actions of debt; though now, by virtue of the ſtatutes above cited and others, a *capias* might be had upon almoſt every ſpecies of complaint.

If therefore the defendant, being ſummoned or attached, makes default, and neglects to appear; or if the ſheriff returns a *nihil*, or that the defendant hath nothing whereby he may be ſummoned, attached, or diſtrained, the *capias* now uſually iſſues: being a writ commanding the ſheriff to take the body of the defendant, if he may be found in his bailiwick or county, and him ſafely to keep, ſo that he may have him in court on the day of the return, to anſwer to the plaintiff of a plea of debt, or treſpaſs, &c. as the caſe may be. This writ, and all others ſubſequent to the original writ, not iſſuing out of chancery, but from the court into which the original was returnable, and being grounded on what has paſſed in that court in conſequence of the ſheriff's return, are called *judicial*, not *original*, writs; they iſſue under the private ſeal of that court, and not under the great ſeal of England; and are *teſted*, not in the king's name, but in that of the chief juſtice only. And theſe ſeveral writs being grounded on the ſheriff's return, muſt reſpectively bear date the ſame day on which the writ immediately preceding was returnable.

This is the regular and orderly method of proceſs. But it is now uſual in practice to ſue out the *capias* in the firſt inſtance, upon a ſuppoſed return of the ſheriff; eſpecially if it be ſuſpected that the defendant, upon notice of the action, will abſcond; and afterwards a fictitious original is drawn up, with a proper return thereupon, in order to give the proceedings a colour of regularity. When this *capias* is delivered to the ſheriff, he by his under-ſheriff grants a warrant to his inferior officers or bailiffs to execute it on the defendant. And, if the ſheriff of Oxfordſhire (in which county the injury is ſuppoſed to be committed and the action is laid) cannot find the defendant in his juriſdiction, he returns that he is not found, *non eſt inventus*, in his bailiwick; whereupon another writ iſſues, called a *teſtatum capias*, directed to the ſheriff of the county where the defendant is ſuppoſed to reſide, as if Berkſhire, reciting the former writ, and that it is teſtified, *teſtatum eſt*, that the defendant lurks or wanders in his bailiwick, where he is commanded to take him, as in the former *capias*. But here alſo, when the action is brought in one county and the defendant lives in another, it is uſual, for ſaving trouble, time, and expence, to make out a *teſtatum capias* at the firſt; ſuppoſing not only an original, but alſo a former *capias*, to have been granted; which in fact never was. And this fiction, being beneficial to all parties, is readily acquieſced in, and is now become the ſettled practice; being one among many inſtances to illuſtrate that maxim of law, that *in fictione juris conſiſtit æquitas*.

But where a defendant abſconds, and the plaintiff would proceed to an outlawry againſt him, an original writ muſt then be ſued out regularly, and after that a *capias*. And if the ſheriff cannot find the defendant upon the firſt writ of *capias*, and returns a *non eſt inventus*, there iſſues out an *alias* writ, and after that a *pluries*, to the ſame effect as the former: only after theſe words "we command you," this clauſe is inſerted, "as we have formerly," or, "as we have often commanded you;"—"*ſicut* alias," or, "*ſicut* pluries, *præcepimus*." And if a *non eſt inventus* is returned upon all of them, then a writ of *exigent* or *exigi facias* may be ſued out, which requires the ſheriff to cauſe the defendant to be proclaimed, required, or exacted, in five county-courts ſucceſſively, to render himſelf; and if he does, then to take him, as in a *capias*: but if he does not appear, and is returned *quinto exactus*, he ſhall then be outlawed by the coroners of the county. Alſo by ſtatute 6 Hen. VIII. c. 4. and 31 Eliz. c. 3. whether the defendant dwells within the ſame or another county than that wherein the *exigent* is ſued out, a *writ of proclamation* ſhall iſſue out at the ſame time with the *exigent*, commanding the ſheriff of the county, wherein the defendant dwells, to make three proclamations thereof in places the moſt notorious, and moſt likely to come to his knowledge, a month before the outlawry ſhall take place. Such outlawry is putting a man out of the protection of the law, ſo that he is incapable to bring an action for redreſs of injuries; and it is alſo attended with a forfeiture of all one's goods and chattels to the king. And therefore, till ſome time after the conqueſt, no man could be outlawed but for felony: but in Bracton's time, and ſomewhat earlier, proceſs of outlawry was ordained to lie in all actions for treſpaſſes *vi et armis*. And ſince, by a variety of ſtatutes (the ſame which allow the writ of *capias* before-mentioned) proceſs of outlawry doth lie in divers actions that are merely civil; providing they be commenced by original and not by bill. If after outlawry the defendant appears publicly, he may be arreſted by a writ of *capias utlagatum*, and committed till the outlawry be reverſed. Which reverſal may be had by the defendant's appearing perſonally in court (and in the king's bench without any perſonal appearance, ſo that he appears by attorney, according to ſtatute 4 & 5 W. & M. c. 18.) and any plauſible cauſe, however ſlight, will in general be ſufficient to reverſe it, it being conſidered only as a proceſs to compel an appearance. But then the defendant muſt pay full coſts, and put the plaintiff in the ſame condition as if he had appeared before the writ of *exigi facias* was awarded.

Such is the firſt proceſs in the court of common pleas. In the king's bench they may alſo (and frequently do) proceed in certain cauſes, particularly in actions of ejectment and treſpaſs, by *original* writ, with *attachment* and *capias* thereon; returnable, not at Weſtminſter, where the common pleas are now fixed in conſequence of *magna charta*, but *ubicunque fuerimus in Anglia*, whereſoever the king ſhall then be in England; the king's bench being removable into any part of England at the pleaſure and diſcretion of the crown. But the more uſual method of proceeding therein is without any original but by a peculiar ſpecies of proceſs intitled a *bill of Middleſex*; and therefore ſo intitled, becauſe the court now ſits in that county; for if it ſat in Kent, it would then be a bill of Kent. For though, as the juſtices of this court have, by its fundamental conſtitution, power to determine all offences and treſpaſſes, by the common law and cuſtom of the realm, it needed no original writ from the crown to give it cognizance of any miſdemeſnor in the county wherein it reſides; yet as, by this court's coming into any county, it immediately ſuperſeded the ordinary adminiſtration of juſtice by the general commiſſions of *eyre* and of *oyer and terminer*, a proceſs of its own became neceſſary, within the county it ſat, to bring in ſuch perſons as were accuſed of committing any forcible injury. The bill of Middleſex (which was formerly always founded on a plaint of treſpaſs *quare clauſum fregit*, entered on the records of the court) is a kind of *capias*, directed to the ſheriff of that county, and commanding him to take the defendant, and have him before his lord the king at Weſtminſter on a day prefixed, to anſwer to the plaintiff of a plea of treſpaſs. For this accuſation of treſpaſs it is that gives the court of king's bench juriſdiction in other civil cauſes, ſince, when once the defendant is taken into cuſtody of the marſhal, or priſon-keeper of this court, for the ſuppoſed treſpaſs, he, being then a priſoner of this court, may here be proſecuted for any other ſpecies of injury. Yet, in order to found this juriſdiction, it is not neceſſary that the defendant be actually the marſhal's priſoner; for, as ſoon as he appears, or puts in bail, to the proceſs, he is deemed by ſo doing to be in ſuch cuſtody of the marſhal as will give the court a juriſdiction to proceed. And, upon theſe accounts, in the bill or proceſs, a complaint of treſpaſs is always ſuggeſted, whatever elſe may be the real cauſe of action. This bill of Middleſex muſt be ſerved on the defendant by the ſheriff, if he finds him in that county: but if he returns, *non eſt inventus*, then there iſſues out a writ of *latitat*, to the ſheriff of another county, as Berks; which is ſimilar to the *teſtatum capias* in the common pleas, and recites the bill of Middleſex and the proceedings thereon, and that it is teſtified that the defendant *latitat et diſcurrit*, lurks and wanders about in Berks; and therefore commands the ſheriff to take him, and have his body in court on the day of the return. But as in the common pleas the *teſtatum capias* may be ſued out upon only a ſuppoſed, and not an actual preceding, *capias*; ſo in the king's bench a *latitat* is uſually ſued out upon only a ſuppoſed, and not an actual, bill of Middleſex. So that, in fact, a *latitat* may be called the firſt proceſs in the court of king's bench, as the *teſtatum capias* is in the common pleas. Yet, as in the common pleas, if the defendant lives in the county wherein the action is laid, a common *capias* ſuffices; ſo in the king's bench likewiſe, if he lives in Middleſex, the proceſs muſt ſtill be by bill of Middleſex only.

In the exchequer the firſt proceſs is by writ of *quo minus*, in order to give the court a juriſdiction over pleas between party and party. In which writ the plaintiff is alleged to be the king's farmer or debtor, and that the defendant hath done him the injury complained of, *quo minus ſufficiens exiſtit*, by which he is the leſs able to pay the king his rent or debt. And upon this the defendant may be arreſted as upon a *capias* from the common pleas.

Thus differently do the three courts ſet out at firſt, in the commencement of a ſuit, in order to intitle the two courts of king's bench and exchequer to hold plea in ſubjects cauſes, which by the original conſtitution of Weſtminſter-hall they were not empowered to do. Afterwards, when the cauſe is once drawn into the reſpective courts, the method of purſuing it is pretty much the ſame in all of them.

If the ſheriff had found the defendant upon any of the former writs, the *capias latitat*, &c. he was anciently obliged to take him into cuſtody, in order to produce him in court upon the return, however ſmall and minute the cauſe of action might be. For, not having obeyed the original ſummons, he had ſhown a contempt of the court, and was no longer to be truſted at large. But when the ſummons fell into diſuſe, and the *capias* became in fact the firſt proceſs, it was thought hard to impriſon a man for a contempt which was only ſuppoſed: and therefore, in common caſes, by the gradual indulgence of the courts (at length authoriſed by ſtatute 12 Geo. I. c. 29. which was amended by ſtatute 5. Geo. II. c. 27. and made perpetual by ſtatute 21 Geo. II. c. 3.) the ſheriff or his officer can now only perſonally ſerve the defendant with the copy of the writ or proceſs, and with notice in writing to appear by his attorney in court to defend this action; which in effect reduces it to a mere ſummons. And if the defendant thinks proper to appear upon this notice, his appearance is recorded, and he puts in ſureties for his future attendance and obedience; which ſureties are called *common bail*, being the ſame two imaginary perſons that were pledges for the plaintiff's proſecution, John Doe and Richard Roe. Or, if the defendant does not appear upon the return of the writ, or within four (or in ſome caſes eight) days after, the plaintiff may enter an appearance for him, as if he had really appeared; and may file common bail in the defendant's name, and proceed thereupon as if the defendant had done it himſelf.

But if the plaintiff will make affidavit, or aſſert upon oath, that the cauſe of action amounts to ten pounds or upwards, then in order to arreſt the defendant, and make him put in ſubſtantial ſureties for his appearance, called *ſpecial bail*, it is required by ſtatute 13 Car. II. ſtat. 2. c. 2. that the true cauſe of action ſhould be expreſſed in the body of the writ or proceſs: elſe no ſecurity can be taken in a greater ſum than L. 40. This ſtatute (without any ſuch intention in the makers) had like to have ouſted the king's bench of all its juriſdiction over civil injuries without force: for, as the bill of Middleſex was framed only for actions of treſpaſs, a defendant could not be arreſted and held to bail thereupon for breaches of civil contracts. But to remedy this inconvenience, the officers of the king's bench deviſed a method of adding what is called a clauſe of *ac etiam* to the uſual complaint of treſpaſs; the bill of Middleſex commanding the defendant to be brought in to anſwer the plaintiff of a plea of treſpaſs, *and alſo* to a bill of debt: the complaint of treſpaſs giving cognizance to the court, and that of debt authoriſing the arreſt. In imitation of which, lord chief juſtice North, a few years afterwards, in order to ſave the ſuitors of his court the trouble and expence of ſuing out ſpecial originals, directed, that in the common pleas, beſides the uſual complaint of breaking the plaintiff's cloſe, a clauſe of *ac etiam* might be alſo added to the writ of *capias*, containing the true cauſe of action; as, "that the ſaid Charles the defendant may anſwer to the plaintiff of a plea of treſpaſs in breaking his cloſe: and alſo, *ac etiam* may anſwer him, according to the cuſtom of the court, in a certain plea of treſpaſs upon the caſe, upon promiſes, to the value of L. 20, &c." The ſum ſworn to by the plaintiff is marked upon the back of the writ; and the ſheriff, or his officer the bailiff, is then obliged actually to arreſt or take into cuſtody the body of the defendant, and, having ſo done, to return the writ with a *cepi corpus* indorſed thereon. See ARREST.

When the defendant is regularly arreſted, he muſt either go to priſon, for ſafe cuſtody; or put in *ſpecial bail* to the ſheriff. For, the intent of the arreſt being only to compel an appearance in court at the return of the writ, that purpoſe is equally anſwered, whether the ſheriff detains his perſon, or takes ſufficient ſecurity for his appearance, called *bail* (from the French word *bailler*, "to deliver)," becauſe the defendant is bailed, or delivered, to his ſureties, upon their giving ſecurity for his appearance; and is ſuppoſed to continue in their friendly cuſtody inſtead of going to gaol. See Bail. The method of putting in bail to the ſheriff is by entering into a bond or obligation, with one or more ſureties, (not fictitious perſons, as in the former caſe of common bail, but real, ſubſtantial, reſponſible bondſmen), to inſure the defendant's appearance at the return of the writ; which obligation is called the *bail-bond*. The ſheriff, if he pleaſes, *may* let the defendant go without any ſureties; but that is at his own peril: for, after once taking him, the ſheriff is bound to keep him ſafely, ſo as to be forthcoming in court; otherwiſe an action lies againſt him for an eſcape. But, on the other hand, he is obliged, by ſtatute 23 Hen. VI. c. 10. to take (if it be tendered) a ſufficient bail-bond; and, by ſtatute 12 Geo. I. c. 29. the ſheriff ſhall take bail for no other ſum than ſuch as is ſworn to by the plaintiff, and indorſed on the back of the writ.

Upon the return of the writ, or within four days after, the defendant muſt *appear* according to the exigency of the writ. This *appearance* is effected by putting in and juſtifying bail *to the action;* which is commonly called *putting in bail above*. If this be not done, and the bail that were taken by the ſheriff *below* are reſponſible perſons, the plaintiff may take an aſſignment from the ſheriff of the bail-bond (under the ſtatute 4 & 5 Ann. c. 16.) and bring an action thereupon againſt the ſheriff's bail. But if the bail ſo accepted by the ſheriff be inſolvent perſons, the plaintiff may proceed againſt the ſheriff himſelf, by calling upon him, firſt to return the writ (if not already done), and afterwards to bring in the body of the defendant. And if the ſheriff does not then cauſe ſufficient bail to be put in *above*, he will himſelf be reſponſible to the plaintiff.

The bail *above*, or bail *to the action*, muſt be put in either in open court, or before one of the judges thereof; or elſe, in the country, before a commiſſioner appointed for that purpoſe by virtue of the ſtatute 4 W. & M. c. 4. which muſt be tranſmitted to the court. Theſe bail, who muſt at leaſt be two in number, muſt enter into a recognizance in court, or before the judge or commiſſioner, whereby they do jointly and ſeverally undertake, that if the defendant be condemned in the action, he ſhall pay the coſts and condemnation, or render himſelf a priſoner, or that they will pay it for him: which recognizance is tranſmitted to the court in a ſlip of parchment, intitled a *bail-piece*. And, if required, the bail muſt *juſtify* themſelves in court, or before the commiſſioner in the country, by ſwearing themſelves houſekeepers, and each of them to be worth double the ſum for which they are bail, after payment of all their debts. This anſwers in ſome meaſure to the *ſtipulatio* or *ſatiſdatio* of the Roman laws, which is mutually given by each litigant party to the other: by the plaintiff that he will proſecute his ſuit, and pay the coſts if he loſes his cauſe; in like manner as our law ſtill requires nominal pledges of proſecution from the plaintiff: by the defendant, that he ſhall continue in court, and abide the ſentence of the judge, much like our ſpecial bail; but with this difference, that the *fidejuſſores* were there abſolutely bound *judicatum ſolvere*, to ſee the coſts and condemnation paid at all events: whereas our ſpecial bail may be diſcharged, by ſurrendering the defendant into cuſtody within the time allowed by law; for which purpoſe they are at all times entitled to a warrant to apprehend him.

Special bail is required (as of courſe) only upon actions of debt, or actions on the caſe in trover, or for money due, where the plaintiff can ſwear that the cauſe of action amounts to ten pounds: but in actions where the damages are precarious, being to be aſſeſſed *ad libitum* by a jury, as in actions for words, ejectment, or treſpaſs, it is very ſeldom poſſible for a plaintiff to ſwear to the amount of his cauſe of action; and therefore no ſpecial bail is taken thereon, unleſs by a judge's order, or the particular directions of the court, in ſome peculiar ſpecies of injuries, as in caſes of mayhem or atrocious battery; or upon ſuch ſpecial circumſtances as make it abſolutely neceſſary that the defendant ſhould be kept within the reach of juſtice. Alſo in actions againſt heirs, executors and adminiſtrators, for debts of the deceaſed, ſpecial bail is not demandable; for the action is not ſo properly againſt them in perſon, as againſt the effects of the deceaſed in their poſſeſſion. But ſpecial bail is required even of them, in actions for a *devaſtavit*, or waſting the goods of the deceaſed; that wrong being of their own committing.

Thus much for *proceſs;* which is only meant to bring the defendant into court, in order to conteſt the ſuit, and abide the determination of the law. When he appears either in perſon as a priſoner, or out upon bail, then follow the *pleadings* between the parties. See Pleadings.

Proceſs upon an Indictment. See Prosecution. The proper proceſs on an indictment for any petty miſdemeſnor, or on a penal ſtatute, is a writ of *venire facias*, which is in the nature of a ſummons to cauſe the party to appear. And if by the return to ſuch *venire* it appears that the party hath lands in the county whereby he may be deſtrained, then a *diſtreſs infinite* ſhall be iſſued from time to time till he appears. But if the ſheriff returns, that he hath no lands in his bailiwick, then (upon his non-appearance) a writ of *capias* ſhall iſſue, which commands the ſheriff to take his body, and have him at the next aſſizes; and if he cannot be taken upon the firſt *capias*, a ſecond and a third ſhall iſſue, called an *alias*, and a *pluries capias*. But, on indictments for treaſon or felony, a *capias* is the firſt proceſs: and, for treaſon or homicide, only one ſhall be allowed to iſſue, or two in the caſe of other felonies, by ſtatute 25 Edw. III. c. 14. though the uſage is to iſſue only one in any felony; the proviſions of this ſtatute being in moſt caſes found impracticable. And ſo, in the caſe of miſdemeſnors, it is now the uſual practice for any judge of the court of king's bench, upon certificate of an indictment found, to award a writ of *capias* immediately, in order to bring in the defendant. But if he abſconds, and it is thought proper to purſue him to an outlawry, then a greater exactneſs is neceſſary. For, in ſuch caſe, after the ſeveral writs have iſſued in a regular number, according to the nature of the reſpective crimes, without any effect, the offender ſhall be put in the *exigent* in order to his outlawry: that is, he ſhall be exacted, proclaimed, or required, to ſurrender, at five county-courts; and if he be returned *quinto exactus*, and does not appear at the fifth exaction or requiſition, then he is adjudged to be *outlawed*, or put out of the protection of the law; ſo that he is incapable of taking the benefit of it in any reſpect, either by bringing actions or otherwiſe.

The puniſhment, for outlawries upon indictments for miſdemeſnors, is the ſame as for outlawries upon civil actions; viz. forfeiture of goods and chattels. But an outlawry in treaſon or felony amounts to a conviction and attainder of the offence charged in the indictment, as much as if the offender had been found guilty by his country. His life is, however, ſtill under the protection of the law, as hath elſewhere been obſerved; (ſee HOMICIDE): that though anciently an outlawed felon was ſaid to have *caput lupinum*, and might be knocked on the head like a wolf, by any one that ſhould meet him; becauſe, having renounced all law, he was to be dealt with as in a ſtate of nature, when every one that ſhould find him might ſlay him: yet now, to avoid ſuch inhumanity, it is holden that no man is intitled to kill him wantonly or wilfully; but in ſo doing is guilty of murder, unleſs it happens in the endeavour to apprehend him. For any perſon may arreſt an outlaw on a criminal proſecution, either of his own head, or by writ or warrant of *capias utlagatum*, in order to bring him to execution. But ſuch outlawry may be frequently reverſed by writ of error, the proceedings therein being (as it is fit they ſhould be) exceedingly nice and circumſtantial; and if any ſingle minute point be omitted or miſconducted, the whole outlawry is illegal, and may be reverſed: upon which reverſal the party accuſed is admitted to plead to, and defend himſelf againſt, the indictment.

Thus much for proceſs to bring in the offender after indictment found; during which ſtage of the proſecution it is that writs of *certiorari facias* are uſually had, though they may be had at any time before trial, to certify and remove the indictment, with all the proceedings thereon, from any inferior court of criminal juriſdiction into the court of king's bench; which is the ſovereign ordinary court of juſtice in cauſes criminal. And this is frequently done for one of theſe four purpoſes; either, 1. To conſider and determine the validity of appeals or indictments and the proceedings thereon; and to quaſh or confirm them as there is cauſe; or, 2. Where it is ſurmiſed that a partial or inſufficient trial will probably be had in the court below, the indictment is removed, in order to have the priſoner or defendant tried at the bar of the court of king's bench, or before the juſtices of *niſi prius*: or, 3. It is ſo removed, in order to plead the king's pardon there: or, 4. To iſſue proceſs of outlawry againſt the offender, in thoſe counties or places where the proceſs of the inferior judges will not reach him. Such writ of *certiorari*, when iſſued and delivered to the inferior court for removing any record or other proceeding, as well upon indictment as otherwiſe, ſuperſedes the juriſdiction of ſuch inferior court, and makes all ſubſequent proceedings therein entirely erroneous and illegal; unleſs the court of king's bench remands the record to the court below, to be there tried and determined. A *certiorari* may be granted at the inſtance of either the proſecutor or the defendant: the former as a matter of right, the latter as a matter of diſcretion; and therefore it is ſeldom granted to remove indictments from the juſtices of gaol-delivery, or after iſſue joined, or confeſſion of the fact in any of the courts below.

At this ſtage of proſecution alſo it is, that indictments found by the grand jury againſt a peer, muſt, in conſequence of a writ of *certiorari*, be certified and tranſmitted into the court of parliament, or into that of the lord high ſteward of Great Britain; and that, in places of excluſive juriſdiction, as the two univerſities, indictments muſt be delivered (upon challenge and claim of cognizance) to the courts therein eſtabliſhed by charter, and confirmed by act of parliament, to be there reſpectively tried and determined. See PLEA.

PROCESS, in chemiſtry, the whole courſe of an experiment or ſeries of operations, tending to produce ſomething new.

PROCESS, in anatomy, denotes any protuberance or eminence in a bone.

PROCESSION, a ceremony in the Romiſh church, conſiſting of a formal march of the clergy and people, putting up prayers, &c. and in this manner viſiting ſome church, &c. They have alſo proceſſions of the hoſt or ſacrament, &c. See HOST.

PROCHEIN AMY, in law, the perſon next akin to a child in non-age, and who, in that reſpect, is allowed to act for him, and be his guardian, &c. if he hold land in ſoccage.

To ſue, an infant is not allowed to make an attorney; but the court will admit his next friend as plaintiff, or his guardian as defendant.

PROCKIA, in botany: A genus of the monogynia order, belonging to the polyandria claſs of plants; and in the natural method ranking with thoſe of which the order is doubtful. The calyx is triphyllous, beſides two leafets at the baſe. There is no corolla; the berry is quinqueangular, and polyſpermous.

PROCLAMATION, a public notice given of any thing of which the magiſtrate thinks proper to advertiſe the people.

Proclamations are a branch of the king's prerogative *; and have then a binding force, when (as Sir Edward Coke obſerves) they are grounded upon and enforce the laws of the realm. For, though the making of laws is entirely the work of a diſtinct part, the legiſlative branch of the ſovereign power, yet the manner, time, and circumſtances of putting thoſe laws in execution, muſt frequently be left to the diſcretion of the executive magiſtrate. And therefore his conſtitutions or edicts, concerning thoſe points which we call *proclamations*, are binding upon the ſubject, where they do not either contradict the old laws, or tend to eſtabliſh new ones; but only enforce the execution of ſuch laws as are already in being, in ſuch manner as the king ſhall judge neceſſary. Thus the eſtabliſhed law is, that the king may prohibit any of his ſubjects from leaving the realm: a proclamation therefore forbidding this in general for three weeks, by laying an embargo upon all ſhipping in time of war, will be equally binding as an act of parliament, becauſe founded upon a prior law. But a proclamation to lay an embargo in time of peace upon all veſſels laden with wheat, (though in the time of a public ſcarcity), being contrary to law, and

* See Prerogative.

and particularly to ſtatute 22 Car. II. c. 13. the adviſers of ſuch a proclamation, and all perſons acting under it, found it neceſſary to be indemnified by a ſpecial act of parliament, 7 Geo. III. c. 7. A proclamation for diſarming Papiſts is alſo binding, being only in execution of what the legiſlature has firſt ordained: but a proclamation for allowing arms to Papiſts, or for diſarming any Proteſtant ſubjects, will not bind; becauſe the firſt would be to aſſume a diſpenſing power, the latter a legiſlative one; to the veſting of either of which in any ſingle perſon the laws of England are abſolutely ſtrangers. Indeed, by the ſtatute 31 Hen. VIII. c. 8. it was enacted, that the king's proclamations ſhould have the force of acts of parliament: a ſtatute, which was calculated to introduce the moſt deſpotic tyranny; and which muſt have proved fatal to the liberties of the kingdom, had it not been luckily repealed in the minority of his ſucceſſor, about five years after. By a late act of parliament the king is empowered to raiſe regiments of Roman Catholics, to ſerve in the preſent war.

PROCLUS, ſurnamed DIADOCUS, a Greek philoſopher and mathematician, was born in Lycia, and lived about the year 500. He was the diſciple of Syrianus, and had a great ſhare in the friendſhip of the emperor Anaſtaſius. It is ſaid, that when Vitalian laid ſiege to Conſtantinople, Proclus burnt his ſhips with large brazen ſpeculums. This philoſopher was a Pagan, and wrote againſt the Chriſtian religion. There are ſtill extant his Commentaries on ſome of Plato's books, and other of his works written in Greek.

PROCONSUL, a Roman magiſtrate, ſent to govern a province with conſular authority.

The proconſuls were appointed out of the body of the ſenate; and uſually as the year of any one's conſulate expired, he was ſent proconſul into ſome province.

The proconſuls decided caſes of equity and juſtice, either privately in their pretorium or palace, where they received petitions, heard complaints, granted writs under their ſeal, and the like; or elſe publicly, in the common hall, with the uſual formalities obſerved in the court of judicature at Rome. They had beſides, by virtue of their edicts, the power of ordering all things relating to the tribunes, taxes, contributions, and proviſions of corn and money, &c. Their office laſted only a year. See CONSUL.

PROCOPIUS, a famous Greek hiſtorian, born in Cæſaria, acquired great reputation by his works in the reign of Juſtinian, and was ſecretary to Beliſarius during all the wars carried on by that general in Perſia, Africa, and Italy. He at length became ſenator, obtained the title of *illuſtrious*, and was made pretor of Conſtantinople.

PROCREATION, the begetting and bringing forth young. See GENERATION and SEMEN.

PROCTOR, a perſon commiſſioned to manage another perſon's cauſe in any court of the civil or eccleſiaſtical law.

PROCTOR, in the Engliſh univerſities. See UNIVERSITY.

PROCURATION, an act or inſtrument by which a perſon is empowered to treat, tranſact, receive, &c. in another perſon's name.

PROCURATOR. See PROCTOR.

PRODIGALITY, means extravagance, profuſion, waſte, or exceſſive liberality, and is the oppoſite extreme to the vice of parſimony. By the Roman law, if a man by notorious prodigality was in danger of waſting his eſtate, he was looked upon as *non compos*, and committed to the care of curators, or tutors, by the prætor. And by the laws of Solon, ſuch prodigals were branded with perpetual infamy.

PRODUCT, in arithmetic and geometry, the factum of two or more numbers, or lines, &c. into one another: thus $5\times4=20$ the product required.

PROEDRI, among the Athenians, were magiſtrates, who had the firſt ſeats at the public aſſemblies, and whoſe office it was to propoſe at each aſſembly the things to be deliberated upon and determined. Their office always ended with the meeting. Their number was nine, ſo long as the tribes were ten in number.

PROFANATION, the acting diſreſpectfully to ſacred things.

PROFANE, a term uſed in oppoſition to *holy*; and in general is applied to all perſons who have not the ſacred character, and to things which do not belong to the ſervice of religion.

PROFESSION means a calling, vocation, or known employment. In Knox's *Eſſays*, vol. 1ſt, page 234, we find an excellent paper on the choice of a profeſſion, which that elegant writer concludes thus: "All the occupations of life (ſays he) are found to have their advantages and diſadvantages admirably adapted to preſerve the juſt equilibrium of happineſs. This we may confidently aſſert, that, whatever are the inconveniences of any of them, they are all preferable to a life of inaction; to that wretched liſtleſſneſs, which is conſtrained to purſue pleaſure as a buſineſs, and by rendering it the object of ſevere and unvaried attention, deſtroys its very eſſence."

Among the Romaniſts profeſſion denotes the entering into a religious order, whereby a perſon offers himſelf to God by a vow of inviolably obſerving obedience, chaſtity, and poverty.

PROFESSOR, in the univerſities, a perſon who teaches or reads public lectures in ſome art or ſcience from a chair for the purpoſe.

PROFILE, in architecture, the draught of a building, fortification, &c. wherein are expreſſed the ſeveral heights, widths, and thickneſſes, ſuch as they would appear were the building cut down perpendicularly from the roof to the foundation. Whence the profile is alſo called the *ſection*, ſometimes *orthographical ſection*, and by Vitruvius alſo *ſciagraphy*.

Profile, in this ſenſe, amounts to the ſame with *elevation*; and ſtands oppoſed to a *plan* or *ichnography*.

PROFILE is alſo uſed for the contour or out-line of a figure, building, member of architecture, or the like; as a baſe, a cornice, &c. Hence *profiling* is ſometimes uſed for deſigning, or deſcribing the member with rule, compaſs, &c.

PROFILE, in ſculpture and painting.—A head, a portrait, &c. are ſaid to be in *profile*, when they are repreſented ſidewiſe, or in a ſide-view; as, when in a portrait there is but one ſide of the face, one eye, one cheek, &c. ſhown, and nothing of the other.—On almoſt all medals, the faces are repreſented in *profile*.

PROFLUVIUM, in medicine, denotes a flux, or liquid evacuation of any thing.

PROGNOSTIC, among phyſicians, ſignifies a judgement concerning the event of a diſeaſe, as whether it ſhall end in life or death, be ſhort or long, mild or malignant, &c.

Programma. **PROGRAMMA**, anciently ſignified a letter ſealed with the king's ſeal.

Programma is alſo an univerſity term for a billet or advertiſement, poſted up or given into the hand, by way of invitation to an oration, &c. containing the argument, or ſo much as is neceſſary for underſtanding thereof.

Progreſſion. **PROGRESSION**, in general, denotes a regular advancing, or going forward, in the ſame courſe and manner.

Progression, in mathematics, is either arithmetical or geometrical. Continued arithmetic proportion is, where the terms do increaſe and decreaſe by equal differences, and is called *arithmetic progreſſion :*

$$\text{Thus}\left\{\begin{array}{l} a,\ a+d,\ a+2d,\ a+3d,\ \text{\&c. increaſing} \\ a,\ a-d,\ a-2d,\ a-3d,\ \text{\&c. decreaſing} \end{array}\right\}\text{by the difference } d.$$

$$\text{In numbers}\left\{\begin{array}{l} 2,\ 4,\ 6,\ 8,\ 10,\ \text{\&c. increaſing} \\ 10,\ 8,\ 6,\ 4,\ 2,\ \text{\&c. decreaſing} \end{array}\right\}\text{by the difference 2.}$$

Geometric Progreſſion, or *Continued Geometric Proportion*, is when the terms do increaſe or decreaſe by equal ratios : thus,

$$\left.\begin{array}{r} a,\ ar,\ arr,\ arrr,\ \text{\&c. increaſing} \\ a,\ \frac{a}{r},\ \frac{a}{rr},\ \frac{a}{rrr},\ \text{\&c. decreaſing} \end{array}\right\}\text{from a continual}\left\{\begin{array}{l}\text{multiplication} \\ \text{diviſion}\end{array}\right\}\text{by } r.$$

$$\left.\begin{array}{r} 2,\ 4,\ 8,\ 16,\ 32,\ 64,\ \text{increaſing} \\ 64,\ 32,\ 16,\ 8,\ 4,\ 2,\ \text{decreaſing} \end{array}\right\}\text{from a continual}\left\{\begin{array}{l}\text{multiplication} \\ \text{diviſion}\end{array}\right\}\text{by 2.}$$

See the article Fluxions, Geometry, and Series.

PROJECTILES.

1 Object of the ſcience. THIS is the name for that part of mechanical philoſophy which treats of the motion of bodies any how projected from the ſurface of this earth, and influenced by the action of terreſtrial gravity.

2 Effect of gravity on projected bodies. It is demonſtrated in the phyſical part of aſtronomy that a body ſo projected muſt deſcribe a conic ſection, having the centre of the earth in one focus ; and that it will deſcribe round that focus areas proportional to the times. And it follows from the principles of that ſcience, that if the velocity of projection exceeds 36700 feet in a ſecond, the body (if not reſiſted by the air) would deſcribe a hyperbola ; if it be juſt 36700, it would deſcribe a parabola ; and if it be leſs than this, it would deſcribe an ellipſis. If projected directly upwards, in the firſt caſe, it would never return, but proceed for ever ; its velocity continually diminiſhing, but never becoming leſs than an aſſignable portion of the exceſs of the initial velocity above 36700 feet in a ſecond ; in the ſecond caſe, it would never return, its velocity would diminiſh without end, but never be extinguiſhed. In the third caſe, it would proceed till its velocity was reduced to an aſſignable portion of the difference between 36700 and its initial velocity ; and would then return, regaining its velocity by the ſame degrees, and in the ſame places, as it loſt it. Theſe are neceſſary conſequences of a gravity directed to the centre of the earth, and inverſely proportional to the ſquare of the diſtance. But in the greateſt projections that we are able to make, the gravitations are ſo nearly equal, and in directions ſo nearly parallel, that it would be ridiculous affectation to pay any regard to the deviations from equality and paralleliſm. A bullet riſing a mile above the ſurface of the earth loſes only $\frac{1}{2000}$ of its weight, and a horizontal range of 4 miles makes only 4 of deviation from paralleliſm.

Let us therefore aſſume gravitation as equal and parallel. The errors ariſing from this aſſumption are quite inſenſible in all the uſes which can be made of this theory.

The theory itſelf will ever be regarded with ſome veneration and affection by the learned. It was the firſt fruits of mathematical philoſophy. Galileo was the firſt who applied mathematical knowledge to the motions of free bodies, and this was the ſubject on which he exerciſed his fine genius.

3 Conſtant or uniform. Gravity muſt be conſidered by us as a conſtant or uniform accelerating or retarding force, according as it produces the deſcent, or retards the aſcent, of a body. A conſtant or invariable accelerating force is one which produces an uniform acceleration ; that is, which in equal times produces equal increments of velocity, and therefore produces increments of velocity proportional to the times in which they are produced. Forces are of themſelves imperceptible, and are ſeen only in their effects ; and they have no meaſure but the effect, or what *meaſures* the effect ; and every thing which we can diſcover with regard to thoſe meaſures, we muſt affirm with regard to the things of which we aſſume them as the meaſures. Therefore,

4 Conſequences of this fact. The motion of a falling body, or of a body projected directly downwards, is uniformly accelerated ; and that of a body projected directly upwards is uniformly retarded : that is, the acquired velocities are as the times in which they are acquired by falling, and the extinguiſhed velocities are as the times in which they are extinguiſhed.

5 Corollaries drawn from it. *Cor.* 1. If bodies ſimply fall, not being projected downwards by any external force, the times of the falls are proportional to the final velocities ; and the times of aſcents, which terminate by the action of gravity alone, are proportional to the initial velocities.

2. The ſpaces deſcribed by a heavy body falling from reſt are as the ſquares of the acquired velocities ; and the differences of theſe ſpaces are as the differences of the ſquares of the acquired velocities : and, on the other hand, the heights to which bodies projected upwards will riſe, before their motions be extinguiſhed, are as the ſquares of the initial velocities.

3. The ſpaces deſcribed by falling bodies are proportional to the ſquares of the times from the beginning of the fall ; and the ſpaces deſcribed by bodies projected directly upwards are as the ſquares of the times of the aſcents.

4. The ſpace deſcribed by a body falling from reſt is one half of the ſpace which the body would have uniformly deſcribed in the ſame time, with the velocity ac-

quired by the fall.—And the height to which a body will riſe, in oppoſition to the action of gravity, is one half of the ſpace which it would uniformly deſcribe in the ſame time with the initial velocity.

In like manner the difference of the ſpaces which a falling or riſing body deſcribes in any equal ſucceſſive parts of its fall or riſe, is one half of the ſpace which it would uniformly deſcribe in the ſame time with the difference of the initial and final velocities.

This propoſition will be more conveniently expreſſed for our purpoſe thus:

A body moving uniformly during the time of any fall with the velocity acquired thereby, will in that time deſcribe a ſpace double of that fall; and a body projected directly upwards will riſe to a height which is one half of the ſpace which it would, uniformly continued, deſcribe in the time of its aſcent with the initial velocity of projection.

Theſe theorems have been already demonſtrated in a popular way, in the article Mechanics, ſect. vi. § 14, 15, 16, &c. and in Gunnery. But we would recommend to our readers the 39th prop. of the firſt book of Newton's *Principia*, as giving the moſt general inveſtigation of this ſubject; equally eaſy with theſe more looſe methods of demonſtration, and infinitely ſuperior to them, by being equally applicable to every variation of the accelerating force. See an excellent application of this propoſition by Mr Robins, for defining the motion of a ball diſcharged from a cannon, in the article Gunnery, n° 15. See another in Optics, n° 127. for defining the motion of light in refraction, &c.

6
The force of gravity in falling bodies can be aſcertained.

5. It is a matter of obſervation and experience, that a heavy body falls 16 feet and an inch Engliſh meaſure in a ſecond of time; and therefore acquires the velocity of 32 feet 2 inches *per* ſecond. This cannot be aſcertained directly, with the preciſion that is neceſſary. A ſecond is too ſmall a portion of time to be exactly meaſured and compared with the ſpace deſcribed; but it is done with the greateſt accuracy by comparing the motion of a falling body with that of a pendulum. The time of a vibration is to the time of falling through half the length of the pendulum, as the circumference of a circle is to its diameter. The length of a pendulum can be aſcertained with great preciſion; and it can be lengthened or ſhortened till it makes juſt 86,400 vibrations in a day: and this is the way in which the ſpace fallen through in a ſecond has been accurately aſcertained.

As all other forces are aſcertained by the accelerations which they produce, they are conveniently meaſured by comparing their accelerations with the acceleration of gravity. This therefore has been aſſumed by all the later and beſt writers on mechanical philoſophy, as the unit by which every other force is meaſured. It gives us a perfectly diſtinct notion of the force which retains the moon in its orbit, when we ſay it is the 3600th part of the weight of the moon at the ſurface of the earth. We mean by this, that if a bullet were here weighed by a ſpring ſteel-yard, and pulled it out to the mark 3600; it it were then taken to the diſtance of the moon, it would pull it out only to the mark 1. And we make this aſſertion on the authority of our having obſerved that a body at the diſtance of the moon falls from that diſtance $\frac{1}{3600}$ part of 16 feet in a ſecond. We do not, therefore, compare the *forces*, which are imperceptible things; we compare the accelerations, which are their indications, effects, and meaſures.

7
Two modes of determining the fall of heavy bodies.

This has made philoſophers ſo anxious to determine with preciſion the fall of heavy bodies, in order to have an exact value of the accelerating power of terreſtrial gravity. Now we muſt here obſerve, that this meaſure may be taken in two ways: we may take the ſpace through which the heavy body falls in a ſecond; or we may take the velocity which it acquires in conſequence of gravity having acted on it during a ſecond. The laſt is the proper meaſure; for the laſt is the immediate effect on the body. The action of gravity has changed the ſtate of the body—in what way? by giving it a determination to motion downward: this both points out the kind and the degree or intenſity of the force of gravity. The ſpace deſcribed in a ſecond by falling, is not an invariable meaſure; for, in the ſucceſſive ſeconds, the body falls through 16, 48, 80, 112, &c. feet, but the changes of the body's ſtate in each ſecond is the ſame. At the beginning it had no determination to move with any appreciable velocity; at the end of the firſt ſecond it had a determination by which it would have gone on for ever (had no ſubſequent force acted on it) at the rate of 32 feet *per* ſecond. At the end of the ſecond ſecond, it had a determination by which it would have moved for ever, at the rate of 64 feet *per* ſecond. At the end of the third ſecond, it had a determination by which it would have moved for ever, at the rate of 96 feet *per* ſecond, &c. &c. The difference of theſe determinations is a determination to the rate of 32 feet *per* ſecond. This is therefore conſtant, and the indication and proper meaſure of the conſtant or invariable force of gravity. The ſpace fallen through in the firſt ſecond is of uſe only as it is one half of the meaſure of this determination; and as halves have the proportion of their wholes, different accelerating forces may be ſafely affirmed to be in the proportion of the ſpaces through which they uniformly impel bodies in the ſame time. But we ſhould always recollect, that this is but one half of the true meaſure of the accelerating force. Mathematicians of the firſt rank have committed great miſtakes by not attending to this; and it is neceſſary to notice it juſt now, becauſe caſes will occur in the proſecution of this ſubject, where we ſhall be very apt to confound our reaſonings by a confuſion in the uſe of thoſe meaſures. Thoſe mathematicians who are accuſtomed to the geometrical conſideration of curvilineal motions, are generally diſpoſed to take the *actual deflection* from the tangent as the meaſure of the deflecting force; while thoſe who treat the ſame ſubject algebraically, by the aſſiſtance of fluxions, take *the change of velocity*, which is meaſured by *twice* the deflection. The reaſon is this: when a body paſſes through the point B of a curve ABC, fig. 1. if the deflecting force were to ceaſe at that inſtant, the body would deſcribe the tangent BD in the ſame time in which it deſcribes the arch BC of the curve, and DC is the deflection, and is therefore taken for the meaſure of the deflecting force. But the algebraiſt is accuſtomed to conſider the curve by means of an equation between the abſciſſæ H*a*, H*b*, H*c*, and their reſpective ordinates A*a*, B*b*, C*c*; and he meaſures the deflections by the changes made on the increments of the ordinates. Thus the increment of the ordinate A*a*, while the body deſcribes the arch AB of the curve, is BG. If the deflecting force were to ceaſe

8
Miſtakes of mathematicians on this ſubject;

Plate CCCXVII.

ceaſe when the body is at B, the next increment would have been equal to BG, that is, it would have been EF; but, in conſequence of the deflection, it is only CF: therefore he takes EC for the meaſure of the deflection, and of the deflecting force. Now EC is ultimately twice DC; and thus the meaſure of the algebraiſt (derived ſolely from the nature of the differential method, and without any regard to phyſical conſiderations) happens to coincide with the true phyſical meaſure. There is therefore great danger of mixing theſe meaſures.

9 Particularly of Leibnitz.

Of this we cannot give a more remarkable inſtance than Leibnitz's attempt to demonſtrate the elliptical motion of the planets in the Leipſic Acts, 1689. He firſt conſiders the ſubject mechanically, and takes the deflection or DC for the meaſure of the deflecting force. He then introduces his differential calculus, where he takes the difference of the increments for the meaſure; and thus brings himſelf into a confuſion, which luckily compenſates for the falſe reaſoning in the preceding part of his paper, and gives his reſult the appearance of a demonſtration of Newton's great diſcovery, while, in fact, it is a confuſed jumble of aſſumptions, ſelf-contradictory, and inconſiſtent with the very laws of mechanics which are uſed by him in the inveſtigation. Seventeen years after this, in 1706, having been criticiſed for his bad reaſoning, or rather accuſed of an envious and unſucceſsful attempt to appropriate Newton's inventions to himſelf, he gives a correction of his paralogiſm, which he calls a correction of language. But he either had not obſerved where the paralogiſm lay, or would not let himſelf down by acknowledging a miſtake in what he wiſhed the world to think his own calculus (fluxions); he applied the correction where no fault had been committed, for he had meaſured both the centrifugal force and the ſolicitation of gravity in the ſame way, but had applied the fluxionary expreſſion to the laſt and not to the firſt, and, by ſo doing, he completely deſtroyed all coincidence between his reſult and the planetary motions. We mention this inſtance, not only as a caution to our mathematical readers, but alſo as a very curious literary anecdote. This diſſertation of Leibnitz is one of the moſt obſcure of his obſcure writings, but deſerves the attention of an intelligent and curious reader, and cannot fail of making an indelible impreſſion on his mind, with relation to the modeſty, candour, and probity of the author. It is preceded by a diſſertation on the ſubject which we are now entering upon, the motion of projectiles in a reſiſting medium. Newton's *Principia* had been publiſhed a few years before, and had been reviewed, in a manner ſhamefully ſlight, in the Leipſic Acts. Both theſe ſubjects make the capital articles of that immortal work. Mr Leibnitz publiſhed theſe diſſertations, without (ſays he) having ſeen Newton's book, in order to ſhow the world that he had, ſome years before, diſcovered the ſame theorems. Mr Nicholas Fatio carried a copy of the *Principia* from the author to Hanover in 1686, where he expected to find Mr Leibnitz; he was then abſent, but Fatio ſaw him often before his return to France in 1687, and does not ſay that the book was not given him. Read along with theſe diſſertations Dr Keill's letter to John Bernoulli and others, publiſhed in the *Journal Literaire de la Hayée* 1714, and to John Bernoulli in 1719.

10 Newton accuſed of a ſimilar miſtake by J. Bernoulli,

Newton has been accuſed of a ſimilar overſight by John Bernoulli, (who indeed calls it a miſtake in principle) in his Propoſition X. Book 2, on the very ſubject we are now conſidering. But Dr Keill has ſhown it to be only an overſight, in drawing the tangent on the wrong ſide of the ordinate. For in this very propoſition Newton exhibits, in the ſtricteſt and moſt beautiful manner, the difference between the geometrical and algebraical manner of conſidering the ſubject; and expreſsly warns the reader, that *his* algebraical ſymbol expreſſes the deflection only, and not the variation of the increment of the ordinate.

11 But falſely.

It is therefore in the laſt degree improbable that he would make this miſtake. He moſt expreſsly does not; and as to the real miſtake, which he corrected in the ſecond edition, the writer of this article has in his poſſeſſion a manuſcript copy of notes and illuſtrations on the whole Principia, written in 1693 by Dr David Gregory, Savilian profeſſor of aſtronomy at Oxford, at the deſire of Mr Newton, as preparatory for a new edition, where he has rectified this and ſeveral other miſtakes in that work, and ſays that Mr Newton had ſeen and approved of the amendments.

12 Inſincerity of Bernoulli with reſpect to Newton.

We mention theſe particulars, becauſe Mr Bernoulli publiſhed an elegant diſſertation on this ſubject in the Leipſic Acts in 1713; in which he charges Newton (though with many proteſtations of admiration and reſpect) with this miſtake in principle; and ſays, that he communicated his correction to Mr Newton by his nephew Nicholas Bernoulli, that it might be corrected in the new edition, which he heard was in the preſs. And he afterwards adds, that it appears by ſome ſheets being cancelled, and new ones ſubſtituted in this part of the work, that the miſtake would have continued, had he not corrected it. We would deſire our readers to conſult this diſſertation, which is extremely elegant, and will be of ſervice to us in this article; and let them compare the civil things which is here ſaid of the *vir incomparabilis*, the *omni laude major*, the *ſummus Newtonus*, with what the ſame author, in the ſame year, in the Leipſic Acts, but under a borrowed name, ſays of him. Our readers will have no heſitation in aſcribing this letter to this author. For, after praiſing John Bernoulli as *ſummus geometra, natus ad ſummorum geometrarum paralogiſmos corrigendos, ſummi candoris ut et modeſtiæ*, he betrays himſelf by an unguarded warmth, when defending J. B.'s demonſtration of the inverſe problem of centripetal forces, by calling it MEAM *demonſtrationem*.

Let our readers now conſider the ſcope and intention of this diſſertation on projectiles, and judge whether the author's aim was to inſtruct the world, or to acquire fame, by correcting Newton. The diſſertation does not contain one theorem, one corollary, nor one ſtep of argument, which is not to be found in Newton's firſt edition; nor has he gone farther than Newton's ſingle propoſition the Xth. To us it appears an exact companion to his propoſition on centripetal forces, which he boaſts of having firſt demonſtrated, although it is in every ſtep a tranſcript of the 42d of the 1ſt Book of Newton's Principia, the geometrical language of Newton being changed into algebraic, as he has in the preſent caſe changed Newton's algebraic analyſis into a very elegant geometrical one.

We hope to be forgiven for this long digreſſion. It is a very curious piece of literary hiſtory, and ſhows the combination which envy and want of honourable principle had formed againſt the reputation of our illuſtrious countryman; and we think it our duty to embrace any opportunity of doing it juſtice.—To return to our ſubject:

13
Accurate meaſure of the accelerative power of gravity.

The accurate meaſure of the accelerative power of gravity, is the *fall* $16\frac{1}{12}$ feet, if we meaſure it by the ſpace, or the *velocity* of $32\frac{1}{6}$ feet per ſecond, if we take the velocity. It will greatly facilitate calculation, and will be ſufficiently exact for all our purpoſes, if we take 16 and 32, ſuppoſing that a body falls 16 feet in a ſecond, and acquires the velocity of 32 feet per ſecond. Then, becauſe the heights are as the ſquares of the times, and as the ſquares of the acquired velocities, a body will fall one foot in one fourth of a ſecond, and will acquire the velocity of eight feet per ſecond. Now let h expreſs the height in feet, and call it the PRODUCING HEIGHT; v the velocity in feet per ſecond, and call it the PRODUCED VELOCITY, the velocity DUE; and t the time in ſeconds.—We ſhall have the following formulæ, which are of eaſy recollection, and will ſerve, without tables, to anſwer all the queſtions relative to projectiles.

14
General formulæ deduced.

$$\text{I. } v = 8\sqrt{h}, = 8 \times 4t, = 32t$$

$$\text{II. } t = \frac{\sqrt{h}}{4}, = \frac{v}{32}$$

$$\text{III. } \sqrt{h} = \frac{v}{8}, = 4t$$

$$\text{IV. } h = \frac{v^2}{64}, = 16t^2$$

15
Examples of their uſe in falling bodies.

To give ſome examples of their uſe, let it be required,

1. To find the time of falling through 256 feet. Here $h = 256$, $\sqrt{256} = 16$, and $\frac{16}{4} = 4$. Anſwer 4″.

2. To find the velocity acquired by falling four ſeconds. $t = 4 . 32 \times 4 = 128$ feet per ſecond.

3. To find the velocity acquired by falling 625 feet. $h = 625 . \sqrt{h} = 25 . 8\sqrt{h} = 2000$ feet per ſecond.

16
In bodies projected upwards.

4. To find the height to which a body will riſe when projected with the velocity of 56 feet per ſecond, or the height through which a body muſt fall to acquire this velocity.

$$v = 56 . \frac{56}{8} = 7, = \sqrt{h} . 7^2 = h, = 49 \text{ feet.}$$

$$\text{or } 56^2 = 3136 . \frac{3136}{64} = 49 \text{ feet.}$$

17
And directly downwards.

5. Suppoſe a body projected directly downwards with the velocity of 10 feet per ſecond; what will be its velocity after four ſeconds? In four ſeconds it will have acquired, by the action of gravity, the velocity of 4×32, or 128 feet, and therefore its whole velocity will be 138 feet per ſecond.

6. To find how far it will have moved, compound its motion of projection, which will be 40 feet in four ſeconds, with the motion which gravity alone would have given it in that time, which is 256 feet; and the whole motion will be 296 feet.

7. Suppoſe the body projected as already mentioned, and that it is required to determine the time it will take to go 296 feet downwards, and the velocity it will have acquired.

Find the height x, through which it muſt fall to acquire the velocity of projection, 10 feet, and the time y of falling from this height. Then find the time z of falling through the height $296 + x$, and the velocity v acquired by this fall. The time of deſcribing the 296 feet will be $z - y$, and v is the velocity required.

From ſuch examples, it is eaſy to ſee the way of anſwering every queſtion of the kind.

18
More general formulæ.

Writers on the higher parts of mechanics always compute the actions of other accelerating and retarding forces by comparing them with the acceleration of gravity, and in order to render their expreſſions more general, uſe a ſymbol, ſuch as g for gravity, leaving the reader to convert it into numbers. Agreeably to this view, the general formulæ will ſtand thus:

$$\text{I. } v = \sqrt{2gh}, \text{ i. e. } \sqrt{2}\sqrt{g}\sqrt{h}, = g\ \overline{t},$$

$$\text{II. } t = \frac{v}{g}, = \frac{\sqrt{4h}}{\sqrt{2g}}, = \sqrt{\frac{4h}{2g}}, = \sqrt{\frac{2h}{g}}$$

$$\text{IIII. } h = \frac{v^2}{2g}, = \frac{gt^2}{2}$$

In all theſe equations, gravity, or its accelerating power, is eſtimated, as it ought to be, by the change of velocity which it generates in a particle of matter in an unit of time. But many mathematicians, in their inveſtigations of curvilineal and other varied motions, meaſure it by the deflection which it produces in this time from the tangent of the curve, or by the increment by which the ſpace deſcribed in an unit of time exceeds the ſpace deſcribed in the preceding unit. This is but one half of the increment which gravity would have produced, had the body moved through the whole moment with the acquired addition of velocity. In this ſenſe of the ſymbol g, the equations ſtand thus:

$$\text{I. } v = 2\sqrt{gh}, = 2gt$$

$$\text{II. } t = \sqrt{\frac{h}{g}}, = \frac{v}{2g}$$

$$\text{IV. } h = \frac{v^2}{4g}, = gt^2, \text{ and } \sqrt{h} = \frac{v}{2\sqrt{g}}$$

It is alſo very uſual to conſider the accelerating force of gravity as the unit of compariſon. This renders the expreſſions much more ſimple. In this way, v expreſſes not the velocity, but the height neceſſary for acquiring it, and the velocity itſelf is expreſſed by $\sqrt{v}$. To reduce ſuch an expreſſion of a velocity to numbers, we muſt multiply it by $\sqrt{2g}$, or by $2\sqrt{g}$, according as we make g to be the generated velocity, or the ſpace fallen through in the unit of time.

19
Bodies projected obliquely.

This will ſuffice for the perpendicular aſcents or deſcents of heavy bodies, and we proceed to conſider their motions when projected obliquely. The circumſtance which renders this an intereſting ſubject, is, that the flight of cannon ſhot and ſhells are inſtances of ſuch motion, and the art of gunnery muſt in a great meaſure depend on this doctrine.

Let a body B (fig. 2.), be projected in any direction BC, not perpendicular to the horizon, and with any velocity. Let AB be the height producing this velocity; that is, let the velocity be that which a heavy body would acquire by falling freely through AB. It is required to determine the path of the body, and all the circumſtances of its motion in this path?

Plate CCCCXVI

1. It is evident, that by the continual action of gravity,

vity, the body will be continually deflected from the line BC, and will deſcribe a curve line BVG, concave towards the earth.

20 Deſcribes a parabola.

2. This curve line is a parabola, of which the vertical line ABE is a diameter, B the vertex of this diameter, and BC a tangent in B.

Through any two points V, G of the curve draw VC, GH parallel to AB, meeting BC in C and H, and draw VE, GK parallel to BC, meeting AB in E, K. It follows, from the compoſition of motions, that the body would arrive at the points V, G of the curve in the ſame time that it would have uniformly deſcribed BC, BH, with the velocity of projection; or that it would have fallen through BE, BK, with a motion uniformly accelerated by gravity; therefore the times of deſcribing BC, BH, uniformly, are the ſame with the times of falling through BE, BK. But, becauſe the motion along BH is uniform, BC is to BH as the time of deſcribing BC to the time of deſcribing BH, which we may expreſs thus, $BC : BH = T, BC : T, BH, = T, BE : T, BK$. But, becauſe the motion along BK is uniformly accelerated, we have $BE : BK = T^2, BE : T^2, BK, = BC^2 : BH^2, = EV^2 : KG^2$; therefore the curve BVG is ſuch, that the abſciſſæ BE, BK are as the ſquares of the correſponding ordinates EV, KG; that is, the curve BVG is a parabola, and BC, parallel to the ordinates, is a tangent in the point B.

3. If through the point A there be drawn the horizontal line AD *d*, it is the directrix of the parabola.

Let BE be taken equal to AB. The time of falling through BE is equal to the time of falling through AB; But BC is deſcribed with the velocity acquired by falling through AB: and therefore by n° 4. of perpendicular deſcents, BC is double of AB, and EV is double of BE; therefore $EV^2 = 4\,BE^2, = 4\,BE \times AB, = BE \times 4\,AB$, and 4 AB is the parameter or *latus rectum* of the parabola BVG, and AB being one-fourth of the parameter, AD is the directrix.

4. The times of deſcribing the different arches BV, VG of the parabola are as the portions BC, BH of the tangent, or as the portions AD, A*d* of the directrix, intercepted by the ſame vertical lines AB, CV, HG; for the times of deſcribing BV, BVG are the ſame with thoſe of deſcribing the correſponding parts BC, BH of the tangent, and are proportional to theſe parts, becauſe the motion along BH is uniform; and BC, BH are proportional to AD, A*d*.

Therefore the motion eſtimated horizontally is uniform.

5. The velocity in any point G of the curve is the ſame with that which a heavy body would acquire by falling from the directrix along *d*G. Draw the tangent GT, cutting the vertical AB in T; take the points *a*, *f*, equidiſtant from A and *d*, and extremely near them, and draw the verticals *ab*, *fg*; let the points *a*, *f*, continually approach A and *d*, and ultimately coincide with them. It is evident that B*b* will ultimately be to *g*G, in the ratio of the velocity at B to the velocity at G; for the portions of the tangent ultimately coincide with the portions of the curve, and are deſcribed in equal times; but B*b* is to *g*G as BH to TG: therefore the velocity at B is to that at G as BH to TG. But, by the properties of the parabola, BH^2 is to TG^2 as AB to *d*G; and AB is to *d*G as the ſquare of the velocity acquired by falling through AB to the ſquare of the velocity acquired by falling through *d*G; and the velocity in BH, or in the point B of the parabola, is the velocity acquired by falling along AB; therefore the velocity in TG, or in the point G of the parabola, is the velocity acquired by falling along *d*G.

21 The parabolic theory ingenious, but of little uſe in practice.

Theſe few ſimple propoſitions contain all the theory of the motion of projectiles in vacuo, or independent on the reſiſtance of the air; and being a very eaſy and neat piece of mathematical philoſophy, and connected with very intereſting practice, and a very reſpectable profeſſion, they have been much commented on, and have furniſhed matter for many ſplendid volumes. But the air's reſiſtance occaſions ſuch a prodigious diminution of motion in the great velocities of military projectiles, that this parabolic theory, as it is called, is hardly of any uſe. A muſket-ball, diſcharged with the ordinary allotment of powder, iſſues from the piece with the velocity of 1670 feet per ſecond: this velocity would be acquired by falling from the height of eight miles. If the piece be elevated to an angle of 45°, the parabola ſhould be of ſuch extent that it would reach 16 miles on the horizontal plain; whereas it does not reach much above half a mile. Similar deficiencies are obſerved in the ranges of cannon ſhot.

22 A ſhort view of it.

We do not propoſe, therefore, to dwell much on this theory, and ſhall only give ſuch a ſynoptical view of it as ſhall make our readers underſtand the more general circumſtances of the theory, and be maſters of the language of the art.

Plate CCCCXVII.

Let OB (fig. 3.) be a vertical line. About the centres A and B, with the diſtance AB, deſcribe the ſemicircles ODB, AHK, and with the axis AB, and ſemiaxis GE, equal to AB, deſcribe the ſemi-ellipſe AEB: with the focus B, vertex A, diameter AB, and tangent AD, parallel to the horizon, deſcribe the parabola APS.

Let a body be projected from B, in any direction BC, with the velocity acquired by falling through AB. By what has already been demonſtrated, it will deſcribe a parabola BVPM. Then,

1. ADL parallel to the horizon is the directrix of every parabola which can be deſcribed by a body projected from B with this velocity. This is evident.

2. The ſemicircle AHK is the locus of all the foci of theſe parabolas: For the diſtance BH of a point B of any parabola from the directrix AD is equal to its diſtance BF from the focus F of that parabola; therefore the foci of all the parabolas which paſs through B, and have AD for their directrix, muſt be in the circumference of the circle which has AB for its radius, and B for its centre.

3. If the line of direction BC cut the upper ſemicircle in C, and the vertical line CF be drawn, cutting the lower ſemicircle in F, F is the focus of the parabola BVPM, deſcribed by the body which is projected in the direction BC, with the velocity acquired by falling through BA: for drawing AC, BF, it is evident that ACFB is a rhombus, and that the angle ABF is biſected by BC, and therefore the focus lies in the line BF; but it alſo lies in the circumference AFK, and therefore in F.

If C is in the upper quadrant of ODB, F is in the upper quadrant of AFK; and if C be in the lower quadrant of ODB (as when BC is the line of direction) then the focus of the correſponding parabola B *v* M is in the lower quadrant of AHK, as at *f*.

4. The ellipſis AEB is the locus of the vertex of all the parabolas, and the vertex V of any one of them BVPM is in the interſection of this ellipſis with the vertical CF: for let this vertical cut the horizontal lines AD, GE, BN, in θ, λ, N. Then it is plain that N λ is half of N θ, and λ V is half of C θ; therefore NV is half of NC, and V is the vertex of the axis.

If the focus is in the upper or lower quadrant of the circle AHK, the vertex is in the upper or the lower quadrant of the ellipſe AEG.

5. If BFP be drawn through the focus of any one of the parabolas, ſuch as BVM, cutting the parabola APS in P, the parabola BVM touches the parabola APS in P: for drawing P δ κ parallel to AB, cutting the directrix O κ of the parabola APS in κ, and the directrix AL of the parabola BVM in δ, then PB=Pκ; but BF=BA, =AO, =κ δ: therefore P δ=PF, and the point P is in the parabola BVM. Alſo the tangents to both parabolas in P coincide, for they biſect the angle κ PB; therefore the two parabolas having a common tangent, touch each other in P.

Cor. All the parabolas which can be deſcribed by a body projected from B, with the velocity acquired by falling through AB, will touch the concavity of the parabola APS, and lie wholly within it.

6. P is the moſt diſtant point of the line BP which can be hit by a body projected from B with the velocity acquired by falling through AB. For if the direction is more elevated than BC, the focus of the parabola deſcribed by the body will lie between F and A, and the parabola will touch APS in ſome point between P and A; and being wholly within the parabola APS, it muſt cut the line BP in ſome point within P. The ſame thing may be ſhown when the direction is leſs elevated than BC.

7. The parabola APS is the locus of the greateſt ranges on any planes BP, BS, &c. and no point lying without this parabola can be ſtruck.

8. The greateſt range on any plane BP is produced when the line of direction BC biſects the angle OBP formed by that plane with the vertical: for the parabola deſcribed by the body in this caſe touches APS in P, and its focus is in the line BP, and therefore the tangent BC biſects the angle OBP.

Cor. The greateſt range on a horizontal plane is made with an elevation of 45°.

9. A point M in any plane BS, lying between B and S, may be ſtruck with two directions, BC and B *c*; and theſe directions are equidiſtant from the direction B *t*, which gives the greateſt range on that plane: for if about the centre M, with the diſtance ML from the directrix AL, we deſcribe a circle LF*f*, it will cut the circle AHK in two points F and *f*, which are evidently the foci of two parabolas BVM, B *v* M, having the directrix AL and diameter ABK. The interſection of the circle ODB, with the verticals FC, *fc*, determine the directions BC, B *c* of the tangents. Draw A *t* parallel to BS, and join *t* B, C *c*, F *f*; then OB *t* $= \frac{1}{2}$ OBS, and B *t* is the direction which gives the greateſt range on the plane BS: but becauſe F *f* is a chord of the circles deſcribed round the centres B and M, F *f* is perpendicular to BM, and C *c* to A *t*, and the arches C *t*, *c t* are equal; and therefore the angles CB *t*, *c* B *t* are equal.

Thus we have given a general view of the ſubject, which ſhows the connection and dependence of every circumſtance which can influence the reſult; for it is evident that to every velocity of projection there belongs a ſet of parabolas, with their directions and ranges; and every change of velocity has a line AB correſponding to it, to which all the others are proportional. As the height neceſſary for acquiring any velocity increaſes or diminiſhes in the duplicate proportion of that velocity, it is evident that all the ranges with given elevations will vary in the ſame proportion, a double velocity giving a quadruple range, a triple velocity giving a noncuple range, &c. And, on the other hand, when the ranges are determined beforehand (which is the uſual caſe), the velocities are in the ſubduplicate proportion of the ranges. A quadruple range will require a double velocity, &c.

28 Experience principally directs the practical gunner.

On the principles now eſtabliſhed is founded the ordinary theory of gunnery, furniſhing rules which are to direct the art of throwing ſhot and ſhells, ſo as to hit the mark with a determined velocity.

But we muſt obſerve, that this theory is of little ſervice for directing us in the practice of cannonading. Here it is neceſſary to come as near as we can to the object aimed at, and the hurry of ſervice allows no time for geometrical methods of pointing the piece after each diſcharge. The gunner either points the cannon directly to the object, when within 200 or 300 yards of it, in which caſe he is ſaid to ſhoot point blank (*pointer au blanc*, i. e. at the white mark in the middle of the gunners target); or, if at a greater diſtance, he eſtimates to the beſt of his judgment the deflection correſponding to his diſtance, and points the cannon accordingly. In this he is aided by the greater thickneſs at the breech of a piece of ordnance. Or, laſtly, when the intention is not to batter, but to rake along a line occupied by the enemy, the cannon is elevated at a conſiderable angle, and the ſhot diſcharged with a ſmall force, ſo that it drops into the enemy's poſt, and bounds along the line. In all theſe ſervices the gunner is directed entirely by trial, and we cannot ſay that this parabolic theory can do him any ſervice.

The principal uſe of it is to direct the bombardier in throwing ſhells. With theſe it is propoſed to break down or ſet fire to buildings, to break through the vaulted roofs of magazines, or to intimidate and kill troops by burſting among them. Theſe objects are always under cover of the enemy's works, and cannot be touched by a direct ſhot. The bombs and carcaſes are therefore thrown upwards, ſo as to get over the defences and produce their effect.

Theſe ſhells are of very great weight, frequently exceeding 200 lbs. The mortars from which they are diſcharged muſt therefore be very ſtrong, that they may reſiſt the exploſion of gunpowder which is neceſſary for throwing ſuch a maſs of matter to a diſtance; they are conſequently unwieldy, and it is found moſt convenient to make them almoſt a ſolid and immoveable lump. Very little change can be made in their elevation, and therefore their ranges are regulated by the velocities given to the ſhell. Theſe again are produced by the quantities of powder in the charge; and experience (confirming the beſt theoretical notions that we can form of the ſubject) has taught us, that the ranges are nearly proportional to the quantities of powder employed, only not increaſing quite ſo faſt. This method is much eaſier than by differences of elevation; for we can ſelect the elevation which gives the greateſt range on the given plane, and then we are certain that we are employing the ſmalleſt quantity of powder with which the ſervice can be performed: and we have another advantage, that the deviations which unavoidable cauſes produce in the real directions of the bomb will then produce the ſmalleſt poſſible deviation from the intended range. This is the caſe in moſt mathematical maxima.

24
The moving force in theory different from that in practice.

In military projectiles the velocity is produced by the exploſion of a quantity of gunpowder: but in our theory it is conceived as produced by a fall from a certain height, by the proportions of which we can accurately determine its quantity. Thus a velocity of 1600 feet per ſecond is produced by a fall from the height of 40,000 feet or 1333 yards.

Plate cccxvii.

The height CA (fig. 4.) for producing the velocity of projection is called, in the language of gunnery, the IMPETUS. We ſhall expreſs it by the ſymbol h.

The diſtance AB to which the ſhell goes on any plane AB, is called the AMPLITUDE or the RANGE r.

The angle DBA, made by the vertical line and the plane AB, may be called the angle of POSITION of that plane, p.

The angle DAB, made by the axis or direction of the piece, and the direction of the object, may be called the angle of ELEVATION of the piece above the plane AB, e.

The angle ZAD, made by the vertical line, and the direction of the piece, may be called the ZENITH diſtance, z.

25
Relations between the velocity, diſtance, &c.

The relations between all the circumſtances of velocity, diſtance, poſition, elevation, and time, may be included in the following propoſitions.

I. Let a ſhell be projected from A, with the velocity acquired by falling through CA, with the intention of hitting the mark B ſituated in the given line AB.

Make ZA=4AC, and draw BD perpendicular to the horizon. Deſcribe on ZA an arch of a circle ZDA, containing an angle equal to DBA, and draw AD to the interſection of this circle with DB; then will a body projected from A, in the direction AD, with the velocity acquired by falling through CA, hit the mark B.

For, produce CA downwards, and draw BF parallel to AD, and draw ZD. It is evident from the conſtruction that AB touches the circle in B, and that the angles ADZ, DBA, are equal, as alſo the angles AZD, DAB; therefore the triangles ZAD, ADB are ſimilar.

$$\text{Therefore } BD : DA = DA : AZ,$$
$$\text{And } DA^2 = BD \times AZ;$$
$$\text{Therefore } BF^2 = AF \times AZ, = AF \times 4\ AC.$$

Therefore a parabola, of which AF is a diameter, and AZ its parameter, will paſs through B, and this parabola will be the path of the ſhell projected as already mentioned.

Remark. When BD cuts this circle, it cuts it in two points D, d; and there are two directions which will ſolve the problem. If B D′ only touches the circle in D′, there is but one direction, and AB′ is the greateſt poſſible range with this velocicity. If the vertical line through B does not meet the circle, the problem is impoſſible, the velocity being too ſmall. When B′D′ touches the circle, the two directions AD′ and A d' coaleſce into one direction, producing the greateſt range, and biſecting the angle ZAB; and the other two directions AD, Ad, producing the ſame range AB, are equidiſtant from AD′, agreeably to the general propoſition.

$$\text{It is evident that } AZ : AD = S,ADZ : S,AZD, = S,DBA : S,DAB, = S,p : S,e$$
$$\text{And } AD : DB = S,DBA : S,DAB, = S,p : S,e$$
$$\text{And } DB : AB = S,DAB : S,ADB, = S,e : S,z$$
$$\text{Therefore } AZ : AB = S^2,p \times S^2,e : S^2,e \times S,z ; = S^2,p : S,e \times S,z$$
$$\text{Or } 4\,h : r = S^2,p : S,e \times S,z, \text{ and } 4\,h \times S,e \times S,z = r \times S^2,p$$

Hence we obtains the relations wanted.

$$\text{Thus } h = \frac{r \times S^2,p}{4S,e \times S,z}, \text{ and } r = \frac{4h \times S\ e \times S,z}{S^2,p}$$
$$\text{And } S,z = \frac{r \times S^2 p}{4h \times S,e}, \text{ and } S,e = \frac{r \times S^2,p,}{4h \times S,z},$$

26
To calculate the time of flight.

The only other circumſtance in which we are intereſted is the time of the flight. A knowledge of this is neceſſary for the bombardier, that he may cut the fuzes of his ſhells to ſuch lengths as that they may burſt at the very inſtant of their hitting the mark.

Now AB : DB = Sin, ADB : Sin, DAB, = S,z : S,e, and $DB = \frac{r \times S,e}{S,z}$. But the time of the flight is the ſame with the time of falling through DB, and 16 feet : DB = 1″ : t″. Hence $t''^2 = \frac{r \times S,e}{16S,z}$, and we have the following eaſy rule.

From the ſum of the logarithms of the range, and of the ſine of elevation, ſubtract the ſum of the logarithms of 16, and of the ſine of the zenith diſtance, half the remainder is the logarithm of the time in ſeconds.

This becomes ſtill eaſier in practice; for the mortar ſhould be ſo elevated that the range is a maximum: in which caſe AB=DB, and then half the difference of the logarithms of AB and of 16 is the logarithm of the time in ſeconds.

27
The theory of gunnery compared with experiment.

Such are the deduction from the general propoſitions which conſtitute the ordinary theory of gunnery. It remains to compare them with experiment.

In ſuch experiments as can be performed with great accuracy in a chamber, the coincidence is as great as can be wiſhed. A jet of water, or mercury, gives us the fineſt example, becauſe we have the whole parabola exhibited to us in the ſimultaneous places of the ſucceeding particles. Yet even in theſe experiments a deviation can be obſerved. When the jet is made on a horizontal plane, and the curve carefully traced on a perpendicular plane held cloſe by it, it is found that the diſtance between the higheſt point of the curve and the mark is leſs than the diſtance between it and the ſpout, and that the deſcending branch of the curve is more perpendicular than the aſcending branch. And this difference is more remarkable as the jet is made with greater velocity, and reaches to a greater diſtance. This is evidently produced by the reſiſtance of the air, which diminiſhes the velocity, without affecting the gravity of the projectile. It is ſtill more ſenſible in the motion of bombs. Theſe can be traced through the air by the light of their fuzes; and we ſee that their higheſt point is always much nearer to the mark than to the mortar on a horizontal plane.

The greateſt horizontal range on this plane ſhould be when the elevation is 45°. It is always found to be much lower.

The ranges on this plane ſhould be as the ſines of twice the elevation.

A ball diſcharged at the elev. 19°. 5′ ranged 448 yards
at 9. 45 330
It ſhould have ranged by theory 241

The range at an elevation of 45° ſhould be twice the impetus. Mr Robins found that a muſket-ball, diſcharged with the uſual allotment of powder, had the velocity of 1700 feet in a ſecond. This requires a fall of 45156 feet, and the range ſhould be 90312, or 17⅛ miles; whereas it does not much exceed half a mile. A 29 pound ball diſcharged with 16 pounds of powder ſhould range about 16 miles; whereas it is generally ſhort of 3 miles.

28
This compariſon ſhews the deficiency of the theory.

Such facts ſhow incontrovertibly how deficient the parabolic theory is, and how unfit for directing the practice of the artilleriſt. A very ſimple conſideration is ſufficient for rendering this obvious to the moſt uninſtructed. The reſiſtance of the air to a very light body may greatly exceed its weight. Any one will feel this in trying to move a fan very rapidly through the air; therefore this reſiſtance would occaſion a greater deviation from uniform motion than gravity would *in that body*. Its path, therefore, through the air may differ more from a parabola than the parabola itſelf deviates from the ſtraight line.

It is for ſuch cogent reaſons that we preſume to ſay, that the voluminous treatiſes which have been publiſhed on this ſubject are nothing but ingenious amuſements for young mathematicians. Few perſons who have been much engaged in the ſtudy of mechanical philoſophy have miſſed this opportunity in the beginning of their ſtudies. The ſubject is eaſy. Some property of the parabola occurs, by which they can give a neat and ſyſtematic ſolution of all the queſtions; and at this time of ſtudy it ſeems a conſiderable eſſay of ſkill. They are tempted to write a book on the ſubject; and it finds readers among other young mechanicians, and employs all the mathematical knowledge that moſt of the young gentlemen of the military profeſſion are poſſeſſed of. But theſe performances deſerve little attention from the practical artilleriſt. All that ſeems poſſible to do for his education is, to multiply judicious experiments on real pieces of ordnance, with the charges that are uſed in actual ſervice, and to furniſh him with tables calculated from ſuch experiments.

Theſe obſervations will ſerve to juſtify us for having given ſo conciſe an account of this doctrine of the parabolic flight of bodies.

29
Cauſes of this deficiency.

But it is the buſineſs of a philoſopher to inquire into the cauſes of ſuch a prodigious deviation from a well founded theory, and having diſcovered them, to aſcertain preciſely the deviation they occaſion. Thus we ſhall obtain another theory, either in the form of the parabolic theory corrected, or as a ſubject of independent diſcuſſion. This we ſhall now attempt.

30
Effect of the atmoſphere.

The motion of projectiles is performed in the atmoſphere. The air is diſplaced, or put in motion. Whatever motion it acquires muſt be taken from the bullet. The motion communicated to the air muſt be in the proportion of the quantity of air put in motion, and of the velocity communicated to it. If, therefore, the diſplaced air be always *ſimilarly diſplaced*, whatever be the velocity of the bullet, the motion communicated to it, and loſt by the bullet, muſt be proportional to the ſquare of the velocity of the bullet and to the denſity of the air jointly. Therefore the diminution of its motion muſt be greater when the motion itſelf is greater, and in the very great velocity of ſhot and ſhells it muſt be prodigious. It appears from Mr Robins's experiments that a globe of 4½ inches in diameter, moving with the velocity of 25 feet in a ſecond, ſuſtained a reſiſtance of 315 grains, nearly ¾ of an ounce. Suppoſe this ball to move 800 feet in a ſecond, that is 32 times faſter, its reſiſtance would be 32 × 32 times ¾ of an ounce, or 768 ounces or 48 pounds. This is four times the weight of a ball of caſt iron of this diameter; and if the initial velocity had been 1600 feet per ſecond, the reſiſtance would be at leaſt 16 times the weight of the ball. It is indeed much greater than this.

31
Compared with that of gravity.

This reſiſtance, operating conſtantly and uniformly on the ball, muſt take away four times as much from its velocity as its gravity would do in the ſame time. We know that in one ſecond gravity would reduce the velocity 800 to 768 if the ball were projected ſtraight upwards. This reſiſtance of the air would therefore reduce it in one ſecond to 672, if it operated uniformly: but as the velocity diminiſhes continually by the reſiſtance, and the reſiſtance diminiſhes along with the velocity, the real diminution will be ſomewhat leſs than 128 feet. We ſhall, however, ſee afterwards that in one ſecond its velocity will be reduced from 800 to 687. From this ſimple inſtance we ſee that the reſiſtance of the air muſt occaſion great deviation from parabolic motion.

32
And conſidered as a retarding force.

In order to judge accurately of its effect, we muſt conſider it as a retarding force, in the ſame way as we conſider gravity. The weight W of a body is the aggregate of the action of the force of gravity g on each particle of the body. Suppoſe the number of equal particles, or the quantity of matter, of a body to be M, then W is equivalent to gM. In like manner, the reſiſtance R, which we obſerve in any experiment, is the aggregate of the action of a retarding force R′ on each particle, and is equivalent to R′M; and as g is equal to $\frac{W}{M}$, ſo R′ is equal to $\frac{R}{M}$. We ſhall keep this diſtinction in view, by adding the differential mark ′ to the letter R or *r*, which expreſſes the aggregate reſiſtance.

33
The reſiſtance of the air not uniform.

If we, in this manner, conſider reſiſtance as a retarding force, we can compare it with any other ſuch force by means of the retardation which it produces in ſimilar circumſtances. We would compare it with gravity by comparing the diminution of velocity which its uniform action produces in a given time with the diminution produced in the ſame time by gravity. But we have no opportunity of doing this directly; for when the reſiſtance of the air diminiſhes the velocity of a body, it diminiſhes it gradually, which occaſions a gradual diminution of its own intenſity. This is not the caſe with gravity, which has the ſame action on a body in motion or at reſt. We cannot, therefore, obſerve the uniform action of the air's reſiſtance as a retarding force. We muſt fall on ſome other way of making the compariſon. We can ſtate them both as dead preſſures. A ball may be fitted to the rod of a ſpring ſtillyard, and expoſed to the impulſe of the wind. This will compreſs the ſtillyard to the mark 3, for inſtance. Perhaps the weight of the ball will compreſs it to the mark 6. We know that half this weight would compreſs it to 3. We account this equal to the preſſure of the air, becauſe they balance the ſame elaſticity of the ſpring. And in this way we can eſtimate the reſiſtance by weights, whoſe preſſures are equal to its preſſure, and we can thus compare it with other reſiſtances, weights, or any other preſſures. In fact, we are meaſuring them all by the elaſticity of the ſpring. This elaſticity in its different poſitions is ſuppoſed to have the proportions of the weights which keep it in theſe poſitions. Thus we reaſon from the nature of gravity, no longer conſidered as a dead preſſure, but as a retarding force; and we apply our concluſions to reſiſtances which exhibit the ſame preſſures, but which we cannot make to act uniformly. This ſenſe of the words muſt be carefully remembered whenever we ſpeak of reſiſtances in pounds and ounces.

34 Gravity and reſiſtance compared when they are equal.

The moſt direct and convenient way of ſtating the compariſon between the reſiſtance of the air and the accelerating force of gravity, is to take a caſe in which we know that they are equal. Since the reſiſtance is here aſſumed as proportional to the ſquare of the velocity, it is evident that the velocity may be ſo increaſed that the reſiſtance ſhall equal or exceed the weight of the body. If a body be already moving downwards with this velocity, it cannot accelerate; becauſe the accelerating force of gravity is balanced by an equal retarding force of reſiſtance. It follows from this remark, that this velocity is the greateſt that a body can acquire by the force of gravity only. Nay, we ſhall afterwards ſee that it never can completely attain it; becauſe as it approaches to this velocity, the remaining accelerating force decreaſes faſter than the velocity increaſes. It may therefore be called the limiting or TERMINAL velocity by gravity.

Let a be the height through which a heavy body muſt fall, in vacuo, to acquire its terminal velocity in air. If projected directly upwards with this velocity, it will riſe again to this height, and the height is half the ſpace which it would deſcribe uniformly, with this velocity, in the time of its aſcent. Therefore the reſiſtance to this velocity being equal to the weight of the body, it would extinguiſh this velocity, by its *uniform* action, in the ſame time, and after the ſame diſtance, that gravity would.

Now let g be the velocity which gravity generates or extinguiſhes during an unit of time, and let u be the terminal velocity of any particular body. The theorems for perpendicular aſcents give us $g=\frac{u^2}{2a}$, u and a being both numbers repreſenting units of ſpace; therefore, in the preſent caſe, we have $r'=\frac{u^2}{2a}$. For the whole reſiſtance r, or r' M, is ſuppoſed equal to the weight, or to g M; and therefore r' is equal to $g, =\frac{u^2}{2a}$ and $2a=\frac{u^2}{g}$. There is a conſideration which ought to have place here. A body deſcends in air, not by the whole of its weight, but by the exceſs of its weight above that of the air which it diſplaces. It deſcends by its *ſpecific* gravity only as a ſtone does in water. Suppoſe a body 32 times heavier than air, it will be buoyed up by a force equal to $\frac{1}{32}$ of its weight; and inſtead of acquiring the velocity of 32 feet in a ſecond, it will only acquire a velocity of 31, even though it ſuſtained no reſiſtance from the *inertia* of the air. Let p be the weight of the body and π that of an equal bulk of air: the accelerative force of relative gravity on each particle will be $g\times 1-\frac{\pi}{p}$; and this relative accelerating force might be diſtinguiſhed by another ſymbol γ. But in all caſes in which we have any intereſt, and particularly in military projectiles, $\frac{\pi}{p}$ is ſo ſmall a quantity that it would be pedantic affectation to attend to it. It is much more than compenſated when we make $g=32$ feet inſtead of $32\frac{1}{12}$ which it ſhould be.

Let e be the time of this aſcent in oppoſition to gravity. The ſame theorems give us $eu=2a$; and ſince the reſiſtance competent to this terminal velocity is equal to gravity, e will alſo be the time in which it would be extinguiſhed by the uniform action of the reſiſtance; for which reaſon we may call it the extinguiſhing time for this velocity. Let R and E mark the reſiſtance and extinguiſhing time for the ſame body moving with the velocity 1.

Since the reſiſtances are as the ſquares of the velocities, and the reſiſtance to the velocity u is $\frac{u^2}{2a}$, R will be $=\frac{1}{2a}$. Moreover, the times in which the ſame velocity will be extinguiſhed by different forces, acting uniformly, are inverſely as the forces, and gravity would extinguiſh the velocity 1 in the time $\frac{1}{g}$, $=$ (in theſe meaſures) to $\frac{1}{\frac{u^2}{2a}}, =\frac{2a}{u^2}$. Therefore we have the following proportion $\frac{1}{2a}(=\text{R}):\frac{u^2}{2a}(=g)=\frac{2a}{u^2}:2a$, and $2a$ is equal to E, the time in which the velocity 1 will be extinguiſhed by the uniform action of the reſiſtance competent to this velocity.

The velocity 1 would in this caſe be extinguiſhed after a motion uniformly retarded, in which the ſpace deſcribed is one-half of what would be uniformly deſcribed during the ſame time with the conſtant velocity 1. Therefore the ſpace thus deſcribed by a motion which begins with the velocity 1, and is uniformly retarded by the reſiſtance competent to this velocity, is equal to the height through which *this* body muſt fall *in vacuo* in order to acquire *its* terminal velocity in air.

All theſe circumſtances may be conceived in a manner which, to ſome readers, will be more familiar and palpable. The terminal velocity is that where the reſiſtance of the air balances and is equal to the weight of the body. The reſiſtance of the air to any particular body is as the ſquare of the velocity; therefore let R be the whole reſiſtance to the body moving with the velocity

1, and r the reſiſtance to its motion with the terminal velocity u; we muſt have $r=R\times u^2$, and this muſt be $=W$ the weight. Therefore, to obtain the terminal velocity, divide the weight by the reſiſtance to the velocity 1, and the quotient is the ſquare of the terminal velocity, or $\frac{W}{R}=u^2$: And this is a very expeditious method of determining it, if R be previouſly known.

Then the common theorems give a, the fall neceſſary for producing this velocity *in vacuo* $=\frac{u^2}{2g}$, and the time of the fall $=\frac{u}{g}=e$, and $eu,=2a,=$ the ſpace uniformly deſcribed with the velocity u during the time of the fall, or its equal, the time of the extinction by the uniform action of the reſiſtance r; and, ſince r extinguiſhes it in the time e, R, which is u^2 times ſmaller, will extinguiſh it in the time u^2e, and R will extinguiſh the velocity 1, which is u times leſs than u, in the time $u\,e$, that is, in the time $2a$; and the body, moving uniformly during the time $2a$, $=E$, with the velocity 1, will deſcribe the ſpace $2a$; and, if the body begin to move with the velocity 1, and be uniformly oppoſed by the reſiſtance R, it will be brought to reſt when it has deſcribed the ſpace a; and the ſpace in which the reſiſtance to the velocity 1 will extinguiſh that velocity by its uniform action, is equal to the height through which that body muſt fall *in vacuo* in order to acquire its terminal velocity in air. And thus every thing is regulated by the time E in which the velocity 1 is extinguiſhed by the uniform action of the correſponding reſiſtance, or by $2\,a$, which is the ſpace uniformly deſcribed during this time, with the velocity 1. And E and $2a$ muſt be expreſſed by the ſame number. It is a number of units, of time, or of length.

35 The compariſon made general.

Having aſcertained theſe leading circumſtances for an unit of velocity, weight, and bulk, we proceed to deduce the ſimilar circumſtances for any other magnitude; and, to avoid unneceſſary complications, we ſhall always ſuppoſe the bodies to be ſpheres, differing only in diameter and denſity.

Firſt, then, let the velocity be increaſed in the ratio of 1 to v.

The reſiſtance will now be $\frac{v^2}{2a},=r$.

The extinguiſhing time will be $\frac{E}{v},=e,=\frac{2a}{v}$, and $e\,v=2a$; ſo that the rule is general, that the ſpace along which *any* velocity will be extinguiſhed by the uniform action of the correſponding reſiſtance, is equal to the height neceſſary for communicating the terminal velocity to *that* body by gravity. For $e\,v$ is twice the ſpace through which the body moves while the velocity v is extinguiſhed by the uniform reſiſtance.

In the 2d place, let the diameter increaſe in the proportion of 1 to d. The aggregate of the reſiſtance changes in the proportion of the ſurface ſimilarly reſiſted, that is, in the proportion of 1 to d^2. But the quantity of matter, or number of particles among which this reſiſtance is to be diſtributed, changes in the proportion of 1 to d^3. Therefore the retarding power of the reſiſtance changes in the proportion of 1 to $\frac{1}{d}$. When the diameter was 1, the reſiſtance to a velocity 1 was $\frac{1}{2a}$. It muſt now be $\frac{1}{2\,a\,d}$. The time in which this diminiſhed reſiſtance will extinguiſh the velocity 1 muſt increaſe in the proportion of the diminution of force, and muſt now be $E\,d$, or $2\,a\,d$, and the ſpace uniformly deſcribed during this time with the initial velocity 1 muſt be $2\,a\,d$; and this muſt ſtill be twice the height neceſſary for communicating the terminal velocity w to *this* body. We muſt ſtill have $g=\frac{w^2}{2\,a\,d}$; and therefore $w^2=2\,g\,a\,d$, and $w=\sqrt{2\,g\,a\,d},=\sqrt{2\,g\,a}\sqrt{d}$. But $u=\sqrt{2\,g\,a}$. Therefore the terminal velocity w for this body is $=u'\sqrt{d}$; and the height neceſſary for communicating it is $a\,d$. Therefore the terminal velocity varies in the ſubduplicate ratio of the diameter of the ball, and the fall neceſſary for producing it varies in the ſimple ratio of the diameter. The extinguiſhing time for the velocity v muſt now be $\frac{Ed}{v}$.

If, in the 3d place, the denſity of the ball be increaſed in the proportion of 1 to m, the number of particles among which the reſiſtance is to be diſtributed is increaſed in the ſame proportion, and therefore the retarding force of the reſiſtance is equally diminiſhed; and if the denſity of the air is increaſed in the proportion of 1 to n, the retarding force of the reſiſtance increaſes in the ſame proportion: hence we eaſily deduce theſe *general* expreſſions.

The terminal velocity $=u\sqrt{d\frac{m}{n}}.\ —=\sqrt{2\,g\,a\,d\frac{m}{n}}$.

The producing fall *in vacuo* $=ad\frac{m}{n}$

The retarding power of reſiſtance to any velocity $=r',=\frac{v^2}{2\,a\,d\frac{m}{n}}$.

The extinguiſhing time for any velocity $v=\frac{Edm}{vn}$.

And thus we ſee that the chief circumſtances are regulated by the terminal velocity, or are conveniently referred to it.

36 Units neceſſary by which the quantities may be meaſured.

To render the deductions from theſe premiſes perſpicuous, and for communicating diſtinct notions or ideas, it will be proper to aſſume ſome convenient units, by which all theſe quantities may be meaſured; and, as this ſubject is chiefly intereſting in the caſe of military projectiles, we ſhall adapt our units to this purpoſe. Therefore, let a ſecond be the unit of time, a foot the unit of ſpace and velocity, an inch the unit of diameter of a ball or ſhell, and a pound avoirdupoiſe the unit of preſſure, whether of weight or of reſiſtance; therefore g is 32 feet.

The great difficulty is to procure an abſolute meaſure of r, or u, or a; any one of theſe will determine the others

37 Sir Iſaac Newton's endeavours in this way.

Sir Iſaac Newton has attempted to determine r by theory, and employs a great part of the ſecond book of the *Principia* in demonſtrating, that the reſiſtance to a ſphere moving with any velocity is to the force which would generate or deſtroy its whole motion in the time that it would uniformly move over $\frac{8}{3}$ of its diameter with this velocity as the denſity of the air is to the denſity of the ſphere. This is equivalent to demonſtrating that the reſiſtance of the air to a ſphere moving through it with any velocity, is equal to half the weight of a column of air having a great circle of the ſphere for its baſe, and for its altitude the height from which a body muſt fall *in vacuo* to acquire this velocity. This appears from Newton's demonſtration; for, let the ſpecific gravity of the air be to that of the ball as 1 to m; then, becauſe the times in which the ſame velocity will be extinguiſhed by the uniform action of different forces are inverſely as the forces, the reſiſtance to this velocity would extinguiſh it in the time of deſcribing $\frac{8}{3}\, m\, d$, d being the diameter of the ball. Now 1 is to m as the weight of the diſplaced air to the weight of the ball, or as $\frac{2}{3}$ of the diameter of the ball to the length of a column of air of equal weight. Call this length a; a is therefore equal to $\frac{2}{3}\, m\, d$. Suppoſe the ball to fall from the height a in the time t, and acquire the velocity u. If it moved uniformly with this velocity during this time, it would deſcribe a ſpace $= 2\, a$, or $\frac{4}{3}\, m\, d$. Now its weight would extinguiſh this velocity, or deſtroy this motion, in the ſame time, that is, in the time of deſcribing $\frac{4}{3}\, m\, d$; but the reſiſtance of the air would do this in the time of deſcribing $\frac{8}{3}\, m\, d$; that is, in twice the time. The reſiſtance therefore is equal to half the weight of the ball, or to half the weight of the column of air whoſe height is the height producing the velocity. But the reſiſtances to different velocities are as the ſquares of the velocities; and therefore, as their producing heights, and, in general, the reſiſtance of the air to a ſphere moving with any velocity, is equal to the half weight of a column of air of equal ſection, and whoſe altitude is the height producing the velocity.

38 His reſult juſt, but his reaſoning erroneous.

The reſult of this inveſtigation has been acquieſced in by all Sir Iſaac Newton's commentators. Many faults have indeed been found with his reaſoning, and even with his pirnciples; and it muſt be acknowledged that although this inveſtigation is by far the moſt ingenious of any in the *Principia*, and ſets his acuteneſs and addreſs in the moſt conſpicuous light, his reaſoning is liable to ſerious objections, which his moſt ingenious commentators have not completely removed. However, the concluſion has been acquieſced in, as we have already ſtated, but as if derived from other principles, or by more logical reaſoning. We cannot, however, ſay that the reaſonings or aſſumptions of theſe mathematicians are much better than Newton's: and we muſt add that all the cauſes of deviation from the duplicate ratio of the velocities, and the cauſes of increaſed reſiſtance, which the later authors have valued themſelves for diſcovering and introducing into their inveſtigations, were pointed out by Sir Iſaac Newton, but purpoſely omitted by him, in order to facilitate the diſcuſſion *in re difficillima*. (See *Schol.* prop. 37. b. ii.)

It is known that the weight of a cubic foot of water is $62\frac{1}{2}$ pounds, and that the medium denſity of the air is $\frac{1}{840}$ of water; therefore let a be the height producing the velocity (in feet), and d the diameter of the ball (in inches), and π the periphery of a circle whoſe diameter is 1; the reſiſtance of the air will be

$$= \frac{62\frac{1}{2}}{840} \times \frac{\pi}{4} \times \frac{1}{144} \times \frac{a}{2} \times d^2 = \frac{a\,d^2}{4928\frac{1}{2}} \text{ pounds, very nearly, } = \frac{v^2}{4928\frac{1}{2} \times 64}\, d^2, = \frac{v^2\, d^2}{315417} \text{ pounds.}$$

We may take an example. A ball of caſt iron weighing 12 pounds, is $4\frac{1}{2}$ inches in diameter. Suppoſe this ball to move at the rate of $25\frac{1}{10}$ feet in a ſecond (the reaſon of this choice will appear afterwards). The height which will produce this velocity in a falling body is $9\frac{7}{8}$ feet. The area of its great circle is 0,11044 feet, or $\frac{11044}{1000000}$ of one foot. Suppoſe water to be 840 times heavier than air, the weight of the air incumbent on this great circle, and $9\frac{7}{8}$ feet high, is 0,081151 pounds: half of this is 0,0405755 or $\frac{405755}{10000000}$ or nearly $\frac{1}{25}$ of a pound. This ſhould be the reſiſtance of the air to this motion of the ball.

39 Neceſſity of experiment.

In all matters of phyſical diſcuſſion, it is prudent to confront every theoretical concluſion with experiment. This is particularly neceſſary in the preſent inſtance, becauſe the theory on which this propoſition is founded is extremely uncertain. Newton ſpeaks of it with the moſt cautious diffidence, and ſecures the juſtneſs of the concluſions by the conditions which he aſſumes in his inveſtigation. He deſcribes with the greateſt preciſion the ſtate of the fluid in which the body muſt move, ſo as that the demonſtration may be ſtrict, and leaves it to others to pronounce whether this is the real conſtitution of our atmoſphere. It muſt be granted that it is not; and that many other ſuppoſitions have been introduced by his commentators and followers, in order to ſuit his inveſtigation (for we muſt aſſert that little or nothing has been added to it) to the circumſtances of the caſe.

40 Newton's experiments.

Newton himſelf, therefore attempted to compare his propoſitions with experiment. Some were made by dropping balls from the dome of St Paul's cathedral; and all theſe ſhowed as great a coincidence with his theory as they did with each other: but the irregularities were too great to allow him to ſay with preciſion what was the reſiſtance. It appeared to follow the proportion of the ſquares of the velocities with ſufficient exactneſs; and though he could not ſay that the reſiſtance was equal to the weight of the column of air having the height neceſſary for communicating the velocity, it was always equal to a determinate part of it; and might be ſtated $= n\, a$, n being a number to be fixed by numerous experiments.

One great ſource of uncertainty in his experiments ſeems to have eſcaped his obſervation: the air in that dome is almoſt always in a ſtate of motion. In the ſummer ſeaſon there is a very ſenſible current of air downwards, and frequently in winter it is upwards: and this current bears a very great proportion to the velocity of the deſcents. Sir Iſaac takes no notice of this.

He made another ſet of experiments with pendulums; and has pointed out ſome very curious and unexpected circumſtances of their motions in a reſiſting medium. There is hardly any part of his noble work in which his addreſs, his patience, and his aſtoniſhing penetration, appear in greater luſtre. It requires the utmoſt intenſeneſs of thought to follow him in theſe diſquiſitions; and we cannot enter on the ſubject at preſent: ſome notice will be taken of theſe experiments in the article RESISTANCE *of Fluids*. Their reſults were much more uniform, and confirmed his general theory; and, as we have ſaid above, it has been acquieſced in by the firſt mathematicians of Europe.

41 Inutility of the theory in practice.

But the deductions from this theory were ſo inconſiſtent with the obſerved motions of military projectiles, when the velocities are prodigious, that no application could be made which could be of any ſervice for determining

42
The attempts of various mathematicians, &c.

mining the path and motion of cannon ſhot and bombs; and although Mr John Bernoulli gave in 1718 a moſt elegant determination of the trajectory and motion of a body projected in a fluid which reſiſts in the duplicate ratio of the velocities (a problem which even Newton did not attempt), it has remained a dead letter. Mr Benjamin Robins, equally eminent for phyſical ſcience and mathematical genius, was the firſt who ſuſpected the true cauſe of the imperfection of the uſually received theories; and in 1737 he publiſhed a ſmall tract, in which he ſhowed clearly, that even the Newtonian theory of reſiſtance muſt cauſe a cannon ball, diſcharged with a full allotment of powder, to deviate farther from the parabola, in which it would move *in vacuo*, than the parabola deviates from a ſtraight line. But he farther aſſerted, on the authority of good reaſoning, that in ſuch great velocities the reſiſtance muſt be much greater than this theory aſſigns; becauſe, beſides the reſiſtance ariſing from the *inertia* of the air which is put in motion by the ball, there muſt be a reſiſtance ariſing from a condenſation of the air on the anterior ſurface of the ball, and a rarefaction behind it: and there muſt be a third reſiſtance, ariſing from the ſtatical preſſure of the air on its anterior part, when the motion is ſo ſwift that there is a vacuum behind. Even theſe cauſes of diſagreement with the theory had been foreſeen and mentioned by Newton (ſee the Scholium to prop. 37, Book II. *Princip.*); but the ſubject ſeems to have been little attended to. The eminent mathematicians had few opportunities of making experiments; and the profeſſional men, who were in the ſervice of princes, and had their countenance and aid in this matter, were generally too deficient in mathematical knowledge to make a proper uſe of their opportunities. The numerous and ſplendid volumes which theſe gentlemen have been enabled to publiſh by the patronage of ſovereigns are little more than prolix extenſions of the ſimple theory of Galileo. Some of them, however, ſuch as St Remy, Antonini, and Le Blond, have given moſt valuable collections of experiments, ready for the uſe of the profound mathematician.

43
Obſervations of Mr Robins on velocity and reſiſtance,

Two or three years after this firſt publication, Mr Robins hit upon that ingenious method of meaſuring the great velocities of military projectiles, which has handed down his name to poſterity with great honour. And having aſcertained theſe velocities, he diſcovered the prodigious reſiſtance of the air, by obſerving the diminution of velocity which it occaſioned. This made him anxious to examine what was the real reſiſtance to any velocity whatever, in order to aſcertain what was the law of its variation; and he was equally fortunate in this attempt. His method of meaſuring the reſiſtance has been fully deſcribed in the article Gunnery, n° 9, &c.

It appears (Robins's *Math. Works*, vol. i. page 205.) that a ſphere of 4½ inches in diameter, moving at the rate of 25⅕ feet in a ſecond, ſuſtained a reſiſtance of 0,04914 pounds, or $\frac{4914}{100000}$ of a pound. This is a greater reſiſtance than that of the Newtonian theory, which gave $\frac{405755}{10000000}$ in the proportion of 1000 to 1211, or very nearly in the proportion of five to ſix in ſmall numbers. And we may adopt as a rule in all moderate velocities, that the reſiſtance to a ſphere is equal to $\frac{61}{100}$ of the weight of a column of air having the great circle of the ſphere for its baſe, and for its altitude the height through which a heavy body muſt fall *in vacuo* to acquire the velocity of projection.

This experiment is peculiarly valuable, becauſe, the ball is preciſely the ſize of a 12 pound ſhot of caſt iron, and its accuracy may be depended on. There is but one ſource of error. The whirling motion muſt have occaſioned ſome whirl in the air, which would continue till the ball again paſſed through the ſame point of its revolution. The reſiſtance obſerved is therefore probably ſomewhat leſs than the true reſiſtance to the velocity of 25⅕ feet, becauſe it was exerted in a relative velocity which was leſs than this, and is, in fact, the reſiſtance competent to this relative and ſmaller velocity.

44
And of Mr Rouſe and De Borda.

—Accordingly, Mr Smeaton, a moſt ſagacious naturaliſt, places great confidence in the obſervations of a Mr Rouſe of Leiceſterſhire, who meaſured the reſiſtance by the effect of the wind on a plane properly expoſed to it. He does not tell us in what way the velocity of the wind was aſcertained; but our deference for his great penetration and experience diſpoſes us to believe that the point was well determined. The reſiſtance obſerved by Mr Rouſe exceeds that reſulting from Mr Robins's experiments nearly in the proportion of 7 to 10.

45
They differ widely in their concluſions.

Chevalier de Borda made experiments ſimilar to thoſe of Mr Robins, and his reſults exceed thoſe of Robins in the proportion of 5 to 6. Theſe differences are ſo conſiderable, that we are at a loſs what meaſure to abide by. It is much to be regretted, that in a ſubject ſo intereſting both to the philoſopher and the man of the world, experiments have not been multiplied. Nothing would tend ſo much to perfect the ſcience of gunnery; and indeed till this be done, all the labours of mathematicians are of no avail. Their inveſtigations muſt remain an unintelligible cipher, till this key be ſupplied. It is to be hoped that Dr Charles Hutton of Woolwich, who has ſo ably extended Mr Robins's Examination of the Initial Velocities of Military Projectiles, will be encouraged to proceed to this part of the ſubject. We ſhould wiſh to ſee, in the firſt place, a numerous ſet of experiments for aſcertaining the reſiſtance in moderate velocities: and, in order to avoid all error from the reſiſtance and inertia of the machine, which is neceſſarily blended with the reſiſtance of the ball, in Mr Robins's form of the experiment, and is ſeparated with great uncertainty and riſk of error, we would recommend a form of experiment ſomewhat different.

46
A new form of experiment recommended.

Let the axis and arm which carries the ball be connected with wheelwork, by which it can be put in motion, and gradually accelerated. Let the ball be ſo connected with a bent ſpring, that this ſhall gradually compreſs it as the reſiſtance increaſes, and leave a mark of the degree of compreſſion; and let all this part of the apparatus be ſcreened from the air except the ball. The velocity will be determined preciſely by the revolutions of the arm, and the reſiſtance by the compreſſion of the ſpring. The beſt method would be to let this part of the apparatus be made to ſlide along the revolving arm, ſo that the ball can be made to deſcribe larger and larger circles. An intelligent mechanician will eaſily contrive an apparatus of this kind, held at any diſtance from the axis by a cord, which paſſes over a pulley in the axis itſelf, and is then brought along a perforation in the axis, and comes out at its extremity, where it is fitted with a ſwivel, to prevent it from ſnapping by being twiſted. Now let the machine be put in motion. The centrifugal force of the ball and apparatus will cauſe it to fly out as far as it is allowed by the cord;

and if the whole is put in motion by connecting it with ſome mill, the velocity may be moſt accurately aſcertained. It may alſo be fitted with a bell and hammer like Graveſande's machine for meaſuring centrifugal forces. Now by gradually veering off more cord, the diſtance from the centre, and conſequently the velocity and reſiſtance increaſe, till the hammer is diſengaged and ſtrikes the bell.

Another great advantage of this form of the experiment is, that the reſiſtance to very great velocities may be thus examined, which was impoſſible in Mr Robins's way. This is the great deſideratum, that we may learn in what proportion of the velocities the reſiſtances increaſe.

In the ſame manner, an apparatus, conſiſting of Dr Lynd's Anemometer, deſcribed in the article PNEUMATICS, n° 311, &c. might be whirled round with prodigious rapidity, and the fluid on it might be made clammy, which would leave a mark at its greateſt elevation, and thus diſcover the reſiſtance of the air to rapid motions.

Nay, we are of opinion that the reſiſtance to very rapid motions may be meaſured directly in the conduit pipe of ſome of the great cylinder bellows employed in blaſt furnaces; the velocity of the air in this pipe is aſcertained by the capacity of the cylinder and the ſtrokes of the piſton. We think it our duty to point out to ſuch as have the opportunities of trying them methods which promiſe accurate reſults for aſcertaining this moſt deſirable point.

47
The reſult of Robins's experiments as yet moſt to be depended on.

We are the more puzzled what meaſure to abide by, becauſe Mr Robins himſelf, in his Practical Propoſitions, does not make uſe of the reſult of his own experiments, but takes a much lower meaſure. We muſt content ourſelves, however, with this experimental meaſure, becauſe it is as yet the only one of which any account can be given, or well-founded opinion formed.

48
Applied to the formulæ.

Therefore, in order to apply our formulæ, we muſt reduce this experiment which was made on a ball of $4\frac{1}{2}$ inches diameter, moving with the velocity of $25\frac{1}{5}$ feet per ſecond, to what would be the reſiſtance to a ball of one inch, having the velocity 1 foot. This will evidently give us $R = \frac{0,04914}{4,5^2 \times 25.2^2}$, being diminiſhed in the duplicate ratio of the diameter and velocity. This gives us $R = 0,00000381973$ pounds, or $\frac{3.81973}{1000000}$ of a pound. The logarithm is $\bar{4},58204$. The reſiſtance here determined is the ſame whatever ſubſtance the ball be of; but the retardation occaſioned by it will depend on the proportion of the reſiſtance to the *vis inſita* of the ball; that is, to its quantity of motion. This in ſimilar velocities and diameters is as the denſity of the ball. The balls uſed in military ſervice are of caſt iron or of lead, whoſe ſpecific gravities are 7,207 and 11,37 nearly, water being 1. There is conſiderable variety in caſt iron, and this denſity is about the medium. Theſe data will give us.

		For Iron.	For Lead.
W, or weight of a ball 1 inch in diameter	- -	lbs. 0,13648	0,21533
Log. of W	- -	9.13509	9.33310
E″	- - -	1116″,6	1761″,6
Log. of E	- -	3.04790	3.24591
u, or terminal velocity	-	189,03	237,43
Log. u	- -	2.27653	2.37553
a, or producing height	-	558,3	880,8

Theſe numbers are of frequent uſe in all queſtions on this ſubject.

Mr Robins gives an expeditious rule for readily finding a, which he calls F (ſee the article GUNNERY), by which it is made 900 feet for a caſt iron ball of an inch diameter. But no theory of reſiſtance which he profeſſes to uſe will make this height neceſſary for producing the terminal velocity. His F therefore is an *empirical* quantity, anologous indeed to the producing height, but accommodated to his theory of the trajectory of cannon ſhot, which he promiſed to publiſh, but did not live to execute. We need not be very anxious about this; for all our quantities change in the ſame proportion with R, and need only a correction by a multiplier or diviſor, when R ſhall be accurately eſtabliſhed.

We may illuſtrate the uſe of theſe formula by an example or two.

49
Examples of their uſe.

1. Then, to find the reſiſtance to a 24 pound ball moving with the velocity of 1670 feet in a ſecond, which is nearly the velocity communicated by 16 lbs. of powder. The diameter is 5,603 inches.

Log. R	- -	$+\bar{4}.58204$
Log. d^2	- -	$+1.49674$
Log. 1670^2	- -	$+6.44548$
Log. 334,4 lbs. $= r$	-	2.52426

But it is found, by unequivocal experiments on the retardation of ſuch a motion, that it is 504 lbs. This is owing to the cauſes often mentioned, the additional reſiſtance to great velocities, ariſing from the condenſation of the air, and from its preſſure into the vacuum left by the ball.

2. Required the terminal velocity of this ball?

Log. R	- -	$+4.58204$
Log. d^2	- - -	$+1.49674$
Log. reſiſt. to veloc. 1	-	$6.07878 = a$
Log. W	- -	$1.38021 = b$
Diff. of a and b, $=$ log u^2	-	5.30143
Log. 447,4 $= u$	-	2.65071

50
Table of terminal velocity according to Newton and Robins.

As the terminal velocity u, and its producing height a, enter into all computations of military projectiles, we have inſerted the following Table for the uſual ſizes of cannon-ſhot, computed both by the Newtonian theory of reſiſtance, and by the reſiſtances obſerved in Robins's experiments.

Lb. Ball.	Newton.		Robins.		Diam. Inch.
	u. Term. Vel.	2 a.	Term. Vel.	2 a.	
1	289,9	2626,4	263,4	2168,6	1,94
2	324,9	3298,5	295,2	2723,5	2,45
3	348,2	3788,2	316,4	3127,9	2,80
4	365,3	4170,3	331,9	3442,6	3,08
6	390,8	4472,7	355,1	3940,7	3,52
9	418,1	5463,5	379,9	4511,2	4,04
12	438,6	6010,6	398,5	4962,9	4,45
18	469,3	6883,3	426,5	5683,5	5,09
24	492,4	7576,3	447,4	6255,7	5,61
32	512,6	8024,8	465,8	6780,4	6,21
	540,5	9129,9	491,5	7538,3	6,75

Mr Muller, in his writings on this ſubject, gives a much

51 Mr Muller's theory altogether erroneous.

much ſmaller meaſure of reſiſtance, and conſequently a much greater terminal velocity: but his theory is a miſtake from beginning to end (See his *Supplement* to his *Treatiſe of Artillery*, art. 150, &c.) In art. 148. he aſſumes an algebraic expreſſion for a principle of mechanical argument; and from its conſequence draws erroneous concluſions. He makes the reſiſtance of a cylinder $\frac{1}{3}$ leſs than Newton *ſuppoſes* it; and his reaſon is falſe. Newton's meaſure is demonſtrated by his commentators Le Seur and Jaquier to be even a little too ſmall, upon his own principles, (Not. 277. Prop. 36. B. II.) Mr Muller then, without any ſeeming reaſon, introduces a new principle, which he makes the chief ſupport of his theory, in oppoſition to the theories of other mathematicians. The principle is falſe, and even abſurd, as we ſhall have occaſion to ſhow by and by. In conſequence, however, of this principle, he is enabled to compare the reſults with many experiments, and the agreement is very flattering. But we ſhall ſoon ſee that little dependence can be had on ſuch compariſons. We notice theſe things here, becauſe Mr Muller being head of the artillery ſchool in Britain, his publications have become a ſort of text-books. We are miſerably deficient in works on this ſubject, and muſt have recourſe to the foreign writers.

52 The motions conſidered through their whole courſe.

We now proceed to conſider theſe motions through their whole courſe: and we ſhall firſt conſider them as affected by the reſiſtance only; then we ſhall conſider the perpendicular aſcents and deſcents of heavy bodies through the air; and, laſtly, their motion in a curvilineal trajectory, when projected obliquely. This muſt be done by the help of the abſtruſer parts of fluxionary mathematics. To make it more perſpicuous, we ſhall, by way of introduction, conſider the ſimply reſiſted rectilineal motions geometrically, in the manner of Sir Iſaac Newton. As we advance, we ſhall quit this track, and proſecute it algebraically, having by this time acquired diſtinct ideas of the algebraic quantities.

33 Preliminary obſervations.

We muſt keep in mind the fundamental theorems of varied motions.

1. The momentary variation of the velocity is proportional to the force and the moment of time jointly, and may therefore be repreſented by $\pm\dot{v}=f\dot{t}$, where $\dot{v}$ is the momentary increment or decrement of the velocity v, f the accelerating or retarding force, and $\dot{t}$ the moment or increment of the time t.

2. The momentary variation of the ſquare of the velocity is as the force, and as the increment or decrement of the ſpace jointly; and may be repreſented by $\pm v\dot{v}=f\dot{s}$. The firſt propoſition is familiarly known. The ſecond is the 39th of Newton's *Principia*, B. I. It is demonſtrated in the article OPTICS, p. 281. and is the moſt extenſively uſeful propoſition in mechanics.

53 The motions as affected by reſiſtance only. Plate CCCCXVII.

Theſe things being premiſed, let the ſtraight line AC (fig. 6.) repreſent the initial velocity V, and let CO, perpendicular to AC, be the time in which this velocity would be extinguiſhed by the uniform action of the reſiſtance, Draw through the point A an equilateral hyperbola A*e*B, having OF, OCD for its aſſymptotes; then let the time of the reſiſted motion be repreſented by the line CB, C being the firſt inſtant of the motion. If there be drawn perpendicular ordinates *κe*, *gf*, DB &c. to the hyperbola, they will be proportional to the velocities of the body at the inſtants *κ*, *g*, D, &c. and the hyperbolic areas AC*κe* AC*gf*, ACDB, &c. will be proportional to the ſpaces deſcribed during the times C*κ*, C*g*, CB, &c.

For, ſuppoſe the time divided into an indefinite number of ſmall and equal moments, C*c*, D*d*, &c. draw the ordinates *ac*, *bd*, and the perpendiculars *bβ*, *aα*. Then, by the nature of the hyperbola, AC : *ac*=O*c* : OC; and AC—*ac* : *ac*=O*c*—OC : OC, that is, A*α* : *ac*=C*c* : OC, and A*α* : C*c*=*ac* : OC, =AC·*ac* : AC·OC; in like manner, B*β* : D*d*=BD·*b*D : BD·OD. Now D*d*=C*c*, becauſe the moments of time were taken equal, and the rectangles AC·CO, BD·DO, are equal, by the nature of the hyperbola; therefore A*α* : B*β*=AC·*ac* : BD·*bd*: but as the points *c*, *d* continually approach, and ultimately coincide with C, D, the ultimate ratio of AC·*ac* to BD·*bd* is that of AC^2 to BD^2; therefore the momentary decrements of AC and BD are as AC^2 and BD^2. Now, becauſe the reſiſtance is meaſured be the momentary diminution of velocity, theſe diminutions are as the ſquares of the velocities; therefore the ordinates of the hyperbola and the velocities diminiſh by the ſame law; and the initial velocity was repreſented by AC: therefore the velocities at all the other inſtants *κ*, *g*, D are properly repreſented by the correſponding ordinates. Hence,

1. Since the abſciſſæ of the hyperbola are as the times, and the ordinates are as the velocities, the areas will be as the ſpaces deſcribed, and AC*κe* is to A*cgf* as the ſpace deſcribed in the time C*κ* to the ſpace deſcribed in the time C*g* (1ſt Theorem on varied motions).

2. The rectangle ACOF is to the area ACDB as the ſpace formerly expreſſed by 2*a*, or E to the ſpace deſcribed in the reſiſting medium during the time CD: for AC being the velocity V, and OC the extinguiſhing time *e*, this rectangle is=*e*V, or E, or 2*a*, of our former diſquiſitions; and becauſe all the rectangles, ſuch as ACOF, BDOG, &c, are equal, this correſponds with our former obſervation, that the ſpace uniformly deſcribed with any velocity during the time in which it would be uniformly extinguiſhed by the correſponding reſiſtance is a conſtant quantity, viz. that in which we always had $ev=E$, or 2*a*.

3. Draw the tangent A*κ*, then, by the hyperbola C*κ*=CO: now C*κ* is the time in which the reſiſtance to the velocity AC would extinguiſh it; for the tangent coinciding with the elemental arc A*a* of the curve, the firſt impulſe of the uniform action of the reſiſtance is the ſame with the firſt impulſe of its varied action. By this the velocity AC is reduced to *ac*. If this operated uniformly like gravity, the velocities would diminiſh uniformly, and the ſpace deſcribed would be repreſented by the triangle AC*κ*.

This triangle, therefore, repreſents the height thro' which a heavy body muſt fall in vacuo, in order to acquire the terminal velocity.

4. The motion of a body reſiſted in the duplicate ratio of the velocity will continue without end, and a ſpace will be deſcribed which is greater than any aſſignable ſpace, and the velocity will grow leſs than any that can be aſſigned; for the hyperbola approaches continually to the aſſymptote, but never coincides with it. There is no velocity BD ſo ſmall, but a ſmaller ZP will be found beyond it; and the hyperbolic ſpace

may be continued till it exceeds any ſurface that can be aſſigned.

5. The initial velocity AC is to the final velocity BD as the ſum of the extinguiſhing time and the time of the retarded motion, is to the extinguiſhing time alone : for $\mathrm{AC} : \mathrm{BD} = \mathrm{OD}$ $(\text{or } \mathrm{OC}+\mathrm{CD}) : \mathrm{OC}$; or $\mathrm{V} : v = e : e + t$.

6. The extinguiſhing time is to the time of the retarded motion as the final velocity is to the velocity loſt during the retarded motion : for the rectangles AFOC, BDOG are equal ; and therefore AVGF and BVCD are equal and $\mathrm{VC} : \mathrm{VA} = \mathrm{VG} : \mathrm{VB}$; therefore $t = e\frac{\mathrm{V}-v}{v}$, and $e = t\frac{v}{\mathrm{V}-v}$.

7. Any velocity is reduced in the proportion of m to n in the time $e\frac{m-n}{n}$. For, let $\mathrm{AC} : \mathrm{BD} = m : n$; then $\mathrm{DO} : \mathrm{CO} = m : n$, and $\mathrm{DC} : \mathrm{CO} = m - n : n$, and $\mathrm{DC} = \frac{m-n}{n}\mathrm{CO}$, or $t = e\frac{m-n}{n}$. Therefore any velocity is reduced to one half in the time in which the initial reſiſtance would have extinguiſhed it by its uniform action.

55 Another mode of determining this motion.

Thus may the chief circumſtances of this motion be determined by means of the hyperbola, the ordinates and abſciſſæ exhibiting the relations of the times and velocities, and the areas exhibiting the relations of both to the ſpaces deſcribed. But we may render the conception of theſe circumſtances infinitely more eaſy and ſimple, by expreſſing them all by lines, inſtead of this combination of lines and ſurfaces. We ſhall accompliſh this purpoſe by conſtructing another curve LKP, having the line MLδ, parallel to OD for its abſciſſa, and of ſuch a nature, that if the ordinates to the hyperbola AC, $e\varkappa$, fg, BD, &c. be produced till they cut this curve in L, p, n, K, &c. and the abſciſſa in L, ι, h, δ, &c. the ordinates ιp, hn, δK, &c. may be proportional to the hyperbolic areas $e\mathrm{A}c\varkappa$, $f\,a\,c\,\mathrm{O}$, $\delta\mathrm{A}c\mathrm{K}$. Let us examine what kind of curve this will be.

Make $\mathrm{OC} : \mathrm{O}\varkappa = \mathrm{O}\varkappa : \mathrm{O}g$; then (Hamilton's *Conics*, IV. 14. Cor.), the areas AC$\varkappa q$, $e\varkappa gf$ are equal : therefore drawing ps, nt perpendicular to OM, we ſhall have (by the aſſumed nature of the curve LpK), $\mathrm{M}s = st$; and if the abſciſſa OD be divided into any number of ſmall parts in geometrical progreſſion (reckoning the commencement of them all from O), the axis Vi of this curve will be divided by its ordinates into the ſame number of equal parts ; and this curve will have its ordinates LM, ps, nt, &c. in geometrical progreſſion, and its abſciſſæ in arithmetical progreſſion.

Alſo, let KN, MV touch the curve in K and L, and let OC be ſuppoſed to be to Oc, as OD to Od, and therefore Cc to Dd as OC to OD ; and let theſe lines Cc, Dd be indefinitely ſmall ; then (by the nature of the curve) Lo is equal to Kr: for the areas $a$AC$c$, $b$BD$d$ are in this caſe equal. Alſo lo is to kr, as LM to KI, becauſe $c\mathrm{C} : d\mathrm{D} = \mathrm{CO} : \mathrm{DO}$:

Therefore $\mathrm{IN} : \mathrm{IK} = r\mathrm{K} : rk$
$\mathrm{IK} : \mathrm{ML} = rk : ol$
$\mathrm{ML} : \mathrm{MV} = ol : o\mathrm{I}$.
and $\mathrm{IN} : \mathrm{MN} = r\mathrm{K} : o\mathrm{L}$.

That is, the ſubtangent IN, or MV, is of the ſame magnitude, or is a conſtant quantity in every part of the curve.

Laſtly, the ſubtangent IN, correſponding to the point K of the curve, is to the ordinate Kδ as the rectangle BDOG or ACOF to the parabolic area BDCA.

For let $fghn$ be an ordinate very near to BDδK ; and let hn cut the curve in n, and the ordinate KI in q; then we have

$\mathrm{K}q : qn = \mathrm{KI} : \mathrm{IN}$, or
$\mathrm{D}g : qn = \mathrm{DO} : \mathrm{IN}$;
but $\mathrm{BD} : \mathrm{AC} = \mathrm{CO} : \mathrm{DO}$;
therefore $\mathrm{BD} . \mathrm{D}g : \mathrm{AC} . qn = \mathrm{CO} : \mathrm{IN}$:

Therefore the ſum of all the rectangles BD.Dg is to the ſum of all the rectangles AC . qn, as CO to IN ; but the ſum of the rectangles BD . Dg is the ſpace ACBD ; and, becauſe AC is given, the ſum of the rectangles AC . qn is the rectangle of AC and the ſum of all the lines qn; that is, the rectangle of AC and RL : therefore the ſpace $\mathrm{ACDB} : \mathrm{AC} . \mathrm{RL} = \mathrm{CO} : \mathrm{IN}$, and $\mathrm{ACDB} \times \mathrm{IN} = \mathrm{AC} . \mathrm{CO} . \mathrm{RL}$; and therefore $\mathrm{IN} : \mathrm{RL} = \mathrm{AC} . \mathrm{CO} : \mathrm{ACDB}$.

Hence it follows that QL expreſſes the area BVA, and, in general, that the part of the line parallel to OM, which lies between the tangent KN and the curve LpK, expreſſes the correſponding area of the hyperbola which lies without the rectangle BDOG.

And now, by the help of this curve, we have an eaſy way of conceiving and computing the motion of a body through the air. For the ſubtangent of our curve now repreſents twice the height through which the ball muſt fall in vacuo, in order to acquire the terminal velocity ; and therefore ſerves for a ſcale on which to meaſure all the other repreſentatives of the motion.

56 The whole reduced to a ſimple arithmetical computation.

But it remains to make another obſervation on the curve LpK, which will ſave us all the trouble of graphical operations, and reduce the whole to a very ſimple arithmetical computation. It is of ſuch a nature, that when MI is conſidered as the abſciſſa, and is divided into a number of equal parts, and ordinates are drawn from the points of diviſion, the ordinates are a ſeries of lines in geometrical progreſſion, or are continual proportionals. Whatever is the ratio between the firſt and ſecond ordinate, there is the ſame between the ſecond and third, between the third and fourth, and ſo on ; therefore the number of parts into which the abſciſſa is divided is the number of theſe equal ratios which is contained in the ratio of the firſt ordinate to the laſt : For this reaſon, this curve has got the name of the *logiſtic* or *logarithmic* curve ; and it is of immenſe uſe in the modern mathematics, giving us the ſolution of many problems in the moſt ſimple and expeditious manner, on which the genius of the ancient mathematicians had been exerciſed in vain. Few of our readers are ignorant, that the numbers called *logarithms* are of equal utility in arithmetical operations, enabling us not only to ſolve common arithmetical problems with aſtoniſhing diſpatch, but alſo to ſolve others which are quite inacceſſible in any other way. Logarithms are nothing more than the numerical meaſures of the abſciſſa of this curve, correſponding to ordinates, which are meaſured on the ſame or any other ſcale by the natural numbers ; that is, if MLδ be divided into equal parts, and from the points of diviſion lines be drawn parallel to

MI, cutting the curve L*p*K, and from the points of interſection ordinates be drawn to MI, theſe will divide MI into portions, which are in the ſame proportion to the ordinates that the logarithms bear to their natural numbers.

In conſtructing this curve we were limited to no particular length of the line LR, which repreſented the ſpace ACDB; and all that we had to take care of was, that when OC, O *n*, O *g* were taken in geometrical progreſſion, M *s*, M *t* ſhould be in arithmetical progreſſion. The abſciſſæ having ordinates equal to *p s*, *n t*, &c. might have been twice as long, as is ſhown in the dotted curve which is drawn through L. All the lines which ſerve to meaſure the hyperbolic ſpaces would then have been doubled. But NI would alſo have been doubled, and our proportions would have ſtill held good; becauſe this ſubtangent is the ſcale of meaſurement of our figure, as E or 2 *a* is the ſcale of meaſurement for the motions.

Since then we have tables of logarithms calculated for every number, we may make uſe of them inſtead of this geometrical figure, which ſtill requires conſiderable trouble to ſuit it to every caſe. There are two ſets of logarithmic tables in common uſe. One is called a table of hyperbolic or natural logarithms. It is ſuited to ſuch a curve as is drawn in the figure, where the ſubtangent is equal to that ordinate $\tau\upsilon$ which correſponds to the ſide πO of the ſquare $\pi\theta\lambda$O inſerted between the hyperbola and its aſſymptotes. This ſquare is the unit of ſurface, by which the hyperbolic areas are expreſſed; its ſide is the unit of length, by which the lines belonging to the hyperbola are expreſſed; $\tau\upsilon$ is $= 1$, or the unit of numbers to which the logarithms are ſuited, and then IN is alſo 1. Now the ſquare $\theta\pi$Oλ being unity, the area BACD will be ſome number; π O being alſo unity, OD is ſome number: Call it x. Then, by the nature of the hyperbola, OB : O π = π θ : DB: That is, $x : 1 = 1 : \frac{1}{x}$, ſo that DB is $\frac{1}{x}$. Now calling D *d* $\dot{x}$, the area B D *d b*, which is the fluxion (ultimately) of the hyperbolic area, is $\frac{\dot{x}}{x}$. Now in the curve L*p*K, MI has the ſame ratio to NI that BACD has to $\theta\lambda$Oπ: Therefore, if there be a ſcale of which NI is the unit, the number on this ſcale correſponding to MI has the ſame ratio to 1 which the number meaſuring BACD has to 1; and I *i*, which correſponds to BD *db*, is the fluxion (ultimately) of MI: Therefore, if MI be called the logarithm of x, $\frac{\dot{x}}{x}$ is properly repreſented by the fluxion of MI. In ſhort, the line MI is divided preciſely as the line of numbers on a Gunter's ſcale, which is therefore a line of logarithms; and the numbers called logarithms are juſt the lengths of the different parts of this line meaſured on a ſcale of equal parts. Therefore, when we meet with ſuch an expreſſion as $\frac{\dot{x}}{x}$ viz. the fluxion of a quantity divided by the quantity itſelf, we conſider it as the fluxion of the logarithm of that quantity, becauſe it is really ſo when the quantity is a number; and it is therefore ſtrictly true that the fluent of $\frac{\dot{x}}{x}$ is the hyperbolic logarithm of x.

Certain reaſons of convenience have given riſe to another ſet of logarithms; theſe are ſuited to a logiſtic curve whoſe ſubtangent is only $\frac{43429}{100000}$ of the ordinate $\tau\upsilon$, which is equal to the ſide of the hyperbolic ſquare, and which is aſſumed for the unit of number. We ſhall ſuit our applications of the preceding inveſtigation to both theſe, and ſhall firſt uſe the common logarithms whoſe ſubtangent is 0,43429.

57 Illuſtrated by examples.

The whole ſubject will be beſt illuſtrated by taking an example of the different queſtions which may be propoſed.

Recollect that the rectangle ACOF is $= 2a$, or $\frac{u^2}{g}$, or E, for a ball of caſt-iron one inch diameter, and if it has the diameter d, it is $\frac{u^2 d}{g}$, or $2\,ad$, or E d.

I. It may be required to determine what will be the ſpace deſcribed in a given time t by a ball ſetting out with a given velocity V, and what will be its velocity v at the end of that time.

Here we have NI : MI=ACOF : BDCA; now NI is the ſubtangent of the logiſtic curve; MI is the difference between the logarithms of OD and OC; that is, the difference between the logarithms of $e+t$ and e; ACOF is $2\,ad$, or $\frac{u^2 d}{g}$, or E d.

Therefore by common logarithms $0{,}43429 : \log. e+t - \log. e = 2\,ad : \text{S}$, = ſpace deſcribed,

or $0{,}43429 : \log. \frac{e+t}{e} = 2\,ad : \text{S}$,

and $\text{S.} = \frac{2\,a\,d}{0{,}43429} \times \log. \frac{e+t}{e}$,

by hyperbolic logarithms $\text{S} = 2ad \times \log. \frac{e+t}{e}$.

Let the ball be a 12 pounder, and the initial velocity be 1600 feet, and the time 20 ſeconds. We muſt firſt find e, which is $\frac{2ad}{\text{V}}$.

Therefore, log. $2a$ - -	+ 3.03236
log. d (4, 5) -	+ 0.65321
log. V. (1600) -	— 3.20412
Log. of 3″,03,=e - -	0.48145
And $e+t$ is 23″,03, of which the log. is	1.36229
from which take the log. of e -	0.48145
remains the log. of $\frac{e+t}{e}$ - - -	0.88084

This muſt be conſidered as a common number by which we are to multiply $\frac{2\,a\,d}{0{,}43429}$.

Therefore add the logarithms of $2ad$	+ 3.68557
log. $\frac{e+t}{e}$ - -	+ 9.94490
log. 0,43429 -	— 9.63778
Log. S. 9833 feet - -	3.99269

For the final velocity,

OD : OC=AC : BD, or $e+t : e = \text{V} : v$.

$23'',03 : 3'',03 = 1600 : 210\frac{1}{2}, = v$.

The ball has therefore gone 3278 yards, and its velocity is reduced from 1600 to 210.

It may be agreeable to the reader to ſee the gradual progreſs of the ball during ſome ſeconds of its motion.

T.	*S.*	*Diff.*	*V.*	*Diff.*
1″	1383		1203	397
2″	2456	1073	964	239
3″	3336	880	804	160
4″	4080	744	690	114
5″	4725	645	604	86
6″	5294	569	537	67

The firſt column is the time of the motion, the ſecond is the ſpace deſcribed, the third is the differences of the ſpaces, ſhowing the motion during each ſucceſſive ſecond; the fourth column is the velocity at the end of the time t; and the laſt column is the differences of velocity, ſhowing its diminution in each ſucceſſive ſecond. We ſee that at the diſtance of 1000 yards the velocity is reduced to one half, and at the diſtance of leſs than a mile it is reduced to one third.

II. It may be required to determine the diſtance at which the initial velocity V is reduced to any other quantity v. This queſtion is ſolved in the very ſame manner, by ſubſtituting the logarithms of V and v for thoſe of $e+t$ and e; for AC : BD=OD : OC, and therefore log. $\frac{AC}{BD}=$ log. $\frac{OD}{OC}$, or log. $\frac{V}{v}=$ log. $\frac{e+t.}{e}$

Thus it is required to determine the diſtance in which the velocity 1780 of a 24 pound ball (which is the medium velocity of ſuch a ball diſcharged with 16 pounds of powder) will be reduced to 1500.

Here d is 5,68, and therefore the logarithm of $2ad$ is - - +3.78671

Log. $\frac{V}{v}=0{,}07433$, of which the log. is +8.87116

Log. 0,43429 - - - —9.63778

Log. 1047,3 feet, or 349 yards 3.02009

This reduction will be produced in about $\frac{7}{8}$ of a ſecond.

III. Another queſtion may be to determine the time which a ball, beginning to move with a certain velocity, employs in paſſing over a given ſpace, and the diminution of velocity which it ſuſtains from the reſiſtance of the air.

We may proceed thus:

$2ad$: S $=0{,}43429$: log. $\frac{e+t}{e}$, $=t$. Then to log. $\frac{e+t}{e}$ add log. e and we obtain log. $e+t$, and $e+t$; from which if we take e we have t. Then to find v, ſay $e+t : e=V : v$.

58 Application of an experiment of Mr Robins. See Robins's Math. Works, vol. i. p. 135. We ſhall conclude theſe examples by applying this laſt rule to Mr Robin's experiment on a muſket bullet of $\frac{3}{4}$ of an inch in diameter, which had its velocity reduced from 1670 to 1425 by paſſing through 100 feet of air. This we do in order to diſcover the reſiſtance which it ſuſtained, and compare it with the reſiſtance to a velocity of 1 foot *per* ſecond.

We muſt firſt aſcertain the firſt term of our analogy. The ball was of lead, and therefore $2a$ muſt be multiplied by d and by m, which expreſſes the ratio of the denſity of lead to that of caſt iron. d is 0,75, and m is $\frac{11{,}37}{7{,}21}=1{,}577$. Therefore log. $2a$ 3.03236

d 9.87506

m 0.19782

Log. $2adm$ 3.10524

and $2adm=1274{,}2$.

Now $1274{,}2 : 100=0{,}43429 : 0{,}03408=$ log. $\frac{e+t}{e}$.

But $e=\frac{2adm}{V}=0{,}763$, and its logarithm=9.88252, which, added to 0.03408, gives 9.91660, which is the log. of $e+t$, $=0{,}825$, from which take e, and there remains $t=,0'',062$, or $\frac{62}{1000}$ of a ſecond, for the time of paſſage. Now, to find the remaining velocity, ſay $825 : ,763=1670 : 1544, =v$.

But in Mr Robins's experiment the remaining velocity was only 1425, the ball having loſt 245; whereas by this computation it ſhould have loſt only 126. It appears, therefore, that the reſiſtance is double of what it would have been if the reſiſtance increaſed in the duplicate proportion of the velocity. Mr Robins ſays it is nearly triple. But he ſuppoſes the reſiſtance to ſlow motions much ſmaller than his own experiment, ſo often mentioned, fully warrants.

The time e, in which the reſiſtance of the air would extinguiſh the velocity is $0',763$. Gravity, or the weight of the bullet, would have done it in $\frac{1670}{32}$ or 52″; therefore the reſiſtance is $\frac{52}{0{,}763}$ times, or nearly 68 times its weight, by this theory, or 5,97 pounds. If we calculate from Mr Robins's experiment, we muſt ſay log. $\frac{V}{v} : 0{,}43429=100 : eV$, which will be 630,23, and $e=\frac{630{,}23}{1670}=0'',3774$, and $\frac{52}{0{,}3774}$ gives 138 for the proportion of the reſiſtance to the weight, and makes the reſiſtance 12,07 pounds, fully double of the other.

It is to be obſerved, that with this velocity, which greatly exceeds that with which the air can ruſh into a void, there muſt be a ſtatical preſſure of the atmoſphere equal to $6\frac{1}{2}$ pounds. This will make up the difference, and allows us to conclude that the reſiſtance ariſing ſolely from the motion communicated to the air follows very nearly the duplicate proportion of the velocity.

The next experiment, with a velocity of 1690 feet, gives a reſiſtance equal to 157 times the weight of the bullet, and this bears a much greater proportion to the former than 1690^2 does to 1670^2; which ſhows, that although theſe experiments clearly demonſtrate a prodigious augmentation of reſiſtance, yet they are by no means ſuſceptible of the preciſion which is neceſſary for diſcovering the law of this augmentation, or for a good foundation of practical rules; and it is ſtill greatly to be wiſhed that a more accurate mode of inveſtigation could be diſcovered.

59 Recapitulation. Thus we have explained, in great detail, the principles and the proceſs of calculation for the ſimple caſe

of the motion of projectiles through the air. The learned reader will think that we have been unreaſonably prolix, and that the whole might have been compriſed in leſs room, by taking the algebraic method. We acknowledge that it might have been done even in a few lines. But we have obſerved, and our obſervation has been confirmed by perſons well verſed in ſuch ſubjects, that in all caſes where the fluxionary proceſs introduces the fluxion of a logarithm, there is a great want of diſtinct ideas to accompany the hand and eye. The ſolution comes out by a ſort of magic or legerdemain, we cannot tell either *how* or *why*. We therefore thought it our duty to furniſh the reader with diſtinct conceptions of the things and quantities treated of. For this reaſon, after ſhowing, in Sir Iſaac Newton's manner, how the ſpaces deſcribed in the retarded motion of a projectile followed the proportion of the hyperbolic areas, we ſhewed the nature of another curve, where lines could be found which increaſe in the very ſame manner as the path of the projectile increaſes; ſo that a point deſcribing the abſciſſa MI of this curve moves preciſely as the projectile does. Then, diſcovering that this line is the ſame with the line of logarithms on a Gunter's ſcale, we ſhewed how the logarithm of a number really repreſents the path or ſpace deſcribed by the projectile. And we were the more diſpoſed to do this, becauſe in the articles LOGARITHMS and *LOGARITHMIC Curve*, there has not been that notice taken of it which would have been proper.

Having thus, we hope, enabled the reader to conceive diſtinctly the quantities employed, we ſhall leave the geometrical method, and proſecute the reſt of the ſubject in a more compendious manner.

60 Of the perpendicular aſcents of heavy projectiles. We are, in the next place, to conſider the perpendicular aſcents and deſcents of *heavy* projectiles, where the reſiſtance of the air is combined with the action of gravity: and we ſhall begin with the deſcents.

Let u, as before, be the terminal velocity, and g the accelerating power of gravity: When the body moves with the velocity u, the reſiſtance is equal to g; and in every other velocity v, we muſt have $u^2 : v^2 = g : \frac{gv^2}{u^2}, = r$, for the reſiſtance to that velocity. In the deſcent the body is urged by gravity g, and oppoſed by the reſiſtance $\frac{gv^2}{u^2}$: therefore the remaining accelerating force, which we ſhall call f, is $g - \frac{gv^2}{u^2}$, or $\frac{gu^2 - gv^2}{u^2}$, or $\frac{g(u^2 - v^2)}{u^2}, = f$.

Now the fundamental theorem for varied motions is $f\dot{s} = u\dot{v}$, and $\dot{s} = \frac{v\dot{v}}{f}, = \frac{u^2}{g} \times \frac{v\dot{v}}{u^2 - v^2}$, and $s = \frac{u^2}{g} \times \int \frac{v\dot{v}}{u^2 - v^2} + C$. Now the fluent of $\frac{v\dot{v}}{u^2 - v^2}$ is $=$ — hyperb. log of $\sqrt{u^2 - v^2}$. For the fluxion of $\sqrt{u^2 - v^2}$ is $\frac{-v\dot{v}}{\sqrt{u^2 - v^2}}$, and this divided by the quantity $\sqrt{u^2 - v^2}$, of which it is the fluxion, gives preciſely $\frac{v\dot{v}}{u^2 - v^2}$, which is therefore the fluxion of its hyperbolic logarithm. Therefore $S = -\frac{u^2}{g} \times L\sqrt{u^2 - v^2} + C$. Where L means the hyperbolic logarithm of the quantity annexed to it, and λ may be uſed to expreſs its common logarithm. (See article FLUXIONS).

The conſtant quantity C for completing the fluent is determined from this conſideration, that the ſpace deſcribed is o, when the velocity is o: therefore $C - \frac{u^2}{g} \times L\sqrt{u^2} = o$, and $C = \frac{u^2}{g} \times L\sqrt{u^2}$, and the complete fluent $S = \frac{u^2}{g} \times \overline{L\sqrt{u^2} - L\sqrt{u^2 - v^2}}$, $= \frac{u^2}{g} \times L\sqrt{\frac{u^2}{u^2 - v^2}}. = \frac{u^2}{0{,}43429g} \times \lambda\sqrt{\frac{u^2}{u^2 - v^2}}$, or (putting M for 0,43429, the modulus or ſubtangent of the common logiſtic curve) $= \frac{u^2}{Mg} \times \lambda\sqrt{\frac{u^2}{u^2 - v^2}}$.

This equation eſtabliſhes the relation between the ſpace fallen through, and the velocity acquired by the fall. We obtain by it $\frac{gS}{u^2} = L\sqrt{\frac{u^2}{u^2 - v^2}}$, and $\frac{2gS}{u^2} = L.\frac{u^2}{u^2 - v^2}$, or, which is ſtill more convenient for us, $\frac{M \times 2gS}{u^2} = \lambda\frac{u^2}{u^2 - v^2}$, that is, equal to the logarithm of a certain number: therefore having found the natural number correſponding to the fraction $\frac{M \times 2gS}{u^2}$, conſider it as a logarithm, and take out the number correſponding to it: call this n. Then, ſince n is equal to $\frac{u^2}{u^2 - v^2}$, we have $nu^2 - nv^2 = u^2$, and $nu^2 - u^2 = nv^2$, or $nv^2 = u^2 \times \overline{n - v}$, and $v^2 = \frac{u^2 \times \overline{n-1}}{n}$.

To expedite all the computations on this ſubject, it will be convenient to have multipliers ready computed for $M \times 2g$, and its half,

viz. 27,794, whoſe log. is - - 1.44396
and 13,897 - - - 1.14293

But v may be found much more expeditiouſly by obſerving that $\sqrt{\frac{u^2}{u^2 - v^2}}$ is the ſecant of an arch of a circle whoſe radius is u, and whoſe ſine is v, or whoſe radius is unity and ſine $= \frac{v}{u}$: therefore, conſidering the above fraction as a logarithmic ſecant, look for it in the tables, and then take the ſine of the arc of which this is the ſecant, and multiply it by u; the product is the velocity required.

We ſhall take an example of a ball whoſe terminal velocity is 689$\frac{1}{3}$ feet, and aſcertain its velocity after a fall of 1848 feet. Here,

$u^2 = 475200$ and its log. - $= 5.67688$
$u = 689\frac{1}{3}$ - - - 2.83844
$g = 32$ - - - 1.50515
$S = 1848$ - - - 3.26670

Then log. 27,794 - - - + 1.44396
log. S - - - + 3.26670
log. u^2 - - - — 5.67688

Log. of 0,10809 = log. n - 9.03378
0,10809 is the logarithm of 1,2826 = n, and $n-1$ = 0,2826, and $\frac{u^2 \times \overline{n-1}}{n} = 323,6^2, = v^2$, and v = 323,6.

In like manner, 0,054045 (which is half of 0,10809) will be found to be the logarithmic ſecant of 28°, whoſe ſine 0,46947 multiplied by 689$\frac{1}{3}$ gives 324 for the velocity.

The proceſs of this ſolution ſuggeſts a very perſpicuous manner of conceiving the law of deſcent; and it may be thus expreſſed:

M is to the logarithm of the ſecant of an arch whoſe ſine is $\frac{v}{u}$, and radius 1, as 2 a is to the height through which the body muſt fall in order to acquire the velocity v. Thus, to take the ſame example.

1. Let the height h be ſought which will produce the velocity 323,62, the terminal velocity of the ball being 689,34. Here 2 a, or $\frac{u^2}{g}$ is 14850, and $\frac{323,62}{689,34}$ = 0,46947, which is the ſine of 28°. The logarithmic ſecant of this arch is 0,05407. Now M or 0,43429 : 0,05407 = 14850 : 1848, the height wanted.

2. Required the velocity acquired by the body by falling 1848 feet. Say 14850 : 1848 = 0,43429 : 0,05407. Look for this number among the logarithmic ſecants. It will be found at 28°, of which the logarithmic ſine is - - - - 9.67161
Add to this the log. of u - - 2.83844
The ſum - - - 2.51005
is the logarithm of 323,62, the velocity required.

61 Erroneous aſſertion of Mr Muller,

We may obſerve, from theſe ſolutions, that the acquired velocity continually approaches to, but never equals, the terminal velocity. For it is always expreſſed by the ſine of an arch of which the terminal velocity is the radius. We cannot help taking notice here of a very ſtrange aſſertion of Mr Muller, late profeſſor of mathematics and director of the royal academy at Woolwich. He maintains, in his Treatiſe on Gunnery, his Treatiſe on Fluxions, and in many of his numerous works, that a body cannot poſſibly move through the air with a greater velocity than this; and he makes this a fundamental principle, on which he eſtabliſhes a theory of motion in a reſiſting medium, which he aſſerts with great confidence to be the only juſt theory; ſaying, that all the inveſtigations of Bernoulli, Euler, Robins, Simpſon, and others, are erroneous. We uſe this ſtrong expreſſion, becauſe, in his criticiſms on the works of thoſe celebrated mathematicians, he lays aſide good manners, and taxes them not only with ignorance, but with diſhoneſty; ſaying, for inſtance, that it required no ſmall dexterity in Robins to confirm by his experiments a theory founded on falſe principles; and that Thomas Simpſon, in attempting to conceal his obligations to him for ſome valuable propoſitions, by changing their form, had ignorantly fallen into groſs errors.

Nothing can be more palpably abſurd than this aſſertion of Mr Muller. A blown bladder will have but a ſmall terminal velocity; and when moving with this velocity, or one very near it, there can be no doubt that it will be made to move much ſwifter by a ſmart ſtroke. Were the aſſertion true, it would be impoſſible for a portion of air to be put into motion through the reſt, for its terminal velocity is nothing. Yet this author makes this aſſertion a principle of argument, ſaying, that it is impoſſible that a ball can iſſue from the mouth of a cannon with a greater velocity than this; and that Robins and others are groſsly miſtaken, when they give them velocities three or four times greater, and reſiſtances which are 10 or 20 times greater than is poſſible; and by thus compenſating his ſmall velocities by ſtill ſmaller reſiſtances, he confirms his theory by many experiments adduced in ſupport of the others. No reaſon whatever can be given for the aſſertion. Newton, or perhaps Huygens, was the firſt who obſerved that there was a limit to the velocity which gravity could communicate to a body; and this limit was found by his commentators to be a term to which it was vaſtly convenient to refer all its other motions. It therefore became an object of attention; and Mr Muller, through inadvertency, or want of diſcernment, has fallen into this miſtake, and with that arrogance and ſelf-conceit which mark all his writings, has made this miſtake a fundamental principle, becauſe it led him to eſtabliſh a novel ſet of doctrines on this ſubject. He was fretted at the ſuperior knowledge and talents of Mr Simpſon, his inferior in the academy, and was guilty of ſeveral mean attempts to hurt his reputation. But they were unſucceſsful.

62 Motion of a body projected downwards.

We might proceed to conſider the motion of a body projected downwards. While the velocity of projection is leſs than the terminal velocity, the motion is determined by what we have already ſaid: for we muſt compute the height neceſſary for acquiring this velocity in the air, and ſuppoſe the motion to have begun there. But if the velocity of projection be greater, this method fails. We paſs it over (though not in the leaſt more difficult than what has gone before), becauſe it is of mere curioſity, and never occurs in any intereſting caſe. We may juſt obſerve, that ſince the motion is ſwifter than the terminal velocity, the reſiſtance muſt be greater than the weight, and the motion will be retarded. The very ſame proceſs will give us for the ſpace deſcribed $S = \frac{u^2}{g} \times L \sqrt{\frac{V^2 - u^2}{v^2 - u^2}}$, V being the velocity of projection, greater than u. Now as this ſpace evidently increaſes continually (becauſe the body always falls), but does not become infinite in any finite time, the fraction $\frac{V^2 - u^2}{v^2 - u^2}$ does not become infinite; that is, v^2 does not become equal to u^2: therefore although the velocity V is continually diminiſhed, it never becomes ſo ſmall as u. Therefore u is a limit of diminution as well as of augmentation.

63 Relation between the time of deſcent and ſpace deſcribed, &c.

We muſt now aſcertain the relation between the time of the deſcent and the ſpace deſcribed, or the velocity acquired. For this purpoſe we may uſe the other fundamental propoſition of varied motions $f\dot{t} = \dot{v}$, which, in the preſent caſe, becomes $\frac{g\overline{u^2 - v^2}}{n^2}\dot{t} = \dot{v}$; therefore $\dot{t} =$

u^2

$\frac{u^2}{g}\times\frac{\dot{v}}{u^2-v^2}, =\frac{u}{g}\times\frac{u\dot{v}}{u^2-v^2}$, and $t=\frac{u}{g}\times\int\frac{u\dot{v}}{u^2-v^2}$. Now (art. Fluxions) $\int\frac{u\dot{v}}{u^2-v^2}=L\sqrt{\frac{u+v}{u-v}}$. Therefore $t=\frac{u}{g}\times L\sqrt{\frac{u+v}{u-v}},=\frac{u}{Mg}\times\lambda\sqrt{\frac{u+v}{u-v}}$. This fluent needs no conſtant quantity to complete it, or rather $C=o$; for t muſt be $=o$ when $v=o$. This will evidently be the caſe: for then $L\sqrt{\frac{u+v}{u-v}}$ is $L\sqrt{\frac{u}{u}},=L\ 1,=0$.

But how does this quantity $\frac{u}{Mg}\times\lambda\sqrt{\frac{u+v}{u-v}}$ ſignify a time? Obſerve, that in whatever numbers, or by whatever units of ſpace and time, u and g are expreſſed, $\frac{u}{g}$ expreſſes the number of units of time in which the velocity u is communicated or extinguiſhed by gravity; and $L\sqrt{\frac{u+v}{u-v}}$, or $\frac{\lambda}{M}\sqrt{\frac{u+v}{u-v}}$, is always an abſtract number, multiplying this time.

We may illuſtrate this rule by the ſame example. In what time will the body acquire the velocity 323,62? Here $u+v=1012,96$, $u-v=365,72$; therefore $\lambda\sqrt{\frac{u+v}{u-v}}=0,22122$, and $\frac{u}{g}$ (in feet and ſeconds) is 21″, 542. Now, for greater perſpicuity, convert the equation $t=\frac{u}{Mg}\times\lambda\sqrt{\frac{u+v}{u-v}}$ into a proportion: thus $M:\lambda\sqrt{\frac{u+v}{u-v}}=\frac{u}{g}:t$, and we have 0,43429 : 0,22122 = 21″,542 : 10″,973, the time required.

This is by far the moſt diſtinct way of conceiving the ſubject; and we ſhould always keep in mind that the numbers of ſymbols which we call logarithms are really parts of the line MI in the figure of the logiſtic curve, and that the motion of a point in this line is preciſely ſimilar to that of the body. The Marquis Poleni, in a diſſertation publiſhed at Padua in 1725, has with great ingenuity conſtructed logarithmics ſuited to all the caſes which can occur. Herman, in his *Phoronomia*, has borrowed much of Poleni's methods, but has obſcured them by an affectation of language geometrically preciſe, but involving the very obſcure notion of abſtract ratios.

It is eaſy to ſee that $\sqrt{\frac{u+v}{u-v}}$ is the cotangent of the $\frac{1}{2}$ complete of an arch, whoſe radius is 1, and whoſe ſine is $\frac{v}{u}$: For let KC (fig 6.) be $=u$, and BE$=v$; then KD$=u+v$, and DA$=u-v$. Join KB and BA, and draw CG parallel to KB. Now GA is the tangent of $\frac{1}{2}$ BA, $=\frac{1}{2}$ complement of HB. Then, by ſimilarity of triangles, GA : AC = AB : BK, $=\sqrt{\overline{AD}}:\sqrt{\overline{DK}}=\sqrt{u-v}:\sqrt{u+v}$ and $\frac{AC}{GA}$ (= cotan. $\frac{1}{2}$BA) $=\sqrt{\frac{u+v}{u-v}}$; therefore look for $\frac{v}{u}$ among the natural ſines, or for log. $\frac{u}{v}$ among the logarithmic ſines, and take the logarithmic cotangent of the half complement of the correſponding arch. This, conſidered as a common number, will be the ſecond term of our proportion. This is a ſhorter proceſs than the former.

Plate CCCCXVII.

By reverſing this proportion we get the velocity correſponding to a given time.

64 Fall of a body in air compared with that of one in vacuo.

To compare this deſcent of 1848 feet in the air with the fall of the body *in vacuo* during the ſame time, ſay $\overline{21'',542}^2 : \overline{10'',973}^2 = 1848 : 1926,6$, which makes a difference of 79 feet.

Cor. 1. The time in which the body acquires the velocity u by falling through the air, is to the time of acquiring the ſame velocity by falling *in vacuo*, as u. $L\sqrt{\frac{u+v}{u-v}}$ to v: for it would acquire this velocity *in vacuo* during the time $\frac{v}{g}$, and it acquires it in the air in the time $\frac{u}{g}L\sqrt{\frac{u+v}{u-v}}$.

2. The velocity which the body acquires by falling through the air in the time $\frac{u}{g}L\sqrt{\frac{u+v}{u-v}}$, is to the velocity which it would acquire *in vacuo* during the ſame time, as v to $u\,L\sqrt{\frac{u+v}{u-v}}$: For the velocity which it would acquire *in vacuo* during the time $\frac{u}{g}L\sqrt{\frac{u+v}{u-v}}$ muſt be $uL\sqrt{\frac{u+v}{u-v}}$ (becauſe in any time $\frac{w}{g}$ the velocity w is acquired).

65 Time of the aſcent of a body projected perpendicularly.

In the next place, let a body, whoſe terminal velocity is u, be projected perpendicularly upwards, with any velocity V. It is required to determine the height to which it aſcends, ſo as to have any remaining velocity v, and the time of its aſcent; as alſo the height and time in which its whole motion will be extinguiſhed.

We have now $\frac{g(u^2+v^2)}{u^2}$ for the expreſſion of f; for both gravity and reſiſtance act now in the ſame direction and retard the motion of the aſcending body: therefore $\frac{g(u^2+v^2)}{u^2}\dot{s}=-v\dot{v}$, and $\dot{s}=-\frac{u^2}{g}\times\frac{v\dot{v}}{u^2+v^2}$, and $s=-\frac{u^2}{g}\times\int\frac{v\dot{v}}{u^2+v^2}+C,=-\frac{u^2}{g}\times L\sqrt{u^2+v^2}+C$ (ſee art. Fluxions). This muſt be $=o$ at the beginning of the motion, that is, when $v=V$, that is, $-\frac{u^2}{g}\times L\sqrt{u^2+V^2}+C=o$, or $C=\frac{u^2}{g}\times L\sqrt{u^2+V^2}$, and the complete fluent will be $s=\frac{u^2}{g}\times\left(L\sqrt{u^2+V^2}-L\sqrt{u^2+v^2}\right)=\frac{u^2}{g}\times L\sqrt{\frac{u^2+V^2}{u^2+v}},=\frac{u^2}{Mg}\times\lambda\sqrt{\frac{u^2+V^2}{u^2+v^2}}$

Let h be the greateſt height to which the body will riſe. Then $s=h$ when $v=o$; and $h=\frac{u^2}{g}\times L\sqrt{\frac{u^2+V^2}{u^2}},=\frac{u^2}{Mg}\times\lambda\sqrt{\frac{u^2+V^2}{u^2}}$. We have $\lambda\sqrt{\frac{u^2+V^2}{u^2+v^2}}=s\frac{mg}{u^2}$; therefore $\lambda\left(\frac{u^2+V^2}{u^2+v^2}\right)=\frac{2Mgs}{u^2}$

Therefore let n be the number whoſe common logarithm is $\frac{2Mgs}{u^2}$; we ſhall have $n=\frac{u^2+V^2}{u^2+v^2}$, and $v^2=\frac{u^2+V^2}{n}-u^2$; and thus we obtain the relation of s and v, as in the caſe of deſcents: but we obtain it ſtill eaſier by obſerving that $\sqrt{u^2+V^2}$ is the ſecant of an arch whoſe radius is u, and whoſe tangent is V, and that $\sqrt{u^2+v^2}$ is the ſecant of another arch of the ſame circle, whoſe tangent is v.

Let the ſame ball be projected upwards with the velocity 411,05 feet per ſecond. Required the whole height to which it will riſe?

Here $\frac{V}{u}$ will be found the tangent of $30.48\frac{1}{3}$, the logarithmic ſecant of which is 0,06606. This, multiplied by $\frac{u^2}{Mg}$, gives 2259 feet for the height. It would have riſen 2640 feet in a void.

66 Velocity of projection compared with that with which it reaches the ground. Suppoſe this body to fall down again. We can compare the velocity of projection with the velocity with which it again reaches the ground. The aſcent and deſcent are equal: therefore $\sqrt{\frac{u^2+V^2}{u^2}}$, which multiplies the conſtant factor in the aſcent, is equal to $\sqrt{\frac{u^2}{u^2-v^2}}$, the multiplier in the deſcent. The firſt is the ſecant of an arch whoſe tangent is V; the other is the ſecant of an arch whoſe ſine is v. Theſe ſecants are equal, or the arches are the ſame; therefore the velocity of projection is to the final returning velocity as the tangent to the ſine, or as the radius to the coſine of the arch. Thus ſuppoſe the body projected with the terminal velocity, or $V=u$; then $v=\frac{u}{\sqrt{2}}$. If $V=689$, $v=487$.

We muſt in the laſt place aſcertain the relation of the ſpace and the time.

Here $\frac{g(u^2+v^2)}{u^2}\dot{t}=-\dot{v}$, and $\dot{t}=-\frac{u^2}{g}\times\frac{\dot{v}}{u^2+v^2},=-\frac{u}{g}\times\frac{u\dot{v}}{u^2+v^2}$; and $t=\frac{-u}{g}\times\int\frac{u\dot{v}}{u^2+v^2}+C$. Now (art. Fluxions) $\int\frac{u\dot{v}}{u^2+v^2}$ is an arch whoſe tangent $=\frac{v}{u}$ and radius 1; therefore $t=-\frac{u}{g}\times$ arc. tan. $\frac{v}{u}+C$. This muſt be $=0$ when $v=V$, or $C-\frac{u}{g}\times$ arc. tan. $\frac{V}{u}=0$, and $C=\frac{u}{g}\times$ arc. tan. $\frac{V}{u}$, and the complete fluent is $t=\frac{u}{g}\times\left(\text{arc. tan.}\frac{V}{u}-\text{arc. tan.}\frac{v}{u}\right)$ The quantities within the brackets expreſs a portion of the arch of a circle whoſe radius is unity; and are therefore abſtract numbers, multiplying $\frac{u}{g}$, which we have ſhown to be the number of units of time in which a heavy body falls *in vacuo* from the height a, or in which it acquires the velocity u.

67 Time of aſcent limited. We learn from this expreſſion of the time, that however great the velocity of projection, and the height to which this body will riſe, may be, the time of its aſcent is limited. It never can exceed the time of falling from the height *a in vacuo* in a greater proportion than that of a quadrantal arch to the radius, nearly the proportion of 8 to 5. A 24 pound iron ball cannot continue riſing above 14 ſeconds, even if the reſiſtance to quick motions did not increaſe faſter than the ſquare of the velocity. It probably will attain its greateſt height in leſs than 12 ſeconds, let its velocity be ever ſo great.

In the preceding example of the whole aſcent, $v=0$, and the time $t=\frac{u}{g}\times$ arc. tan. $\frac{V}{u}$, or $\frac{u}{g}$ arc. 30°.48′. Now 30°. 48′ = 1848′, and the radius 1 contains 3438; therefore the arch $=\frac{1848}{3438},=0,5376$; and $\frac{u}{g}=21'',54$. Therefore $t=21'',54\times0,5376,=11'',58$, or nearly $11\frac{1}{2}$ ſeconds. The body would have riſen to the ſame height in a void in $10\frac{3}{4}$ ſeconds.

68 This time compared in bodies projected in air and in vacuo. *Cor.* 1. The time in which a body, projected in the air with any velocity V, will attain its greateſt height, is to that in which it would attain its greateſt height *in vacuo*, as the arch whoſe tangent expreſſes the velocity is to the tangent; for the time of the aſcent in the air is $\frac{u}{g}\times$ arch; the time of the aſcent *in vacuo* is $\frac{V}{g}$. Now $\frac{V}{u}$ is = tan. and $V=u\times$ tan. and $\frac{V}{g}=\frac{u}{g}\times$ tan.

Plate CCCCXVII It is evident, by inſpecting fig. 6. that the arch AI is to the tangent AG as the ſector ICA to the triangle GCA; therefore the time of attaining the greateſt height in the air is to that of attaining the greateſt height *in vacuo* (the velocities of projection being the ſame), as the circular ſector to the correſponding triangle.

If therefore a body be projected upwards with the terminal velocity, the time of its aſcent will be to the time of acquiring this velocity *in vacuo* as the area of a circle to the area of the circumſcribed ſquare.

2. The height H to which a body will riſe in a void, is to the height h to which it would riſe through the air when projected with the ſame velocity V as $M\cdot V^2$ to $u^2\times\lambda\frac{u^2+V^2}{u^2}$: for the height to which it will riſe *in vacuo* is $\frac{V^2}{2g}$, and the height to which it riſes in the air is $\frac{u^2}{Mg}\lambda\sqrt{\frac{u^2+V^2}{u^2}}$; therefore $H:h=\frac{V^2}{2g}:\frac{u^2}{Mg}\lambda\sqrt{\frac{u^2+V^2}{u^2}},=V^2:\frac{u^2}{M}\times2\lambda\sqrt{\frac{u^2+V^2}{u^2}},=V^2:\frac{u^2}{M}\times\lambda\frac{u^2+V^2}{u^2},=M\cdot V^2:u^2\times\lambda\frac{u^2+V^2}{u^2}$.

Therefore if the body be projected with its terminal velocity, ſo that $V=u$, the height to which it will riſe in the air is $\frac{30103}{43429}$ of the height to which it will riſe *in vacuo*, or $\frac{5}{7}$ in round numbers.

We have been thus particular in treating of the perpendicular aſcents and deſcents or heavy bodies through the air, in order that the reader may conceive diſtinctly the quantities which he is thus combining in his algebraic operations, and may ſee their connection in nature with each other. We ſhall alſo find that, in the preſent ſtate of our mathematical knowledge, this ſimple ſtate of the caſe contains almoſt all that we can determine with any confidence. On this account it were to be wiſhed that the profeſſional gentlemen would make many experiments on theſe motions. There is no way that promiſes ſo much for aſſiſting us in forming accurate notions of the air's reſiſtance. Mr Robins's method with the pendulum is impracticable with great ſhot; and the experiments which have been generally reſorted to for this purpoſe, viz. the ranges of ſhot and ſhells on a horizontal plane, are ſo complicated in themſelves, that the utmoſt mathematical ſkill is neceſſary for making any inferences from them; and they are ſubject to ſuch irregularities, that they may be brought to ſupport almoſt any theory whatever on this ſubject. But the perpendicular flights are affected by nothing but the initial velocity and the reſiſtance of the air; and a conſiderable deviation from their intended direction does not cauſe any ſenſible error in the conſequences which we may draw from them for our purpoſe.

69 Neceſſity of further experiments.

70 Of oblique projection.

But we muſt now proceed to the general problem, to determine the motion of a body projected in any direction, and with any velocity. Our readers will believe beforehand that this muſt be a difficult ſubject, when they ſee the ſimpleſt caſes of rectilineal motion abundantly abſtruſe: it is indeed ſo difficult, that Sir Iſaac Newton has not given a ſolution of it, and has thought himſelf well employed in making ſeveral approximations, in which the fertility of his genius appears in great luſtre. In the tenth and ſubſequent propoſitions of the ſecond book of the *Principia*, he ſhows what ſtate of denſity in the air will comport with the motion of a body in any curve whatever: and then, by applying this diſcovery to ſeveral curves which have ſome ſimilarity to the path of a projectile, he finds one which is not very different from what we may ſuppoſe to obtain in our atmoſphere. But even this approximation was involved in ſuch intricate calculations, that it ſeemed impoſſible to make any uſe of it. In the ſecond edition of the *Principia*, publiſhed in 1713, Newton corrects ſome miſtakes which he had committed in the firſt, and carries his approximations much farther, but ſtill does not attempt a direct inveſtigation of the path which a body will deſcribe in our atmoſphere. This is ſomewhat ſurpriſing. In prop. 14. &c. he ſhows how a body, actuated by a centripetal force, in a medium of a denſity varying according to certain laws, will deſcribe an eccentric ſpiral, of which he aſſigns the properties, and the law of deſcription. Had he ſuppoſed the denſity conſtant, and the difference between the greateſt and leaſt diſtances from the centre of centripetal force exceedingly ſmall in compariſon with the diſtances themſelves, his ſpiral would have coincided with the path of a projectile in the air of uniform denſity, and the ſteps of his inveſtigation would have led him immediately to the complete ſolution of the problem. For this is the real ſtate of the caſe. A heavy body is not acted on by equal and parallel gravity, but by a gravity inverſely proportional to the ſquare of the diſtance from the centre of the earth, and in lines tending to that centre nearly; and it was with the view of ſimplifying the inveſtigation, that mathematicians have adopted the other hypotheſis.

71 This problem not ſolved by Newton.

72 Diſputes among Britiſh and foreign mathematicians.

Soon after the publication of this ſecond edition of the *Principia*, the diſpute about the invention of the fluxionary calculus became very violent, and the great promoters of that calculus upon the continent were in the habit of propoſing difficult problems to exerciſe the talents of the mathematician. Challenges of this kind frequently paſſed between the Britiſh and foreigners. Dr Keill of Oxford had keenly eſpouſed the claim of Sir Iſaac Newton to this invention, and had engaged in a very acrimonious altercation with the celebrated John Bernoulli of Baſle. Bernoulli had publiſhed in the *Acta Eruditorum Lipſiæ* an inveſtigation of the law of forces, by which a body moving in a reſiſting medium might deſcribe any propoſed curve, reducing the whole to the ſimpleſt geometry. This is perhaps the moſt elegant ſpecimen which he has given of his great talents. Dr Keill propoſed to him the particular problem of the trajectory and motion of a body moving through the air, as one of the moſt difficult. Bernoulli very ſoon ſolved the problem in a way much more general than it had been propoſed, viz. without any limitation either of the law of reſiſtance, the law of the centripetal force, or the law of denſity, provided only that they were regular, and capable of being expreſſed algebraically. Dr Brooke Taylor, the celebrated author of the Method of Increments, ſolved it at the ſame time, in the limited form in which it was propoſed. Other authors ſince that time have given other ſolutions. But they are all (as indeed they muſt be) the ſame in ſubſtance with Bernoulli's. Indeed they are all (Bernoulli's not excepted) the ſame with Newton's firſt approximations, modified by the ſteps introduced into the inveſtigation of the ſpiral motions mentioned above; and we ſtill think it moſt ſtrange that Sir Iſaac did not perceive that the *variation of curvature*, which he introduced into that inveſtigation, made the whole difference between his approximations and the complete ſolution. This we ſhall point out as we go along. And we now proceed to the problem itſelf, of which we ſhall give Bernoulli's ſolution, reſtricted to the caſe of uniform denſity and a reſiſtance proportional to the ſquare of the velocity. This ſolution is more ſimple and perſpicuous than any that has ſince appeared.

73 Bernoulli's ſolution.

Problem. To determine the trajectory, and all the circumſtances of the motion, of a body projected thro' the air from A (fig. 7.) in the direction AB, and reſiſted in the duplicate ratio of the velocity.

Plate CCCCXVII.

Let the arch AM be put $= z$, the time of deſcribing it t, the abſciſſa AP $= x$, the ordinate PM $= y$. Let the velocity in the point M $= v$, and let MN, $= \dot{z}$, be deſcribed in the moment $\dot{t}$; let r be the reſiſtance of the air, g the force of gravity, meaſured by the velocity which it will generate in a ſecond; and let a be the height through which a heavy body muſt fall *in vacuo* to acquire the velocity which would render the reſiſtance of the air equal to its gravity: ſo that we have $r = \frac{v^2}{2a}$; becauſe, for any velocity u, and producing height h, we have $g = \frac{u^2}{2h}$

Let Mm touch the curve in M; draw the ordinate

p Nm, and draw Mo, Nn perpendicular to Np and Mm. Then we have MN$=\dot z$, and M$o=\dot x$, alſo mo is ultimately $=\dot y$ and Mm is ultimately $=$ MN or $\dot z$. Laſtly, let us ſuppoſe $\dot x$ to be a conſtant quantity, the elementary ordinates being ſuppoſed equidiſtant.

74 Action of gravity in given ime.

The action of gravity during the time $\dot t$ may be meaſured by mN, which is half the ſpace which it would cauſe the body to deſcribe uniformly in the time $\dot t$ with the velocity which it generates in that time. Let this be reſolved into nN, by which it deflects the body into a curvilineal path, and mn, by which it retards the aſcent and accelerates the deſcent of the body along the tangent. The reſiſtance of the air acts ſolely in retarding the motion, both in aſcending and deſcending, and has no deflective tendency. The whole action of gravity then is to its accelerating or retarding tendency as mN to mn, or (by ſimilarity of triangles) as mM to mo. Or $\dot z : \dot y = g : \frac{g\dot y}{\dot z}$, and the whole retardation in the aſcent will be $r + \frac{g\dot y}{\dot z}$. The ſame fluxionary ſymbol will expreſs the retardation during the deſcent, becauſe in the deſcent the ordinates decreaſe, and $\dot y$ is a negative quantity.

The diminution of velocity is $-\dot v$. This is proportional to the retarding force and to the time of its action jointly, and therefore $-\dot v = \overline{r + \frac{g\dot y}{\dot z}} \times \dot t$; but the time $\dot t$ is as the ſpace $\dot z$ divided by the velocity v; therefore $-\dot v = r + \frac{g\dot y}{\dot z} \times \frac{\dot z}{v}, = -\frac{r\dot z + g\dot y}{v}$, and $-v\dot v = -r\dot z - g\dot y, = \frac{v^2\dot z}{2a} - g\dot y$. Becauſe mN is the deflection by gravity, it is as the force g and the ſquare of the time $\dot t$ jointly (the momentary action being held as uniform). We have therefore mN, or $-\ddot y = g\dot t^2$. Obſerve that mN is in fact only the half of $-\ddot y$; but g being twice the fall of a heavy body in a ſecond, we have $-\ddot y$ ſtrictly equal to $g\dot t^2$). But $\dot t^2 = \frac{\dot z^2}{v^2}$; therefore $-\ddot y = \frac{g\dot z^2}{v^2}$, and $v^2 = \frac{g\dot z^2}{-\ddot y}$, and $-v^2\ddot y = g\dot z^2$. The fluxion of this equation is $-v^2\dddot y - 2v\ddot y\dot v = 2g\dot z\ddot z$; but, becauſe $\dot z : \dot y = m$M$: mo, = mN : mn, = \ddot y : \ddot z$, we have $\dot z\ddot z = \dot y\ddot y$. Therefore $2g\dot y\ddot y = 2g\dot z\ddot z, = -v^2\dddot y - 2v\ddot y\dot v$, and $-2v\dot v\ddot y = v^2\dddot y, -2g\dot y\ddot y$, and $-v\dot v = \frac{v^2\dddot y}{2\ddot y} - g\dot y$. But we have already $-v\dot v = \frac{v^2\dot z}{2a} - g\dot y$; therefore $\frac{v^2\dddot y}{\ddot y} = \frac{v^2\dot z}{a}$, and finally $\frac{\dddot y}{\ddot y} = \frac{\dot z}{a}$, or $a\dddot y = \dot z\ddot y$, for the fluxionary equation of the curve.

75 Relation between the length of the curve and its variation of curvature.

If we put this into the form of a proportion, we have $a : \dot z = \ddot y : \dddot y$. Now this evidently eſtabliſhes a relation between the length of the curve and its variation of curvature; and between the curve itſelf and its evoluta, which are the very circumſtances introduced by Newton into his inveſtigation of the ſpiral motions. And the equation $\frac{\dot z}{a} = \frac{\dddot y}{\ddot y}$ is evidently an equation connected with the logarithmic curve and the logarithmic ſpiral. But we muſt endeavour to reduce it to a lower order of fluxions, before we can eſtabliſh a relation between z, x, and y.

Let p expreſs the ratio of $\dot y$ to $\dot x$, that is, let p be $= \frac{\dot y}{\dot x}$, or $p\dot x = \dot y$. It is evident that this expreſſes the inclination of the tangent at M to the horizon, and that p is the tangent of this inclination, radius being unity. Or it may be conſidered merely as a number, multiplying $\dot x$, ſo as to make it $= \dot y$. We now have $\dot y^2 = p^2\dot x^2$, and ſince $\dot z^2 = \dot x^2 + \dot y^2$, we have $\dot z^2 = \dot x^2 + p^2\dot x^2$, $= \overline{1+p^2} \times \dot x^2$ and $\dot z = \dot x\sqrt{1+p^2}$.

Moreover, becauſe we have ſuppoſed the abſciſſa x to increaſe uniformly, and therefore $\dot x$ to be conſtant, we have $\ddot y = \dot x\dot p$, and $\dddot y = \dot x\ddot p$. Now let q expreſs the ratio of $\dot p$ to $\dot x$, that is, make $\frac{\dot p}{\dot x} = q$, or $q\dot x = \dot p$. This gives us $\dot x\dot q = \ddot p$, and $\dot x^2\dot q = \dot x\ddot p, = \dddot y$.

By theſe ſubſtitutions our former equation $a\dddot y = \dot z\ddot y$ changes to $a\dot x^2\dot q = \dot x\sqrt{1+p^2}\,\dot x\dot p$, or $a\dot q = \dot p\sqrt{1+p^2}$, and, taking the fluent on both ſides, we have $aq = \int\dot p\sqrt{1+p^2} + C$, C being the conſtant quantity required for completing the fluent according to the limiting conditions of the caſe. Now $\dot x = \frac{\dot p}{q}$, and $\frac{1}{q} = \frac{a}{\int,\dot p\sqrt{1+p^2}+C}$. Therefore $\dot x = \frac{a\dot p}{\int,\dot p\sqrt{1+\;}+C}$

Alſo, ſince $\dot y = p\dot x, = \frac{p\dot p}{q}$, we have $\dot y = \frac{ap\dot p}{\int,\dot p\sqrt{1+p^2}+C}$

Alſo $\dot z = \dot x\sqrt{1+p^2} = \frac{a\dot p\sqrt{1+p^2}}{\int,\dot p\sqrt{1+p^2}+C}$

The values of $\dot x$, $\dot y$, $\dot z$, give us

$$x = \int\frac{a\dot p}{\int,\dot p\sqrt{1+p^2}+C}, = a\int\frac{\dot p}{\int\dot p\sqrt{1+p^2}+C}.$$

$$y = \int \frac{ap\dot{p}}{\int,\dot{p}\sqrt{1+p^2}|+C}, = a\int\frac{p\dot{p}}{\int,\dot{p}\sqrt{1+p^2}|+C}.$$

$$z = \int,\frac{a\sqrt{1+p^2}|\,\dot{p}}{\int,\dot{p}\sqrt{1+p^2}|+C}, = a\int\frac{\dot{p}\sqrt{1+p^2}}{\int,\dot{p}\sqrt{1+p^2}|+C}.$$

The proceſs therefore of deſcribing the trajectory is, 1*ſt*. To find q in terms of p by the area of the curve whoſe abſciſſa is p and the ordinate is $\sqrt{1+p^2}$.

2*d*, We get x by the area of another curve whoſe abſciſſa is p, and the ordinate is $\frac{1}{q}$.

3*d*, We get y by the area of a third curve whoſe abſciſſa is p, and the ordinate is $\frac{p}{q}$

76 To compute the magnitude of the ordinate and abſciſſa.

The problem of the trajectory is therefore completely ſolved, becauſe we have determined the ordinate, abſciſſa, and arch of the curve for any given poſition of its tangent. It now only remains to compute the magnitudes of theſe ordinates and abſciſſæ, or to draw them by a geometrical conſtruction. But in this conſiſts the difficulty. The areas of theſe curves, which expreſs the lengths of x and y, can neither be computed nor exhibited geometrically, by any accurate method *yet* diſcovered, and we muſt content ourſelves with approximations. Theſe render the deſcription of the trajectory exceedingly difficult and tedious, ſo that little advantage has as yet been derived from the knowledge we have got of its properties. It will however greatly aſſiſt our conception of the ſubject to proceed ſome length in this conſtruction; for it muſt be acknowledged that very few diſtinct notions accompany a mere algebraic operation, eſpecially if in any degree complicated, which we confeſs is the caſe in the preſent queſtion.

Plate CCCCXVIII.

Let BmNR (fig. 8.) be an equilateral hyperbola, of which B is the vertex, BA the ſemitranſverſe axis, which we ſhall aſſume for the unity of length. Let AV be the ſemiconjugate axis = BA, = unity, and AS the aſſymptote, biſecting the right angle BAV. Let PN, $p\,n$ be two ordinates to the conjugate axis, exceedingly near to each other. Join BP, AN, and draw Bβ, Nν perpendicular to the aſſymptote, and BC parallel to AP. It is well known that BP is equal to NP. Therefore $PN^2 = BA^2 + AP^2$. Now ſince BA = 1, if we make AP = p of our formulæ, PN is $\sqrt{1+p^2}$, and Pp is = $\dot{p}$, and the area BAPNB = $\int,\dot{p}\sqrt{1+p^2}|$: That is to ſay, the number $\int,\dot{p}\sqrt{1+p^2}$ (for it is a number) has the ſame proportion to unity of number that the area BAPNB has to BCVA, the unit of ſurface. This area conſiſts of two parts, the triangle APN, and the hyperbolic ſector ABN. APN = $\frac{1}{2}$ AP × PN, = $\frac{1}{2}p\sqrt{1+p^2}$, and the hyperbolic ſector ABN = BNνβ, which is equivalent to the hyperbolic logarithm of the number repreſented by Aν when Aβ is unity. Therefore it is equal to $\frac{1}{2}$ the logarithm of $p+\sqrt{1+p^2}$. Hence we ſee by the bye that $\underline{\int,\dot{p}\sqrt{1+p^2}} = \frac{1}{2}p\sqrt{1+p^2} + \frac{1}{2}$ hyperbolic logarithm $p+\sqrt{1+p^2}$.

Now let AMD be another curve, ſuch that its ordinates Vm, PD, &c. may be proportional to the areas ABmV, ABNP, and may have the ſame proportion to AB, the unity of length, which theſe areas have to ABCV, the unity of ſurface. Then VM : VC = VmBA : VCBA and PD : Pδ = PNBA : VCBA, &c. Theſe ordinates will now repreſent $\int,\dot{p}\sqrt{1+p^2}$ with reference to a linear unit, as the areas to the hyperbola repreſented it in reference to a ſuperficial unit.

Again, in every ordinate make PD : Pδ = Pδ : PO, and thus we obtain a reciprocal to PD or to $\int,\dot{p}\sqrt{1+p^2}$, or equivalent to $\int,\frac{1}{\dot{p}\sqrt{.+p^2}}$. This will evidently be $\frac{\dot{x}}{a\dot{p}}$, and PO op will be $\frac{\dot{x}}{a}$, and the area contained between the lines AF, AW, and the curve GEOH, and cut off by the ordinate PO, will repreſent $\frac{x}{a}$.

Laſtly, make PO : PQ = AV : AP, = 1 : p; and then PQqp will repreſent $\frac{\dot{y}}{a}$, and the area ALEQP will repreſent $\frac{y}{a}$.

But we muſt here obſerve, that the fluents expreſſed by theſe different areas require what is called the *correction* to accommodate them to the circumſtances of the caſe. It is not indifferent from what ordinate we begin to reckon the areas. This depends on the initial direction of the projectile, and that point of the abſciſſa AP muſt be taken for the commencement of all the areas which gives a value of p ſuited to the initial direction. Thus, if the projection has been made from A (fig. 7.) at an elevation of 45°, the ratio of the fluxions $\dot{x}$ and $\dot{y}$ is that of equality; and therefore the point E of fig. 8. where the two curves interſect and have a common ordinate, evidently correſponds to this condition. The ordinate EV paſſes through V, ſo that AV or p = AB, = 1, = tangent 45°, as the caſe requires. The values of x and of y correſponding to any other point of the trajectory, ſuch as that which has AP for the tangent of the angle which it makes with the horizon, are now to be had by computing the areas VEOP, VEQP.

Plate. CCCCXVII.

Plate. CCCCXVIII.

Another curve might have been added, of which the ordinates would exhibit the fluxions of the arch of the trajectory $\dot{z} = \frac{a\dot{p}\sqrt{1+p^2}}{\int,\dot{p}\sqrt{1+p^2}|+C}$ and of which the area would exhibit the arch itſelf. And this would have been very eaſy, for it is $\dot{z} = a\frac{\dot{p}\sqrt{1+p^2}}{\int,\dot{p}\sqrt{1+p^2}|+C}$, which is evidently the fluxion of the hyperbolic logarithm of $\int,\dot{p}\sqrt{1+p^2}|$. But it is needleſs, ſince $\dot{z} = \dot{x}\sqrt{1+p^2}$, and we have already got $\dot{x}$. It is only increaſing PO in the ratio of BA to BP.

77 Conſequences of knowing the form of the trajectory.

And thus we have brought the inveſtigation of this problem a conſiderable length, having aſcertained the *form* of the trajectory. This is ſurely done when the ratio of the arch, abſciſs, and ordinate, and the poſition of its tangent, is determined in every point. But it is ſtill very far from a ſolution, and much remains to be done before we can make any practical application of it. The only general conſequence that we can deduce from the premiſes

ſts is, that in every caſe where the reſiſtance in any point bears the ſame proportion to the force of gravity, the trajectory will be ſimilar. Therefore two balls, of the ſame denſity, projected in the ſame direction, will deſcribe ſimilar trajectories if the velocities are in the ſubduplicate ratio of the diameters. This we ſhall find to be of conſiderable practical importance. But let us now proceed to determine the velocity in the different points of the trajectory, and the times of deſcribing its ſeveral portions.

78 To determine the velocity in different points.

Recollect, therefore, that $v^2 = \frac{-g\dot{z}^2}{\ddot{y}}$ and that $\dot{z}^2 = \dot{x}^2\,\overline{1+p^2}$ and $\ddot{y} = \dot{x}\dot{p}$. This gives $v^2 = \frac{-g\dot{x}\,\overline{1+p^2}}{\dot{p}}$. But $\dot{p} = q\dot{x}$. Therefore $v^2 = \frac{-g \times \overline{1+p^2}}{q}, = \frac{-ag\,\overline{1+p^2}}{\int,\dot{p}\sqrt{1+p^2}+C}$, and $v = \sqrt{\frac{-g\,\overline{1+p^2}}{q}}, = \frac{\sqrt{a}\sqrt{-g}\sqrt{1+p^2}}{\sqrt{\int\dot{p}\sqrt{1+p^2}|+C}}$.

Alſo $\dot{t}$ was found $= \frac{\dot{z}}{v}, = \frac{\dot{x}\sqrt{1+p^2}}{v}, = \frac{\dot{p}\sqrt{1+p^2}}{qv}$. If we now ſubſtitute for v its value juſt found, we obtain $\dot{t} = \frac{\dot{p}}{\sqrt{-gq}}$, and $t = \int\frac{\dot{p}}{\sqrt{-gq}}, = \int\frac{\dot{p}\sqrt{a}}{\sqrt{-g\int\dot{p}\sqrt{1+p^2}|+C}}, = \frac{\sqrt{a}}{\sqrt{-g}} \times \int\frac{\dot{p}}{\sqrt{\int\dot{p}\sqrt{1+p^2}|+C}}$.

79 Difficulty of accommodating the formulæ to particular caſes.

The greateſt difficulty ſtill remains, viz. the accommodating theſe formulæ, which appear abundantly ſimple, to the particular caſes. It would appear at firſt ſight that all trajectories are ſimilar; ſince the ratio of the fluxions of the ordinate and abſciſſa correſponding to any particular angle of inclination to the horizon ſeems the ſame in them all: but a due attention to what has been hitherto ſaid on the ſubject will ſhow us that we have as yet only been able to aſcertain the velocity in the point of the trajectory, which has a certain inclination to the horizon, indicated by the quantity p, and the time (reckoned from ſome aſſigned beginning) when the projectile is in that point.

To obtain abſolute meaſures of theſe quantities, the term of commencement muſt be fixed upon. This will be expreſſed by the conſtant quantity C, which is aſſumed for completing the fluent of $\dot{p}\sqrt{1+p^2}$, which is the baſis of the whole conſtruction. We there found $q = \frac{\int,\dot{p}\sqrt{1+p^2}}{a}$. This fluent is in general $q = \frac{C+\int,\dot{p}\sqrt{1+p^2}}{a}$, and the conſtant quantity C is to be accommodated to ſome circumſtances of the caſe.

80 Euler's method the ſimpleſt.

Different authors have ſelected different circumſtances, Euler, in his Commentary on Robins, and in a diſſertation in the Memoirs of the Academy of Berlin publiſhed in 1753, takes the vertex of the curve for the beginning of his abſciſſa and ordinate. This is the ſimpleſt method of any, for C muſt then be ſo choſen that the whole fluent may vaniſh when $p = 0$, which is the caſe in the vertex of the curve, where the tangent is parallel to the horizon. We ſhall adopt this method.

Plate CCXVIII.

Therefore, let AP (fig. 9.) $= x$, PM $= y$. AM $= z$. Put the quantity C which is introduced into the fluent equal to $\frac{n}{a}$. It is plain that n muſt be a number; for it muſt be homologous with $\dot{p}\sqrt{1+p^2}$, which is a number. For brevity's ſake let us expreſs the fluent of $\dot{p}\sqrt{1+p^2}$ by the ſingle letter P; and thus we ſhall have $x = a \times \int\frac{\dot{p}}{n+P}$, $y = a \times \int\frac{p\dot{p}}{n+P}$, $z = a \times \int\frac{\dot{p}\sqrt{1+p^2}}{n+P}$. And $v^2 = \frac{-ag\,(1+p^2)}{n+P}$. Now the height h neceſſary for communicating any velocity v is $\frac{v^2}{2g} = \frac{-ag\,(1+p^2)}{2g\,(n+P)}, = \frac{-\frac{1}{2}a\,(1+p^2)}{n+P}$. And laſtly, $t = \frac{\sqrt{a}}{\sqrt{g}}\int\frac{\dot{p}}{\sqrt{n+P}}$.

Theſe fluents, being all taken ſo as to vaniſh at the vertex, where the computation commences, and where p is $= 0$ (the tangent being parallel to the horizon), we obtain in this caſe $h = \frac{\frac{1}{2}a}{n}, = \frac{a}{2n}$, and $n = \frac{a}{2h}$.

Hence we ſee that the circumſtance which modifies all the curves, diſtinguiſhing them from each other, is the velocity (or rather its ſquare) in the higheſt point of the curve. For h being determined for any body whoſe terminal velocity is u, n is alſo determined; and this is the modifying circumſtance. Conſidering it geometrically, it is the area which muſt be cut off from the area DMAP of fig. 8. in order to determine the ordinates of the other curves.

We muſt farther remark, that the values now given relate only to that part of the area where the body is deſcending from the vertex. This is evident; for in order that y may increaſe as we recede from the vertex, its fluxion muſt be taken in the oppoſite ſenſe to what it was in our inveſtigation. *There* we ſuppoſed y to increaſe as the body aſcended, and then to diminiſh during the deſcent; and therefore the fluxion of y was firſt poſitive and then negative.

The ſame equations, however, will ſerve for the aſcending branch CNA of the curve, only changing the ſign of P; for if we conſider y as decreaſing during the aſcent, we muſt conſider q as expreſſing $\frac{-\dot{p}}{\dot{x}}$, and therefore P, or $\int\dot{p}\sqrt{1+p^2}$, which is $= \frac{q}{a}$, muſt be taken negatively. Therefore, in the aſcending branch, we have AQ or x (increaſing as we recede from A) $= a \times \int\frac{\dot{p}}{n-P}$, QN or $y = a \times \int\frac{p\dot{p}}{n-P}$, AN or $z = a \times \int\frac{\dot{p}\sqrt{1+p^2}}{n-P}$, $t = \frac{\sqrt{a}}{\sqrt{g}} \times \int\frac{\dot{p}}{\sqrt{1-P}}$, and the height producing the velocity at N $= \frac{\frac{1}{2}a\,(1+p^2)}{n-P}$.

81 Remarkable property of the curve or trajectory.

Hence we learn by the bye, that in no part of the aſcending branch can the inclination of the tangent be ſuch that P ſhall be greater than n; and that if we ſuppoſe P equal to n in any point of the curve, the velocity in that point will be infinite. That is to ſay, there is a certain aſſignable elevation of the tangent which cannot be exceeded in a curve which has this velocity in the vertex. The beſt way for forming a conception of this circumſtance in the nature of the curve, is to invert the motion, and ſuppoſe an accelerating force equal and oppoſite to the reſiſtance, to act on the body in conjunction with gravity. It muſt deſcribe the ſame curve, and this branch ANC muſt have an aſſymptote LO, which has this limiting poſition of the tangent. For, as the body deſcends in this curve, its velocity increaſes to infinity by the joint action of gravity and this *accelerating* force, and yet the tangent never approaches ſo near the perpendicular poſition as to make $P = n$. This remarkable property of the curve was known to Newton, as appears by his approximations, which all lead him to curves of a hyperbolic form, having one aſſymptote inclined to the horizon. Indeed it is pretty obvious: For the reſiſtance increaſing faſter than the velocity, there is no velocity of projection ſo great but that the curve will come to deviate ſo from the tangent, that in a finite time it will become parallel to the horizon. Were the reſiſtance proportional to the velocity, then an infinite velocity would produce a rectilineal motion, or rather a deflection from it leſs than any that can be aſſigned.

82
On what its form and magnitude depends.

We now ſee that the particular form and magnitude of this trajectory depends on two circumſtances, a and n. a affects chiefly the magnitude. Another circumſtance might indeed be taken in, viz. the diminution of the accelerating force of gravity by the ſtatical effect of the air's gravity. But, as we have already obſerved, this is too trifling to be attended to in military projectiles.

$\frac{\dot{y}}{\dot{x}}$ was made equal to $\dot{p}$. Therefore the radius of curvature, determined by the ordinary methods, is $\frac{\dot{x}(1+p^2)(\sqrt{1+p^2})}{\dot{p}}$ *, and, becauſe $\frac{\dot{x}}{\dot{p}}$ is $= \frac{a}{n+P}$ for the deſcending branch of the curve, the radius of curvature at M is $\frac{a \times \overline{1+p^2} \times \sqrt{1+p^2}}{n+P}$, and, in the aſcending branch at N, it is $\frac{a \times \overline{1+p^2} \times \sqrt{1+p^2}}{n-P}$. On both ſides therefore, when the velocity is infinitely great, and P by this means ſuppoſed to equal or exceed n, the radius of curvature is alſo infinitely great. We alſo ſee that the two branches are unlike each other, and that when p is the ſame in both, that is, when the tangent is equally inclined to the horizon, the radius of curvature, the ordinate, the abſciſs, and the arch, are all greater in the aſcending branch. This is pretty obvious. For as the reſiſtance acts entirely in diminiſhing the velocity, and does not affect the deflection occaſioned by gravity, it muſt allow gravity to incurvate the path ſo much the more (with the ſame inclination of its line of action) as the velocity is more diminiſhed. The curvature, therefore, in thoſe points which have the ſame inclination of the tangent, is greateſt in the deſcending branch, and the motion is ſwifteſt in the aſcending branch. It is otherwiſe in a void, where both ſides are alike. Here u becomes infinite, or there is no terminal velocity; and n alſo becomes infinite, being $= \frac{a}{2b}$.

It is therefore in the quantity P, or $\int \dot{p}\sqrt{1+p^2}$, that the difference between the trajectory in a void and in a reſiſting medium conſiſts; it is this quantity which expreſſes the accumulated change of the ratio of the increments of the ordinate and abſciſs. In vacuo the ſecond increment of the ordinate is conſtant when the firſt increment of the abſciſſa is ſo, and the whole increment of the ordinate is as $1+p$. And this difference is ſo much the greater as P is greater in reſpect of n. P is nothing at the vertex, and increaſes along with the angle MTP; and when this is a right angle, P is infinite. The trajectory in a reſiſting medium will come therefore to deviate infinitely from a parabola, and may even deviate farther from it than the parabola deviates from a ſtraight line. That is, the diſtance of the body in a given moment from that point of its parabolic path where it would have been in a void, is greater than the diſtance between that point of the parabola from the point of the ſtraight line where it would have been, independent of the action of gravity. This muſt happen whenever the reſiſtance is greater than the weight of the body, which is generally the caſe in the beginning of the trajectory in military projectiles; and this (were it now neceſſary) is enough to ſhow the inutility of the parabolic theory.

83
Several properties of it aſcertained.

Although we have no method of deſcribing this trajectory, which would be received by the ancient geometers, we may aſcertain ſeveral properties of it, which will aſſiſt us in the ſolution of the problem. In particular, we can aſſign the abſolute length of any part of it by means of the logiſtic curve. For becauſe $P = \int \dot{p}\sqrt{1+p^2}$, we have $\dot{p}\sqrt{1+p^2} = \dot{P}$, and therefore z, which was $= a \times \int \frac{\dot{p}\sqrt{1+p^2}}{\int \dot{p}\sqrt{1+p^2}|} + C$, or $= a \times \int \frac{\dot{P}}{n+P}$, may be expreſſed by logarithms; or $z = a \times$ hyp. log. of $\frac{n+P}{n}$, ſince at the vertex A, where z muſt be $= 0$, P is alſo $= 0$.

Being able, in this way, to aſcertain the length AM of the curve (counted from the vertex), correſponding to any inclination p of the tangent at its extremity M, we can aſcertain the length of any portion of it, ſuch as M m, by firſt finding the length of the part A m, and then of the part AM. This we do more expeditiouſly thus: Let p expreſs the poſition of the tangent in M, and q its poſition at m; then $AM = a \times \log. \frac{n+P}{n}$ and $Am = a \times \log. \frac{n+Q}{n}$, and therefore M m is $= a \times \log. \frac{n+Q}{n+P}$. Thus we can find the values of a great number of ſmall portions, and the inclination of the tangents at their extremities. Then to each of theſe portions we can aſſign its proportion of the abciſſa and ordinate, without having recourſe to the values of x and y. For the portion of abſciſs correſponding to the arch M m, whoſe middle point is inclined to the horizon in the angle b, will be M m × coſine b, and the correſponding portion of the ordinate will be M m × ſin. b. Then we obtain the velocity in each part of the curve by the equation $h = \frac{\frac{1}{2} a \times \overline{1+p^2}}{n+p}$; or, more directly the velocity v at M will be $= \sqrt{ag}\,\frac{\sqrt{1+p^2}}{\sqrt{n+P}}$. Laſtly, divide the length of the little arch by this, and the quotient will be the time of deſcribing M m very nearly. Add all theſe together, and we obtain the whole time of deſcribing the arch AM, but a little too great, becauſe the motion in the ſmall arch is not perfectly uniform. The error, however, may be as ſmall as we pleaſe, becauſe we may make the arch as ſmall as we pleaſe; and for greater accuracy, it will be proper to take the p by which we compute the velocity, a medium between the p for the beginning and that for the end of the arch.

---

* Simpſon's Fluxions, § 68, &c.

84 Euler's method preferred.

This is the method followed by Euler, who was one of the moſt expert analyſts, if not the very firſt, in Europe. It is not the moſt elegant, and the methods of ſome other authors, who approximate directly to the areas of the curves which determine the values of x and y, have a more ſcientific appearance; but they are not ultimately very different: For, in ſome methods, theſe areas are taken piecemeal, as Euler takes the arch; and by the methods of others, who give the value of the areas by Newton's method of deſcribing a curve of the parabolic kind through any number of given points, the ordinates of theſe curves, which expreſs $\dot{x}$ and $\dot{y}$, muſt be taken ſingly, which amounts to the ſame thing, with the great diſadvantage of a much more complicated calculus, as any one may ſee by comparing the expreſſions of $\dot{x}$ and $\dot{y}$ with the expreſſion of $\dot{z}$. As to thoſe methods which approximate directly to the areas or values of x and y by an infinite ſeries, they all, without exception, involve us in moſt complicated expreſſions, with coefficients of ſines and tangents, and ambiguous ſigns, and engage us in a calculation almoſt endleſs. And we know of no ſeries which converges faſt enough to give us tolerable accuracy, without ſuch a number of terms as is ſufficient to deter any perſon from the attempt. The calculation of the arches is very moderate, ſo that a perſon tolerably verſant in arithmetical operations may compute an arch with its velocity and time in about five minutes. We have therefore no heſitation in preferring this method of Euler's to all that we have ſeen, and therefore proceed to determine ſome other circumſtances which render its application more general.

85 Its application made more general.

If there were no reſiſtance, the ſmalleſt velocity would be at the vertex of the curve, and it would immediately increaſe by the action of gravity conſpiring (in however ſmall degree) with the motion of the body. But in a reſiſting medium, the velocity at the vertex is diminiſhed by a quantity to which the acceleration of gravity in that point bears no aſſignable proportion. It is therefore diminiſhed, upon the whole, and the point of ſmalleſt velocity is a little way beyond the vertex. For the ſame reaſons, the greateſt curvature is a little way beyond the vertex. It is not very material for our preſent purpoſe to aſcertain the exact poſitions of thoſe points.

The velocity in the deſcending branch augments continually: but it cannot exceed a certain limit, if the velocity at the vertex has been leſs than the terminal velocity; for when the curve is infinite, p is alſo infinite, and $h = \frac{\frac{1}{2} ap^2}{P}$, becauſe n in this caſe is nothing in reſpect of P, which is infinite; and becauſe p is infinite, the number hyp. log. $\overline{p + \sqrt{1+p^2}}$, though infinite, vaniſhes in compariſon with $p \times \sqrt{1+p^2}$; ſo that in this caſe $P = \frac{1}{2}p^2$, and $h = a$, and $v =$ the terminal velocity.

If, on the other hand, the velocity at the vertex has been greater than the terminal velocity, it will diminiſh continually, and when the curve has become infinite, v will be equal to the terminal velocity.

In either caſe we ſee that the curve on this ſide will have a perpendicular aſſymptote. It would require a long and pretty intricate analyſis to determine the place of this aſſymptote, and it is not material for our preſent purpoſe. The place and poſition of the other aſſymptote LO is of the greateſt moment. It evidently diſtinguiſhes the kind of trajectory from any other. Its poſition depends on this circumſtance, that if p marks the poſition of the tangent, $n-P$, which is the denominator of the fractions expreſſing the ſquare of the velocity, muſt be equal to nothing, becauſe the velocity is infinite: therefore, in this place, $P = n$, or $n = \frac{1}{2}p\sqrt{1+p^2} + \frac{1}{2}\text{log.}\,\overline{p+\sqrt{1+p^2}}$. In order, therefore, to find the point L, where the aſſymptote LO cuts the horizontal line AL, put $P = n$, then will $AL = x - \frac{y\dot{x}}{\dot{y}}, = a \times \left(\int\frac{\dot{p}}{n-P} - \frac{1}{p}\int\frac{p\dot{p}}{n-P}\right)$.

Through the whole of this article $\int$ means fluent.

It is evident that the logarithms uſed in theſe expreſſions are the natural or hyperbolic. But the operations may be performed by the common tables by making the value of the arch M m of the curve $= \frac{a}{M} \times \text{log.}\,\frac{n+Q}{n+P}$ &c. where M means the ſubtangent of the common logarithms, or 0,43429; alſo the time of deſcribing this arch will be expeditiouſly had by taking a medium μ between the values of $\frac{\sqrt{1+p^2}}{\sqrt{n+P}}$ and $\frac{\sqrt{1+q^2}}{\sqrt{n+Q}}$, and making the time $= \frac{\sqrt{a}}{M\mu\sqrt{g}} \times \text{log.}\,\frac{n+Q}{n+P}$.

86 Mode of applying this proceſs in practice.

Such then is the proceſs by which the form and magnitude of the trajectory, and the motion in it, may be determined. But it does not yet appear how this is to be applied to any queſtion in practical artillery. In this proceſs we have only learned how to compute the motion from the vertex in the deſcending branch till the ball has acquired a particular direction, and the motion to the vertex from a point of the aſcending branch where the ball has another direction, and all this depending on the greateſt velocity which the body can acquire by falling, and the velocity which it has in the vertex of the curve. But the uſual queſtion is, "What will be the motion of the ball projected in a certain direction with a certain velocity?"

The mode of application is this: Suppoſe a trajectory computed for a particular terminal velocity, produced by the fall a, and for a particular velocity at the vertex, which will be characterized by n, and that the velocity at that point of the aſcending branch where the inclination of the tangent is 30° is 900 feet *per* ſecond. Then, we are certain that if a ball, whoſe terminal velocity is that produced by the fall a, be projected with the velocity of 900 feet per ſecond, and an elevation of 30°, it will deſcribe this very trajectory, and the velocity and time correſponding to every point will be ſuch as is here determined.

Now this trajectory will, in reſpect to form, anſwer an infinity of caſes: for its characteriſtic is the proportion of the velocity in the vertex to the terminal velocity. When this proportion is the ſame, the number n will be the ſame. If therefore we compute the trajectories for a ſufficient variety of theſe proportions, we ſhall find a trajectory that will nearly correſpond to any caſe that can be propoſed; and an approximation ſufficiently exact will be had by taking a proportional medium between the two trajectories which come neareſt to the caſe propoſed.

87 Computed tables or trajectories.

Accordingly, a ſet of tables or trajectories have been computed by the Engliſh tranſlator of Euler's Commentary on Robins's Gunnery. They are in number 18, diſtinguiſhed by the poſition of the aſſymptote of the aſcending branch. This is given for 5°, 10°, 15°, &c. to 85°, and the whole trajectory is computed as far as it can ever be ſuppoſed to extend in practice. The following table gives the value of the number n correſponding to each poſition of the aſſymptote.

OLB	n	OLB	n
0	0,00000	45	1,14779
5	0,08760	50	1,43236
10	0,17724	55	1,82207
15	0,27712	60	2,39033
20	0,37185	65	3,29040
25	0,48269	70	4,88425
30	0,60799	75	8,22357
35	0,75382	80	17,54793
40	0,92914	85	67,12291

Since the path of a projectile is much leſs incurvated, and more rapid in the aſcending than in the deſcending branch, and the difference is ſo much the more remarkable in great velocities; it muſt follow, that the range on a horizontal or inclined plane depends moſt on the aſcending branch: therefore the greateſt range will not be made with that elevation which biſects the angle of poſition, but with a lower elevation; and the deviation from the biſecting elevation will be greater as the initial velocities are greater. It is very difficult to frame an exact rule for determining the elevation which gives the greateſt range. We have ſubjoined a little table which gives the proper elevations (nearly) correſponding to the different initial velocities.

It was computed by the following approximation, which will be found the ſame with the ſeries uſed by Newton in his Approximations.

Let e be the angle of elevation, a the height producing the terminal velocity, b the height producing the initial velocity, and c the number whoſe hyperbolic logarithm is 1 (*i. e.* the number 2,718) Then,

$$y = x \times \left(\text{tan. } e + \frac{a}{2\,b.\,\text{coſ. } e}\right) - \frac{a^2}{2b}\left(\text{C}^{\frac{x}{a.\text{coſ.}e.}} - 1\right),$$

&c. Make $y = v$, and take the maximum by varying e, we obtain $\text{Sin.}^{2}\,\overline{e + \frac{a.\ \text{ſin.}\ e.}{2b}} =$ hyperbol. log. $\left(1 + \frac{2b}{a\ \text{ſine}\ e}\right)$, which gives us the angle e.

The numbers in the firſt column, multiplied by the terminal velocity of the projectile, give us the initial velocity; and the numbers in the laſt column, being multiplied by the height producing the terminal velocity, and by 2,3026, give us the greateſt ranges. The middle column contains the elevation. The table is not computed with ſcrupulous exactneſs, the queſtion not requiring it. It may however be depended on within one part of 2000

To make uſe of this table, divide the initial velocity by the terminal velocity u, and look for the quotient in the firſt column. Oppoſite to this will be found the elevation giving the greateſt range; and the number in the laſt column being multiplied by 2,3026 × a (the height producing the terminal velocity) will give the range.

TABLE of Elevations giving the greateſt Range.

Initial vel. / u,	Elevation.	Range. / $2,3026a$,
0,6909	43°.40′	0,1751
0,7820	43 .20	0,2169
0,8645	42 .50	0,2548
1,3817	41 .40	0,4999
1,5641	40 .20	0,5789
1,7291	40 .10	0,6551
2,0726	39 .50	0,7877

4,8361	31 .50	1,5341

88 Advantage to be derived from the ſolution of the problem.

Such is the ſolution which the preſent ſtate of our mathematical knowledge enables us to give of this celebrated problem. It is exact in its principle, and the application of it is by no means difficult, or even operoſe. But let us ſee what advantage we are likely to derive from it.

In the firſt place, it is very limited in its application. There are few circumſtances of general coincidence, and almoſt every caſe requires an appropriated calculus. Perhaps the only general rules are the two following:

1. Balls of equal denſity, projected with the ſame elevation, and with velocities which are as the ſquare-roots of their diameters, will deſcribe ſimilar curves.— This is evident, becauſe, in this caſe, the reſiſtance will be in the ratio of their quantities of motion. Therefore

all the homologous lines of the motion will be in the proportion of the diameters.

2. If the initial velocities of balls projected with the ſame elevation are in the inverſe ſubduplicate ratio of the whole reſiſtances, the ranges, and all the homologous lines of their track, will be inverſely as thoſe reſiſtances.

Theſe theorems are of conſiderable uſe: for by means of a proper ſeries of experiments on one ball projected with different elevations and velocities, tables may be conſtructed which will aſcertain the motions of an infinity of others.

89 Shown from various conſiderations to be very little.

But when we take a retroſpective view of what we have done, and conſider the conditions which were aſſumed in the ſolution of the problem, we ſhall find that much yet remains before it can be rendered of great practical uſe, or even ſatiſfy the curioſity of the man of ſcience. The reſiſtance is all along ſuppoſed to be in the duplicate ratio of the velocity; but even theory points out many cauſes of deviation from this law, ſuch as the preſſure and condenſation of the air, in the caſe of very ſwift motions; and Mr Robins's experiments are ſufficient to ſhow us that the deviations muſt be exceedingly great in ſuch caſes. Mr Euler and all ſubſequent writers have allowed that it may be three times greater, even in caſes which frequently occur; and Euler gives a rule for aſcertaining with tolerable accuracy what this increaſe and the whole reſiſtance may amount to. Let H be the height of a column of air whoſe weight is equivalent to the reſiſtance taken in the duplicate ratio of the velocity. The whole reſiſtance will be expreſſed by $H + \frac{H^2}{28845}$. This number 28845 is the height in feet of a column of air whoſe weight balances its elaſticity. We ſhall not at preſent call in queſtion his reaſons for aſſigning this preciſe addition. They are rather reaſons of arithmetical conveniency than of phyſical import. It is enough to obſerve, that if this meaſure of the reſiſtance is introduced into the proceſs of inveſtigation, it is totally changed; and it is not too much to ſay, that with this complication it requires the knowledge and addreſs of a Euler to make even a partial and very limited approximation to a ſolution.—Any law of the reſiſtance, therefore, which is more complicated than what Bernoulli has aſſumed, namely, that of a ſimple power of the velocity, is abandoned by all the mathematicians, as exceeding their abilities; and they have attempted to avoid the error ariſing from the aſſumption of the duplicate ratio of the velocity, either by ſuppoſing the reſiſtance throughout the whole trajectory to be greater than what it is in general, or they have divided the trajectory into different portions, and aſſigned different reſiſtances to each, which vary, through the whole of that portion, in the duplicate ratio of the velocities. By this kind of patchwork they make up a trajectory and motion which correſponds, in ſome tolerable degree, with what? With an accurate theory? No; but with a ſeries of experiments. For, in the firſt place, every theoretical computation that we make, proceeds on a ſuppoſed initial velocity; and this cannot be aſcertained with any thing approaching to preciſion, by any theory of the action of gunpowder that we are yet poſſeſſed of. In the next place, our theories of the reſiſting power of the air are entirely eſtabliſhed on the experiments on the flights of ſhot and ſhells, and are corrected and amended till they tally with the moſt approved experiments we can find.

We do not learn the ranges of a gun by theory, but the theory by the range of the gun. Now the variety and irregularity of all the experiments which are appealed to are ſo great, and the acknowledged difference between the reſiſtance to ſlow and ſwift motions is alſo ſo great, that there is hardly any ſuppoſition which can be made concerning the reſiſtance, that will not agree in its reſults with many of thoſe experiments. It appears from the experiments of Dr Hutton of Woolwich, in 1784, 1785, and 1786, that the ſhots frequently deviated to the right or left of their intended track 200, 300, and ſometimes 400 yards. This deviation was quite accidental and anomalous, and there can be no doubt but that the ſhot deviated from its intended and *ſuppoſed* elevation as much as it deviated from the intended vertical plane, and this without any opportunity of meaſuring or diſcovering the deviation. Now, when we have the whole range from one to three to chooſe among for our meaſure of reſiſtance, it is evident that the confirmations which have been drawn from the ranges of ſhot are but feeble arguments for the truth of any opinion. Mr Robins finds his meaſures fully confirmed by the experiments at Metz and at Minorca. Mr Muller finds the ſame. Yet Mr Robins's meaſure both of the initial velocity and of the reſiſtance are at leaſt treble of Mr Muller's; but by compenſation they give the ſame reſults. The Chevalier Borda, a very expert mathematician, has adduced the very ſame experiments in ſupport of his theory, in which he abides by the Newtonian meaſure of the reſiſtance, which is about $\frac{1}{3}$ of Mr Robins's, and about $\frac{2}{3}$ of Muller's.

90 Cauſes of its inutility.

What are we to conclude from all this? Simply this, that we have hardly any knowledge of the air's reſiſtance, and that even the ſolution given of this problem has not as yet greatly increaſed it. Our knowledge conſiſts only in thoſe experiments, and mathematicians are attempting to patch up ſome notion of the motion of a body in a reſiſting medium, which ſhall tally with them.

There is another eſſential defect in the conditions aſſumed in the ſolution. The denſity of the air is ſuppoſed uniform; whereas we are certain that it is leſs by one fifth or one ſixth towards the vertex of the curve, in many caſes which frequently occur, than it is at the beginning and end of the flight. This is another latitude given to authors in their aſſumptions of the air's reſiſtance. The Chevalier de Borda has, with conſiderable ingenuity, accommodated his inveſtigation to this circumſtance, by dividing the trajectory into portions, and, without much trouble, has made one equation anſwer them all. We are diſpoſed to think that his ſolution of the problem (in the Memoirs of the Academy of Paris for 1769) correſponds better with the phyſical circumſtances of the caſe than any other. But his proceſs is there delivered in too conciſe a manner to be intelligible to a perſon not perfectly familiar with all the reſources of modern analyſis. We therefore preferred John Bernoulli's, becauſe it is elementary and rigorous.

After all, the practical artilleriſt muſt rely chiefly on the records of experiments contained in the books of

91 Neceſſity attending to experiments.

practice at the academies, or thoſe made in a more public manner. Even a perfect theory of the air's reſiſtance can do him little ſervice, unleſs the force of gunpowder were uniform. This is far from being the caſe even in the ſame powder. A few hours of a damp day will make a greater difference than occurs in any theory; and, in ſervice, it is only by trial that every thing is performed. If the firſt ſhell falls very much ſhort of the mark, a little more powder is added; and, in cannonading, the correction is made by varying the elevation.

We hope to be forgiven by the eminent mathematicians for theſe obſervations on their theories. They by no means proceed from any diſreſpect for their labours. We are not ignorant of the almoſt inſuperable difficulty of the taſk, and we admire the ingenuity with which ſome of them have contrived to introduce into their analyſis reaſonable ſubſtitutions for thoſe terms which would render the equations intractable. But we muſt ſtill ſay, upon their own authority, that theſe are but ingenious gueſſes, and that experiment is the touchſtone by which they mould their ſubſtitutions; and when they have found a coincidence, they have no motive to make any alteration. Now, when we have ſuch a latitude for our meaſure of the air's reſiſtance, that we may take it of any value, from one to three, it is no wonder that compenſations of errors ſhould produce a coincidence; but where is the coincidence? The theoriſt *ſuppoſes* the ball to ſet out with a certain velocity, and his theory gives a certain range; and this range agrees with obſervation—but how? Who knows the velocity of the ball in the experiment? This is concluded from a theory incomparably more uncertain than that of the motion in a reſiſting medium.

The experiments of Mr Robins and Dr Hutton ſhow, in the moſt incontrovertible manner, that the reſiſtance to a motion exceeding 1100 feet in a ſecond, is almoſt *three times* greater than in the duplicate ratio to the reſiſtance to moderate velocities. Euler's tranſlator, in his compariſon of the author's trajectories with experiment, ſuppoſes it to be *no* greater. Yet the coincidence is very great. The ſame may be ſaid of the Chevalier de Borda's. Nay, the ſame may be ſaid of Mr Robins's own practical rules: for he makes his F, which correſponds to our *a*, almoſt double of what theſe authors do, and yet his rules are confirmed by practice. Our obſervations are therefore well founded.

92 The theory is ſtill of ſome uſe in practice,

But it muſt not be inferred from all this, that the phyſical theory is of no uſe to the practical artilleriſt. It plainly ſhows him the impropriety of giving the projectile an enormous velocity. This velocity is of no effect after 200 or 300 yards at fartheſt, becauſe it is ſo rapidly reduced by the prodigious reſiſtance of the air. Mr Robins has deduced ſeveral practical maxims of the greateſt importance from what we already know of this ſubject, and which could hardly have been even conjectured without this knowledge. See GUNNERY.

93 And may be brought to greater perfection.

And it muſt ſtill be acknowledged, that this branch of phyſical ſcience is highly intereſting to the philoſopher; nor ſhould we deſpair of carrying it to greater perfection. The defects ariſe almoſt entirely from our ignorance of the law of variation of the air's reſiſtance. Experiments may be contrived much more conducive to our information here than thoſe commonly reſorted to. The oblique flights of projectiles are, as we have ſeen, of very complicated inveſtigation, and ill fitted for inſtructing us; but numerous and well contrived experiments on the perpendicular aſcents are of great ſimplicity, being affected by nothing but the air's reſiſtance. To make them inſtructive, we think that the following plan might be purſued. Let a ſet of experiments be premiſed for aſcertaining the initial velocities. Then let ſhells be diſcharged perpendicularly with great varieties of denſity and velocity, and let nothing be attended to but the height and the time; even a conſiderable deviation from the perpendicular will not affect either of theſe circumſtances, and the effect of this circumſtance can eaſily be computed. The height can be aſcertained with ſufficient preciſion for very valuable information by their light or ſmoke. It is evident that theſe experiments will give *direct* information of the air's retarding force; and every experiment gives us two meaſures, viz. the aſcent and deſcent: and the compariſon of the times of aſcent or deſcent, combined with the obſerved height in one experiment made with a great initial velocity, will give us more information concerning the air's reſiſtance than 50 ranges. If we ſhould ſuppoſe the reſiſtance as the ſquare of the velocity, this compariſon will give in each experiment an exact determination of the initial and final velocities, which no other method can give us. Theſe, with experiments on the *time* of horizontal flights, with known initial velocities, will give us more inſtruction on this head than any thing that has yet been done; and till ſomething of this kind is carefully done, we preſume to ſay that the motion of bodies in a reſiſting medium will remain in the hands of the mathematicians as a matter of curious ſpeculation. In the mean time, the rules which Mr Robins has delivered in his Gunnery are very ſimple and eaſy in their uſe, and ſeem to come as near the truth as any we have met with. He has not informed us upon what principles they are founded, and we are diſpoſed to think that they are rather empirical than ſcientific. But we profeſs great deference for his abilities and penetration, and doubt not but that he had framed them by means of as ſcientific a diſcuſſion as his knowledge of this new and difficult ſubject enabled him to give it.

95 Tables calculated on the preceding principles.

We ſhall conclude this article, by giving two or three tables, computed from the principles eſtabliſhed above, and which ſerve to bring into one point of view the chief circumſtances of the motion in a reſiſting medium. Although the reſult of much calculation, as any perſon who conſiders the ſubject will readily ſee, they muſt not be conſidered as offering any very accurate reſults; or that, in compariſon with one or two experiments, the differences ſhall not be conſiderable. Let any perſon peruſe the publiſhed regiſters of experiments which have been made with every attention, and he will ſee ſuch enormous irregularities, that all expectations of perfect agreement with them muſt ceaſe. In the experiments at Woolwich in 1735, which were continued for ſeveral days, not only do the experiments of one day differ among themſelves, but the mean of all the experiments of one day differs from the mean of all the experiments of another no leſs than one fourth of the whole. The experiments in which the greateſt regularity may be expected, are thoſe made with great elevations. When the elevation is ſmall, the range is more affected by a change of velocity, and ſtill more by any deviation from the ſuppoſed or intended direction of the ſhot.

The firſt table ſhows the diſtance in yards to which a ball projected with the velocity 1600 will go, while its velocity is reduced one tenth, and the diſtance at which it drops 16 feet from the line of its direction. This table is calculated by the reſiſtance obſerved in Mr Robins's experiments. The firſt column is the weight of the ball in pounds. The ſecond column remains the ſame whatever be the initial velocity; but the third column depends on the velocity. It is here given for the velocity which is very uſual in military ſervice, and its uſe is to aſſiſt us in directing the gun to the mark.— If the mark at which a ball of 24 pounds is directed is 474 yards diſtant, the axis of the piece muſt be pointed 16 feet higher than the mark. Theſe deflections from the line of direction are nearly as the ſquares of the diſtances.

32	272	479

The next table contains the ranges in yards of a 24 pound ſhot, projected at an elevation of 45°, with the different velocities in feet per ſecond, expreſſed in the firſt column. The ſecond column contains the diſtances to which the ball would go in vacuo in a horizontal plane; and the third contains the diſtances to which it will go through the air. The fourth column is added, to ſhow the height to which it riſes in the air; and the fifth ſhows the ranges corrected for the diminution of the air's denſity as the bullet aſcends, and may therefore be called the *corrected range.*

95
Uſe of the laſt table.

The initial velocities can never be puſhed as far as we have calculated for in this table; but we mean it for a table of more extenſive uſe than appears at firſt ſight. Recollect, that while the proportion of the velocity at the vertex to the terminal velocity remains the ſame, the curves will be ſimilar: therefore, if the initial velocities are as the ſquare roots of the diameters of the balls, they will deſcribe ſimilar curves, and the ranges will be as the diameters of the balls.

Therefore, to have the range of a 12 pound ſhot, if projected at an elevation of 45, with the velocity 1500; ſuppoſe the diameter of the 12 pounder to be *d*, and that of the 24 pounder D; and let the velocities be v and V: Then ſay, $\sqrt{d} : \sqrt{D} = 1500$, to a fourth proportional V. If the 24 pounder be projected with the velocity V, It will deſcribe a curve ſimilar to that deſcribed by the 12 pounder, having the initial velocity 1500. Therefore find (by interpolation) the range of the 24 pounder, having the initial velocity V. Call this R. Then $D : d = R : r$, the range of the 12 pounder which was wanted, and which is nearly 3380 yards.

We ſee by this table the immenſe difference between the motions through the air and in a void. We ſee that the ranges through the air, inſtead of increaſing in the duplicate ratio of the initial velocities, really increaſe ſlower than thoſe velocities in all caſes of military ſervice; and in the moſt uſual caſes, viz. from 800 to 1600, they increaſe nearly as the ſquare-roots of the velocities.

A ſet of ſimilar tables, made for different elevations, would almoſt complete what can be done by theory, and would be much more expeditious in their uſe than Mr Euler's Trajectories, computed with great labour by his Engliſh tranſlator.

The ſame table may alſo ſerve for computing the ranges of bomb-ſhells. We have only to find what muſt be the initial velocity of the 24 pound ſhot which correſponds to the propoſed velocity of the ſhell. This muſt be deduced from the diameter and weight of the ſhell, by making the velocity of the 24 pounder ſuch, that the ratio of its weight to the reſiſtance may be the ſame as in the ſhell.

Plate CCCCXVIII
96
Relation of the different quantities in it.

That the reader may ſee with one glance the relation of thoſe different quantities, we have given this table, expreſſed in a figure (fig. 10). The abſciſſa, or axis DA, is the ſcale of the initial velocities in feet per ſecond, meaſured on a ſcale of 400 equal parts in an inch. The ordinates to the curve ACG expreſs the yards of the range on a ſcale containing 800 yards in an inch. The ordinates to the curve A α γ expreſs (by the ſame ſcale) the height to which the ball riſes in the air.

The ordinate BC (drawn through the point of the abſciſſa which correſponds to the initial velocity 2000 is divided in the points 4, 9, 12, 18, 24, 32, 42, in the ratio of the diameters of cannon-ſhot of different weights; and the ſame ordinate is produced on the other ſide of the axis, till BO be equal to BA; and then BO is divided in the ſubduplicate ratio of the ſame diameters. Lines are drawn from the point A, and from any point D of the abſciſſa, to theſe diviſions.

We ſee diſtinctly by this figure how the effect of the initial velocity gradually diminiſhes, and that in very great velocities the range is very little increaſed by its augmentation. The dotted curve APQR, ſhows what the ranges in vacuo would be.

By this figure may the problems be ſolved. Thus, to find the range of the 12 pounder, with the initial velocity 1500. Set off 1500 from B to F; draw FH parallel to the axis, meeting the line 12A in H; draw the ordinate HK; draw KL parallel to the axis, meeting 24 B in L; draw the ordinate LM, cutting 12 B in N. MN is the range required.

If curves, ſuch as ACG, were laid down in the ſame manner for other elevations, all the problems might be ſolved with great diſpatch, and with much more accuracy than the theory by which the curves are drawn can pretend to.

PROJECTION OF THE SPHERE.

Stereographic Projection of the Sphere.

THE PROJECTION of the SPHERE is a perſpective repreſentation of the circles on the ſurface of the ſphere; and is variouſly denominated according to the different poſitions of the eye and plane of projection.

There are three principal points of projection; the *ſtereographic*, the *orthographic*, and *gnomonic*. In the ſtereographic projection the eye is ſuppoſed to be placed on the ſurface of the ſphere; in the orthographic it is ſuppoſed to be at an infinite diſtance; and in the gnomonic projection the eye is placed at the centre of the ſphere. Other kinds of its projection are, the *globular*, *Mercator's*, *ſcenographic*, &c. for which ſee the articles GEOGRAPHY, NAVIGATION, PERSPECTIVE, &c.

DEFINITIONS.

1. The plane upon which the circles of the ſphere are deſcribed, is called the *plane of projection*, or the *primitive circle*. The pole of this circle is the *pole of projection*, and the place of the eye is the *projecting point*.

2. The *line of meaſures* of any circle of the ſphere is that diameter of the primitive, produced indefinitely, which paſſes through the centre of the projected circle.

AXIOM.

The projection, or repreſentation of any point, is where the ſtraight line drawn from it to the projecting point interſects the plane of projection.

SECTION I.

Of the Stereographic Projection of the Sphere.

IN the ſtereographic projection of the ſphere, the eye is placed on the ſurface of the ſphere in the pole of the great circle upon which the ſphere is to be projected. The projection of the hemiſphere oppoſite to the eye falls within the primitive, to which this projection is generally limited: it, however, may be extended to the other hemiſphere, or that wherein the eye is placed, the projection of which falls without the primitive.

As all circles in this projection are projected either into circles or ſtraight lines, which are eaſily deſcribed, it is, therefore more generally underſtood, and by many preferred to the other projections.

PROPOSITION I. THEOREM I.

Every great circle which paſſes through the projecting point is projected into a ſtraight line paſſing through the centre of the primitive; and every arch of it, reckoned from the other pole of the primitive, is projected into its ſemitangent.

Stereographic Projection of the Sphere. Plate CCCCXIX.

Let ABCD (fig. 1.) be a great circle paſſing thro' A, C, the poles of the primitive, and interſecting it in the line of common ſection BED, E being the centre of the ſphere. From A, the projecting point, let there be drawn ſtraight lines AP, AM, AN, AQ, to any number of points P, M, N, Q, in the circle ABCD: theſe lines will interſect BED, which is in the ſame plane with them. Let them meet it in the points *p*, *m*, *n*, *q*; then *p*, *m*, *n*, *q*, are the projections of P, M, N, Q: hence the whole circle ABCD is projected into the ſtraight line BED, paſſing through the centre of the primitive.

Again, becauſe the pole C is projected into E, and the point M into *m*; therefore the arch CM is projected into the ſtraight line E*m*, which is the ſemitangent of the arch CM to the radius AE. In the like manner, the arch CP is projected into its ſemitangent E*p*, &c.

COROLLARIES.

1. Each of the quadrants contiguous to the projecting point is projected into an indefinite ſtraight line, and each of thoſe that are remote into a radius of the primitive.

2. Every ſmall circle which paſſes through the projecting point is projected into that ſtraight line which is its common ſection with the primitive.

3. Every ſtraight line in the plane of the primitive, and produced indefinitely, is the projection of ſome circle on the ſphere paſſing through the projecting point.

4. The projection of any point in the ſurface of the ſphere, is diſtant from the centre of the primitive, by the ſemitangent of the diſtance of that point from the pole oppoſite to the projecting point.

PROPOSITION II. THEOREM II.

Every circle on the ſphere which does not paſs through the projecting point is projected into a circle.

If the given circle be parallel to the primitive, then a ſtraight line drawn from the projecting point to any point in the circumference, and made to revolve about the circle, will deſcribe the ſurface of a cone; which being cut by the plane of projection parallel to the baſe, the ſection will be a circle. Se *Conic-Sections*.

But if the circle MN (fig. 2.) be not parallel to the primitive circle BD, let the great circle ABCD, paſſing through the projecting point, cut it at right angles in the diameter MN, and the primitive in the diameter BD. Through M, in the plane of the great circle, let MF be drawn parallel to BD; let AM, AN be joined and meet BD in *mn*. Then, becauſe AB, AD are quadrants, and BD, MF parallel, the arch AM is equal to AF, and the angle AMF or A *mn* is equal to ANM. Hence the conic ſurface deſcribed by the revolution of AM about the circle MN is cut by the primitive in a ſubcontrary poſition; therefore the ſection is in this caſe likewiſe a circle.

Corollaries.

1. The centres and poles of all circles parallel to the primitive have their projections in its centre.

2. The centre and poles of every circle inclined to the primitive have their projections in the line of meaſures.

3. All projected great circles cut the primitive in two points diametrically oppoſite; and every circle in the plane of projection, which paſſes through the extremities of a diameter of the primitive, or through the projections of two points that are diametrically oppoſite on the ſphere, is the projection of ſome great circle.

4. A tangent to any circle of the ſphere, which does not paſs through the projecting point is projected into a tangent to that circle's projection; alſo, the circular projections of tangent circles touch one another.

5. The extremities of the diameter, on the line of meaſures of any projected circle, are diſtant from the centre of the primitive by the ſemitangents of the leaſt and greateſt diſtances of the circle on the ſphere, from the pole oppoſite to the projecting point.

6. The extremities of the diameter, on the line of meaſures of any projected great circle, are diſtant from the centre of the primitive by the tangent and cotangent of half the great circle's inclination to the primitive.

7. The radius of any projected circle is equal to half the ſum, or half the difference of the ſemitangents of the leaſt and greateſt diſtances of the circle from the pole oppoſite to the projecting point, according as that pole is within or without the given circle.

Proposition III. Theorem III.

An angle formed by two tangents at the ſame point in the ſurface of the ſphere, is equal to the angle formed by their projections.

Plate CCCCXIX. Let FGI and GH (fig. 3.) be the two tangents, and A the projecting point; let the plane AGF cut the ſphere in the circle AGL, and the primitive in the line BML. Alſo, let MN be the line of common ſection of the plane AGH with the primitive: then the angle $FGH=LMN$. If the plane FGH be parallel to the primitive BLD, the propoſition is manifeſt. If not, through any point K in AG produced, let the plane FKH, parallel to the primitive, be extended to meet FGH in the line FH. Then, becauſe the plane AGF meets the two parallel planes BLD, FKH, the lines of common ſection LM, FK are parallel; therefore the angle $AML=AKF$. But ſince A is the pole of BLD, the chords, and conſequently the arches AB AL, are equal, and the arch ABG is the ſum of the arches AL, BG; hence the angle AML is equal to an angle at the circumference ſtanding upon AG, and therefore equal to AGI or FGK; conſequently the angle $FGK=FKG$, and the ſide $FG=FK$. In like manner $HG=HK$: hence the triangles GHF, KHF are equal, and the angle $FGH=FKH=LMN$.

Corollaries.

1. An angle contained by any two circles of the ſphere is equal to the angle formed by their projections. For the tangents to theſe circles on the ſphere are projected into ſtraight lines, which either coincide with, or are tangents to, their projections on the primitive.

2. An angle contained by any two circles of the ſphere is equal to the angle formed by the radii of their projections at the point of interſection.

Proposition IV. Theorem IV.

The centre of a projected great circle is diſtant from the centre of the primitive; the tangent of the inclination of the great circle to the primitive, and its radius, is the ſecant of its inclination.

Let MNG (fig. 4.) be the projection of a great circle, meeting the primitive in the extremities of the diameter MN, and let the diameter BD, perpendicular to MN, meet the projection in F, G. Biſect FG in H, and join NH. Then, becauſe any angle contained by two circles of the ſphere is equal to the angle formed by the radii of their projections at the point of interſection; therefore the angle contained by the propoſed great circle and the primitive is equal to the angle ENH, of which EH is the tangent, and NH the ſecant, to the radius of the primitive.

Corollaries.

2. All circles which paſs through the points M, N are the projections of great circles, and have their centres in the line BG; and all circles which paſs through the points F, G are the projections of great circles, and have their centres in the line HI, perpendicular to BG.

2. If NF, NH be continued to meet the primitive in L, F; then BL is the meaſure of the great circle's inclination to the primitive; and $MT=2BL$.

Proposition V. Theorem V.

The centre of projection of a leſs circle perpendicular to the primitive, is diſtant from the centre of the primitive, the ſecant of the diſtance of the leſs circle from its neareſt pole; and the radius of projection is the tangent of that diſtance.

Let MN (fig. 5.) be the given leſs circle perpendicular to the primitive, and A the projecting point Draw AM, AN to meet the diameter BD produced in G and H; then GH is the projected diameter of the leſs circle: biſect GH in C, and C will be its centre; join NE, NC. Then becauſe AE, NI are parallel, the angle $INE=NEA$; but $NEA=2NMA=2NHG=NCG$: hence $ENC=INE+INC=NCG+INC=$ a right angle; and therefore NC is a tangent to the primitive at N; but the arch ND is the diſtance of the leſs circle from its neareſt pole D: hence NC is the tangent, and EC the ſecant of the diſtance of the leſs circle from its pole to the radius of the primitive.

Stereographic Projection of the Sphere.

Proposition VI. Theorem VI.

The projection of the poles of any circle, inclined to the primitive, are, in the line of meaſures, diſtant from the centre of the primitive, the tangent, and cotangent, or half its inclination.

Plate CCCCXIX.

Let MN (fig. 6.) be a great circle perpendicular to the primitive ABCD, and A the projecting point; then P, p are the poles of MN, and of all its parallels mn, &c. Let AP, Ap meet the diameter BD in Ff, which will therefore be the projected poles of MN and its parallels. The angle BEM is the inclination of the circle MEN, and its parallels, to the primitive: and becauſe BC and MP are quadrants, and MC common to both; therefore PC=BM: and hence PEC is alſo the inclination of MN and its parallels. Now EF is the tangent of EAF, or of half the angle PEC the inclination; and Ef is the tangent of the angle EAf; but EAf is the complement of EAF, hence Ef is the cotangent of half the inclination.

Corollaries.

1. The projection of that pole which is neareſt to the projecting point is without the primitive, and the projection of the other within.
2. The projected centre of any circle is always between the projection of its neareſt pole and the centre of the primitive; and the projected centres of all circles are contained between their projected poles.

Proposition VII. Theorem VII.

Equal arches of any two great circles of the ſphere will be intercepted between two other circles drawn on the ſphere through the remote poles of thoſe great circles.

Let AGB, CFD (fig. 7.) be two great circles of the ſphere, whoſe remote poles are E, P; through which draw the great circle PBEC, and leſs circle PGE, interſecting the great circles AGB, CFD, in the points B, G, and D, F; then the arch BG is equal to the arch DF.

Becauſe E is the pole of the circle AGB, and P the pole of CFD, therefore the arches EB, PD are equal; and ſince BD is common to both, hence the arch ED is equal to the arch PB. For the ſame reaſon, the arches EF, PG are equal; but the angle DEF is equal to the angle BPG: hence theſe triangles are equal, and therefore the arch DF is equal to the arch BG.

Proposition VIII. Theorem VIII.

If from either pole of a projected great circle, two ſtraight lines be drawn to meet the primitive and the projection, they will intercept ſimilar arches of theſe circles.

On a plane of projection AGB (fig. 7.) let the great circle CFD be projected into cfd, and its pole P into p; through p draw the ſtraight lines pd, pf, then are the arches GB, fd ſimilar.

Since pd lies both in the plane AGB and APBE, it is in their common ſection, and the point B is alſo in their common ſection; therefore pd paſſes through the point B. In like manner it may be ſhown that the line pf paſſes through G. Now the points D, F are projected into d, f: hence the arches FD, fd are ſimilar; but GB is equal to FD, therefore the intercepted arch of the primitive GB is ſimilar to the projected arch fd.

Corollary.

Hence, if from the angular point of a projected ſpherical angle two ſtraight lines be drawn through the projected poles of the containing ſides, the intercepted arch of the primitive will be the meaſure of the ſpherical angle.

Proposition IX. Problem I.

To deſcribe the projection of a great circle through two given points in the plane of the primitive.

Let P and B be given points, and C the centre of the primitive.

1. When one point P (fig. 8.) is the centre of the primitive, a diameter drawn through the given points will be the great circle required.
2. When one point P (fig. 9.) is in the circumference of the primitive. Through P draw the diameter PD; and an oblique circle deſcribed through the three points P, B, D, will be the projection of the required great circle.
3. When the given points are neither in the centre nor circumference of the primitive. Through either of the given points P (fig. 10.) draw the diameter ED, and at right angles thereto draw the diameter FG. From F through P draw the ſtraight line FPH, meeting the circumference in H: draw the diameter HI, and draw the ſtraight line FIK, meeting ED produced in D; then an arch, terminated by the circumference, being deſcribed through the three points P, B, K, will be the great circle.

Proposition X. Problem II.

To deſcribe the repreſentation of a great circle about any given point as a pole.

Let P be the given pole, and C the centre of the primitive.

1. When P (fig. 8.) is in the centre of the primitive, then the primitive will be the great circle required.
2. When the pole P (fig. 11.) is in the circumference of the primitive. Through P draw the diameter PE, and the diameter AB drawn at right angles to PE will be the projected great circle required.
3. When the given pole is neither in the centre nor circumference of the primitive. Through the pole P (fig. 12.) draw the diameter AB, and draw the diameter DE perpendicular to AB; through E and P draw the ſtraight line EPF, meeting the circumference in F. Make FC equal to FD; through E and G draw the ſtraight line EGH, meeting the diameter AB produced if neceſſary in H; then from the centre H, with the radius HE, deſcribe the oblique circle DIE, and it will be the projection of the great circle required.

Plate CCCCXX.

Or, make DK equal to FA; join EK, which interſects the diameter AB in I; then through the three points D, I, E, deſcribe the oblique circle DIE.

Proposition XI. Problem III.

To find the poles of a great circle.

1. When the given great circle is the primitive, its centre is the pole.

2. To

Plate CCCCXIX. Plate CCCCXX.

2. To find the pole of the right circle ABC (fig. 11.) Draw the diameter PE perpendicular to the given circle AB; and its extremities P, E are the poles of the circle ACB.

3. To find the pole of the oblique circle DEF (fig. 13.) Join DF, and perpendicular thereto draw the diameter AB, cutting the given oblique circle DEF in E. Draw the ſtraight line FEG, meeting the circumference in G. Make GI, GH, each equal to AD; then FI being joined, cuts the diameter AB in P, the lower pole; through F and H draw the ſtraight line FHp, meeting the diameter AB produced in p, which will be the oppoſite or exterior pole.

Proposition XII. Problem IV.

To deſcribe a leſs circle about any given point as a pole, and at any given diſtance from that pole.

1. When the pole of the leſs circle is in the centre of the primitive; then from the centre of the primitive, with the ſemitangent of the diſtance of the given circle from its pole, deſcribe a circle, and it will be the projection of the leſs circle required.

2. If the given pole is in the circumference of the primitive, from C (fig. 14.), the centre of the primitive, ſet off CE the ſecant of the diſtance of the leſs circle from its pole P; then from the centre E, with the tangent of the given diſtance, deſcribe a circle, and it will be the leſs circle required. Or, make PG, PF each equal to the chord of the diſtance of the leſs circle from its pole. Through B, G, draw the ſtraight line BGD meeting CP produced in D: biſect GD in H, and draw HE perpendicular to GD; and meeting PD in E, then E is the centre of the leſs circle.

3. When the given pole is neither in the centre nor circumference of the primitive. Through P (fig. 15.), the given pole, and C the centre of the primitive, draw the diameter AB, and draw the diameter DE perpendicular to AB; join EP, and produce it to meet the primitive in p; make pF, pG, each equal to the chord of the diſtance of the leſs circle from its pole; join EF which interſects the diameter AB in H; from E through G draw the ſtraight line EGI, meeting the diameter AB produced in I; biſect HI in K: Then a circle deſcribed from the centre K, at the diſtance KH or KI, will be the projection of the leſs circle.

Proposition XIII. Problem V.

To find the poles of a given leſs circle.

The poles of a leſs circle are alſo thoſe of its parallel great circle. If therefore the parallel great circle be given, then its poles being found by Prob. III. will be thoſe of the leſs circle. But if the parallel great circle be not given, let HMIN (fig. 15.) be the given leſs circle. Through its centre, and C the centre of the primitive, draw the line of meaſures IAHB; and draw the diameter DE perpendicular to it, alſo draw the ſtraight line EHF meeting the primitive in F; make Fp equal to the chord of the diſtance of the leſs circle from its pole; join Ep, and its interſection P with the diameter AB is the interior pole. Draw the diameter pCL through E and L, draw ELq meeting the diameter AB produced in q; then q is the external pole. Or thus: Join EI interſecting the primitive in G; join alſo EH, and produce it to meet the primitive in F, biſect the arch GF in p; from E to p draw the ſtraight line EPp, and P is the pole of the given leſs circle.

Proposition XIV. Problem VI.

To meaſure any arch of a great circle.

1. Arches of the primitive are meaſured on the line of chords.

2. Right circles are meaſured on the line of ſemitangents, beginning at the centre of the primitive. Thus, the meaſure of the portion AC (fig. 16.) of the right circle DE, is found by applying it to the line of ſemitangents. The meaſure of the arch DB is found by ſubtracting that of BC from 90°: the meaſure of the arch AF, lying partly on each ſide of the centre, is obtained by adding the meaſures of AC and CF. Laſtly, To meaſure the part AB, which is neither terminated at the centre or circumference of the primitive, apply CA to the line of ſemitangents; then CB, and the difference between the meaſures of theſe arches, will be that of AB.

Or thus, Draw the diameter GH perpendicular to DE; then from either extremity, as D, of this diameter, draw lines through the extremities of the arch intended to be meaſured; and the intercepted portion of the primitive applied to the line of chords will give the meaſure of the required arch. Thus IK applied to the line of chords will give the meaſure of AB.

3. To meaſure an arch of an oblique circle: draw lines from its pole through the extremities of the arch to meet the primitive, then the intercepted portion of the primitive applied to the line of chords will give the meaſure of the arch of the oblique circle. Thus, let AB (fig. 17.), be an arch of an oblique circle to be meaſured, and P its pole; from P draw the lines PAD, PBE meeting the primitive in B and E; then the arch DE applied to the line of chords will give the meaſure of the arch of the oblique circle AB.

Proposition XV. Problem VII.

To meaſure any arch of a leſs circle.

Let DEG (fig. 18.) be the given leſs circle, and DE the arch to be meaſured: find its internal pole P; and deſcribe the circle AFI parallel to the primitive, and whoſe diſtance from the projecting point may be equal to the diſtance of the given leſs circle from its pole P: then join PD, PE, which produce to meet the parallel circle in A and F. Now AF applied to a line of chords will give the meaſure of the arch DE of the given leſs circle.

Proposition XVI. Problem VIII.

To meaſure any ſpherical angle.

1. If the angle is at the centre of the primitive, it is meaſured as a plane angle.

2. When the angular point is in the circumference of the primitive; let A (fig. 19.) be the angular point, and ABE an oblique circle inclined to the primitive. Through P, the pole of ABE, draw the line APp meeting the circumference in p: then the arch Ep is the meaſure of the angle BAD, and the arch AFp is the meaſure of its ſupplement BAF: alſo pF is the meaſure of the angle BAC, and pED that of its ſupplement.

Stereographic Projection of the Sphere.

Plate CCCCXX.

3. If the angular point is neither at the centre nor circumference of the primitive. Let A (fig. 20.) be the angular point, and DAH, or GAF the angle to be meaſured, P the pole of the oblique circle DAF, and p the pole of GAH: then from A, through the points Pp, draw the ſtraight lines APM, ApN, and the arch MN will be the meaſure of the angle DAH; and the ſupplement of MN will be the meaſure of the angle HAF or DAG.

Proposition XVII. Problem IX.

To draw a great circle perpendicular to a projected great circle, and through a point given in it.

Find the pole of the given circle, then a great circle deſcribed through that pole and the given point will be perpendicular to the given circle. Hence if the given circle be the primitive, then a diameter drawn through the given point will be the required perpendicular. If the given circle is a right one, draw a diameter at right angles to it; then through the extremities of this diameter and the given point deſcribe an oblique circle, and it will be perpendicular to that given. If the given circle is inclined to the primitive, let it be repreſented by BAD (fig. 21.), whoſe pole is P, and let A be the point through which the perpendicular is to be drawn: then, by Prob. I. deſcribe a great circle through the points P and A, and it will be perpendicular to the oblique circle BAD.

Proposition XVIII. Problem X.

Through a point in a projected great circle, to deſcribe another great circle to make a given angle with the former, provided the meaſure of the given angle is not leſs than the diſtance between the given point and circle.

Let the given circle be the primitive, and let A (fig. 19.) be the angular point. Draw the diameters AE, DF perpendicular to each other; and make the angle CAG equal to that given, or make CG equal to the tangent of the given angle; then from the centre G, with the diſtance GC, deſcribe the oblique circle ABE, and it will make with the primitive an angle equal to that given.

If the given circle be a right one, let it be APB (fig. 22.) and let P be the given point. Draw the diameter GH perpendicular to AB; join GP, and produce it to a; make Hb equal to twice Aa; and Gb being joined interſects AB in C. Draw CD perpendicular to AB, and equal to the cotangent of the given angle to the radius PC; or make the angle CPD equal to the complement of that given: then from the centre D, with the radius DP, deſcribe the great circle FPE, and the angle APF, or BPE, will be equal to that given.

If APB (fig. 23.) is an oblique circle. From the angular point P, draw the lines PG, PC through the centres of the primitive and given oblique circle. Through C, the centre of APB, draw GCD at right angles to PG; make the angle GPD equal to that given; and from the centre D, with the radius DP, deſcribe the oblique circle FPE, and the angle APF, or BPE, will be equal to that propoſed.

Proposition XIX. Problem XI.

Any great circle cutting the primitive being given, to deſcribe another great circle which ſhall cut the given one in a propoſed angle, and have a given arch intercepted between the primitive and given circles.

Stereographic Projection of the Sphere.

Plate CCCCXXI.

If the given circle be a right one, let it be repreſented by APC (fig. 24.); and at right angles thereto draw the diameter BPM; make the angle BPF equal to the complement of the given angle, and PF equal to the tangent of the given arch; and from the centre of the primitive with the ſecant of the ſame arch deſcribe the arch Gg. Through F draw FG parallel to AC, meeting Gg in G; then from the centre G, with the tangent PF, deſcribe an arch no, cutting APC in I, and join GI. Through G, and the centre P, draw the diameter HK; draw PL perpendicular to HK, and IL perpendicular to GI, meeting PL in L; then L will be the centre of the circle HIK, which is that required.

But if the given great circle be inclined to the primitive, let it be ADB (fig. 25.), and E its centre: make the angle BDF equal to the complement of that given, and DF equal to the tangent of the given arch, as before. From P, the centre of the primitive, with the ſecant of the ſame arch, deſcribe the arch Gg, and from E, the centre of the oblique circle, with the extent EF, deſcribe an arch interſecting Gg in G. Now G being determined, the remaining part of the operation is performed as before.

When the given arch exceeds 90°, the tangent and ſecant of its ſupplement are to be applied on the line DF the contrary way, or towards the right; the former conſtruction being reckoned to the left.

Proposition XX. Problem XII.

Any great circle in the plane of projection being given to deſcribe another great circle, which ſhall make given angles with the primitive and given circles.

Let ADC (fig. 26.) be the given circle, and Q its pole. About P, the pole of the primitive, deſcribe an arch mn, at the diſtance of as many degrees as are in the angle which the required circle is to make with the primitive. About Q the pole of the circle ADC, and at a diſtance equal to the meaſure of the angle which the required circle is to make with the given circle ADC, deſcribe an arch on, cutting mn in n. Then about n as a pole, deſcribe the great circle EDF, cutting the primitive and given circle in E and D, and it will be the great circle required.

Scholium.

It will hence be an eaſy matter to conſtruct all the various ſpherical triangles. The reader is, however, referred to the article *Spherical Trigonometry*, for the method of conſtructing them agreeable to this projection; and alſo for the application to the reſolution of problems of the ſphere. For the method of projecting the ſphere upon the plane of the meridian, and of the horizon, according to the ſtereographic projection, ſee the article Geography.

SECTION II.

Of the Orthographic Projection of the Sphere.

The orthographic projection of the ſphere, is that in which the eye is placed in the axis of the plane of pro-

Orthographic Projection of the Sphere.

jection, at an infinite diſtance with reſpect to the diameter of the ſphere; ſo that at the ſphere all the viſual rays are aſſumed parallel, and therefore perpendicular to the plane of projection.

Hence the orthographic projection of any point is where a perpendicular from that point meets the plane of projection: and the orthographic repreſentation of any object is the figure formed by perpendiculars drawn from every point of the object to the plane of projection.

This method of projection is uſed in the geometrical delineation of eclipſes, occultations, and tranſits. It is alſo particularly uſeful in various other projections, ſuch as the analemma. See GEOGRAPHY, &c.

PROPOSITION I. THEOREM I.

Every ſtraight line is projected into a ſtraight line. If the given line be parallel to the plane of projection, it is projected into an equal ſtraight line; but if it is inclined to the primitive, then the given ſtraight line will be to its projection in the ratio of the radius to the coſine of inclination.

Plate CCCXXI.

Let AB (fig. 27.) be the plane of projection, and let CD be a ſtraight line parallel thereto: from the extremities C, D of the ſtraight line CD, draw the lines CE, DF perpendicular to AB; then by 3. of XI. of Eucl. the interſection EF, of the plane CEFD, with the plane of projection, is a ſtraight line: and becauſe the ſtraight lines CD, EF are parallel, and alſo CE, DF; therefore, by 34. of I. of Eucl. the oppoſite ſides are equal; hence the ſtraight line CD, and its projection EF, are equal. Again, let GH be the propoſed ſtraight line, inclined to the primitive; then the lines GE, HF being drawn perpendicular to AB, the intercepted portion EF will be the projection of GH. Through G draw GI parallel to AB, and the angle IGH will be equal to the inclination of the given line to the plane of projection. Now GH being the radius, GI, or its equal EF, will be the coſine of IGH; hence the given line GH is to its projection EF as radius to the coſine of inclination.

COROLLARIES.

1. A ſtraight line perpendicular to the plane of projection is projected into a point.
2. Every ſtraight line in a plane parallel to the primitive is projected into an equal and parallel ſtraight line.
3. A plane angle parallel to the primitive is projected into an equal angle.
4. Any plane rectilineal figure parallel to the primitive is projected into an equal and ſimilar figure.
5. The area of any rectilineal figure is to the area of its projection as radius to the coſine of its inclination.

PROPOSITION II. THEOREM II.

Every great circle, perpendicular to the primitive, is projected into a diameter of the primitive; and every arch of it, reckoned from the pole of the primitive, is projected into its ſine.

Let BFD (fig. 28.) be the primitive, and ABCD a great circle perpendicular to it, paſſing through its poles A, C; then the diameter BED, which is their line of common ſection, will be the projection of the circle ABCD. For if from any point, as G, in the circle ABC, a perpendicular GH fall upon BD, it will alſo be perpendicular to the plane of the primitive: therefore H is the projection of G. Hence the whole circle is projected into BD, and any arch AG into EH equal to GI its ſine.

COROLLARIES.

1. Every arch of a great circle, reckoned from its interſection with the primitive, is projected into its verſed ſine.
2. Every leſs circle perpendicular to the primitive is projected into its line of common ſection with the primitive, which is alſo its own diameter; and every arch of the ſemicircle above the primitive, reckoned from the middle point, is projected into its ſine.
3. Every diameter of the primitive is the projection of a great circle; and every chord the projection of a leſs circle.
4. A ſpherical angle at the pole of the primitive is projected into an equal angle.

PROPOSITION III. THEOREM III.

A circle parallel to the primitive is projected into a circle equal to itſelf, and concentric with the primitive.

Let the leſs circle FIG (fig. 29.) be parallel to the plane of the primitive BND. The ſtraight line HE, which joins their centres, is perpendicular to the primitive; therefore E is the projection of H. Let any radii HI and IN perpendicular to the primitive be drawn. Then IN, HE being parallel, are in the ſame plane; therefore IH, NE, the lines of common ſection of the plane IE, with two parallel planes, are parallel; and the figure IHEN is a parallelogram. Hence NE = IH, and conſequently FIG is projected into an equal circle KNL, whoſe centre is E.

COROLLARY.

The radius of the projection is the coſine of the diſtance of the parallel circle from the primitive, or the ſine of its diſtance from the pole of the primitive.

PROPOSITION IV. THEOREM IV.

An inclined circle is projected into an ellipſe, whoſe tranſverſe axis is the diameter of the circle.

1. Let ELF (fig. 30.) be a great circle inclined to the primitive EBF, and EF their line of common ſection. From the centre C, and any other point K, in EF, let the perpendiculars CB, KI be drawn in the plane of the primitive, and CL, KN, in the plane of the great circle, meeting the circumference in L, N. Let LG, ND be perpendicular to CB, KI; then G, D are the projections of L, N. And becauſe the triangles LCG, NKD are equiangular, $CL^2 : CG^2 :: NK^2 : DK^2$; or $EC^2 : CG^2 :: EKF : DK^2$: therefore the points G, D are in the curve of an ellipſe, of which EF is the tranſverſe axis, and CG the ſemiconjugate axis.

COROLLARIES.

1. In a projected great circle, the ſemiconjugate axis is the coſine of the inclination of the great circle to the primitive.

2. Per-

Orthographic Projection of the Sphere.

2. Perpendiculars to the tranſverſe axis intercept correſponding arches of the projection and the primitive.

3. The eccentricity of the projection is the ſine of the inclination of the great circle to the primitive.

Plate CCCCXXI.

Caſe 2. Let AQB (fig. 31.) be a leſs circle, inclined to the primitive, and let the great circle LBM, perpendicular to both, interſect them in the lines AB, LM. From the centre O and any other point N in the diameter AB, let the perpendiculars TOP, NQ, be drawn in the plane of the leſs circle, to meet its circumference in T, P, Q. Alſo, from the points A, N, O, B, let AG, NI, OC, BH, be drawn perpendicular to LM; and from P, Q, T, draw PE, QD, TF perpendicular to the primitive; then G, I, C, H, E, D, F, are the projections of theſe points. Becauſe OP is perpendicular to LBM, and OC, PE, being perpendicular to the primitive, are in the ſame plane, the plane COPE is perpendicular to LBM. But the primitive is perpendicular to LBM; therefore the common ſection EC is perpendicular to LBM, and to LM. Hence CP is a parallelogram, and EC = OP. In like manner, FC, DI, are proved perpendicular to LM, and equal to OT, NQ. Thus, ECF is a ſtraight line, and equal to the diameter PT. Let QR, DK be parallel to AB, LM; then RO = NQ = DI = KC, and PR × RT = EK × KF. But AO : CG :: NO : CI; therefore $AO^2 : CG^2 :: QR^2 : DK^2$ and $EC^2 : CG. : EKF : DK^2$.

Corollaries.

1. The tranſverſe axis is to the conjugate as radius to the coſine of the circle's inclination to the primitive.

2. Half the tranſverſe axis is the coſine of half the ſum of the greateſt and leaſt diſtances of the leſs circle from the primitive.

3. The extremities of the conjugate axis are in the line of meaſures, diſtant from the centre of the primitive by the coſines of the greateſt and leaſt diſtances of the leſs circle from the primitive.

4. If from the extremities of the conjugate axis of any elliptical projection perpendiculars be drawn (in the ſame direction if the circle do not interſect the primitive, but if otherwiſe in oppoſite directions), they will interſect an arch of the primitive, whoſe chord is equal to the diameter of the circle.

Proposition V. Theorem V.

The projected poles of an inclined circle are in its line of meaſures diſtant from the centre of the primitive the ſine of the inclination of the circle to the primitive.

Let ABCD (fig. 32.) be a great circle, perpendicular both to the primitive and the inclined circle, and interſecting them in the diameters AC, MN. Then ABCD paſſes through the poles of the inclined circle; let theſe be P, Q; and let P*p*, Q*q*, be perpendicular to AC; *p*, *q* are the projected poles; and it is evident that *p* O = ſine of BP, or MA, the inclination.

Corollaries.

1. The centre of the primitive, the centre of the projection, the projected poles, and the extremities of the conjugate axis, are all in one and the ſame ſtraight line.

2. The diſtance of the centre of projection from the centre of the primitive, is to the coſine of the diſtance of the circle from its own pole, as the ſine of the circle's inclination to the primitive is to the radius.

Orthographic Projection of the Sphere.

Proposition VI. Problem I.

To deſcribe the projection of a circle perpendicular to the primitive, and whoſe diſtance from its pole is equal to a given quantity.

Let PA*p*B (fig. 33.) be the primitive circle, and P, *p* the poles of the right circle to be projected. Then if the circle to be projected is a great circle, draw the diameter AB at right angles to the axis P*p*, and it will be that required. But if the required projection is that of a leſs circle, make PE, PF each equal to the chord of the diſtance of the leſs circle from its pole; join EF, and it will be the projection of the leſs circle required.

Proposition VII. Problem II.

Through a given point in the plane of the primitive to deſcribe the projection of a great circle, having a given inclination to the primitive.

1. When the given inclination is equal to a right angle, a ſtraight line drawn through the centre of the primitive and the given point will be the projection required.

2. When the given inclination is leſs than a right angle, and the given point in the circumference of the primitive. Let R (fig. 34.) be a point given in the circumference of the primitive, through which it is required to draw the projection of a great circle, inclined to the primitive in an angle meaſured by the arch QP of the primitive.

Through the given point R draw the diameter RCS, and draw GC*g* at right angles to it. Make the arch GV of the primitive equal to QP, and draw VA at right angles to GC; and in G*g*, towards the oppoſite parts of C, take CB equal to AC; then, with the greater axis RS, and leſs axis AB, deſcribe an ellipſe, and it will be the projection of the oblique circle required.

3. When the diſtance of the given point from the primitive is equal to the coſine of the given inclination.

Every thing remaining as in the preceding caſe; let A be the given point, and AC the coſine of an arch GV, equal to the given arch QP; then drawing the diameter RCS at right angles to ACB, the ellipſe deſcribed with the given axis RS, AB will be the projection of the inclined circle.

4. When the diſtance of the given point from the centre of the primitive is leſs than the ſemidiameter of the primitive, but greater than the coſine of the given inclination.

Walker on the Sphere, p. 159.

Let D be the given point, through which draw the diameter IC*i*; and at the point D draw DL perpendicular to DC meeting the primitive in L; alſo draw LK, making with LD the angle DLK equal to the complement of the given inclination. Let LK meet DC in K; then will DK be leſs than DC. On DC as a diameter deſcribe a circle, and make DH equal to DK; through H draw a diameter of the primitive RCS, and deſcribe an ellipſe through the points R, D, S, and it will be the projection of the inclined circle.

Proposition VIII. Problem III.

Through two given points in the plane of the primitive to deſcribe the projection of a great circle.

1. If the two given points and the centre of the primitive be in the ſame ſtraight line, then a diameter of the primitive being drawn through theſe points will be the projection of the great circle required.

2. When the two given points are not in the ſame ſtraight line with the centre of the primitive; and one of them is in the circumference of the primitive.

Plate CCCCXXI.

Let D, R, (fig. 34.) be the two given points, of which R is in the circumference of the primitive. Draw the diameter RCS, and GC*g*, FDH perpendicular to it, meeting the primitive in G*g* F. Divide GC, *g*C, in A, B, in the ſame proportion as FH is divided in D; and deſcribe the ellipſe whoſe axes are RS, AB, and centre C; and it will be the projection required.

3. When the given points are within the primitive, and not in the ſame ſtraight line with its centre.

Let D, E (fig. 35.) be the two given points; through C the centre of the primitive draw the ſtraight lines ID*i*, KE*i*; draw DL perpendicular to I*i*, and EO perpendicular to K*k*, meeting the primitive in L, O. Through E, and towards the ſame parts of C, draw EP parallel to DC, and in magnitude a fourth proportional to LD, DC, OE. Draw the diameter CP meeting the primitive in R, S, and deſcribe an ellipſe through the points D and R or S, and it will alſo paſs through E. This ellipſe will be the projection of the propoſed inclined circle.

Proposition IX. Problem IV.

To deſcribe the projection of a leſs circle parallel to the primitive, its diſtance from the pole of the primitive being given.

From the pole of the primitive, with the ſine of the given diſtance of the circle from its pole, deſcribe a circle, and it will be the projection of the given leſs circle.

Proposition X. Problem V.

About a given point as a projected pole to deſcribe the projection of an inclined circle, whoſe diſtance from its pole is given.

Let P (fig. 36.) be the given projected pole, through which draw the diameter G*g*, and draw the diameter H*h* perpendicular thereto. From P draw PL perpendicular to GP meeting the circumference in L; through which draw the diameter L*l*. Make LT, LK each equal to the chord of the diſtance of the leſs circle from its pole, and join TK, which interſects L*l*, in Q. From the points T, Q, K draw the lines FA, QS, KB, perpendicular to G*g*; and make OR, OS, each equal to QT, or QK. Then an ellipſe deſcribed through the points A, S, B, R will be the projection of the propoſed leſs circle.

Proposition XI. Problem VI.

To find the poles of a given projected circle.

1. If the projected circle be parallel to the primitive, the centre of the primitive will be its pole.

2. If the circle be perpendicular to the primitive, then the extremities of a diameter of the primitive drawn at right angles to the ſtraight line repreſenting the projected circle, will be the poles of that circle.

3. When the projected circle is inclined to the primitive.

Let ARBS (fig. 36, 37.) be the elliptical projection of any oblique circle; through the centre of which, and C the centre of the primitive, draw the line of meaſures CBA, meeting the ellipſe in B, A; and the primitive in G, *g*. Draw CH, BK, AT perpendicular to G*g*, meeting the primitive in H, K, T. Biſect the arch KT in L, and draw LP perpendicular to G*g*; then P will be the projected pole of the circle, of which ARBS is the projection.

Proposition XII. Problem VII.

To meaſure any portion of a projected circle, and converſely.

1. When the given projection is that of a great circle.

Let ADEB (fig. 38.) be the given great circle, either perpendicular or inclined to the primitive, of which the portion DE is to be meaſured, and let M*m* be the line of meaſures of the given circle. Through the points D, E draw the lines EG, DF parallel to M*m*; and the arch FG of the primitive will be the meaſure of the arch DE of the great circle, and converſely.

2. When the projection is that of a leſs circle parallel to the primitive.

Plate CCCCXXII.

Let DE (fig. 39.) be the portion to be meaſured, of the leſs circle DEH parallel to the primitive. From the centre C draw the lines CD, CE, and produce them to meet the primitive in the points B, F. Then the intercepted portion BF of the primitive will be the meaſure of the given arch DE of the leſs circle DEH.

3. If the given leſs circle, of which an arch is to be meaſured, is perpendicular to the primitive.

Let ADEB (fig. 40.) be the leſs circle, of which the meaſure of the arch DE is required. Through C, the centre of the primitive, draw the line of meaſures M*m*, and from the interſection O of the given right circle, and the line of meaſures, with the radius OA, or OB, deſcribe the ſemicircle AFGB; through the points D, E draw the lines DF, EG parallel to the line of meaſures, and the arch FG will be the meaſure of DE, to the radius AO. In order to find a ſimilar arch in the circumference of the primitive, join OF, OG, and at the centre C of the primitive, make the angle *m*CH equal to FOG, and the arch *m*H to the radius C*m* will be the meaſure of the arch DE.

4. When the given projection is of a leſs circle inclined to the primitive.

Let RDS (fig. 41.) be the projection of a leſs circle inclined to the primitive, and DE a portion of that circle to be meaſured. Through O the centre of the projected circle, and C the centre of the primitive, draw the line of meaſures M*m*; and from the centre O, with the radius OR, or OS, deſcribe the ſemicircle RGFS; through the points D, E draw the lines DF, EG parallel to the line of meaſures, and FG will be the meaſure of the arch DE to the radius OR, or OS. Join OF, OG, and make the angle *m*CH equal to

FOG, and the arch mH of the primitive will be the meaſure of the arch DE of the inclined circle RDS.

The converſe of this propoſition, namely, to cut off an arch from a given projected circle equal to a given arch of the primitive, is obvious.

The above operation would be greatly ſhortened by uſing the line of ſines in the ſector.

It ſeems unneceſſary to inſiſt farther on this projection, eſpecially as the reader will ſee the application of it to the projection of the ſphere on the planes of the *Meridian*, *Equator*, and *Horizon* in the article Geography; and to the delineation of *Eclipſes* in the article Astronomy. The *Analemma*, Plate CCXII. in the article Geography, is alſo according to this projection; and the method of applying it to the ſolution of aſtronomical problems is there exemplified.

SECTION III.

Of the Gnomonic Projection of the Sphere.

In this projection the eye is in the centre of the ſphere, and the plane of projection touches the ſphere in a given point parallel to a given circle. It is named *gnomonic*, on account of its being the foundation of dialling: the plane of projection may alſo repreſent the plane of a dial, whoſe centre being the projected pole, the ſemiaxis of the ſphere will be the ſtile or gnomon of the dial.

As the projection of great circles are repreſented by ſtraight lines, and leſs circles parallel to the plane of projection are projected into concentric circles; therefore many problems of the ſphere are very eaſily reſolved. Other problems, however, become more intricate on account of ſome of the circles being projected into ellipſes, parabolas, and hyperbolas.

Proposition I. Theorem I.

Every great circle is projected into a ſtraight line perpendicular to the line of meaſures; and whoſe diſtance from the centre is equal to the cotangent of its inclination, or to the tangent of its neareſt diſtance from the pole of the projection.

Plate cccxxii.

Let BAD (fig. 42.) be the given circle, and let the circle CBED be perpendicular to BAD, and to the plane of projection; whoſe interſection CF with this laſt plane will be the line of meaſures. Now ſince the circle CBED is perpendicular both to the given circle BAD and to the plane of projection, the common ſection of the two laſt planes produced will therefore be perpendicular to the plane of the circle CBED produced, and conſequently to the line of meaſures: hence the given circle will be projected into that ſection; that is, into a ſtraight line paſſing through d, perpendicular to Cd. Now Cd is the cotangent of the angle CdA, the inclination of the given circle, or the tangent of the arch CD to the radius AC.

Corollaries.

1. A great circle perpendicular to the plane of projection is projected into a ſtraight line paſſing through the centre of projection; and any arch is projected into its correſpondent tangent.

2. Any point, as D, or the pole of any circle, is projected into a point d, whoſe diſtance from the pole of projection is equal to the tangent of that diſtance.

3. If two great circles be perpendicular to each other, and one of them paſſes through the pole of projection, they will be projected into two ſtraight lines perpendicular to each other.

4. Hence if a great circle be perpendicular to ſeveral other great circles, and its repreſentation paſs through the centre of projection; then all theſe circles will be repreſented by lines parallel to one another, and perpendicular to the line of meaſures, for repreſentation of that firſt circle.

Proposition II. Theorem II.

If two great circles interſect in the pole of projection, their repreſentations will make an angle at the centre of the plane of projection, equal to the angle made by theſe circles on the ſphere.

For ſince both theſe circles are perpendicular to the plane of projection, the angle made by their interſections with this plane is the ſame as the angle made by theſe circles.

Proposition III. Theorem III.

Any leſs circle parallel to the plane of projection is projected into a circle whoſe centre is the pole of projection, and its radius is equal to the tangent of the diſtance of the circle from the pole of projection.

Let the circle PI (fig. 42.) be parallel to the plane GF, then the equal arches PC, CI are projected into the equal tangents GC, CH; and therefore C, the point of contact and pole of the circle PI and of the projection, is the centre of the repreſentation G, H.

Corollary.

If a circle be parallel to the plane of projection, and 45 degrees from the pole, it is projected into a circle equal to a great circle of the ſphere; and therefore may be conſidered as the primitive circle, and its radius the radius of projection.

Proposition IV. Theorem IV.

A leſs circle not parallel to the plane of projection is projected into a conic ſection, whoſe tranſverſe axis is in the line of meaſures; and the diſtance of its neareſt vertex from the centre of the plane of projection is equal to the tangent of its neareſt diſtance from the pole of projection; and the diſtance of the other vertex is equal to the tangent of the greateſt diſtance.

Any leſs circle is the baſe of a cone whoſe vertex is at A (fig. 43.); and this cone being produced, its interſection with the plane of projection will be a conic ſection. Thus the cone DAF, having the circle DF for its baſe, being produced, will be cut by the plane of projection in an ellipſe whoſe tranſverſe diameter is df; and Cd is the tangent of the angle CAD, and Cf the tangent of CAF. In like manner, the cone AFE, having the ſide AE parallel to the line of meaſures df, being cut by the plane of projection, the ſection will be a parabola, of which f is the neareſt vertex, Gnomonic Projection of the Sphere.

tex, and the point into which E is projected is at an infinite diſtance. Alſo the cone AFG, whoſe baſe is the circle FG, being cut by the plane of projection, the ſection will be a hyperbola; of which f is the neareſt vertex; and GA being produced gives d the other vertex.

Corollaries.

1. A leſs circle will be projected into an ellipſe, a parabola, or hyperbola, according as the diſtance of its moſt remote point is leſs, equal to, or greater than, 90 degrees.

2. If H be the centre, and K, k, l the focus of the ellipſe, hyperbola, or parabola; then $HK = \frac{Ad - Af}{2}$ for the ellipſe; $Hk = \frac{Ad + Af}{2}$ for the hyperbola; and fn being drawn perpendicular to AE $fl = \frac{nE + Ff}{2}$ for the parabola.

Proposition V. Theorem V.

Plate ccccxxii.

Let the plane TW (fig. 44.) be perpendicular to the plane of projection TV, and BCD a great circle of the ſphere in the plane TW. Let the great circle BED be projected into the ſtraight line bek. Draw CQS perpendicular to bk, and Cm parallel to it and equal to CA, and make QS equal to Qm; then any angle QSt is the meaſure of the arch Qt of the projected circle.

Join AQ; then becauſe Cm is equal to CA, the angle QCm equal to QCA, each being a right angle, and the ſide QC common to both triangles; therefore Qm, or its equal QS, is equal QA. Again, ſince the plane ACQ is perpendicular to the plane TV, and bQ to the interſection CQ; therefore bQ is perpendicular both to AQ and QS: hence, ſince AQ and QS are equal, all the angles at S cut the line bQ in the ſame points as the equal angles at A. But by the angles at A the circle BED is projected into the line bQ. Therefore the angles at S are the meaſures of the parts of the projected circle bQ; and S is the dividing centre thereof.

Corollaries.

1. Any great circle bQt is projected into a line of tangents to the radius SQ.

2. If the circle bC paſs through the centre of projection, then the projecting point A is the dividing centre thereof, and Cb is the tangent of its correſpondent arch CB to CA the radius of projection.

Proposition VI. Theorem VI.

Let the parallel circle GLH (fig. 44.) be as far from the pole of projection C as the circle FNI is from its pole; and let the diſtance of the poles C, P be biſected by the radius AO; and draw bAD perpendicular to AO; then any ſtraight line bQt drawn through b will cut off the arches hl, Fn equal to each other in the repreſentations of theſe equal circles in the plane of projection.

Let the projections of the leſs circles be deſcribed. Then, becauſe BD is perpendicular to AO, the arches BO, DO are equal; but ſince the leſs circles are equally diſtant each from its reſpective pole, therefore the arches FO, OH are equal; and hence the arch BF is equal to the arch DH. For the ſame reaſon the arches BN, DL are equal; and the angle FBN is equal to the angle LDH; therefore, on the ſphere, the arches FN, HL are equal. And ſince the great circle BNLD is projected into the ſtraight line bQnl, &c. therefore n is the projection of N, and l that of L; hence fn, hl, the projections of FN, HL reſpectively, are equal.

Proposition VII. Theorem VII.

If Fnk, hlg (fig. 45.) be the projections of two equal circles, whereof one is as far from its pole P as the other from its pole C, which is the centre of projection; and if the diſtance of the projected poles C, p, be divided in o, ſo that the degrees in Co, op be equal, and the perpendicular oS be erected to the line of meaſures gh. Then the line pn, Cl drawn from the poles C, p, through any point Q in the line oS, will cut off the arches Fn, hl equal to each other, and to the angle QCp.

The great circle AO perpendicular to the plane of the primitive is projected into the ſtraight line oS perpendicular to gh, by Prop. i. Cor. 3. Let Q be the projection of q; and ſince pQ, CQ are ſtraight lines, they are therefore the repreſentations of the arches Pq, Cq of great circles. Now ſince PqC is an iſoſceles ſpherical triangle, the angles PCQ, CPQ are therefore equal; and hence the arches Pq, Cq produced will cut off equal arches from the given circles FI, GH, whoſe repreſentations Fn, hl are therefore equal: and ſince the angle QCp is the meaſure of the arch hl, it is alſo the meaſure of its equal Fn.

Corollary.

Hence, if from the projected pole of any circle a perpendicular be erected to the line of meaſures, it will cut off a quadrant from the repreſentation of that circle.

Proposition VIII. Theorem VIII.

Let Fnk (fig. 45.) be the projection of any circle FI, and p the projection of its pole P. If Cg be the cotangent of CAP, and gB perpendicular to the line of meaſures gC, let CAP be biſected by AO, and the line oB drawn to any point B, and alſo pB cutting Fnk in d; then the angle goB is the meaſures of the arch Fd.

The arch PG is a quadrant, and the angle $goA = gPA + oAP = gAC + oAP = gAC + CAo = gAo$; therefore $gA = go$; conſequently o is the dividing centre of gB, the repreſentation of GA; and hence, by Prop. v. the angle goB is the meaſure of gB. But ſince pg repreſents a quadrant, therefore p is the pole of gB; and hence the great circle pdB paſſing through the pole of the circles gB and Fn will cut off equal arches in both, that is, Fd = gB = angle goB.

Corollary.

The angle goB is the meaſure of the angle gpB.

For the triangle gpB repreſents a triangle on the ſphere, wherein the arch which gB repreſents is equal to the angle which the angle p repreſents; becauſe gp is a quadrant; therefore goB is the meaſure of both.

Proposition IX. Problem I.

To draw a great circle through a given point, and whoſe diſtance from the pole of projection is equal to a given quantity.

Plate ccccxxii.

Let ADB (fig. 46.) be the projection, C its pole or centre, and P the point through which a great circle is to be drawn: through the points P, C draw the ſtraight line PCA, and draw CE perpendicular to it: make the angle CAE equal to the given diſtance of the circle from the pole of projection C; and from the centre C, with the radius CE, deſcribe the circle EFG: through P draw the ſtraight line PIK, touching the circle EFG in I, and it will be the projection of the great circle required.

Proposition X. Problem II.

To draw a great circle perpendicular to a great circle which paſſes through the pole of projection, and at a given diſtance from that pole.

Let ADB (fig. 46.) be the primitive, and CI the given circle: draw CL perpendicular to CI, and make the angle CLI equal to the given diſtance: then the ſtraight line KP, drawn through I parallel to CL, will be the required projection.

Proposition XI. Problem III.

At a given point in a projected great circle, to draw another great circle to make a given angle with the former; and, converſely, to meaſure the angle contained between two great circles.

Let P (fig. 47.) be the given point in the given great circle PB, and C the centre of the primitive: through the points P, C draw the ſtraight line PCG; and draw the radius of the primitive CA perpendicular thereto; join PA; to which draw AG perpendicular: through G draw BGD at right angles to GP, meeting PB in B; biſect the angle CAP by the ſtraight line AO; join BO, and make the angle BOD equal to that given; then DP being joined, the angle BPD will be that required.

If the meaſure of the angle BPD be required, from the points B, D draw the lines BO, DO, and the angle BOD is the meaſure of BPD.

Proposition XII. Problem IV.

To deſcribe the projection of a leſs circle parallel to the plane of projection, and at a given diſtance from its pole.

Let ADB (fig. 46.) be the primitive, and C its centre: ſet the diſtance of the circle from its pole, from B to H, and from H to D; and draw the ſtraight line AED, interſecting CE perpendicular to BC, in the point E: with the radius CE deſcribe the circle EFG, and it is the projection required.

Proposition XIII. Problem V.

To draw a leſs circle perpendicular to the plane of projection.

Plate ccccxxiii.

Let C (fig. 48.) be the centre of projection, and TI a great circle parallel to the propoſed leſs circle: at C make the angles ICN, TCO each equal to the diſtance of the leſs circle from its parallel great circle TI: let CL be the radius of projection, and from the extremity L draw LM perpendicular thereto; make CV equal to LM; or CF equal to CM: then with the vertex V and aſſymptotes CN, CO deſcribe the hyperbola WVK †; or, with the focus F and CV deſcribe the hyperbola, and it will be the perpendicular circle deſcribed.

† See Conic Sections.

Proposition XIV. Problem VI.

To deſcribe the projection of a leſs circle inclined to the plane of projection.

Draw the line of meaſures dp (fig. 49.) and at C, the centre of projection, draw CA perpendicular to dp, and equal to the radius of projection: with the centre A, and radius AC, deſcribe the circle DCFG; and draw RAE parallel to dp: then take the greateſt and leaſt diſtances of the circle from the pole of projection, and ſet them from C to D and F reſpectively, for the circle DF; and from A, the projecting point, draw the ſtraight lines AFf, and ADd; then df will be the tranſverſe axis of the ellipſe: but if D fall beyond the line RE, as at G, then from G draw the line GAD d, and df is the tranſverſe axis of an hyperbola: and if the point D fall in the line RE, as at E, then the line AE will not meet the line of meaſures, and the circle will be projected into a parabola whoſe vertex is f: biſect df in H, the centre, and for the ellipſe take half the difference of the lines Ad, Af, which laid from H will give K the focus: for the hyperbola, half the ſum of Ad, Af being laid from H, will give k its focus: then with the tranſverſe axis df, and focus K, or k, deſcribe the ellipſe dMf, or hyperbola fm, which will be the projection of the inclined circle: for the parabola, make EQ equal to Ff, and draw fn perpendicular to AQ, and make fk equal to one half of nQ: then with the vertex f, and focus k, deſcribe the parabola fm, for the projection of the given circle FE.

Proposition XV. Problem VII.

To find the pole of a given projected circle.

Let DMF (fig. 50.) be the given projected circle, whoſe line of meaſures is DF, and C the centre of projection; from C draw the radius of projection CA, perpendicular to the line of meaſures, and A will be the projecting point: join AD, AF, and biſect the angle DAF by the ſtraight line AP; hence P is the pole. If the given projection be an hyperbola, the angle fAG (fig. 49.), biſected, will give its pole in the line of meaſures; and in a parabola, the angle fAE biſected will give its pole.

Proposition XVI. Problem VIII.

To meaſure any portion of a projected great circle, or to lay off any number of degrees thereon.

Let EP (fig. 51.) be the great circle, and IP a portion thereof to be meaſured; draw ICD perpendicular to IP; let C be the centre, and CB the radius of projection, with which deſcribe the circle EBD; make

Gnomonic Projection of the Sphere.

IA equal to IB; then A is the dividing centre of EP; hence AP being joined, the angle IAP is the meaſure of the arch IP.

Or, if IAP be made equal to any given angle, then IP is the correſpondent arch of the projection.

Proposition XVII. Problem IX.

To meaſure any arch of a projected leſs circle, or to lay off any number of degrees on a given projected leſs circle.

Plate CCCCXXIII

Let F *n* (fig. 52.) be the given leſs circle, and P its pole: from the centre of projection C draw CA perpendicular to the line of meaſures GH, and equal to the radius of projection; join AP, and biſect the angle CAP by the ſtraight line AO, to which draw AD perpendicular: deſcribe the circle G *l* H, as far diſtant from the pole of projection C as the given circle is from its pole P; and through any given point *n*, in the projected circle F *n*, draw D *n l*, then H *l* is the meaſure of the arch F *n*

Or let the meaſure be laid from H to *l*, and the line D *l* joined will cut off F *n* equal thereto.

Proposition XVIII. Problem X.

To deſcribe the gnomonic projection of a ſpherical triangle, when three ſides are given; and to find the meaſures of either of its angles.

Let ABC (fig. 53.) be a ſperical triangle whoſe three ſides are given: draw the radius CD (fig. 54.) perpendicular to the diameter of the primitive EF; and at the point D make the angles CDA, CDG, ADI, equal reſpectively to the ſides AC, BC, AB, of the ſpherical triangle ABC (fig. 53.), the lines DA, DG interſecting the diameter EF, produced if neceſſary in the points A and G: make DI equal to DG; then from the centre C, with the radius CG, deſcribe an arch; and from A, with the diſtance AI deſcribe another arch, interſecting the former in B; join AB, CB, and ACB will be the projection of the ſpherical triangle (fig. 53.); and the rectilineal angle ACB is the meaſure of the ſpherical angle ACB (fig. 53).

Proposition XIX. Problem XI.

The three angles of a ſpherical triangle being given, to project it, and to find the meaſures of the ſides.

Let ABC (fig. 55,) be the ſpherical triangle of which the angles are given: conſtruct another ſpherical triangle EFG, whoſe ſides are the ſupplements of the given angles of the triangle ABC; and with the ſides of this ſupplemental triangle deſcribe the gnomonic projection, &c. as before.

It may be obſerved, that the ſupplemental triangle EFG has alſo a ſupplemental part EF *g*; and when the ſides GE, GF, which are ſubſtituted in place of the angles A, B, are obtuſe, their ſupplements *g* E, *g* F are to be uſed in the gnomonic projection of the triangle.

Proposition XX. Problem XII.

Given two ſides, and the included angle of a ſpherical triangle, to deſcribe the gnomonic projection of that triangle, and to find the meaſures of the other parts.

Let the ſides AC, CB, and the angle ACB (fig. 53.), be given: make the angles CDA, CDG (fig. 56.) equal reſpectively to the ſides AC, CB (fig. 53.); alſo make the angle ACB (fig. 56.) equal to the ſpherical angle ACB (fig. 53.), and CB equal to CG, and ABC will be the projection of the ſpherical triangle.

To find the meaſure of the ſide AB: from C draw CL perpendicular to AB, and CM parallel thereto, meeting the circumference of the primitive in M; make LN equal to LM; join AN, BN, and the angle ANB will be the meaſure of the ſide AB.

To find the meaſure of either of the ſpherical angles, as BAC: from D draw DK perpendicular to AD, and make KH equal to KD: from K draw KI perpendicular to CK, and let AB produced meet KI in I, and join HI: then the rectilineal angle KHI is the meaſure of the ſpherical angle BAC. By proceeding in a ſimilar manner, the meaſure of the other angle will be found.

Proposition XXI. Problem XIII.

Two angles and the intermediate ſide given, to deſcribe the gnomonic projection of the triangle; and to find the meaſures of the remaining parts.

Let the angles CAB, ACB, and the ſide AC of the ſpherical triangle ABC (fig. 53.), be given: make the angle CDA (fig. 56.) equal to the meaſure of the given ſide AC (fig. 53.); and the angle ACB (fig. 56.) equal to the angle ACB (fig. 53.); produce AC to H, draw DK perpendicular to AD, and make KH equal to KD; draw KI perpendicular to CK, and make the angle KHI equal to the ſpherical angle CAB: from I, the interſection of KI, HI, to A draw IA, and let it interſect CB in B, and ACB will be the gnomonic projection of the ſpherical triangle ACB (fig. 53). The unknown parts of this triangle may be meaſured by laſt problem.

Proposition XXII. Problem XIV.

Two ſides of a ſpherical triangle, and an angle oppoſite to one of them given, to deſcribe the projection of the triangle; and to find the meaſure of the remaining parts.

Let the ſides AC, CB, and the angle BAC of the ſpherical triangle ABC (fig. 53.) be given: make the angles CDA, CDG (fig. 56.) equal reſpectively to the meaſures of the given ſides AC, BC: draw DK perpendicular to AD, make KH equal to DK, and the angle KHI equal to the given ſpherical angle BAC; draw the perpendicular KI, meeting HI in I; join AI; and from the centre C, with the diſtance CG, deſcribe the arch GB, meeting AI in B, join CB, and ABC will be the rectilineal projection of the ſpherical triangle ABC (fig. 53.) and the meaſures of the unknown parts of the triangle may be found as before.

Proposition XXIII. Problem XV.

Given two angles, and a ſide oppoſite to one of them, to deſcribe the gnomonic projection of the triangle, and to find the meaſures of the other parts.

Let the angles A, B, and the ſide BC of the tri-

angle

Plate CCCCXXIII.

angle ABC (fig. 55.), be given: let the ſupplemental triangle EFE be formed, in which the angles E, F, G, are the ſupplements of the ſides BC, CA, AB reſpectively, and the ſides EF, FG, GE, the ſupplements of the angles C, A, B Now, at the centre C (fig. 56.) make the angles CDA, CDK equal to the meaſures of the ſides GE, GF reſpectively, being the ſupplements of the angles B and A; and let the lines DA, DK interſect the diameter of the primitive EF, in the points A and K: draw DG perpendicular to AD, make GH equal to DG, and at the point H make the angle GHI equal to the angle E, or to its ſupplement; and let EI, perpendicular to CH, meet HI in I, and join AI: then from the centre C, with the diſtance CG, deſcribe an arch interſecting AI in B; join CB, and ABC will be the gnomonic projection of the given triangle ABC (fig. 55.): the ſupplement of the angle ACB (fig. 56.) is the meaſure of the ſide AB (fig. 55.); the meaſures of the other parts are found as before.

It has already been obſerved, that this method of projection has, for the moſt part, been applied to dialling only. However, from the preceding propoſitions, it appears that all the common problems of the ſphere may be more eaſily reſolved by this than by either of the preceding methods of projection; and the facility with which theſe problems are reſolved by this method has given it the preference in dialling. It may not perhaps be amiſs, in this place, to give a brief illuſtration of it in this particular branch of ſcience.

In an horizontal dial, the centre of projection Z (fig. 57.) repreſents the zenith of the place for which the dial is to be conſtructed; ZA the perpendicular height of the ſtyle: the angle ZPA, equal to the given latitude, determines the diſtance ZP of the zenith from the pole; and AP the edge of the ſtyle, which by its ſhadow gives the hour: the angle ZAP, equal alſo to the latitude, gives the diſtance of the equator EQ from the zenith: let E *a* be equal to EA, and *a* will be the dividing point of the equator. Hence if the angles E *a* I, E *a* II, &c. E *a* XI, E *a* X, &c, be made equal to 15°, 30°, &c. the equator will be divided into hours; and lines drawn from P to theſe points of diviſion will be hour lines.

If the dial is either vertical, or inclined to the horizon, then the point Z will be the zenith of that place whoſe horizon is parallel to the plane of the dial: ZE will be the latitude of that place; and the hours on the former dial will now be changed into others, by a quantity equal to the difference of longitude between the given place and that for which the dial is to be conſtructed. Thus if it is noon when the ſhadow of the ſtyle falls on the line *P* X, then the difference of meridians is the angle E *a* X, or 30°. Hence, when a dial is to be conſtructed upon a given plane, either perpendicular or inclined to the horizon, the declination and inclination of that plane muſt be previouſly found.

In an erect direct ſouth dial, its zenith Z is the ſouth point of the horizon, ZP is the diſtance of this point from the pole, and ZE its diſtance from the equator. If the dial is directed to the north, Z, repreſents the north point of the horizon; PZ the diſtance of Z from the pole under the horizon; and ZE the elevation of the equator above the horizon.

If the dial is an erect eaſt or weſt dial, the zenith Z is the eaſt or weſt points of the horizon accordingly, and the pole P is at an infinite diſtance, for the angle ZAP is a right angle; and therefore the line AP will not meet the meridian PZ. The line ZA produced is the equator, and is divided into hours by lines perpendicular to it.

If the plane of the dial is parallel to the equator, its zenith Z coincides with one of the poles of the equator P; and hence the hour lines of this dial are formed by drawing lines from the point Z, containing angles equal to 15°.

In the preceding method, of projection of the ſpheres equal portions of a great circle on the ſphere are repreſented by unequal portions in the plane of projection, and this inequality increaſes with the diſtance from the centre of projection. Hence, in projections of the earth, thoſe places towards the circumference of the projection are very much diſtorted. In order to avoid this inconveniency, M. de la Hire * propoſed, that the eye ſhould be placed in the axis produced, at the diſtance of the ſine of 45° beyond the pole: In this caſe arches of the ſphere and their projections are very nearly proportional to each other. Hence in a map of the earth agreeable to this conſtruction, the axis, inſtead of being divided into a line of ſemitangents, is divided equally, in like manner as the circumference. The map of the world, Plate CCXIV. is conſtructed agreeable to this method of projection.

---

* Hiſt. de l'Academie R. des Scien. 1701. See alſo article Geography. p. 650.

PROJECTION, in perſpective denotes the appearance, or repreſentation of an object on the perſpective plane.

The projection, *e. gr.* of a point, as B (Fig. 1. Plate CCCLXXXIII.) is a point *b*, through which the optic ray BE paſſes from the objective point through the plane to the eye; or it is the point wherein the plane cuts the optic ray.

And hence it is eaſily conceived what is meant by the projection of a line, a plane or a ſolid.

Projection in Alchemy, the caſting of a certain imaginary powder, called *powder of projection*, into a crucible, or other veſſel, full of ſome prepared metal, or other matter; which is to be hereby preſently tranſmuted into gold.

Powder of Projection, or of the philoſopher's ſtone, is a powder ſuppoſed to have the virtue of changing any quantity of an imperfect metal, as copper or lead in a more perfect one, as ſilver or gold, by the admixture of a little quantity thereof.

The mark to which alchemiſts direct all their endeavours, is to find the powder of projection; which every one of them has been within an ace of a hundred times. See *Philosopher's Stone*.

PROJECTURE, in architecture, the outjetting and prominency, or emboſſing, which the mouldings and other members have beyond the naked wall, column, &c.

PROLAPSUS, in ſurgery, a prolapſion or falling out of any part of the body from its natural ſituation: thus we ſay, *prolapſus inteſtini*, "a prolapſion of the inteſtine," &c. See SURGERY.

PROLATE, in geometry, an epithet applied to a ſpheroid produced by the revolution of a ſemi-ellipſis about its larger diameter. See SPHEROID.

PROLEGOMENA, in philology, certain preparatory obſervations or diſcourſes prefixed to a book, &c. containing ſomething neceſſary for the reader to be appriſed of, to enable him the better to underſtand the book, or to enter deeper into the ſcience, &c.

PROLEPSIS, a figure in rhetoric, by which we anticipate or prevent what might be objected by the adverſary. See ORATORY, n° 80.

PROLEPTIC, an epithet applied to a periodical diſeaſe which anticipates, or whoſe paroxyſm returns ſooner and ſooner every time; as is frequently the caſe in agues.

PROLIFER FLOS; (*proles*, "an offspring;" and *fero*, "to bear);" a prolific flower, or a flower which from its own ſubſtance produces another; a ſingular degree of luxuriance, to which full flowers are chiefly incident. See BOTANY, p. 428.

PROLIFIC, ſomething that has the qualities neceſſary for generating.

The prolific powers of ſome individuals among mankind are very extraordinary.—Inſtances have been found where children, to the number of ſix, ſeven, eight, nine, and ſometimes ſixteen, have been brought forth after one pregnancy. The wife of Emmanuel Gago, a labourer near Valladolid, was delivered, the 14th of June 1779, of five girls, the two firſt of whom were baptized: the other three were born in an hour after; two of them were baptized; but the laſt, when it came into the world, had every appearance of death. The celebrated Tarſin was brought to bed in the ſeventh month of her pregnancy, at Argenteuil near Paris, 17th July 1779, of three boys, each 14 inches and a half long, and of a girl 13 inches: they were all four baptiſed, but did not live 24 hours.

The public papers for the month of June 1779 made mention of one Maria Ruiz, of the diſtrict of Lucena in Andaluſia, who was ſucceſſively delivered of 16 boys, without any girls; and ſeven of them were ſtill alive on the 17th of Auguſt thereafter. The following, though a recent fact, is almoſt incredible: In the year 1755, a Muſcovite peaſant, named *James Kyrloff*, and his wife, were preſented to the Empreſs of Ruſſia. This peaſant had been twice married, and was then 70 years of age. His firſt wife was brought to bed 21 times; namely, four times of four children each time; ſeven times of three, and ten times of two; making in all 57 children, who were then alive. His ſecond wife, who accompanied him, had already been delivered ſeven times, once of three children, and ſix times of twins, which made 15 children for her ſhare. Thus the Muſcovite patriarch had already had 72 children by two marriages. We are aſſured that the ſultan Muſtapha III. had iſſue by his concubines 580 male children. What number of female children he had, and whether there were twins of both ſexes, we are not informed. Theſe facts ſuppoſe great fecundity; and whatever credit is given to them, we muſt conſider as entirely fabulous what is reported concerning a counteſs of Holland who was delivered of 365 children, of a very ſmall ſize.

PROLIXITY, in diſcourſe, the fault of entering into too minute a detail, or being too long, preciſe, and circumſtantial, even to a degree of tedioulneſs.

PROLOCUTOR of the convocation, the ſpeaker or chairman of that aſſembly. See CONVOCATION.

PROLOGUE, in dramatic poetry, a diſcourſe addreſſed to the audience before the drama or play begins. The original intention was to advertiſe the audience of the ſubject of the piece, and to prepare them to enter more eaſily into the action, and ſometimes to make an apology for the poet.

PROMETHEUS, the ſon of Japetus, ſuppoſed to have been the firſt diſcoverer of the art of ſtriking fire by flint and ſteel; which gave riſe to the fable of his ſtealing fire from heaven: A renowned warrior; but whoſe hiſtory is involved in fable. He flouriſhed about 1687 B. C. The poetical account is, that he formed a man of clay of ſuch exquiſite workmanſhip, that Pallas, charmed with his ingenuity, offered him whatever in heaven could contribute to finiſh his deſign; and for this purpoſe took him up with her to the celeſtial manſions, where he ſtole ſome fire from the chariot of the ſun, which he uſed to animate his image. At this theft Jupiter was ſo enraged, that he ordered Vulcan to chain him down on Mount Caucaſus, and ſent an eagle or vulture to prey on his liver; which every night was renewed, in proportion to the quantity eaten up in the daytime, until at laſt he was delivered by Hercules, who killed the vulture.

PROMETHEUS, in ancient aſtronomy, was the name of a conſtellation of the northern hemiſphere, now called *Hercules*, *Engonaſin*. See ASTRONOMY, n° 406.

1
Promiſe defined.

PROMISE, in ordinary caſes, is a declaration of ſome intention to be put in execution; but in morals is a ſolemn aſſeveration by which one pledges his veracity that he ſhall perform, or cauſe to be performed, the thing which he mentions.

2
How it comes to be binding.

As ſuch a declaration excites expectations in the minds of thoſe to whom it is made; and as to fruſtrate theſe expectations might rouſe indignation, and be followed by conſequences injurious to the perſon, the character, or intereſt, of him who made it—it becomes a matter of prudence in the promiſer to keep his word. And farther, as a certain degree of confidence is found neceſſary to the very exiſtence of civil ſociety, and as others may have acted on the faith of his promiſe, it is now not a matter of prudence only to keep his word—it is a duty which he owes to all who have ſpent their time, their money, or their labour, in conſequence of thoſe expectations which he has warranted them to entertain.

It, then, being conſonant to ſound reaſon, neceſſary to the exiſtence of civil ſociety, and in general the intereſt of both the promiſer and promiſee, that the words of the promiſe ſhould be fulfilled, it has become a maxim in morals that a man is obliged to perform his promiſe.

3
Interpretation of a promiſe ſometimes difficult.

In many inſtances, the great difficulty concerning a promiſe is, how to explain it; for although the grounds of its obligation be thoſe expectations which it has raiſed, a queſtion will occur, Is the promiſer bound to anſwer fully all the expectations to which the different conſtructions of his words may have given birth? Should I, for inſtance, deſire a man to run with a letter to ſuch a place, and engage to ſatisfy him upon his return; and if on his return I gave him double of the uſual hire in like caſes; but if he be not ſatisfied with leſs than the triple of ſuch a ſum, am I obliged to grant his demands? This will lead us to conſider the rules by which a promiſe ſhould be interpreted.

4 Whether the meaning of the promiſer or promiſee ought to be taken.

If a promiſe were always to be deemed obligatory in the ſenſe in which the promiſee receives it, a man would not know what he had promiſed; the promiſee, from a difference of views, aſſociations, and intereſts, might conceive a ſenſe of which the promiſer had never dreamed; might ſuppoſe engagements which were never intended, which could not be foreſeen, and, although foreſeen, could not be performed. For theſe reaſons it is natural to think that the ſenſe of the promiſer ſhould rather direct the interpretation. He knows preciſely what it is he has undertaken, and is unqueſtionably the beſt judge of what meaning he affixed to his words. His explanation ſhould therefore be admitted, if information alone could give him a title to decide in the affair.

But ſomething more than mere information, or a knowledge of the cauſe, is expected from a judge, as integrity is equally eſſential to his character. Doubts may ariſe when the words will admit of various meanings, whether the promiſer will be ſo candid as impartially to own the preciſe meaning which he had actually annexed to his expreſſions: At any rate, if he wiſhed to deceive, he might purpoſely uſe an ambiguous phraſeology, and perform the promiſe in a ſenſe of his own without ſatiſfying the reaſonable hopes of the promiſee.

When the daughter of Tarpeius bargained with Tatius to betray the citadel for what he and his Sabines wore on their left hands, meaning their rings and their golden bracelets, Tatius probably performed his promiſe in the way which he intended, when he cauſed her to be buried under their ſhields, which they carried alſo on their left hands. But who will ſay that here was not treachery and a diſhonourable abuſe of that confidence which had been repoſed in him?

5 In doubtful caſes the interpretation of neither is to be truſted.

It muſt therefore be obvious, that the import of a promiſe, where its meaning is diſputed, is not to be determined by the ſenſe of the promiſer nor by the expectations of the promiſee; and if it was ſaid that the obligation of a promiſe aroſe from thoſe expectations which had been raiſed by it, the aſſertion now muſt be limited to thoſe expectations which were intentionally raiſed by the promiſer, or thoſe which to his knowledge the promiſee was induced to entertain in conſequence of that declaration which had been made to him. Should there ſtill be a doubt about what expectations were intentionally raiſed, and what ſhould have been reaſonably entertained, recourſe muſt be had to the judgment of thoſe who are allowed to be perſons of candour, and who are acquainted with the characters of the men, and with thoſe circumſtances in which the promiſe was made.

6 Caſes where a promiſe is not binding.

The following are ſome of the caſes in which a promiſe is not binding. As the obligation to perform the promiſe ariſes from thoſe expectations which are intentionally raiſed by the promiſer; it is plain that no promiſe can be binding before acceptance, before the promiſe has been communicated to the promiſee, and before he has entertained hopes of its performance. The caſe is ſimilar where a promiſe is releaſed, that is, where the performance is diſpenſed with by the promiſee, and where he entertains no expectations on account of any thing that the promiſer has ſaid to him. Should a third perſon entertain hopes on account of the promiſe, he is to cheriſh theſe hopes at his own hazard, having no encouragement from the promiſer to do ſo: yet if this perſon has been warranted to hope by the promiſee, the promiſee has renounced his privilege of releaſing the promiſe, and along with the promiſer becomes bound for its performance.

7 When it is releaſed by the promiſee.

8 Where its performance is unlawful.

A promiſe is not binding where the performance is unlawful; and the performance is unlawful where it is contrary to former promiſes, or to any moral and religious precept, which from the beginning to the end of time is of perpetual and unalterable obligation. Thus no man is bound by his promiſe to give to me what he has already promiſed to another; and no man is bound by his promiſe to blaſpheme God, to commit murder, or to criminate the innocent. Such promiſes are unlawfully made, and cannot be otherwiſe than unlawfully performed.

9 A caſe where doubts have ariſen.

Some have even carried their ſcruples ſo far as to doubt, whether any promiſe, unlawfully made, can be lawfully performed. Should a man, during the lifetime of his wife, happen to promiſe marriage to another, ſuch a man (they ſay) by the Chriſtian religion has already committed adultery in his heart; and ſhould he afterwards become a widower, he is not bound, and he even ought not, to fulfil his engagements, as this would be putting his criminal intention into execution. This ſpecies of reaſoning, we muſt confeſs, is to us unintelligible. —As the wife is dead, what now ſhould prevent the man from marrying the object of his affections? Why, ſay the caſuiſts, he already is under a promiſe to marry her, and his promiſe was made at a time when it ſhould not have been made. It is true, the performance, conſidered by itſelf, is oppoſed by no law human or divine; but then it originated in what was wrong; and however much the Supreme Being and the bulk of the creation may be out of the ſecret, we have diſcovered by the ingenious logic of caſuiſtry, that evil can never ſpring out of good, nor good out of evil; but that the means and the end, the motive and the action are always of the ſame complexion in morals.

10 Erroneous promiſes.

When a promiſe is made, the particular circumſtances in which it is to be deemed obligatory are ſometimes mentioned. "I promiſe (for inſtance) to lend my friend 200 pounds within three days, provided a certain creditor which I name do not make a demand on me before that time." In other caſes no circumſtance is foreſeen by the promiſer to prevent the fulfilling of his engagement; and hence we have erroneous promiſes, which proceed on the ſuppoſition that things are true, poſſible, and lawful, which are not ſo. An erroneous promiſe, which proceeds on the falſe repreſentation of the promiſee, is not binding.

A London gentleman lately purchaſed an eſtate in the ſouth of England at a public ſale, believing the deſcription which he ſaw in the newſpapers, and which likewiſe was given by the auctioneer, to be true; but finding afterwards that the eſtate nowiſe correſponded to the deſcription, the law freed him from his engagement, becauſe the ſeller had evidently been guilty of

a breach of promiſe in not ſatisfying thoſe expectations which he had intentionally and even ſtudiouſly excited in the buyers.

11 A promiſe not binding when the performance is impoſſible,

An erroneous promiſe, whoſe performance is impoſſible, is not binding. Before the concluſion of the late war a planter of Tobago promiſed to ſend to his friend in England 12 hogſheads of ſugar from the next year's produce of his eſtate; but before that time Tobago fell into the hands of the French, and the Weſt Indian found it impoſſible to anſwer the expectations of his friend in England.

12 Nor when it is unlawful.

An erroneous promiſe, whoſe performance is unlawful, or, to ſpeak more preciſely, whoſe performance is contrary to a prior promiſe, or to any moral or religious obligation, is not binding. A father believing the accounts from abroad of his ſon's death, ſoon after bequeathes his fortune to his nephew: but the ſon, the report of whoſe death had been falſe, returns home, and the father is releaſed from the promiſe to his nephew, becauſe it was contrary to a prior promiſe, which he had tacitly come under to his ſon. This prior promiſe was implied in the whole of the father's conduct, and was expreſſed in ſigns as emphatic and as unequivocal as thoſe of language. It had all the effect too of the moſt ſolemn promiſe on the ſon, who, to his father's knowledge, was induced in conſequence of this promiſe to entertain the moſt ſanguine hopes of ſucceeding to his father, if he ſurvived. The world likewiſe could bear teſtimony that theſe expectations were not raſhly cheriſhed. He was brought into exiſtence by means of his father, who was thereby underſtood to love him affectionately; he was uſhered into ſociety as the repreſentative of his family, and was therefore ſuppoſed to be the heir of its wealth. Religion itſelf ſupported his pretenſions, pronouncing the father worſe than an infidel who neglects to ſhow that attention to his children which the world naturally expects from a parent.—That the father's promiſe was not releaſed from the mere circumſtance that the miſtake was known to his nephew the promiſee, will appear plain from the following circumſtance. Suppoſe the father a landed proprietor, that the leaſe of one of his farms has expired, and that he has long been expecting to let it at L. 200; ſuppoſe that this ſum is refuſed, and that he agrees with the preſent tenant to grant a new leaſe at L. 150—the obligation here to perform his promiſe is not diſſolved by an after offer of L. 200, though the tenant knew that L. 200 had been expected, and that only from deſpairing of that ſum his landlord had granted the new leaſe at L. 150: the promiſe is binding, becauſe the performance is every way lawful, contrary to no prior engagement, and oppoſed to no principle in morals. The law of the land, were the proprietor reluctant, would enforce the obligation, and exact obedience in the tone of authority; becauſe breaches of faith, were they permitted in ſuch caſes, would deſtroy all confidence, and annihilate the bonds of ſocial union:

> Men live and proſper but in mutual truſt;
> A confidence of one another's truth. *Oroonoko.*

13 ility no erion ereby to ge of validity romiſes.

The great difficulty which many have to encounter in determining when erroneous promiſes ought or ought not to be kept, ariſes from their proceeding on a principle of whoſe conſequences they do not ſeem to be always aware. There is ſeldom, they perceive, a virtuous action that is not attended with ſome happy effects; and it will, perhaps, be generally allowed, that the comparative merit of ſimilar virtues may ſafely be eſtimated by their utility: But to make utility, as ſome do, the criterion of virtue, and pronounce an action vicious or virtuous merely on account of thoſe conſequences which they ſee may flow from it, is a dangerous maxim. Evil has often ſprung out of good, and good out of evil; and good and evil have frequently ſprung from the ſame action. In Mandeville's *Hive*,

14 This principle would give a ſanction to vice and falſehood.

> That root of evil Avarice,
> That damn'd ill-natur'd baneful vice,
> Was ſlave to Prodigality,
> That noble ſin; whilſt Luxury
> Employ'd a million of the poor,
> And odious Pride a million more.
> Envy itſelf and Vanity
> Were miniſters of Induſtry:
> That darling folly, Fickleneſs,
> In diet, furniture, and dreſs,
> That ſtrange ridiculous vice, was made
> The very wheel that turn'd the trade.

The deſcription here is not altogether falſe; and theſe indeed may be ſome of the conſequences that flow from avarice, luxury, pride, vanity, and envy: but theſe are not all.—To ſee at once all the conſequences that ſpring from an action, the good and the bad, the particular and general, the immediate and remote, would require ſometimes the foreſight of Omniſcience, and at all times a knowledge ſuperior to what is human. In the Fable, of the Bees, the author's object was to ſhow that private vices are public benefits; and he therefore was naturally led by his argument to conſider only ſuch conſequences of vice as favoured his hypotheſis. He wanted candour. And that artifice which runs through his Fable happens to remind us, that while the remote and the general effects of an action may not be ſeen, the particular and immediate, which fall within our notice, are apt to be viewed through the medium of paſſion, intereſt, or opinion. For theſe reaſons, it appears ſurpriſing how any perſon ſhould ever imagine that the obligation to perform a promiſe ſhould depend entirely upon the ideas which the promiſer apprehended of its utility.

The beſt refutation of ſuch an opinion are the ſingular concluſions to which it leads.

15 The conſequences that flow from it ridiculous and abſurd.

A late writer on political juſtice, who appears to have embraced it, gets into reaſoning not very common. In a part of his ſyſtem he looks on morals as an article of trade: virtue and vice, in his Chapter of *Promiſes*, are but antiquated terms for profit and loſs; and right and wrong are uſed to expreſs what is beneficial and what is hurtful, in his apprehenſion, to himſelf and the community.—With reſpect to veracity, thoſe "rational and intelligent beings," by whom he wiſhes the affairs of the world to be carried on, may, while they act as rational and intelligent, break or perform their promiſes at pleaſure. He thinks it "eſſential to various circumſtances of human intercourſe, that we ſhould be known to beſtow a ſteady attention upon the quantities of convenience or inconvenience, of good or evil, that might ariſe to others from our conduct." After this attention, the diſappointment of the promiſee is not to be minded, though the expectations excited by theſe "rational and intelligent beings" may have "altered the nature of his ſituation, and engaged him in undertakings from which he would otherwiſe have abſtained." What the promiſer takes to be the general utility and the fitneſs of things is to be his guide. And a breach of promiſe will be attended with the following advantages: "The promiſee, and all other men, will be taught to depend more upon their own exertions, and leſs upon the aſſiſtance of others, which caprice may refuſe or juſtice with-hold. He and all others will be taught to acquire ſuch merit, and to engage in ſuch purſuits, as ſhall oblige any honeſt man to come to their ſuccour if they ſhould ſtand in need of aſſiſtance." This breach of promiſe, with a view to the general utility, will, ſo far from being criminal, form a part of that reſolute execution of juſtice which would in a thouſand ways increaſe the independence, the energies, and the virtue of mankind*."

16
A private individual has no right to intrude his ſchemes of utility on the public.

Such are the views which determined this author to conſider "the validity of promiſes" as "inconſiſtent with juſtice," and as "foreign to general good." From one, however, who relies with ſo much confidence on the promiſer, it would be certainly deſirable to know, whether the perſon, who violates his faith for the public utility, is always to be candid. Where breach of faith promotes his own intereſt, ought he alone to decide on the validity of his promiſe? or where promiſes are broken for the general good, is he to be guided by his own viſionary ſchemes of utility? Is he to act as truſtee for the public without any delegated power? and ſhall the community ſubmit to his deciſions without ſo much as putting the queſtion, Who hath made thee a ruler over us? When a writer thus deviates ſo far from the path of reaſon, it is natural to aſk, what was the *ignus fatuus* that miſled him? In the preſent caſe it is pretty obvious. Being ſomething of opinion with the celebrated Turgot*, that romances are the only books in which moral principles are treated in an impartial manner, this gentleman, in his Chapter of *Promiſes*, ſeems to have borrowed a part of his morality from the doggerels of Butler; and having adopted though from different motives, the political principles of Sir Hudibras's ſquire, that obedience to civil government is not due becauſe it is promiſed, he has come to exactly the ſame concluſion with reſpect to the obligation of keeping one's word. But Ralph has reaſoned with more ingenuity; and has ſhown not only that the public good, but the glory of the Lord, may be ſometimes promoted by a breach of faith.

> The ſaints, * whom oaths and vows oblige,
> Know little of their privilege;
> Farther, I mean, than carrying on
> Some ſelf-advantage of their own:
> For if the dev'l, to ſerve his turn,
> Can tell truth, why the ſaints ſhould ſcorn,
> When it ſerves theirs, to ſwear and lie,
> I think there's little reaſon why:
> Elſe h' has a greater pow'r than they,
> Which 'twere impiety to ſay:
> W' are not commanded to forbear,
> Indefinitely, at all to ſwear;
> But to ſwear idly, and in vain,
> Without ſelf-intereſt and gain;
> For breaking of an oath and lying
> Is but a kind of ſelf-denying,
> A ſaint-like virtue; and from hence
> Some have broke oaths by Providence:
> Some, to the glory of the Lord,
> Perjur'd themſelves and broke their word:——
> For ſaints may do the ſame thing by
> The ſpirit, in ſincerity.
> Which other men are tempted to,
> And at the devil's inſtance do.
>
> HUDIBRAS, *Cant.* II.

Here are new views of utility; which, were they to be conſidered as of any weight, would increaſe the difficulty of determining when an erroneous promiſe ought to be kept.

17
Views of utility an unſafe guide in morals.

But ſhould views of utility be laid aſide, and ſhould it be made an invariable rule that truth is on no account to be violated, that deceit is never to be practiſed, and that moral obligations are not to be diſſolved for the proſpect of any phyſical advantage; thoſe doubts which ariſe concerning the validity of erroneous promiſes will ſoon diſappear. Diſagreeable perhaps and ridiculous conſequences may ſometimes ariſe to a few individuals from an honeſt and conſcientious adherence to their promiſe; but will any aſſert that the general good, *that burden of the ſong*, will ever be endangered by too much veracity?

So numerous inconveniences ariſe daily from the regular operation of thoſe great phyſical laws, which are under the immediate direction of Providence, that thoſe philoſophers who have adopted the principle of utility, and are much ſurpriſed to ſee the univerſe ſo aukwardly planned for the eaſe and comfort of them and their ſpecies, have been under the neceſſity of imputing many events in nature to the malignity of ſome evil independent being; or of allowing that things have degenerated ſince they firſt came from the hands of the Creator, and that they muſt now be exceedingly altered from what they had been when He choſe to pronounce them all very good. Thus, abſurdity or impiety muſt always be the conſequence of judging of the vice and virtue of an action by its utility, and of eſtimating its utility by our limited views and erroneous conceptions.

18
Extorted promiſe

19
Whethe binding not.

As for extorted promiſes, it is curious to obſerve how this queſtion ſhould always be ſtarted, whether or not they ought to be kept? and another queſtion ſhould ſeldom be thought of, whether or not they ought to be made? Fortitude was one of the cardinal virtues among the ancients; and is deemed of ſuch importance in the Chriſtian ſyſtem, that the fearful are claſſed with the unbelievers, and are thought unworthy of the favour of Deity, as being incapable of ſupporting thoſe trials to which heaven expoſes the faithful as the trueſt teſt of Chriſtian virtue.—If a perſon ſhould want the neceſſary fortitude to be virtuous, it will be a poor excuſe for his baſeneſs, that he has added deceit to his cowardice: and ſurely it is not the buſineſs of morality, when it has found him guilty of one crime, to grant him a diſpenſation for committing two. The laws of juriſprudence, it will readily be allowed, cannot favour the claims of the promiſee; becauſe they ought never

* See Note b. iii. ch. 6.

* The ſaints are Godwin's rational and intelligent beings.

to lend their ſupport to oppreſſion and violence. But their acquital, ſhould he violate his faith, will by no means vindicate the character of the promiſer. Their acquitting a woman from the charge of adultery, goes a ſhort way in reſtoring the fair reputation of her innocence.

Let juriſprudence decide as it will, the man of honour and the generous patriot can never be brought to reſpect the perſon who, ſtruck with a panic, could betray either himſelf or his friends. The magnanimous ſpirits who could die for the truth will view with contempt his pitiful deceit. Thoſe unfortunate men who may ſuffer from that very diſtruſt which the breach of his faith has begotten, will always deteſt him as a traitor and enemy; and heaven itſelf cannot be ſuppoſed to reward that ſoldier who deſerts her cauſe, and relinquiſhes the poſt which ſhe has aſſigned him, at the ſight of danger.

If we once begin to accommodate morality to the diſpoſitions and humours of mankind, it is hard to ſay where this ſpecies of complaiſance will end. The degrees of timidity are ſo various, and ſome tempers by nature ſo yielding, that repeated importunity or an earneſt requeſt will extort a promiſe.

20 The laws of morality are not to be accomodated to the humours and intereſts of mankind.

A young lady was frequently preſſed by her dying huſband to grant him a promiſe that ſhe would not marry after his death. For ſome time ſhe was able to reſiſt with becoming ſpirit his abſurd requeſt; but upon his declaring oftener than once that he could not otherwiſe die in peace, ſhe complied and promiſed. Too young, however, for this effort of continence, ſhe afterwards liſtened to the addreſſes of a ſecond lover, and found her heart inſenſibly engaged before ſhe adverted to the impropriety of a new attachment. But propoſals of marriage could ſcarcely fail to remind her of her promiſe and awaken her ſcruples. Theſe ſhe ſoon communicated to her lover, with her firm reſolution to remain a widow, if the contrary meaſure, which ſhe greatly preferred, and on which her earthly happineſs depended, were not approved by ſome ſpiritual counſellor.

Upon this declaration it was agreed to take the advice of their own miniſter, who was an eminent diſſenting clergyman in the dioceſe of Oxford: but this gentleman, unwilling to decide in a matter of ſuch importance, propoſed to refer it to Dr Secker, who was then biſhop of that ſee. This prelate too declined to give any judgment in the caſe; but, as was his way, muſtered up a number of arguments on each ſide of the queſtion, and committed them to a letter, which a learned gentleman of our acquaintance had ſome time ago an opportunity of ſeeing in manuſcript.

If the ſentiments to which the biſhop was inclined could have been inferred from his ſtatement of arguments, he ſeemed to think that the promiſe was binding. In our opinion, he ought to have given a poſitive deciſion. It was no matter whether the promiſe was extorted or not: the promiſe was made; and the queſtion was now, whether or not was the performance lawful? That it was lawful appears evident. The lady was under a moral obligation to remain a widow; and no moral obligation, ſo far as we know, required her to marry.

21 Moral laws ſuperior to phyſical in point of obligation.

To be fruitful and multiply, indeed, is declared in Scripture, and is found, to the woſul experience of many, to be one of the general laws of our nature. But of all theſe laws intended by nature to regulate the conduct of inferior intelligences, the moral, which were meant to be checks and correctors of thoſe abuſes to which the phyſical are apt to be carried, are certainly the moſt ſacred and obligatory. To procreate his ſpecies, a man is not then to be guilty of adultery, nor of fornication, nor to liſten to the lewd calls of incontinency. St Paul's obſervation, that it is better to marry than burn, cannot be allowed in this inſtance to have much weight. He has not defined what degree of amorous inflammation conſtitutes burning, nor in what caſes this burning would be a ſufficient warrant for marrying. In the preſent inſtance he does not even conſider marriage as a duty; he compares it with burning, and thinks it only the leaſt of the two evils. Not that marriage is evil of itſelf; for he that marrieth doth well: but there are circumſtances in which it would be inconvenient to marry, and in which he that marrieth not is ſaid to do better. But if thoſe inconveniences be reaſons ſufficient to deter from marrying, is that perſon to be held excuſable who, in order to gratify an animal paſſion, ſomewhat refined, ſhould violate an oath, and trample on a ſacred moral obligation?

The young lady might indeed declare that her earthly happineſs was at an end if ſhe were not permitted to marry again: but what circumſtance prevented her from marrying? It was not the opinion of her own paſtor, nor the biſhop of Oxford: the truth is, it was certain ſcruples of her own, which being unable of herſelf to overcome, ſhe had piouſly ſolicited the aſſiſtance of others. It is certainly a misfortune that a devotional and amorous turn ſhould always be ſo cloſely connected in the females. Both, however, cannot always be indulged. Who will ſay, that the motive is rational which inclines one to cheriſh a paſſion which conſcience diſapproves? The virtue of continency might indeed have borne hard on this lady's conſtitution, and in her way to immortal happineſs might have formed a gate ſo ſtrait and narrow as it might be difficult for her to paſs through: but after all, her caſe was not harder than that of nuns, who take the vows of perpetual chaſtity, and endure ſufferings of a ſimilar nature, and in ſome inſtances even perhaps greater than hers; yet doing it cheerfully, from the ſuppoſition that the Omniſcient is well acquainted with the nature of the great ſacrifice which they make, and that after death he will ſtudy to requite them, and beſtow on them ſomething like an equivalent, which in their opinion can ſcarcely be leſs than a happineſs in heaven as ample as their wiſhes and as laſting as their ſouls.

Every promiſe, therefore, which is not releaſed, nor fraudently obtained by the promiſee, is to be held binding if the performance be lawful and poſſible.

22 A promiſe of a ſimilar nature with an oath.

The Chriſtian cannot, and a man of honour will ſcarcely venture to reject this maxim, that a good man ought not to change though he ſwear to his hurt. Yet a ſimple promiſe and a promiſſory oath are not very different in point of obligation. Moſt people know, and, where any moral duty is concerned, they ought particularly to reflect, that this world is governed by an Almighty Being, who knows all things, who lives always, and who is juſt to reward and to puniſh. The perſon who makes a promiſſory oath does it avowedly under an immediate ſenſe of theſe truths; the perſon who makes a ſimple promiſe, though he certainly ought, yet may not reflect on theſe at the time. The former, when he violates his oath, exhibits, only to outward appearance, a greater contempt of the Divine power, knowledge, and juſtice, than he who violates a ſimple promiſe under an impreſſion of the ſame truths. To Him who knows the ſecrets of the heart, the breach of the promiſe muſt appear as criminal as the breach of the oath. See ASSUMPSIT and OATH.

PROMONTORY, in geography, a high point of land or rock projecting out into the ſea; the extremity of which towards the ſea is called a *cape* or *headland*. See Plate CCXII.

PROMPTER, in the drama, an officer poſted behind the ſcenes, whoſe buſineſs it is to watch attentively the actors ſpeaking on the ſtage, in order to ſuggeſt and put them forward when at a ſtand, to correct them when amiſs, &c. in their parts.

PROMULGATED, or PROMULGED, ſomething publiſhed or proclaimed, and generally applied to a law, to denote the publiſhing or proclaiming it to the people.

PRONAOS, in the ancient architecture, a porch to a church, palace, or other ſpacious building. See the article PORCH.

PRONATION, among anatomiſts. The radius of the arm has two kinds of motions, the one called *pronation*, the other *ſupination*. Pronation is that whereby the palm of the hand is turned downwards; and ſupination, the oppoſite motion thereto, is that whereby the back of the hand is turned downwards. The peculiar muſcles whereby pronation is performed, are called *pronatores*, as thoſe by which ſupination is performed are termed *ſupinatores*. See ANATOMY, *Table of the Muſcles*, and *Plates*.

PRONG-HOE, in huſbandry, a term uſed to expreſs an inſtrument uſed to hoe or break the ground near and among the roots of plants.

The ordinary contrivance of the hoe is very defective, it being only made for ſcraping on the ſurface; but the great uſe of hoeing being to break and open the ground, beſide the killing of the weeds, which the ancients, and many among us, have thought the only uſe of the hoe, this dull and blunt inſtrument is by no means calculated for the purpoſes it is to ſerve. The prong-hoe conſiſts of two hooked points of ſix or ſeven inches long, and when ſtruck into the ground will ſtir and remove it the ſame depth as the plough does, and thus anſwer both the ends of cutting up the weeds and opening the land. It is uſeful even in the horſe-hoeing huſbandry, becauſe the hoe-plough can only come within three or four inches of the rows of the corn, turnips, and the like; whereas this inſtrument may be uſed afterwards, and with it the land may be raiſed and ſtirred even to the very ſtalk of the plant. See AGRICULTURE and HOE.

PRONOUN, PRONOMEN, in grammar, a declinable part of ſpeech, which being put inſtead of a noun, points out ſome perſon or thing. See GRAMMAR.

PRONUNCIATION, in grammar, the manner of articulating or ſounding the words of a language.

Pronunciation makes the moſt difficult part of written grammar; in regard that a book expreſſing itſelf to the eyes, in a matter that wholly concerns the ears, ſeems next akin to that of teaching the blind to diſtinguiſh colours: hence it is that there is no part ſo defective in grammar as that of pronunciation, as the writer has frequently no term whereby to give the reader an idea of the ſound he would expreſs; for want of a proper term, therefore, he ſubſtitutes a vicious and precarious one. To give a juſt idea of the pronunciation of a language, it ſeems neceſſary to fix as nearly as poſſible all the ſeveral ſounds employed in the pronunciation of that language. Cicero tells us, that the pronunciation underwent ſeveral changes among the Romans: and indeed it is more precarious in the living languages, being, as Du Bos tells us, ſubſervient to faſhion in theſe. The French language is clogged with a difficulty in pronunciation from which moſt others are free; and it conſiſts in this, that moſt of their words have two different pronunciations, the one in common proſe, the other in verſe.

As to the pronunciation of the Engliſh language, the ingenious Mr Martin, in his Spelling-Book of Arts and Sciences, lays down the following rules: 1. The final *(e)* lengthens the ſound of the foregoing vowel; as in *can, cane; rob, robe; tun, tune*, &c. 2. The final *(e)*, in words ending in *re*, is ſounded before the *r* like *u*; as *maſſacre, maſſa-cur; lucre, lu-cur*, &c. 3. The Latin dipthongs *æ, œ*, are ſounded like *e*; as *Ætna, Etna; œconomy, economy*, &c.: but at the end of the words *oe*, ſounds like *o*; as in *toe, foe*, &c. 4. Alſo the Engliſh improper diphthongs, *eu, eo, eu, ue*, ſound only the *e* and *u*; as *tea* or *te*; *feoffee* or *feſſe*; *due* or *du*; *true* or *tru*, &c. though ſometimes *eo* and *ea* are pronounced like *ee*, as in *people, fear, near*, &c. 5. Sometimes the diphthong *(ie)* is pronounced like *e* in *cieling*, like *ee* in *field*, and, at the end of words, always like *y*, as in *lie*, &c.; and *ei* is pronounced either like *e* or *ai*, as in *deceit, reign*, &c. 6. The tripthong *eau* is pronounced like *o*, in *beau* and *jet d'eau*; and *ieu* ſounds like *u* in *lieu, adieu*, &c. 7. The ſound of *c* is hard before the vowels *a, o, u*, as in *call, cold, cup*, &c.; alſo ſometimes before *h*, as in *chart, cold*, &c.; and before *l* and *r*, as in *clear, creep*, &c. It is otherwiſe generally ſoft, as in *city, cell, cyder, child*, &c. 8. In French words *ch* is ſounded like *ſh*, as in *chagreen, machine*; and ſometimes like *qu*, as in *choir*. 9. the ſound of *g* is hard before *a, o, u, l, r*, as in *gall, go, gum, glean, grope*; alſo before *ui*, as in *guilt, guild*, &c.; and before *h*, as in *ghoſt*; ſometimes before *i*, as in *gibbous, gibberiſh*. It is alſo generally hard before *e*, as in *get, geld*, &c.; but ſoft in many words derived from the Greek and Latin, as in *geometry, genealogy, genus*, &c. Two *gg* are always hard, as in *dagger*, &c. The ſound of *g*, when ſoft, is like that of *j*. 10. In any part of a word, *ph* ſounds like *f*, as in *philoſophy*, &c. 11. The ſound of *qu*, at the end of French words, is like *k*, as in *riſque*, &c. 12. The ſyllables *ti* and *ci*, if followed by a vowel, ſound like *ſi* or *ſhi*; as in *fiction, logician*, &c. 13. When *cc* occurs before *i*, the firſt is hard and the latter is ſoft; as in *flaccid*, &c. 14. The letter *p* is not pronounced at the beginning of ſyllables before *ſ* and *t*; as in *pſalm, ptarmics*, &c. As to other peculiarities regarding the pronunciation of ſingle letters, many of them have been taken notice of at the beginning of each, in the courſe of this work.

But it is not enough to know the juſt pronunciation of ſingle letters, but alſo of words: in order to which, the accenting of words ought to be well underſtood; ſince nothing is more harſh and diſagreeable to the ears, than to hear a perſon ſpeak or read with wrong accents. And indeed in Engliſh the ſame word is often

Pronunciation, Proof.

Proof.

both a noun and a verb, diſtinguiſhed only by the accent, which is on the firſt ſyllable of the noun, and on the laſt of the verb; as *fèrment* and *fermènt*; *rècord* and *recòrd*, &c. We are to obſerve alſo, that in order to a juſt expreſſion of words, ſome require only a ſingle accent on the ſyllable, as in *tòrment*, &c.; but in others it ſhould be marked double, as in *anȉmal*, becauſe it is pronounced as if the letter was wrote double, viz. *an-nimal*.

Mr Sheridan's Dictionary will be found extremely uſeful as a directory in acquiring the pronunciation of the Engliſh language; but care muſt be taken to avoid his provincial brogue, which has certainly miſled him in ſeveral inſtances. Mr Walker's Pronouncing Dictionary, lately publiſhed, will likewiſe deſerve the ſtudent's attention. It is a work of great labour and merit, and is highly uſeful. It has indeed ſome faults and inaccuracies, but it is notwithſtanding, in all probability, the beſt of the kind.

PRONUNCIATION is alſo uſed for the fifth and laſt part of the rhetoric, which conſiſts in varying and regulating the voice agreeably to the matter and words, ſo as moſt effectually to perſuade and touch the hearers. See ORATORY, Part IV.

PROOF, in law and logic, is that degree of evidence which carries conviction to the mind. It differs from demonſtration, which is applicable only to thoſe truths of which the contrary is inconceivable. It differs likewiſe from probability, which produces for the moſt part nothing more than opinion, while proof produces belief. See PROBABILITY.

The *proof* of crimes was anciently effected among our anceſtors divers ways; viz. by duel or combat, fire, water, &c. See DUEL and ORDEAL.

PROOF of Artillery and ſmall Arms, is a trial whether they ſtand the quantity of powder allotted for that purpoſe. The rule of the board of ordnance is, that all guns, under 24-pounders, be loaded with powder as much as their ſhot weighs; that is, a braſs 24-pounder with 21 lb. a braſs 32-pounder with 26 lb. 12 oz. and a 42-pounder with 31 lb. 8 oz.; the iron 24-pounder with 18 lb. the 32-pounder with 21 lb. 8 oz, and the 42-pounder with 25 lb.
